Embryology.—The respiratory system is developed from the ventral surface of the foregut as a long gutter-like pouch which reaches from just behind the rudiment of the tongue to the stomach. Limiting the anterior or cephalic end of this is a ∩-shaped elevation in the ventral wall of the pharynx which separates the ventral ends of the third and fourth visceral bars and is known as the *furcula;* it is from this that the epiglottis, aryteno-epiglottidean folds and arytenoid cartilages are developed. Later on the respiratory tube is separated from the digestive by two ridges, one on each side, which, uniting, form a transverse partition. In the region of the furcula, however, the partition stops and here the two tubes communicate. The caudal end of the respiratory tube buds out into the two primary bronchi, and the right one of these, later on, bears three buds, while the left has only two; these are the secondary bronchi, which keep on dividing into two, one branch keeping the line of the parent stem to form the stem bronchus, while the other goes off at an angle. By the repeated divisions of these tubes the complex "bronchial tree" is formed and from the terminal shoots the infundibula bud out. The alveoli only develop in the last three months of foetal life. The thyroid cartilage is probably formed from the fourth and fifth bronchial bars, while the cricoid seems to be the enlarged first ring of the trachea. Before birth the lungs are solid and much less vascular than after breathing is established. (For further details *see* Quain's *Anatomy,* vol. i., Lond. 1908.)

Comparative Anatomy.—In the lower vertebrates respiration is brought about by the blood vessels surrounding the gill clefts (*see* PHARYNX). In the higher fishes (Ganoids and Teleosteans) the "swim bladder" appears as a diverticulum from the dorsal wall of the alimentary canal, and its duct sometimes remains open and at others becomes a solid cord. In the former case it is probable that the blood is to some extent oxygenated in the vascular wall of this bladder. In the Dipnoi (mud-fish) the opening of the swim bladder shifts to the ventral side of the pharynx and the bladder walls become sacculated and very vascular, so that, when the rivers are dried up, the fish can breathe altogether by means of it. In the S. American and African species of mud-fish the bladder or lung, as it may now be called, is divided by a longitudinal septum in its posterior (caudal) part into right and left halves. In this sub-class of Dipnoi, therefore, a general agreement is seen with the embryology or ontogeny of Man's lungs. In the Amphibia the two lungs are quite separate though they are mere sacculated bags without bronchi. A trachea, however, appears in some species (*e.g.,* Siren) and a definite larynx with arytenoid cartilages, vocal cords and complicated muscles is established in the Anura (frogs and toads). In most of the Reptilia the bag-like lungs are elaborated into spongy organs with arborizing bronchi in their interior. From the crocodiles upward a main or stem bronchus passes to the caudal end of the lung, and from this the branches or lateral bronchi come off. The larynx shows little advance on that of the Anura.

The respiratory organs of birds are highly specialized. The larynx is rudimentary, and sound is produced by the *syrinx,* a secondary larynx at the bifurcation of the trachea; this may be tracheal, bronchial or, most often, tracheo-bronchial. The lungs are small and closely connected with the ribs, while from them numerous large air sacs extend among the viscera, muscles and into many of the bones, which, by being filled with hot air, help to maintain the high temperature and lessen the specific gravity of the body. This pneumaticity of the bones is to a certain extent reproduced by the air sinuses of the skull in crocodiles and mammals. Still, the amount of air in the bones does not necessarily correspond with the power of flight, for the Ratitae (ostriches and emeus) have very pneumatic bones, while in the sea-gulls they are hardly pneumatic at all.

In mammals the thyroid cartilage becomes an important element in the larynx, and in the Echidna the upper and lower parts of it, derived respectively from the fourth and fifth bronchial bars, are separate (R. H. Burne, *Journ. Anat. and Phys.* xxxviii. p. xxvii.). The whole larynx is much nearer the head than in Man, and in young animals the epiglottis projects up behind the soft palate. This prevents the milk trickling into the larynx during suckling, and is especially well seen in the Marsupials and Cetacea, though evidences of it are present in the human embryo. In the lower mammals an inter-arytenoid cartilage is very frequent (*see* J. Symington, "The Marsupial Larynx," *J. Anat. and Phys.* xxxiii. 31, also "The Monotreme Larynx," *ib.* xxxiv. 90).

The lungs show much variation in their lobulation; among the porcupines forty lobes have been counted in the right lung, while in other mammals no lobulation at all could be made out. The *azygous lobe* of the right lung is a fairly constant structure and is situated between the post-caval vein and the oesophagus. It is supplied by the terminal branch of the right stem bronchus and, although it is usually absent in Man, the bronchus which should have supplied it is always to be found. (F. G. P.)

RESPIRATORY SYSTEM, DISEASES OF. The great extent of the respiratory system reaching from the lips and nostrils to the ultimate air cells of the lungs, the numerous muscles, intrinsically and extrinsically concerned with respiratory movements, the object of respiration, to wit, aeration of the blood, the manifest interrelationships between heart, kidneys, skin, nervous system and lungs, are sufficient to indicate that diseases of the respiratory system cover a very wide range. Many of the subjects belonging thereto are dealt with in special articles, notably ASTHMA; BRONCHITIS; BRONCHIECTASIS; DIPHTHERIA; EMPHYSEMA; INFLUENZA; LARYNGITIS; MINERS' PHTHISIS; PHTHISIS; PLEURISY; PNEUMONIA; PNEUMOTHORAX; TUBERCULOSIS; WHOOPING COUGH; HEART AND LUNG, SURGERY OF; EAR, NOSE AND THROAT, DISEASES OF; PLEURO-PNEUMONIA IN CATTLE; RADIOTHERAPY.

But viewed from another standpoint these diseases are relatively simple. The pathological processes underlying them are the familiar ones of inflammation and new growths and the symptoms produced depend upon the particular part of the tract involved. For example, in diphtheria the disease may affect the tonsils and

soft palate; in this case the local symptoms are relatively small and the constitutional effects produced by the absorbed diphtheria toxin are great. Or it may affect the larynx when the local obstruction dominates the picture. Or again, from the larynx the disease may extend to the bronchioles by way of the trachea, bronchi and their branches and lead to a bronchopneumonia similar, except for its ultimate aetiology, to that met with in measles, whooping cough or influenza. This bronchopneumonia, in its turn, resembles that constituting pulmonary tuberculosis with such modifications as depend upon the acuteness or chronicity of the tuberculous inflammatory process and the extent to which it is simple or complicated by secondary infections. The same is true with regard to new growths; the type of growth may or may not be histologically the same in different parts of the tract but the symptoms produced depend upon the situation of the growth and its size and behaviour relative to the region it affects.

Wide Inter-relationships.—The far-reaching effects of respiratory diseases may only become obvious on special occasions. The levator ani muscle seems far removed from the possible effects of morbid conditions in the throat or lungs, and yet if an abscess be forming in the neighbourhood of the anus, the act of coughing causes a sharp stab of pain locally because the levator is an extraordinary muscle of respiration and is called into play in coughing. This example serves to show how nerve conditions such as paralysis of the phrenic nerve which supplies the diaphragm (*q.v.*) or of intercostal nerves which supply the intercostal muscles, or morbid processes in other regions such as peritonitis, may interfere with the normal expansion and contraction of the lung tissue and induce pulmonary changes by disturbing the muscular movements that control them.

The pleura, lying between the lung and the thoracic wall, is in the main liable to disease by extension from one side or the other and rarely escapes involvement. Pulmonary tuberculosis is always associated with tubercle of the pleura and in cancer of the breast the disease often extends to the pleura. In both instances nodules in the normally smooth membrane lead to inflammatory changes with exudation of fluid into the serous cavity and adhesions between its walls.

If attention be directed more particularly to the lungs and pleura, the concentration of pulmonary and systemic vascular systems in the heart, with participation of each side of the heart in both circulations, results in a peculiar relationship of diseases of the respiratory system with those of the heart. Regurgitation at the mitral valve is immediately felt throughout the lungs and as far back as the pulmonary valves, as is evidenced by the accentuated pulmonary second sound. (*See* HEART: AUSCULTATION.) The rise of blood pressure within the lungs is borne ultimately by the right ventricle, and failure here, with the resulting incompetence of the tricuspid valve, leads to pulmonary congestion and exudation of oedematous fluid into the air spaces and into the pleural cavities. Similarly, some diseases of the kidney, indirectly by reason of the changes they induce in the heart, and, perhaps, directly by the altered composition of the blood they imply, lead to pulmonary and pleural congestion and exudation. Blood conditions, too, whether dependent upon anaemia or circulation of toxic materials, bacterial or other, act upon the heart muscle and secondarily upon the lungs. It is in this way that so-called hypostatic congestion and pneumonia are produced in the later stages of acute febrile disorders.

Secondary Effects. The various diseases of the respiratory system occasion modifications of respiration in absolute rate, ratio borne by inspiration to expiration and rhythm. Thus the absolute rate is increased in acute pneumonia owing to diminution of the available area for respiration and to the fever; in anaemia when extra exertion is called for, because the necessary oxygen is not provided at a normal rate of breathing owing to the deficient haemoglobin content of the red blood corpuscles. Similarly, expiration is prolonged in emphysema because the elasticity of the lung tissue is impaired, and rhythm is modified in exhaustion of the respiratory centre in the medulla oblongata (Cheyne-Stokes breathing). They lead to the introduction of abnormal respiratory acts, *e.g.*, cough, and to a whole series of constitutional changes, *e.g.*, fever, delirium, altered secretions by virtue of the pathological conditions underlying them, and by the interference they impose upon oxygenation of the blood they induce secondary changes in other organs. The more complex those organs the sooner they show the strain; heart, kidney, brain fail sooner than skin, muscle, bone. Nevertheless in time even the last show changes; skin becomes obviously oedematous, muscle gains or loses water as evidenced by its specific gravity, and bone may undergo associated changes as in the so-called pulmonary osteoarthropathies.

Hitherto the relations considered have been those pertaining to the various parts of the body, but diseases of the respiratory system also are related to the composition of the air inhaled. Irritating gases as ammonia, chlorine, poison gases as used in the World War induce oedema of the glottis, bronchitis, oedema of the lung, pneumonia; even tobacco smoke in excess leads to granular pharyngitis, irritable larynx, excessive secretion of mucus in the bronchi. Air-borne bacteria as B. tuberculosis and possibly the organisms or viruses of influenza, pneumonia, common catarrh, pleuro-pneumonia in cattle induce inflammatory changes, more or less acute, in bronchi and pulmonary tissue. Dust particles inhaled in the course of occupation occasion a whole group of industrial diseases. These affect stone-masons, knife-grinders, miners, wool and cotton spinners, indeed, any trade wherein the air of the factory is heavily laden with dry particles. In all these instances the lung condition is chronic and therefore associated with great formation of fibrous tissue (fibroid pneumonia) and lung damaged in this way is peculiarly liable to tuberculosis. Hence the industrial diseases under consideration consist in the main of fibroid tuberculosis (fibroid phthisis). There is reason to believe that silica particles when inhaled are particularly injurious perhaps by the local formation of small quantities of silicic acid.

(W. S. L.-B.)

Means of Diagnosis.—Some notable advances in the technique of diagnosis and in the means of treatment, both medical and surgical, of diseases of the respiratory system have been evolved in the present century. Many of them are still in the process of development, but the results so far obtained have been encouraging. Direct methods of investigation, so long familiar in regard to the mouth, pharynx and larynx, have been extended to the trachea and bronchi, by means of the bronchoscope. The trachea, the main bronchi and their principal subdivisions can now be directly illuminated and observed. The importance of this in regard to the presence of inhaled foreign bodies is obvious, but it has also proved helpful in connection with obscure pathological conditions of these tubes. A notable application of the same principle of direct illumination has been made by Jacobaeus of Stockholm to the pleura and lungs. To enable this to be done, an artificial pneumothorax (*q.v.*) is first established, whereby the lung retracts from the chest wall except where it is prevented from so doing by adhesions. At a suitable time after this, a small tube is inserted through an intercostal space under local anaesthesia, and a special instrument with electric light and a system of lenses is fitted into it. By this means a clear view of the state of the pleura and of the surface of the lung may be obtained. Small adhesions, preventing the complete collapse of the lung, in the application of the artificial pneumothorax treatment to various conditions, may be successfully divided. The method promises also to be helpful in the diagnosis of certain tumours of the lung and pleura.

Improvements in the technique of X-ray methods have greatly increased their value in diagnosis. Their use is now almost a routine matter in cases of obscure intra-thoracic disease. In the distinction between fluid in the pleura and solid conditions of the lung, in the diagnosis of the extent of the disease in tuberculosis of the lungs and to some degree in the assessment of its type, in the early recognition of tumours of the bronchi, lungs, pleura or mediastinal glands, X-ray investigation is invaluable, and sometimes indispensable.

A recent extension of their use in regard to the diagnosis of bronchiectasis or dilatation of the bronchial tubes is already proving of great value. A measured quantity of lipiodol, a liquid substance opaque to the X-rays, is injected down the trachea, through the crico-thyroid membrane or directly in between two of the car-

tilaginous rings of the trachea, under good local anaesthesia, the patient usually being placed in such a way that the lipiodol goes chiefly into the main bronchus of the side it is desired to investigate. The lipiodol rapidly diffuses into the bronchi of that lung, and in an X-ray film taken shortly afterwards the bronchial tree and its abnormal dilatations, if present, are seen with extraordinary clearness and accuracy. Applications of an old method, the study of so-called "vital capacity," that is, the amount of air it is possible to exhale by a maximum expiration after a maximum inspiration, promise to give valuable information in diagnosis. The further developments of bacteriological and other laboratory methods in the period under consideration have been helpful but not dramatic in their results.

DISEASES OF THE AIR PASSAGES

General Measures.—An important function of the nose is to see that the air reaches the lungs, warmed, moistened and filtered from micro-organisms. In this connection the importance of adequate treatment, either medical or surgical, of conditions causing nasal or pharyngeal obstruction and therefore leading to mouth breathing, has become more generally recognized. For the same reasons, the treatment of septic conditions in the nose and nasal sinuses is more commonly carried out. The value of scientifically devised breathing exercises is also more widely accepted. Such measures lessen the risks of catarrhal infections, and in young people prevent deformities of the chest with their attendant disadvantages. The use of the bronchoscope has proved to be of great value in the extraction of inhaled foreign bodies. In America, Chevalier Jackson of Pittsburgh has pioneered this method with brilliant results. By its means the majority of inhaled foreign bodies can be removed, and the serious and often fatal results so common formerly are obviated.

The use of vaccines (*see* VACCINE THERAPY) in the prevention of the "common cold" and the more serious forms of catarrh of the air passages has given encouraging results. It is usual to employ a "stock" vaccine, containing a mixture of catarrh-producing organisms. An autogenous vaccine, *i.e.*, one made from the patient's own infective organisms, is, however, sometimes employed. At present, however, these protective vaccines have not proved as generally effective as the use of antityphoid and antiparatyphoid vaccines in the prevention of the enteric fever group of diseases. With increasing knowledge of the catarrh-producing organisms, a somewhat large and diverse group, and of the conditions favouring their activity, greater success may be obtained.

In the case of bronchitis, the use of vaccines in treatment has proved somewhat disappointing, except in the form due to the pneumobacillus of Friedländer, though in chronic cases they are helpful.

Gassing.—The employment of irritant and poisonous gases in the World War largely increased our knowledge of their effects, and in some measure led to advances in means for the prevention of such effects and for the treatment of the resultant conditions occurring in civil life from accidental or occupational causes. Some of these, such as chlorine and phosgene, lead to oedema of the lungs; others, such as mustard gas, to acute bronchopneumonia; and others, such as carbon monoxide, to changes in the blood. Tuberculosis as a sequel of gassing has proved to be relatively infrequent, but severe chronic bronchitis and emphysema are common.

Asthma.—The idiosyncrasies of asthmatics are well known, and their susceptibility to the emanations of certain animals was long ago recognized by Hyde Salter. This peculiarity has found a rational explanation in recent work on anaphylaxis (*q.v.*). Some, if not all, cases of asthma seem to fall into a group of toxic idiopathies—*i.e.*, disease conditions due to hypersusceptibility to certain foreign protein substances. These may be derived from animals, such as the horse, dog, cat, etc.; or from articles used as foods; or again they may be toxic agents produced by bacteria.

This aspect of the disease has been closely studied by Chandler Walker in America and by Fleming and Coke in Great Britain. It was hoped that by testing the sensitiveness of the skin of asthmatic patients to large numbers of such substances, collectively called antigens, by means of scratches to which they are applied in solution, it would be possible to discover the particular agents to which the patient was susceptible, with a view either to avoiding contact with them if possible, or to desensitization by inoculation with minute but increasing doses of the particular substances concerned. Some good results are on record, but on the whole this method has been disappointing. Probably hypersensitiveness is not the only factor in asthma, and there may be, in addition, an inherited or acquired instability of the centre in the brain controlling the innervation of the bronchi.

The non-specific method of treatment of hypersusceptibility called protein shock therapy (*see* THERAPEUTICS) has been extensively tried in this disease, with some benefit in certain cases, but on the whole also with disappointing results. Of medicinal agents, apart from the iodides and the antispasmodic group of drugs such as belladonna, stramonium, grindelia and lobelia, small injections of adrenalin or of pituitrin, alone or together, have proved most useful.

Bronchiectasis.—Bronchiectasis (*q.v.*), was for a long period almost the despair of treatment. The application of surgical methods in suitable cases, if employed sufficiently early, seems to promise hope of real amelioration, or even of actual cure. In a small proportion of the cases, where pleural adhesion has not occurred, artificial pneumothorax may be sufficient; but, in the majority phrenicotomy or a more or less extensive thoracoplasty may be necessary. By these means the sputum may be lessened or entirely lost, and its offensive character ended.

DISEASES OF THE LUNGS

Pneumonia.—Study of the causal organism, the pneumococcus, by Duchez, Gillespie and Cole in America, served to explain in some degree the failure of serum treatment in this disease in the past. They have shown that there are at least four types of pneumococcus, each with different serum reactions, called respectively types I., II., III. and IV. Attempts have been made to prepare specific anti-sera for each of these, but so far only that for type I. has proved to be of real value in treatment, though a serum has been used in type II. Unfortunately, no effective antiserum has been obtained for type III., which is responsible for the most serious and fatal form of pneumonia. Pneumococcal vaccines have been used in the treatment of acute pneumonia, but though sometimes successful they have not achieved any widespread recognition. If they are to be of real value they must be employed early in the course of the disease. It has been recommended to use a stock vaccine as soon as the disease is recognized, and then if possible to prepare and use an autogenous one. Vaccines seem to be more helpful in cases of delayed resolution.

Other Diseases.—As regards abscess and gangrene of the lung, although some cases are successfully treated by medical measures, notably in the case of gangrene by injections of arsphenamine, the greatest success has been achieved from improved surgical methods.

In the case of tumours of the lung, mediastinum and pleura, the application of artificial pneumothorax promises to render some of these more easy to recognize and to deal with surgically.

With respect to pulmonary mycoses and spirochaetosis, improved laboratory methods have enlarged our knowledge of conditions due to some organisms such as moulds and spirochaetes, which occasionally cause pulmonary infections. (For pulmonary tuberculosis *see* TUBERCULOSIS.)

DISEASES OF THE PLEURA

Pleurisy with Effusion and Empyema.—New methods of tapping the pleura have been introduced, including the replacement of the fluid by sterile air or oxygen by means of an apparatus like that for inducing pneumothorax. This may be particularly helpful in regard to chronic or recurrent effusions, more especially such as occur in association with malignant disease.

As regards empyema, the treatment of collections of pus in the pleura has changed considerably. The method employed varies with the cause of the empyema. In cases due to the pneumococcus, early drainage by means of removal of a small piece of rib is now

the rule. In those due to streptococcal invasion repeated aspiration is adopted, until the process is localized, or until the fluid withdrawn is actually pus instead of thin turbid fluid, after which drainage by removal of a piece of rib is employed. In both cases many surgeons now employ special appliances for drainage, whereby a negative pressure is maintained in the pleural space to promote re-expansion of the lung. In empyema associated with tuberculosis, aspiration with gas replacement is the rule.

Surgery of the Pleura and Lungs.—War experience gave a valuable impetus to the surgical treatment of respiratory conditions. The treatment of empyema has already been referred to. Haemothorax or blood effused into the pleural space is now treated like any other effusion, and aspirated or gas-replaced if necessary. If infected it is treated like empyema (*q.v.*). Artificial pneumothorax is proving of great value as a preliminary to other operative procedures, apart from its uses as a means of treatment of pulmonary tuberculosis. The operation of exairesis or avulsion of the distal part of the phrenic nerve as a means of treatment of chronic basic lung conditions, including pulmonary tuberculosis, is on its trial and bids fair to be useful. More extensive operative procedures are ligature of branches of the pulmonary artery, and lobectomy or removal of diseased portions of the lung.

Operations designed to promote collapse of the lung when this is impracticable by artificial pneumothorax are pneumolysis and thoracoplasty. In pneumolysis attempts are made to collapse the lung, by the insertion outside the pleura of fat tissue or some extraneous substance such as paraffin. In thoracoplasty, sufficient portions of as many ribs as may be necessary are removed to allow the chest wall to fall in and thereby collapse the lung. The outlook in regard to the surgery of the lung and pleura is distinctly encouraging.

RESTAURANT. This term was first used for an establishment where refreshments and meals were provided by one Boulanger, or Champ d'Oiseau, who opened the first establishment of the kind in the rue des Poulies, Paris, about 1765. The success of the house was almost instantaneous, and brought imitators, other restaurants being opened by chefs and stewards who left their employers. A notable advance followed the Revolution, when ruined aristocracy could no longer afford large retinues. Amongst the early restaurants was one managed by Antoine Beauvilliers.

The "Ordinary."—The earliest predecessors in England of the modern restaurant were the old coffee-houses and taverns which had a daily "ordinary"—a mid-day dinner or supper, generally noted for a particular dish, and served at a common table at a fixed price and time. Some of the more ancient of these arose in the middle of the 17th century. The first coffee-house was opened in St. Michael's alley, Cornhill, by Pasqua Rosee, a Greek. This youth was the first to teach the method of roasting coffee and to introduce the drink into England.

Nearly 100 years before it was burnt down in the Great Fire of 1666, the Castle ordinary, off Paternoster Row, was a great place for booksellers and literary men. It was rebuilt after the Great Fire, and attained its greatest fame as Dolly's Chop House, in Queen's Head Passage, Paternoster Row, when "Dolly," a proprietress, introduced pretty serving maids in place of men. For 150 years it was famous for its beef steaks and gill ales, and among its customers were Fielding, Defoe, Smollett, Richardson, Swift, Dryden, Pope, Gainsborough and Handel. It was demolished in 1885. Jonathan's Coffee House in Change alley, opened at the time of the South Sea Bubble speculation, was a luncheon rendezvous for stock jobbers long prior to the establishment of the Stock Exchange, and similarly Lloyds' Coffee House in Lombard street and Abchurch lane was the underwriters' headquarters and the cradle of Lloyds of to-day.

Other famous ordinaries were the Rainbow, in Fleet street, frequented by Dr. Johnson, Boswell and other notables, the Old Cock, Nando's, the Goose and Gridiron, also near St. Paul's, which, as the Mitre, was the first "musick house," and Simpson's Fish Dinner House, Bird-in-Hand court, Cheapside. The last-named was founded in 1723. It served a 2/- "fish ordinary" of soup, three fish courses, haunch of mutton and cheese 200 years ago, and was doing the same in 1929. Though no ordinary is served there, the Cheshire Cheese in Fleet street retains the atmosphere, and the steak, kidney, lark and oyster pudding of the days of Dr. Johnson.

Reference to the "ordinaries" may be found as long ago as 1577 (Hollinshed). In the 17th century the more expensive ordinaries were frequented by men of fashion, and gambling usually followed, so that the term "ordinary," by which was understood either the establishment or the meal was then more synonymous with the gambling house than the tavern. In the early part of the 18th century, however, the character changed again, and the choice of such establishments was great in number and varied in quality. Steele in the *Tatler* (1709) refers to a board being hung out of a window announcing "an excellent ordinary on Saturdays and Sundays." In the *Journey through England* (1714) it is remarked, "At two we generally go to dinner. Ordinaries are not so common here as abroad yet the French have set up two or three good ones in Suffolk street, where one is tolerably well served." Pontack's was considered one of the finest, and Defoe says that dinner there cost from 4s. to 5s. each, or anything up to a guinea. In addition a man could "dive," take his food in a mixed company of footmen and chair men for 2½d., have a sausage at a "farthing fry," or go to one of the taverns where the real "ordinary," a very good dinner of several courses, was served at from 6d. to 1s. Johnson records that he used to dine regularly for 7d. The usual hours for the meal were between 1 and 4, and there were 33 taverns serving ordinaries in the area between Threadneedle and Lombard streets and Gracechurch and Bishopgate streets.

Some of these have lasted until now, but the majority have had to give way to bank and office premises. Of the old ones, Birch's, formerly in Cornhill, dates from 1700, and Stone's Chop House in Panton street W., from 1770.

The restaurant habit as known to-day in London dates from the later decades of the 19th century when large fashionable hotels began to cater to the needs of fastidious diners on an elaborate scale. Suppers after the theatre became popular, and the establishments attached to hotels competed at widely varying prices while small restaurants sprang up in Soho, run by French and Italian proprietors, and provided good dinners tastefully served, at reasonable prices.

Modern grill rooms are an even later offshoot of the hotels and restaurants, and owe their existence largely to the travelling American who, with his own ideas of comfort, felt he did not wish to dress every night, but that otherwise he would be out of place in a fashionable restaurant. The grill room made no demand for dress, and offered an excellent dinner, long or short as required, served with rapidity in luxurious surroundings. London's first grill room was opened by Spiers and Pond in the '60s under the arch at Ludgate Hill, and the Savoy hotel was the first of the large hotels to inaugurate a similar room.

One of the first restaurants in London was that opened at Whiteleys in 1873, purely for the benefit of customers, but that it was not enthusiastically received is shown in the first year's loss of £183 on £1,629 turnover. But from then on the idea grew in favour and the takings annually. Soup or fish, meat and vegetables were served for 1s. 6d. In 1884 the first A.B.C. teashop was opened near London Bridge Station, and was ridiculed, the coffee shops with their high-backed benches being still popular. Ten years later J. Lyons and Co. (*q.v.*) opened at 213 Piccadilly, their first teashop which was still open in 1928.

All the larger restaurants have banqueting halls and other rooms where Masonic, regimental, club and other festival dinners may be

had at varying prices. Among the "classic" restaurants are the Carlton, Savoy, Berkeley, Ritz, Claridge's, Oddenino's, Verrey's and the Café Royal, and latterly the May Fair, the Devonshire, and the Green Park.

UNITED STATES

The word restaurant in America was first applied to the dining rooms of the better class hotels and to a few high class à la carte restaurants. As establishments of different types came into being their character was fixed by some such expression as coffee-house, as in England. Then came cafés, lunch rooms, dairy lunch rooms, cafeterias, tea rooms, waffle houses, fountain lunches, sandwich shops and many others, all included in the general use of the word restaurant.

The early American eating places were patterned after the inns, taverns and coffee houses in England and on the Continent. In Philadelphia there was the Blue Anchor Tavern, opened as early as 1683 or 1684. Ye Coffee House was opened in 1700, the proprietor being Henry Flower, who was also the postmaster of the province. In fact, the Coffee House was in all probability used as the post office for a time. The London Coffee House, opened in 1702, and the second London Coffee House, established in 1754 by William Bradford, printer of the Pennsylvania journal, and the City Tavern (1773) were meeting places for the sea captains, merchants and others who went there to transact their business, as well as social gathering places for the leading citizens. The City Tavern, later known as the Merchants Coffee House, was long considered the largest and best coffee house in America.

Ye Crown Coffee House, in Boston, was built in 1711 on the Boston Pier, or Long Wharf, by Jonathan Belcher.

In New York the famous old Fraunces' Tavern at Broad and Pearl streets near the Battery still stands, only the ground floor being used as a restaurant. Upstairs the Sons of the Revolution protect the collection of mementoes of Washington's life and times in the room in which he said farewell to his officers. Brown's Chop House was famous for many generations not only for its chops and steaks but for its unique collection of old photographs, prints and autographs. For years it was the rendezvous of journalists, authors, actors and painters. The Old St. Denis on Broadway at 11th street in the 90's; Fleischman's Vienna Garden, opposite the St. Denis, with its continental touch; Dorlon's on 23rd St., famous for its sea food; the old Hoffman House; Café Martin and the Holland House should be at least mentioned. But supreme over all until Sherry opened was Delmonico, first built on Broad street, later moved to 26th street and finally to 44th street and Fifth avenue. Soon after Delmonico moved to 44th street, Sherry opened diagonally across the avenue and, attracting the younger generation, threatened for a time to usurp the crown so long worn by Delmonico. But the two great restaurants were both destined to go. Delmonico closed its doors, and the Sherry of to-day is not the old-time Sherry.

Bégué's, opened over 60 years ago in New Orleans for the butchers of the city, is now a fashionable rendezvous.

Don's and the El Dorado House, famous for their Spanish cooking, were the earliest eating places in San Francisco in the pioneer days. Lavish feasts and exorbitant prices were the order of the day. The most fashionable restaurant was the Iron House made of sheet iron which had been brought in a sailing vessel around the Horn. Unique among the restaurants was the Bazzuro, opened by an Italian. The first restaurant by that name was a sailing vessel which had run aground in the bay. Later this spot was filled in with land and a house built on the same site. The restaurant is still run by members of the original family. Other eating places of special interest were the Tehama House, frequented by the army and navy officers; Marchand's, where the food was cooked in the window to entice the passerby; and the Mint, which boasted an old Southern mammy in the kitchen. Few of these famous places survived the San Francisco fire of 1906.

A full description of chain restaurants and mass feeding is given in the article FOOD SERVICE OF THE WORLD.

RESTIF, NICOLAS EDME (1734–1806), called RESTIF DE LA BRETONNE, French novelist, son of a farmer, was born at Sacy (Yonne) on Oct. 23, 1734. He was educated by the Jansenists at Bicêtre, and on the expulsion of the Jansenists was received by one of his brothers, who was a curé. Owing to a scandal in which he was involved, he was apprenticed to a printer at Auxerre, and, having served his time, went to Paris. Here he worked as a journeyman printer, and in 1760 he married Anne or Agnes Lebègue, a relation of his former master at Auxerre. Restif produced about two hundred volumes, many of them printed with his own hand, on almost every conceivable subject. He drew on the episodes of his own life for his books, which display an extraordinary licence in choice of subject and in treatment. They provide useful documents for the history of the underworld of the period. They include: *Le Pied de Fanchette*, a novel (1769); *Le Pornographe* (1769), a plan for regulating prostitution which is said to have been actually carried out by the Emperor Joseph II., while not a few detached hints have been adopted by continental nations; *Le Paysan perverti* (1775), a novel with a moral purpose, sufficiently horrible in detail; *La Vie de mon père* (1779); *Les Contemporaines* (42 vols., 1780–1785), a vast collection of short stories; *Ingénue Saxancour*, also a novel (1785); and, lastly, the extraordinary autobiography of *Monsieur Nicolas* (16 vols., 1794–1797; the last two are practically a separate and much less interesting work), in which at the age of sixty he has set down his remembrances, his notions on ethical and social points, his hatreds, and above all his numerous loves, real and fancied. The original editions of these, and indeed of all his books, have long been bibliographical curiosities owing to their rarity, the beautiful and curious illustrations which many of them contain, and the quaint typographic system in which most are composed. Just before his death (Feb. 2, 1806) Napoleon gave him a place in the ministry of police.

See J. Assézat's selection from the *Contemporaines*, with excellent introductions (3 vols., 1875), and the valuable reprint of *Monsieur Nicolas* (14 vols., 1883–84); also Eugen Dühren, *Rétif de la Bretonne, der Mensch, der Schriftsteller, der Reformator* (Berlin, 1906), and *Rétif-Bibliothek* (Berlin, 1906).

RESTITUTION: *see* DIVORCE; LARCENY.

RESTRAINT, in law, a restriction or limitation. The word is used primarily in four connections:

Restraints on Alienation.—When real property is conveyed in fee simple, restricting the right of the grantee to alienate it, thereby derogating from the grant, it was considered by the common law so inimicable to the policy of permitting the ready transfer of land that such restrictions were stricken down by the courts as illegal. A general restraint upon alienation was thus void, though the courts would uphold restraint limited with reference to time or to a class of persons. *See* Gray, *Restraints on the Alienation of Property* (2nd ed. 1895).

Restraints on Anticipation.—A restraint on anticipation consists of an attempt by the grantor of an estate for life to prevent the grantee from anticipating the income by alienating it voluntarily or involuntarily prior to its acquisition. In England such restraints are invalid save with reference to restraints imposed upon a married woman as to her separate estate during the period of coverture. *See* Conveyancing Act, 1881, s. 39; Married Women's Property Act, 1883, s. 29. In the United States such restraints accompanying the creation of a spendthrift trust are valid in many States. *See* TRUST.

Restraint of Marriage.—A gift or bequest to a person may have a condition attached in restraint of marriage. A condition in general restraint of marriage is void, as being contrary to public policy, although a condition in restraint of a second marriage is not void. A condition in partial restraint of marriage is valid, and may be either to restrain marriage with a particular class of persons, *e.g.*, a papist, a domestic servant or a Scotsman, or under a certain age.

Restraint of Trade.—A contract in general restraint of trade was deemed void at common law as against public policy (*Mitchel* v. *Reynolds*, 1 P. Wms. 181 [1711]), though a contract in partial restraint of trade accompanying the sale of a business or the employment of an individual is valid (*United States* v. *Addyston Pipe and Steel Co.*, 85 Fed. 271 [1898]). The modern attitude, however, is that the test that should determine the validity of con-

tracts in restraint of trade should be whether they are reasonably necessary to protect the interests of the parties and not unnecessarily harmful to the general public (*Nordenfelt* v. *Nordenfelt Guns and Ammunition Co.* [1894], Appeal Cases 535). Legislation and judicial decision in recent years have widely affected the doctrines of restraint of trade. *See* TRUSTS.

For the United States *see* Kales, *Contracts and Combinations in Restraint of Trade* (1918); Henderson, *The Federal Trade Commission* (1924); National Industrial Conference Board, *Trade Associations. Their Economic Significance and Legal Status* (1925).

RESTRICTION OF ENEMY SUPPLIES DEPARTMENT, a department of the British Ministry of Blockade created in May, 1916. On the outbreak of the World War, the British Government set up an advisory committee, known as the Restriction of Enemy Supplies committee, to examine and report upon blockade matters. In Sept. 1915, this was merged into the War Trade Advisory committee, in order to co-ordinate the work of the War Trade Department, the Contraband committee, the Restriction of Enemy Supplies committee and the committee controlling the export of Coal, Cotton, Rubber and Tin. Neither the Restriction of Enemy Supplies committee nor the War Trade Advisory committee had any executive power. They carried out investigations, examined reports and drew up recommendations for submission to the cabinet on questions of policy, but the execution of the schemes recommended and adopted continued to devolve upon various executive departments. But as the work of the blockade required to be consolidated and brought under a single control in charge of a recognized minister who should be a member of the Government, the Ministry of Blockade was formed in May 1916, with Lord Robert Cecil at its head. A department of that ministry was organized under the name of the Restriction of Enemy Supplies department, with the late Rt. Hon. F. Leverton Harris as director. He was succeeded in Jan. 1917 by Sir William Mitchell-Thomson, Bart. The functions of the department were to bring effective pressure to bear upon those neutral countries situated within the ring of the naval blockade, so as to limit as far as possible their exports to Germany of home products, manufactures and minerals. The department took over the administration of certain agreements which had previously been entered into, and laid before the minister of blockade, for submission to the cabinet, further proposals designed to meet the end in view. When sanctioned, the work of carrying them into effect devolved upon the department.

Practical Work.—The Restriction of Enemy Supplies Department began operations by sending a mission to Holland, the outcome of which was an agreement whereby Dutch dairy and agricultural produce, which, until then, had been going almost entirely to Germany, was thereafter divided in agreed proportions. This result was attained, partly by using the supply of fertilizers and similar commodities as a lever, and partly by employing a system of purchase and bonus. By this means, not only was the quantity of produce available for Germany substantially reduced, but the supply of foodstuffs to Great Britain was materially augmented. Between Aug. 1916, and Dec. 1918, the amount of dairy and agricultural produce diverted from Germany came to nearly 200,000 tons and, in addition, the non-export from Holland of certain important commodities was secured. The department also concluded agreements with the Dutch trawler owners and the Dutch herring drifter owners, in order to restrict the export of fish to Germany. It is computed that not less than 40,000 tons of herrings and 14,000 tons of trawl fish were prevented from being exported to the enemy. In the course of time, owing to the losses sustained by the Dutch trawlers by submarines and mines, the amount of fish available for export from Holland diminished, until it became a negligible quantity.

As regards Norway, the department took over from an earlier committee the administration of an agreement which had been in operation, and they also made a new agreement with the Norwegian Government by which only 15% of all fish and fish oil landed in Norway could be exported, and even that quantity was subject to conditions rendering the export difficult. A staff of British employees was organized throughout Norway to control the operations of the agreement. A total of nearly 330,000 tons of herrings, salt fish, fish oil, etc., was diverted from Germany. In view of the supreme importance to Germany of steel hardening material, particularly in connection with high-speed tools, the department also obtained the control of practically the whole of the output of molybdenum from Norway.

The department also successfully carried out the salvage of certain extremely valuable supplies of tin, copper, ferro-tungsten and nickel destined for Russia, which were lying derelict along the Finnish frontier, and which were in danger of falling into enemy hands. In the case of Sweden, the department was able to secure the total prohibition of the export of fish to Germany, and, later on, the prohibition of the export of mica.

Under the arrangements adopted in the case of Denmark, upwards of 160,000 tons of bacon and eggs were exported to the United Kingdom up to October, 1917. Earlier in that year, all fodder and feeding stuffs were stopped from going to Denmark and Holland and thereafter the export of dairy produce in any direction from both those countries fell off rapidly. (C. J. Hi.)

See also BLOCKADE; RATIONING (BLOCKADE).

RESURRECTION-PLANT (*Anastatica hierochuntina*), a small herb of the family Cruciferae, called also rose of Jericho, native to Arabia, Persia and Egypt. Upon the ripening of the seeds during the dry season, the leaves fall off and the branches curve inward so that the dry plant assumes a globular form. It then rolls about in the manner of a tumble-weed (*q.v.*), until the rainy season. When wetted the branches unfold and it assumes for a time the appearance of a living plant. The name is also given to several moss-like species of *Selaginella*, which also dry up into a ball and expand when wetted, as *S. lepidophylla*, called also bird's-nest moss, found from Texas southward to Peru, which, even when dead, will expand when placed in water.

RESZKE, JEAN DE (1850–1925), operatic singer, was born at Warsaw on Jan. 14, 1850. His parents were Poles; his father was a State official and his mother a capable amateur singer, their house being a recognized musical centre. He studied law before adopting singing as his profession and going to Italy to study. He made his first public appearance, as a baritone, at Venice in Jan. 1874, as Alfonso in *La Favorita*, and in the following April he sang for the first time in London, appearing at Drury Lane theatre, and a little later in Paris. He was not entirely successful and retired for a further period of study, during which his voice gained remarkably in the upper register; so that when he made his first reappearance at Madrid in 1879 it was as a tenor, in the title-rôle of *Robert le Diable*. His great fame as a singer, especially in Wagnerian parts, dates from this time. He appeared at the Metropolitan Opera House, New York, from 1893 to 1899. In 1904 he retired, but he continued teaching almost to the day of his death, on April 3, 1925.

RETABLE, a term of ecclesiastical art and architecture, applied in modern English usage to an altar-ledge or shelf, raised slightly above the back of the altar or communion table, on which are placed the cross, ceremonial candlesticks and other ornaments. Retables may be lawfully used in the church of England (*Liddell & Beale*, 1860, 14 P.C.).

RETAILING is that part of the distributive process that is concerned with the selection, purchase, display and sale at retail of commodities to the consumer. The object of retailing is to obtain for a given community appropriate merchandise in such grades and in such quantities that it will give the purchaser complete satisfaction and that it can be sold at a profit. The units of merchandise sold in the greatest volume at retail are food products, clothing, clothing accessories and articles for the furnishing of homes.

The most significant developments in retailing in the five years ending in 1929 have been:

(a.) The rapid changes in style and design of many commodities that were formerly relatively staple;

(b.) The inauguration of hand-to-mouth buying because of the need for greater turnover in sales and also because of the quicker obsolescence of merchandise caused by its rapid style changes;

(c.) The elimination of the wholesaler in certain lines as an important link in the chain of distribution, caused by more and more retailers purchasing direct from manufacturers;

(d.) The rapidly increasing cost of distribution, and,

(e.) The phenomenal growth of chain store or multiple shop systems which are becoming very important factors in reducing the cost of distribution.

It is authoritatively estimated that in the United States of America, the volume of sales at retail for the year 1928 aggregated $41,000,000,000. Of this volume, it is estimated that:

$25,200,000,000 or 61½%	represents sales by small independent specialty and neighbourhood stores;
6,500,000,000 or 16%	represents sales by large departmental stores;
6,200,000,000 or 15%	represents sales by chain stores;
1,400,000,000 or 3½%	represents sales by mail order concerns;
800,000,000 or 2%	represents sales by company stores operated by various firms for their staffs;
800,000,000 or 2%	represents sales by house to house canvassers;
100,000,000 or ¼ of 1%	represents sales by consumers' cooperative stores.

The volume of retailing carried on by small independent stores is exceedingly large because it has been easy for anyone with very small capital to engage in retailing. But out of every 100 independent retail stores opened during the past 25 years, not over 10 have been really successful. A recent survey made by the University of Buffalo revealed that of 7,225 *independent* retail grocery stores which engaged in business in Buffalo between 1918 and 1926, only 242 had survived—a mortality of approximately 97%!

In the past three years it has been especially difficult for the small independent retailer in spite of affiliating with other independent retailers in group buying and thus obtaining price concessions from the manufacturers, to succeed in competition either with the large department stores or with the chain stores or multiple shops. Consequently, it is safe to predict that the trend of distribution both in America and in Europe will be toward a decreasing proportion of commodities sold by the small independent specialty stores and an increased volume of merchandise distributed by departmental and chain stores.

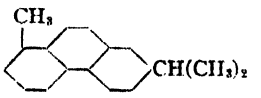
The growth of group buying and the development of central buying by the chain stores is tending toward the elimination of the wholesaler in some lines. The effect of this change has been to transfer the wholesaling function to the manufacturer, who in many lines must manufacture in advance and carry "fill in" stocks to render the services to the retailer that the wholesaler formerly rendered. Some wholesalers have maintained their positions in the distributive process by acquiring a financial interest in a number of retail stores.

The amount of merchandise sold at retail through the chain stores is increasing more rapidly each year than that sold through departmental stores. This is due to the fact that the chain store unit can distribute merchandise at a lower overhead expense than the departmental store. The principal commodities distributed by chains are hosiery and underwear, women's ready-to-wear, women's and men's shoes, men's clothing and furnishings, household utensils, hardware, millinery, furniture, drugs and toilet articles, groceries and sweets.

The tremendous purchasing power of these chains enables them to buy in such quantities that manufacturers are impelled to quote them prices as low as those formerly quoted to wholesalers. Since the chain stores do not provide the convenience either of charge accounts or free delivery they usually are able to sell their standardized articles more cheaply than those independent department stores which provide complete assortments of new merchandise, delivery service and the privilege of returning merchandise that is not satisfactory.

The competition from the chain stores is resulting in affiliations and combinations of department stores for the purpose of reducing overhead expense through research activities and of reducing the cost of merchandise through group buying or central buying. Most department stores in America and many in England are now combined either in associations or in financially controlled combinations. The future will determine whether public opinion will support both the department store and the chain store. The chain store represents a standard but rigid type of store with limited selections of merchandise at standardized prices which is sold, generally speaking, on a cash and carry basis. Certain of the chain stores distributing food products deliver merchandise. The department store represents an institution with policies that are more flexible and more in harmony with the needs of its locality as these change from time to time.

As the competition between chains becomes increasingly keen and as department stores attempt to meet chain store competition through overhead economies effected by mergers and the savings effected through central buying and group buying, there may develop again in distribution a place for the independent retailer.



See CHAIN STORES and DEPARTMENT STORES. (P. J. R.)

RETAINER, properly the act of retaining or keeping for oneself, or a person or object which retains or keeps; historically, a follower of a house or family, and particularly used of armed followers attached to the barons of the middle ages.

Retainer of Counsel.—When it is considered desirable by a litigant that the services of any particular counsel (barrister) should be obtained for the conduct of his case, it is necessary to deposit with counsel a form of retainer together with the necessary fee in cash, from which time counsel is bound to give the party who has thus retained him the first call on his services in the matter in which he has been retained. Retainers are either *general* or *special*. A general retainer retains counsel for all proceedings in which the person retaining is a party. A special retainer is one which only applies to some particular cause or action. In the United States, the retainer is much less formal than in England, and is used to refer to the preliminary fee given a counsel to take or defend proceedings. *See* ADVOCATE; BARRISTER.

Retainer of Debt.—In connection with the administration of an estate under a will, it is the right of the personal representative—whether executor or administrator—of a deceased person to retain in respect of all assets which have come into his hands a debt due to himself in his own right whether solely or jointly with another person as against creditors of an equal degree, and this even though his debt is barred by the Statutes of Limitation (*see* Administration of Estates Act 1925, s. 34; *Taylor* v. *Deblois,* Fed. Cas. No. 13,790). The appointment of a receiver deprives the representative of his right except as regards assets which come to his hands prior to the appointment of the receiver.

RETENE, an aromatic hydrocarbon occurring in wood tars and obtained by distilling resinous woods. It crystallises in colourless plates melting at 98·5° C and boiling at 394° C. Chromic acid oxidises the hydrocarbon to retene quinone (an *ortho*-diketone) and permanganate oxidises the quinone to 3-hydroxy-*iso*propyldiphenyl-1:1′:2′-tricarboxylic acid. These reactions show that retene is ethyl*iso*propylphenanthrene, $C_{18}H_{18}$, with the adjacent structural formula. *See* A. E. Everest, *The Higher Coal Tar Hydrocarbons* (1927).

RETFORD (officially EAST RETFORD), a market town and municipal borough in Nottinghamshire, England, 138½ m. N. by W. from London by the L.N.E.R., the station being a junction. Pop. (1921) 13,414. Retford (*Redforde, Ratford*) owes its importance to its position near one of the Roman roads and on the river Idle, where there was a ford. In 1086 the archbishop of York owned a mill at Retford, and Roger de Busli had rights here. Retford was a borough by prescription, and was in the hands of the crown when, in 1276, Edward I. granted it to the burgesses in fee-farm with the right of electing bailiffs. This charter was confirmed by Edward III., Henry VI. and Elizabeth. In 1607

James I. granted a charter of incorporation to the bailiffs and burgesses, under which the town was governed until 1835, when it was reincorporated under a mayor. East Retford returned two members to parliament in 1315, and again from 1572 till 1885, when it was disfranchised. There is a large trade in corn and cheese, and the town possesses iron foundries and works, paper and corn mills and rubber works. Coal is mined in the vicinity.

RETHEL, ALFRED (1816–1859), German historical painter, was born at Diepenbend near Aix-la-Chapelle on May 15, 1816. At the age of 13 he executed a drawing which procured his admission to the academy of Düsseldorf, where he studied for several years. In 1836 he removed to Frankfürt, and was selected to decorate the walls of the imperial hall in the Römer with figures of famous men. Four years later he was commissioned to ornament the restored council house of his native city with frescoes from the life of Charlemagne, but the execution of this work was delayed for some six years. Returning to Aix, in 1846, he commenced his Charlemagne frescoes. But mental derangement, remotely attributable to an accident in childhood, began to manifest itself. While he hovered between madness and sanity, Rethel produced some of his most impressive work—"Nemesis pursuing a Murderer," "Death the Avenger," and by contrast "Death the Friend." Rethel also executed a powerful series of drawings—"The Dance of Death"—suggested by the Belgian insurrections of 1848. He died at Düsseldorf on Dec. 1, 1859.

His "Peter and John at the Beautiful Gate of the Temple," is in the Leipzig museum, and his "St. Boniface" and several cartoons for the frescoes at Aix are in the Berlin national gallery. *See* his *Life*, by Wolfgang Müller von Königswinter (1861); *Art Journal*, Nov. 1865; and the monograph by Max Schmid in Knackfuss's *Künstlerbiographien*, vol. 32 (1898).

RETHEL, a town of France, capital of an arrondissement in the department of Ardennes, on the Aisne and the Ardennes canal, 31 m. S.W. of Mézières by rail. Pop. (1926) 5,586. Rethel, of Roman origin, was from the 10th century the seat of a countship held successively by the families of Flanders, Burgundy, Cleves, Foix and Gonzaga. In 1581 it was erected into a duchy in favour of the latter. In 1663 it was sold by Charles VI. de Gonzaga to Mazarin, whose family held it till the Revolution. Rethel has a subprefecture, a board of trade arbitrators, a chamber of arts and manufactures, and carries on wool-spinning, the weaving of light woollen fabrics, and the manufacture of farm implements.

RETZ, JEAN FRANÇOIS PAUL DE GONDI, CARDINAL DE (1614–1679), French churchman and agitator, was born at Montmirail in 1614. The family had acquired great estates in Brittany, and Retz himself always spelt his designation "Rais." He was a third son, and was destined for the church. He studied at the Sorbonne, and when he was scarcely eighteen wrote the remarkable *Conjuration de Fiesque*, a little historical essay, of which he drew the material from the Italian of Augustino Mascardi, but which is all his own in the negligent vigour of the style and the audacious insinuation, if nothing more, of revolutionary principles. Anne of Austria appointed him in 1643 to the coadjutorship and the reversion to the archbishopric of Paris. Retz acquired great influence with the Parisians, which he gradually turned against Mazarin. No one had more to do than Retz with the outbreak of the Fronde in October 1648, and his history for the next four years is the history of that confused and, as a rule, much misunderstood movement. Of the two parties who joined in it Retz could only depend on the bourgeoisie of Paris. But although he had some speculative tendencies in favour of popular liberties, and even perhaps of republicanism, Retz represented no real political principle, and when the break up of the Fronde came he was left in the lurch. In 1652 he was arrested and imprisoned, first at Vincennes, then at Nantes; he escaped, however, after two years' captivity, and for some time wandered about in various countries. He had been made a cardinal before his downfall, and had no small influence in the election of Alexander VII. In 1662, he was received back again into favour by Louis XIV. and on more than one occasion he served as envoy to Rome. Retz, however, was glad in making his peace to resign his claims to the archbishopric of Paris. In compensation he received the rich abbacy of St. Denis and restoration to his other benefices with the payment of arrears.

The last seventeen years of Retz's life were passed partly in his diplomatic duties (he was again in Rome at the papal election of 1668), partly at Paris, partly at his estate of Commercy, but latterly at St. Mihiel in Lorraine. His debts were enormous, and in 1675 he resolved to make over to his creditors all his income except twenty thousand livres, and, as he said, to "live for" them. He died in Paris on Aug. 24, 1679. One of the chief authorities for the last years of Retz is Madame de Sévigné, whose connection he was by marriage. De Retz's *Memoirs* were certainly not written till the last ten years of his life, and they do not go farther than the year 1655. They are addressed in the form of narrative to a lady who is not known, though guesses have been made at her identity, some even suggesting Madame de Sévigné herself. They display extraordinary narrative skill.

The *Memoirs* of the Cardinal de Retz were first published in a very imperfect condition in 1717 at Nancy. The first satisfactory edition was that which appeared in the twenty-fourth volume of the collection of Michaud and Poujoulat (Paris, 1836). They were then re-edited from the autograph manuscript by Géruzez (Paris, 1844), and by Champollion-Figeac with the Mazarinades, etc. (Paris, 1859). In 1870 a complete edition of the works of Retz was begun by M. A. Feillet in the collection of *Grands Écrivains*. The editor dying, this passed into the hands of M. Gourdault and then into those of M. Chantelauze, who had already published studies on the connection of St. Vincent de Paul with the Gondi family, etc. (1882).

See also L. Batiffol, *Le Cardinal de Retz* (1927).

REUBEN, according to Gen. xxix. 32, was the eldest son of Jacob, by his first wife, Leah. From this it may be inferred that at one time Reuben ranked as the foremost of the Hebrew tribes. But for reasons which are obscure the tribe lost this preeminence at an early period of the history. In Gen. xxxv. 22 Reuben is said to have been intimate with his father's concubine, and the story, which breaks off abruptly, probably went on to record a curse pronounced upon him in consequence. This would be regarded as a sufficient explanation of the decline of the tribe (*cf.* Gen. xlix. 4, and *see* I. Chron. v. 1). It is possible that the story may be a personification of some aggressive move made by the tribe Reuben against the Bilhah clan. The subsequent history of the tribe is obscure. The territory which later traditions assign to it east of the Dead Sea is not clearly delimited or distinguished from the territories of Gad and Moab. A Reubenite name is found on the west of the Jordan (Josh. xv. 6, xviii. 17), and the reference to Reuben in the Song of Deborah (Judges v. 15–17) would naturally mean that Reuben was a pastoral tribe on the west of the Jordan, since of the next tribe mentioned it is definitely stated "Gilead abode beyond Jordan."

(*See* C. F. Burney, *Israel's Settlement in Canaan*, pp. 50–52.)

(W. L. W.)

REUCHLIN, JOHANN (1455–1522), German humanist and Hebraist, was born on Feb. 22, 1455, at Pforzheim in the Black Forest, where his father was an official of the Dominican monastery. The name was graecized by his Italian friends into Capnion. Reuchlin constantly writes himself Phorcensis. He learned Latin at the monastery school at Pforzheim, and spent a short time in 1470 at the university of Freiburg. His fine voice gained him a place in the household of Charles I., margrave of Baden, and he was chosen to accompany to the university of Paris the young prince Frederick. In Paris he learned Greek, and he attached himself to the leader of the Paris realists, Jean Heynlin, or à Lapide (d. 1496), whom he followed to the vigorous young university of Basel in 1474. At Basel Reuchlin took his master's degree (1477), and began to lecture, teaching a more classical Latin than was then common in German schools, and also explaining Aristotle in Greek. His Greek studies were continued at Basel under Andronicus Contoblacas, and he became acquainted with the bookseller, Johann Amorbach, for whom he prepared a Latin lexicon (*Vocabularius Breviloquus*, 1st. ed., 1475–76). Reuchlin soon left Basel to study under George Hieronymus at Paris. He then studied law at Orleans (1478), and at Poitiers, where he became licentiate in July 1481. On his return to Germany he was engaged as interpreter by Count Eberhard of Württemberg, for a tour in Italy. They started for Florence and Rome in February 1482. His connection with the count became permanent,

and after his return to Stuttgart he received important posts at Eberhard's court. About this time he appears to have married, but little is known of his married life. He left no children; but in later years his sister's grandson Melanchthon was almost as a son to him till the Reformation estranged them.

In 1490 he was again in Italy. Here he saw Pico della Mirandola, to whose Cabbalistic doctrines he afterwards became heir, and also made the friendship of the pope's secretary, Jakob Questenberg. On an embassy to the emperor Frederick at Linz in 1492, he began to read Hebrew with the emperor's Jewish physician Jakob ben Jehiel Loans. In 1494 his rising reputation had been greatly enhanced by the publication of *De Verbo Mirifico*.

In 1496 Eberhard of Württemberg died, and Reuchlin was glad to accept the invitation of Johann von Dalberg (1445–1503), bishop of Worms, to Heidelberg, which was then the seat of the "Rhenish Society." In this court of letters Reuchlin made translations from the Greek authors. He was during a great part of his life the real centre of all Greek teaching as well as of all Hebrew teaching in Germany. Reuchlin pronounced Greek as his native teachers had taught him to do, *i.e.*, in the modern Greek fashion. This pronunciation, which he defends in *Dialogus de Recta Lat. Graecique Serm. Pron.* (1519), came to be known, in contrast to that used by Erasmus, as the Reuchlinian.

At Heidelberg Reuchlin had many private pupils, among whom Franz von Sickingen is the best known name. With the monks he had never been liked; at Stuttgart also his great enemy was the Augustinian Conrad Holzinger. On this man he took a scholar's revenge in his first Latin comedy *Sergius*, a satire on worthless monks and false relics.

Through Dalberg, Reuchlin came into contact with Philip, elector palatine of the Rhine, who employed him to direct the studies of his sons, and in 1498 sent him on a mission to Rome. He came back laden with Hebrew books, and found when he reached Heidelberg that a change of government had opened the way for his return to Stuttgart, where his wife had remained all along. His friends had now again the upper hand, and knew Reuchlin's value. In 1500, or perhaps in 1502, he was given high judicial office in the Swabian League, which he held till 1512, when he retired to a small estate near Stuttgart.

For many years Reuchlin had been increasingly absorbed in Hebrew studies, which had for him more than a mere philological interest for as a good humanist he could not rest satisfied with the Vulgate text of the Old Testament. In 1506 appeared his epoch-making *De Rudimentis Hebraicis*—grammar and lexicon—mainly after Kimhi, yet not a mere copy of one man's teaching. The edition was costly and sold slowly. One great difficulty was that the wars of Maximilian I. in Italy prevented Hebrew Bibles coming into Germany. But for this also Reuchlin found help by printing the Penitential Psalms with grammatical explanations (1512), and other helps followed from time to time. But his Greek studies had interested him in those fantastical and mystical systems of later times with which the Cabbala has no small affinity. Reuchlin's mystico-cabbalistic ideas and objects were expounded in the *De Verbo Mirifico*, and in the *De Arte Cabbalistica* (1517).

Unhappily many of his contemporaries thought that the first step to the conversion of the Jews was to take from them their books. This view had for its chief advocate the bigoted Johann Pfefferkorn (1469–1521), who secured the ear of the emperor Maximilian. In 1510 Reuchlin was summoned in the name of the emperor to give his opinion on the suppression of the Jewish books. He proposed that the emperor should decree that for ten years there be two Hebrew chairs at every German university for which the Jews should furnish books. The other experts proposed that all books should be taken from the Jews; and, as the emperor still hesitated, the bigots threw on Reuchlin the whole blame of their ill success. Pfefferkorn circulated at the Frankfort fair of 1511 a gross libel (*Handspiegel wider und gegen die Juden*) declaring that Reuchlin had been bribed; and Reuchlin retorted as warmly in the *Augenspiegel* (1511). His adversary's next move was to declare the *Augenspiegel* a dangerous book; the Cologne theological faculty, with the inquisitor Jakob von Hochstraten (d. 1527), took up this cry, and on Oct. 7, 1512, they obtained an imperial order confiscating the *Augenspiegel*. Reuchlin was timid, but he was honesty itself. He was willing to receive corrections in theology, which was not his subject, but he could not unsay what he had said; and as his enemies tried to press him into a corner he met them with open defiance in a *Defensio contra Calumniatores* (1513). The universities were now appealed to for opinions, and were all against Reuchlin. Even Paris (August 1514) condemned the *Augenspiegel*, and called on Reuchlin to recant. Meantime a formal process had begun at Mainz before the grand inquisitor, but Reuchlin by an appeal succeeded in transferring the question to Rome. Judgment was given in July 1516; and then, though the decision was really for Reuchlin, the trial was simply quashed. The result had cost Reuchlin years of trouble and no small part of his modest fortune, but the obscurantists received a crushing blow in Germany. No party could survive the ridicule that was poured on them in the *Epistolae Obscurorum Virorum*.

Reuchlin did not long enjoy his victory in peace. In 1519 Stuttgart was visited by famine, civil war and pestilence. Reuchlin sought refuge in Ingolstadt and taught there for a year as professor of Greek and Hebrew. He was now called to Tübingen and again spent the winter of 1521–22 teaching in his own systematic way. He died at the baths of Liebenzell on June 30, 1522, leaving in the history of the new learning a name only second to that of his younger contemporary Erasmus.

See L. Geiger, *Johann Reuchlin* (1871), which is the standard biography; also D. F. Strauss, *Ulrich von Hutten;* S. A. Hirsch, "John Reuchlin, the Father of the Study of Hebrew among the Christians," and his "John Pfefferkorn and the Battle of Books," in his *Essays* (London, 1905). Some interesting details about Reuchlin are given in the autobiography of Conrad Pellicanus (*q.v.*), which was not published when Geiger's book appeared. *See* also the article on Reuchlin in Herzog-Hauck, *Realencyklopädie*, and literature there cited.

RÉUNION, known also by its former name BOURBON, an island and French colony in the Indian Ocean, 400 m. S.E. of Tamatave, Madagascar, and 130 S.W. of Port Louis, Mauritius. It is elliptic in form and has an area of 970 sq.m. It lies between 20° 51′ and 21° 22′ S. and 55° 15′ and 55° 54′ E.

The coast-line is little indented, high and difficult of access and the harbours are usually sunken craters. The narrow coast-lands 1 to 3 km. wide are succeeded by hilly ground which gives place to mountain masses and tableland, which occupy the greater part of the island. The main axis runs N.W. and S.E., and divides the island into a windward (E.) district and a leeward (W.) district, the dividing line being practically that of the watershed. The whole relief is very complex owing to vulcanicity. First was formed a mountain whose summit is approximately represented by Piton des Neiges (10,069 ft.), an immense denuded crater, and at a later date another crater opened towards the E., piling up the mountain mass of Le Volcan. The oldest erupted rocks belong to the type of the andesites; the newest are varieties of basalt. The two massifs are united by high tablelands. In the older massif the most striking features are now three areas of subsidence—the cirques of Salazie, Rivière des Galets and Cilaos—which lie N.W. and S. of the Piton des Neiges. The first, which may be taken as typical, is surrounded by high almost perpendicular walls of basaltic lava. Towards the S. lies the vast stratum of rocks which, on November 26, 1875, suddenly sweeping down from the Piton des Neiges and the Gros Morne, buried the little village of Grand Sable.

The second massif, Le Volcan, is cut off from the rest of the island by two "enclosures," each about 500 or 600 ft. deep. The outer enclosure runs across the island in a north and south direction; the inner forms a kind of parabola with its arms stretching E. to the sea and embracing not only the volcano proper but also the great eastward slope known as the Grand Brûlé. The 30 m. of mountain wall round the volcano is perhaps unique in its astonishing regularity. It encloses an area of about 40 sq.m. known as the Grand Enclos. There are two principal craters, each on an elevated cone,—the more westerly, now extinct, known as the Bory Crater (8,612 ft.), after Bory de St. Vincent, the geologist, and the more easterly called the Burning Crater or Fournaise (8,294 ft.). The latter is partially surrounded by an "enclosure" on a small scale with precipices 200 ft. high. Eruptions, though

not infrequent (thirty were registered between 1735 and 1860), are seldom serious; the more noteworthy are those of 1745, 1778, 1791, 1812, 1860, 1870, 1881. After 40 years of inactivity Fournaise was in eruption for four months from Dec. 1925 to April 1926. Hot mineral springs are found on the flanks of the Piton des Neiges: the Source de Salazie, 2,860 ft. above sea-level, has a temperature of 90° F, and discharges water impregnated with bicarbonate of soda, carbonates of magnesium, lime, iron, etc.; that of Cilaos is 3,650 ft. above the sea with a temperature of 100°; and that of Mafate 2,238 ft. and 87°.

Climate.—The year divides into two seasons—that of heat and rain from November to April, that of dry and more bracing weather from May to October. The prevailing wind is the south-east trade wind, which sometimes veers round to the south, and more frequently to the north-east; the west winds are not so steady (three hundred and seven days of east to fifty-eight of west wind in the course of the year). As over all the Indian Ocean cyclonic storms are frequent at the change of seasons. The *raz de marée* occasionally does great damage. The relief of the land causes quite appreciable climatic differences, the leeward side getting much less rain than the windward. On the coast and lower zones on the windward side the mean temperature is about 73° in the "winter" and 78° in the "summer." On the leeward side the heat is somewhat greater. In the Salazie cirque the mean annual average is 66°; at the Plaine des Palmistes 62°. On the mountain heights snow falls every year. In general, the higher parts of the island are healthy, but fever is prevalent on the coast.

Fauna and Flora.—The fauna of Réunion is not very rich in variety of species. The mammals are a brown maki (*Lemur mongoz*, Linn.) from Madagascar, several bats, a wild cat, the tang or tamec (*Centetes setosus*, Denn.), rats, etc. Among the more familiar birds are the "oiseau de la vierge" (*Muscipeta borbonica*), the tectec (*Pratincola sybilla*), *Certhia borbonica*, the cardinal (*Foudia madagascariensis*), various swallows, ducks, etc. The visitants from Madagascar, Mauritius and even India are very numerous. Lizards and frogs of more than one species are common, but there is only one snake (*Lycodon aulicum*) known in the island. Various species of *Gobius*, a native species of mullet, *Nestis cyprinoides*, *Osphronamus olfax* and *Doules rupestris* are among the freshwater fishes.

The heat, humidity and fertility of the volcanic soil have given Réunion an abundant and varied vegetation. In the forest region of the island there is a belt, 4,500–5,000 ft. above the sea, characterized by the prevalence of dwarf bamboo (*Bambusa alpina*); and above that is a similar belt of *Acacia heterophylla*. Besides this last the best timber-trees are *Casuarina laterifolia*, *Foetida mauritiana*, *Imbricaria petiolaris*, *Elaeodendron orientale*, *Calophyllum spurium* (red tacamahac), *Terminalia borbonica*, *Parkia speciosa*. A species of coffee plant is indigenous. Fruits grown are: the banana, the coco-nut, bread-fruit and jack-fruit, etc. Forests originally covered nearly the whole island; the majority of the land has been cleared, but the administration has in part replanted the higher districts with eucalyptus and caoutchouc trees.

Inhabitants.—Réunion, strictly speaking, has no indigenous population. The inhabitants include creoles, mulattoes, negroes, Indians and other Asiatics. The creole population is descended from the first French settlers, chiefly Normans and Bretons, who married Malagasy women. Three quarters of the inhabitants are of European origin. Three kinds of creoles are recognized—those of the towns and coasts, those of the mountains, and the *petits créoles*, originally a class of small farmers living in the uplands, now reduced to a condition of poverty and dependence on the planters. The *créoles blancs de villes*, the typical inhabitants of the island, are in general of a somewhat weak physique, quick-witted and of charming manners, brave and very proud of their island, but not of strong character. The creole patois is French mixed with a considerable number of Malagasy and Indian words, and containing many local idioms. The population, about 35,000 towards the close of the 18th century, now numbers 186,637 inhabitants of whom 180,694 are of French extraction.

Towns and Communication.—St. Denis, pop. (1926) 23,390, the capital of the island, lies on the N. coast. It is built in the form of an amphitheatre, and has several fine public buildings and centrally situated botanic gardens. The only anchorage for vessels is an open roadstead. St. Pierre (pop. 20,479), the chief town on the leeward side of the island, has a small artificial harbour. Between St. Pierre and St. Denis, and both on the leeward shore, are the towns of St. Louis (pop. 15,867) and St. Paul (pop. 21,643). A few miles N. of St. Paul on the S. side of Cape Pointe des Galets is the port of the same name, the only considerable harbour in the island. It was completed in 1886, it covers 40 acres, is well protected, and has 28 ft. of water. A railway serving the port goes round the coast from St. Pierre, by St. Paul, St. Denis, to St. Benoît (a town on the E. side of the island with a pop. of 12,523), a distance of 83¼ m. Telegraphic communication with all parts of the world was established in 1906.

Industries.—The greater part of the land under cultivation on the island is occupied by sugar-cane plantations, the remainder being under either maize, manioc, potatoes, haricots, or coffee, vanilla and cocoa. The sugar-cane, introduced in 1711 by Pierre Parat, is now the staple crop. In the 18th century the first place belonged to coffee (introduced from Arabia in 1715) and to the clove tree, brought from the Dutch Indies by Poivre at the risk of his life. Both are now cultivated on a very limited scale. Vanilla, introduced in 1818, was not extensively cultivated till about 1850. Bourbon vanilla, as it is called, is of high character, and next to sugar is the most important article of cultivation in the island. There are small plantations of cocoa and cinchona; cotton-growing was tried, but proved unsuccessful.

The sugar industry has suffered greatly from the competition with beet sugar and the effects of bounties, also from the scarcity of labour, from the ravages of the phylloxera (which made its appearance in 1878) and from extravagant methods of manufacture. It was not until 1906 that steps were taken for the creation of central sugar mills and refineries, in consequence of the compulsory shutting down of many small mills. Rum is largely distilled and forms an important article of export. There are also manufactories for the making of geranium essence, St. Pierre being the centre of this industry. Other articles exported are aloe fibre and vacoa casks. The mineral wealth of the island has not been exploited, except for the mineral springs which yield waters highly esteemed. Cattle are imported from Madagascar; rice from Saigon and India; petroleum, for factories, from America and Russia; almost everything else comes from France, to which country go most of the exports. Over 75% of the shipping is under the French flag. Fishing is an important occupation.

Commerce.—In 1926 the exports were valued at 164,895,913 francs and the imports at 164,883,564 francs. The currency consists of notes of the Banque de la Réunion with a capital of 6,000,000 francs (guaranteed by the government) and nickel token money.

Administration and Revenue.—Réunion is regarded practically as a department of France. It sends two deputies and one senator to the French legislature, and is governed by laws passed by that body. All inhabitants, not being aliens, enjoy the franchise, no distinction being made between whites, negroes or mulattoes, all of whom are citizens. At the head of the local administration is a governor who is assisted by a secretary-general, a *procureur général*, a privy council and a council-general elected by the suffrages of all citizens. The governor has the right of direct communication and negotiation with the government of South Africa and all states east of the Cape. The council-general has wide powers, including the fixing of the budget. For administrative purposes the island is divided into two arrondissements, the Windward, with five cantons and nine communes, and the Leeward, with four cantons and seven communes. The towns are subject to the French municipal law. The 1926 budget gives receipts as 52,502,932 francs, expenditures 46,076,028 francs.

History.—Réunion is usually said to have been first discovered in April 1513, by the Portuguese navigator Pedro Mascarenhas, and his name, or that of Mascarene islands, is still applied to the archipelago of which it forms a part; but it seems probable that it must be identified with the island of Santa Apollonia discov-

ered by Diego Fernandes Pereira on Feb. 9, 1507. When in 1638 the island was taken possession of by Captain Gaubert, or Gobert, of Dieppe, it was uninhabited; a more formal annexation in the name of Louis XIII. was effected in 1643; and in 1649 Étienne de Flacourt repeated the ceremony. He also changed the name of the island from Mascarenhas to Bourbon. By decree of the Convention in 1793, Bourbon in turn gave place to Réunion, and though during the empire this was discarded in favour of Île Bonaparte, and at the Restoration people naturally went back to Bourbon, Réunion has been the official designation since 1848.

The first inhabitants were a dozen mutineers deported from Madagascar by Pronis, but they remained only three years (1646–49). Other colonists went thither of their own will in 1654 and 1662. In 1664 the *Compagnie des Indes orientales de Madagascar*, to whom a concession of the island was granted, initiated a regular colonization scheme. Their first commandant was Étienne Régnault, who in 1689 received from the French crown the title of governor. The growth of the colony was very slow, and in 1717 there were only some 2,000 inhabitants. It is recorded that they lived on excellent terms with the pirates, who from 1684 frequented the neighbouring seas for many years. The French Revolution effected little change in the island and occasioned no bloodshed; the colonists successfully resisted the attempts of the Convention to abolish slavery, which continued until 1848 (when over 60,000 negroes were freed), the slave trade being, however, abolished in 1817. In 1809 the British attacked the island, and the French were forced to capitulate on July 8, 1810: the island remained in the possession of Great Britain until April 1815, when it was restored to France. From that period the island has had no exterior troubles. The Third Republic conferred the full rights of French citizenship including the vote on the negro population in 1870. The immigration of coolies began in 1860, but in 1882 the Government of India prohibited the further emigration of labourers from that country. Réunion suffered from disastrous cyclones in 1879 and 1904.

The geology and volcanoes of Réunion were the object of elaborate study by Bory de St. Vincent in 1801 and 1802 (*Voyages dans les quatre principales îles des mers d'Afrique*, 1804), and have since been examined by R. von Drasche (see *Die Insel Réunion*, etc., Vienna, 1878, and C. Vélain, *Descriptions géologique de . . . l'île de la Réunion . . .*, 1878).

REUNION, CHURCH. The movements for the Reunion of the Churches, especially among English-speaking Christians, are due mainly to two causes. In the first place, the reasons for division, which seemed once to be based on spiritual principles about which no compromise was possible, have grown fainter than they were. Few men cling to them so tenaciously as they did, *e.g.*, in the 17th century. Secondly, there is a widespread feeling of the ineffectiveness of the churches in face of the tasks and problems of civilisation since the outbreak of the World War in 1914. To a large extent this is attributed to the divisions and consequent lack of unity of witness and aim among the churches themselves.

These movements for reunion are concerned with the divisions outside the Roman Catholic Church, which takes no part in them. On principle it cannot do so, as it has its own terms, surrender and not adjustment, from which there can be no departure.

An apparent exception to this statement occurred in what are known as the Conversations at Malines (1924–25). At the invitation of Cardinal Mercier a small body of English theologians met a similar body of Roman Catholic scholars for the purpose of exploring their grounds of difference. Begun quite unofficially, at a later stage these conversations were held with the cognisance of the Archbishop of Canterbury. They were carried on in an atmosphere of friendship and respect; but the recent papal encyclical (1928) laid down the only terms of reunion with Rome: unconditional surrender.

The Church of England and the Orthodox Eastern Church.—Negotiations between the Church of England and the Eastern Orthodox Church for mutual recognition and fellowship have a fairly long history, but the pace has been quickened largely owing to events which followed the World War. In Jan. 1920, an Encyclical Letter was issued from the Patriarchate of Constantinople "unto all the Churches of Christ wheresoever they be." It was an earnest plea for closer contact and better mutual understanding; and as a means to this end it suggested that there should be a uniform calendar for Christian feasts, intercourse between theological schools, exchange of students, impartial and more historical examination of doctrinal differences, etc. Following this, a "proposed concordat" was drawn up by the American Episcopal Church. After setting forth points of agreement in faith and order, it concludes:—

"In accordance with the preceding agreements, we do solemnly declare our acceptance of the sacramental acts each of the other, and that they are true and valid. And, holding fast the truth once delivered to the Saints, we pronounce that intercommunion is desirable and authorised for all our members wherever and whenever it is deemed convenient and practicable by the proper local and ecclesiastical authorities."

To this the locum tenens of the Oecumenical Patriarchate sent a sympathetic reply. The next step was the presence of a delegation of the Patriarchate at the Lambeth Conference in July 1920. Their subsequent report to the Holy Synod was marked by a good deal of reserve. The latitude of the Church of England proved to be a source of difficulty. The delegation also pointed out that the Lambeth Appeal puts forward "measures in relation to the non-episcopal Churches which also, in spite of goodwill, manifestly conflict with venerated principles and systems." Subsequently the Eastern Churches committee appointed by the Archbishop of Canterbury issued a statement of terms of intercommunion. In Feb. 1923, the Archbishop announced that the Holy Synod at Constantinople, after careful consideration, had decided in favour of the validity of Anglican ordinations. He pointed out, however, that this decision must be endorsed by all Patriarchates or by a General Council before it could become an oecumenical act.

The Church of England and the Free Churches.—The Lambeth Appeal, though addressed to all Christian people, has has had its most important effect in the field of English ecclesiastical life. It has forced the great nonconformist bodies to reconsider their relations to the Church of England and the grounds of their separation, and to do so in an atmosphere of friendliness and goodwill. The terms on which the appeal believes that union is possible are as follows:—

"We believe that the visible unity of the church will be found to involve the whole-hearted acceptance of—

The Holy Scriptures, as the record of God's revelation of Himself to man, and as being the rule and ultimate standard of faith; and the Creed, commonly called Nicene, as the sufficient statement of the Christian faith, and either it or the Apostle's Creed as the baptismal confession of belief;

The divinely instituted sacraments of Baptism and the Holy Communion, as expressing for all the corporate life of the whole fellowship in and with Christ;

A ministry acknowledged by every part of the Church as possessing not only the inward call of the Spirit, but also the commission of Christ and the authority of the whole body."

It is claimed that the Episcopate is the one means of providing such a ministry. "But we greatly desire," it is added, "that the office of a Bishop should be everywhere exercised in a representative and constitutional manner, and more truly express all that ought to be involved for the life of the Christian family in the title of Father-in-God." These proposals have been the subject of prolonged discussion between representatives of the Church of

England on the one hand and a joint committee of the Federal Council of the Evangelical Free Churches (*q.v.*) and the National Free Church Council (*q.v.*) on the other, but so far no agreement has been found possible on two matters of essential importance, viz., the use of the Creed and the necessity of episcopal ordination.

On the first point, the Free Church position is expressed in the resolutions adopted by the annual assembly of the Federal Council in Sept. 1922:—

"We regard the place given to the two ancient Catholic creeds as . . . subordinate to the inspired Word and living Spirit; and these creeds are received not as a complete expression of the faith, but as preserving 'essential elements' in it 'in the form handed down through many centuries,' and with reasonable liberty as to their interpretation and their use. We hold as not only consistent with this, but as implied in it, alike the fullest freedom in the intellectual investigation of Truth and the most single-hearted discipleship to the Mind of Christ."

In regard to episcopal ordination the difficulty turns upon the question of the validity of the Free Church ministry. There is on the one hand a natural refusal to accept anything which implies that the Free Church minister must be re-ordained before he can administer valid sacraments in a united Church, and on the other there is disinclination on the part of the Church of England to advance beyond the admission that many Free Church ministries have been "manifestly blessed and owned by the Holy Spirit as effective means of grace," and consequently must be regarded as "real ministries of Christ's Word and Sacraments in the Universal Church," though they may be in varying degrees "irregular or defective."

General Results.—The difficulties indicated above are still unsolved, in spite of many discussions and explanatory statements marked by a very conciliatory spirit. In a memorandum signed by the Archbishops of Canterbury and York and the Moderator of the Federal Council in June 1925, it is stated that the joint conference believes that there should be a suspension of its activities in order that the documents already submitted may be studied with care. At its annual meeting in Sept. the Federal Council concurred, and at the same time recorded its conviction that the conferences which have taken place "have done much to bring representative members of the Churches concerned into closer fellowship and to a better understanding of each other's position; and, further, that they have prepared the way to further progress towards unity in the future."

METHODIST AND PRESBYTERIAN REUNION

Methodist Reunion.—The movement for reunion among the three branches of the Methodist Churches in England has reached a stage when it seems likely that it will soon be an accomplished fact. A scheme has been drawn up, and in 1924 the Wesleyan Conference, the Primitive Methodist Conference and the United Methodist Conference passed a practically identical resolution in the following terms:—

"The conference is of opinion that, provided the Methodist people desire the organic union of the three Methodist Churches concerned, the scheme now submitted (which is the result of prolonged deliberation and exhaustive inquiry) affords a basis of union which would ensure harmonious working without the sacrifice of any principle vital to Methodism. The conference therefore commends the scheme to the prayerful consideration of the Methodist people."

In 1925 the Wesleyan conference took the further necessary step of declaring in favour of the union of the three Methodist Churches, provided that substantial agreement can be secured as to the measures to be adopted for effecting union. The required agreement has been secured, and the necessary Act of Parliament passed.

The Churches of Scotland.—The first step towards union between the Church of Scotland and the United Free Church of Scotland was taken in 1908, when the General Assembly of the Church of Scotland resolved "to request the other Presbyterian Churches to confer with them on the present ecclesiastical situation." Conferences followed, and in 1914 a constitution was drafted under which the Church would be both national and free. No further progress was possible till 1919, owing to the War. In 1920, the articles of the constitution were approved and in July 1921, an Enabling Bill was passed by Parliament. Certain questions connected with the property and endowments of the Church of Scotland remained to be dealt with by a departmental committee appointed in 1922 and presided over by Lord Haldane. It reported in 1923, and its recommendations are embodied in The Church of Scotland (Property and Endowments) Bill of 1924. (On reunion in Canada *see* METHODISM; PRESBYTERIANISM.)

REUNION IN THE MISSION FIELD

The need for union in the mission field is illustrated by the negotiations between the Episcopal Synod of India and Ceylon and the South India United Church. The latter is a union of Christian congregations connected with the London Missionary Society and the American Board of Commissioners for Foreign Missions (both Congregational), the Church of Scotland, the United Free Church of Scotland, the Dutch Reformed Church in America and the Basel Mission. A joint committee was constituted in 1920 and several reports have been issued. As in England, the difficulty of agreement turned chiefly to the insistence upon episcopal ordination for all ministers of the United Church. It is suggested that the fact of episcopacy should be recognised without insistence upon any doctrine of its meaning, and that a joint service should be held to commission all ministers who desired full status in the United Church on reciprocally equal terms. The South India United Church also insists that it cannot allow itself to be cut off from these non-episcopal churches with which it is now in full communion.

It treasures its present catholicity too highly to take any step that would diminish or destroy the fellowship which it now enjoys with Evangelical Christendom.—(Resolution, Aug. 1923.)

A brief reference must be made to some of the movements of co-operation among different bodies of Christians, which have grown in strength and number since the end of the World War. Though these movements do not deal directly with the problem of reunion, the same motives lie behind them, viz.: a sense of the weakness of the Christian witness in the world due to division and a desire to co-operate in large fields of Christian enterprise which are recognised as common ground. (*a*) The World Alliance for promoting International Friendship through the Churches, founded at Constance on Aug. 2, 1914.

Its object is set forth in the following resolutions:—

1. That, inasmuch as the work of conciliation and the promotion of amity is esentially a Christian task, it is expedient that the Churches in all lands should use their influence with the peoples, parliaments and governments of the world to bring about good and friendly relations between the nations, so that, along the path of peaceful civilisation, they may reach that universal goodwill which Christianity has taught mankind to aspire after. 2. That inasmuch as all sections of the Church of Christ are equally concerned in the maintenance of peace and the promotion of good feeling among all the races of the world, it is advisable for them to act in concert in their efforts to carry the foregoing resolution into effect.

The Alliance consists of 28 national councils and is representative of the organised Christianity of the world with the exception of the Roman Catholic Church. The international committee meets once every three years. Its meetings in Copenhagen (1922) and Stockholm (1925) did much to focus Christian thought upon the question of peace. The expense of the international work of the Alliance is borne by the American Peace Union.

International Missionary Council.—The functions of this body are defined in the following resolutions adopted in 1921:—

1. To stimulate thinking and investigation on missionary questions, to enlist in the solution of these questions the best knowledge and experience to be found in all countries and to make the results available for all missionary societies and missions.

2. To help to co-ordinate the activities of the national mis-

sionary organisations of the different countries and of the societies they represent, and to bring about united action where necessary in missionary matters.

3. Through common consultation to help to unite Christian public opinion in support of freedom of conscience and religion and of missionary liberty.

4. To help to unite the Christian forces of the world in seeking justice in international and inter-racial relations.

The Council is responsible for the publication of the *International Review of Missions.*

Universal Christian Conference.—The universal Christian conference on Life and Work held its first meeting at Stockholm in Aug. 1925. Six hundred and ten delegates were present, representing 31 communions and 37 nations. As a result, a message to all followers of Christ has been issued, setting forth the findings of the conference in the sphere of economics, of social morality and of international and inter-racial relationships. A continuation committee has been appointed.

REUS, a city of north-east Spain, in the province of Tarragona, on the Saragossa-Tarragona railway, 4 m. N. of Salou, its port on the Mediterranean. Pop. (1920), 30,266. Reus consists of two parts, the old and the new, separated by the Calle Arrabal, which occupies the site of the old city wall. The earliest records of Reus date from about the middle of the 13th century. Its modern prosperity is traced to about the year 1750, when a colony of English settled here and established a trade in woollens, leather, wine and spirits. The principal incidents in its political history arose out of the occurrences of 1843 (*see* SPAIN, *History*), in connection with which the town received the title of city, and Generals Zurbano and Prim were made counts of Reus. The city was the birthplace of General Prim (1814–1870) and of the painter Mariano Fortuny (1839–1874). The city has important flour, wine and fruit export houses.

REUSCH, FRANZ HEINRICH (1823–1900), German theologian, was born at Brilon, Westphalia, on Dec. 4, 1823. He studied general literature at Paderborn, and theology at Bonn, Tübingen and at Munich, where he was a friend and pupil of Döllinger. In 1854 he became *Privatdozent* in the exegesis of the Old Testament in the Catholic Theological Faculty at Bonn; in 1858 he was made extraordinary, and in 1861 ordinary, professor of theology in the same university. From 1866 to 1877 he was editor of the *Bonner Theologisches Literaturblatt.* In the controversies on the Infallibility of the Pope, Reusch, who had been ordained priest in 1849, attached himself to Döllinger's party, and he and his colleagues Hilgers, Knoodt and Langen were interdicted by the archbishop of Cologne in 1871 from pursuing their courses of lectures. In 1872 he was excommunicated. For many years after this he held the post of Old Catholic *curé* of Bonn, as well as the position of vicar-general to the Old Catholic Bishop Reinkens, but resigned both in 1878, when, with Döllinger, he disapproved of the permission to marry granted by the Old Catholic Church in Germany to its clergy. He was made rector of Bonn university in 1873. In 1874 and 1875 he was official reporter of the Reunion Conferences held at Bonn. He produced with Döllinger the *Geschichte der Moralstreitigkeiten in der Römisch-Katholischen Kirche seit dem XVI. Jahrhundert,* and the *Erörterungen über Leben und Schriften des hl. Liguori.* He died on March 3, 1900.

REUSS, ÉDOUARD GUILLAUME EUGÉNE (1804–1891), German Protestant theologian, was born at Strasbourg on July 18, 1804. He studied philology in his native town (1819–22), theology at Göttingen under J. G. Eichhorn; and Oriental languages at Halle under Wilhelm Gesenius, and afterwards at Paris under Silvestre de Sacy (1827–28). He taught at Strasbourg from 1828 until 1888, for sixty years, having become full professor in 1836. His most important works are: *Geschichte der heiligen Schriften N. Test.* (1842), *Histoire de la théologie chrétienne au siècle apostolique* (1852); *L'Histoire du canon des saintes écritures dans l'église chrétienne* (1863); *La Bible, nouvelle traduction avec commentaire* (1874, etc.); and *Geschichte der heiligen Schriften A. Test.*, a veritable encyclopaedia of the history of Israel from its earliest beginning till the taking of Jerusalem by Titus. He died at Strasbourg on April 15, 1891.

For many years Reuss edited with A. H. Cunitz (b. 1812) the *Beiträge zu den theologischen Wissenschaften.* With A. H. Cunitz and J. W. Baum (1809–1878), and after their death alone, he edited the monumental edition of Calvin's works (38 vols., 1863 ff.). His critical edition of the Old Testament appeared a year after his death.

See the article in Herzog-Hauck, *Realencyklopädie,* and *cf.* Otto Pfleiderer, *Development of Theology in Germany since Kant* (1890).

REUSS, the name of two former German principalities (Reuss-Greiz and Reuss-Schleiz-Gera) which have been, since 1918, amalgamated into Thuringia (*q.v.*).

History.—The princes of Reuss traced their descent to Henry (d. about 1120), who was appointed by the emperor, Henry IV., imperial bailiff (Ger. *Vogt,* from Lat. *advocatus imperii*) of Gera and of Weida. His descendants called themselves lords of Weida. The land under their rule gradually increased in size, and it is said that the name of Reuss was applied to it owing to the fact that one of its princes married a Russian princess, their son being called *der Russe,* or the Russian. In 1564 the family was divided into three branches by the sons of Henry XVI. (d. 1535). One of these died out in 1616, but those of Reuss-Greiz and Reuss-Schleiz-Gera survived as sovereign houses till the revolution of 1918. The lords of Reuss took the title of count in 1673; and the head of the elder line became a prince of the empire in 1778, and the head of the younger line in 1806. In 1807 the two princes joined the confederation of the Rhine, and in 1815 the German confederation. In 1866 both principalities became members of the North German confederation.

A curious custom prevailed in the house of Reuss. The male members of both branches of the family all bore the name of Henry (Heinrich), the individuals being distinguished by numbers.

See H. von Voss, *Die Ahnen des reussischen Hauses* (Lobenstein, 1882); O. Liebmann, *Das Staatsrecht des Fürstenthums Reuss* (1884); C. F. Collmann, *Reussische Geschichte. Das Vogtland im Mittelalter* (Greiz, 1892); B. Schmidt, *Die Reussen, Genealogie des Gesamthauses Reuss* (Schleiz, 1903).

REUTER (roi'ter) **FRITZ** (1810–1874), German novelist, made Plattdeutsch a literary language. Born Nov. 7, 1810, at Stavenhagen, in Mecklenburg-Schwerin, he studied at Rostock and at Jena, where he was a member of the political students' club, or German Burschenschaft, and in 1833 was arrested in Berlin by the Prussian Government. Although the only charge which could be proved against him was that he had been seen wearing the Burschenschaft colours, he was condemned to death for high treason. The sentence was commuted to imprisonment for 30 years in a Prussian fortress. In 1838, through the personal intervention of the grand-duke of Mecklenburg, he was handed over to the authorities of his native state, and in 1840 was set free by a general amnesty.

In 1850 he settled as a private tutor at the little town of Treptow in Pomerania. Here he married Luise Kunze, the daughter of a Mecklenburg pastor. Reuter's first publication was a collection of miscellanies, written in Plattdeutsch, and entitled *Läuschen un Riemels* ("anecdotes and rhymes," 1853; a second collection followed in 1858). There followed *Polterabendgedichte* (1855), and *De Reis' nah Belligen* (1855). In 1856 Reuter left Treptow and established himself at Neubrandenburg. His next book (published in 1858) was *Kein Hüsung,* an epic in which he presents with great force and vividness some of the least attractive aspects of village life in Mecklenburg. This was followed, in 1860, by *Hanne Nüte un de lütte Pudel,* the best of his verse compositions. In 1860 he published the first series of his *Olle Kamellen* ("old stories of bygone days"), which contained *Woans ick tau'ne Fru kam* and *Ut de Franzosentid.* Later volumes were entitled *Ut*

mine Festungstid (1861); *Ut mine Stromtid* (3 vols. 1864); and *Dörchläuchting* (1866)—all written in the Plattdeutsch dialect of the author's home. *Ut mine Stromtid* is by far the greatest of Reuter's writings. *Ut de Franzosentid* describes the deep national impulse under which Germany rose against Napoleon. *Ut mine Stromtid* deals with the revolution of 1848.

In 1863 Reuter moved to Eisenach; and here he died on July 12, 1874.

Reuter's *Sämtliche Werke*, in 13 vols., were first published in 1863–68. To these were added in 1875 two volumes of *Nachgelassene Schriften*, with a biography by A. Wilbrandt; and in 1878 two supplementary volumes to the works appeared. A popular edition in 7 vols. was published in 1877–78 (new edition, 1902); there are also editions by K. F. Müller (18 vols., 1905), and W. Seelmann (7 vols., 1905–06). See *Briefe F. Reuters an seinen Vater*, ed. F. Engel (2 vols., 1895); A. Römer, *F. Reuter in seinem Leben und Schaffen* (1895); G. Raatz, *Wahrheit und Dichtung in Reuters Werken* (1895); E. Brandes, *Aus F. Reuters Leben* (1899); K. F. Müller, *Der Mecklenburger Volksmund und F. Reuters Schriften* (1902). A complete bibl. will be found in the *Niederdeutsche Jahrbuch* for 1896 and 1902.

REUTER, GABRIELE (1859–), German novelist, was born at Alexandria, Egypt, on Feb. 8, 1859. Her first novel, *Glück und Geld*, appeared in 1888. One of her early novels, *Aus guter Familie*, had reached its 25th edition in 1907. Among her works are *Frauenseelen* (1901); *Jugend eines Idealisten* (1916); and *Benedikta* (1923).

REUTER, PAUL JULIUS, Baron de (1816–1899), founder of Reuter's News Agency, was born at Cassel, Germany. At the age of thirteen he became a clerk in his uncle's bank at Göttingen, where he met Gauss, whose experiments in telegraphy were then attracting some attention. In 1849 there was a gap between the end of the new German telegraph line at Aix-la-Chapelle and that of the French and Belgian lines at Verviers. Reuter organized a news-collecting agency at each of these places and bridged the interval by a pigeon-post. On the establishment of through telegraphic communication, Reuter endeavoured to start a news agency in Paris, but finding that the French government's restrictions would render the scheme unworkable, removed in 1851 to England and became a naturalized British subject. The first submarine cable—between Dover and Calais—had just been laid, and Reuter opened a news office in London. At first, however, his business was practically confined to the transmission of private commercial telegrams to places not connected with the new system. He appointed agents at the telegraph termini on the Continent to forward these despatches by rail or pigeon-post to the addresses. His efforts to induce the English papers to publish his foreign news telegrams were unsuccessful, until in 1858 *The Times* published the report of an important speech by Napoleon III. forwarded by Reuter's Paris agent.

Reuter now extended his sphere of operations all over the world. In 1866 he laid down a special cable from Cork to Crookhaven, which enabled him to circulate news of the American Civil War several hours before the steamer could reach Liverpool. A concession for a cable beneath the North Sea to Cuxhaven was granted him by the king of Hanover in 1865, and in the same year a concession was granted him for a cable between France and the United States, the line being worked jointly by Reuter and the Anglo-American Telegraph Company. Reuter was in 1871 given the title of baron by the duke of Saxe-Coburg and Gotha, and by a special grant of Queen Victoria he and his heirs were authorized to have the privileges of this rank in England. Reuter died at Nice on Feb. 25, 1899.

REUTERHOLM, GUSTAF ADOLF, Baron (1756–1813), Swedish statesman. After a brief military career he was appointed *Kammerherr* to Sophia Magdalena, queen consort of Gustavus III., and became intimately connected with the king's brother, Charles, then duke of Sudermania. He was imprisoned for a time in 1789 with other malcontents opposed to Gustavus III. On the death of Gustavus and the assumption of the regency by Charles he was made a member of the council of state and one of the "lords of the realm." His policy became increasingly reactionary and on the accession of Gustavus IV. he was expelled from Stockholm. He died in exile in Schleswig on Dec. 27, 1813.

See *Sveriges Historia* (Stockholm, 1877–81), vol. v.

REUTERS, the principal British and International News Agency, founded over eighty years ago by Baron Julius de Reuter, who established a system of offices and correspondents throughout the world. He concentrated in London the news from these correspondents and then redistributed it. In 1865 de Reuter transferred his business to a joint stock company, of which he became the governing director; he was succeeded in 1879 by his elder son, Baron Herbert de Reuter (d. 1915). The Hon. Mark S. Napier was chairman of the company from 1910 to 1919, and in conjunction with him, Sir Roderick Jones, the present chairman and managing director, for national reasons arising out of the World War, converted the agency from a public company into a private trusteeship. This involved buying out the then existing shareholders for a sum of considerably over half a million sterling. Ten years later Sir Roderick reorganized the trusteeship in conjunction with the Press Association to ensure the passage ultimately of the complete ownership of Reuters to the newspapers of the United Kingdom. The principal news agency in every country in the world is affiliated with Reuters. Reuters' correspondents resident in the respective countries enjoy the exclusive call for Reuters' purposes upon the news of these agencies. Where Reuters do not supply their telegrams direct to the newspapers, they deliver their service to these agencies to be disposed of by them in their territories. In addition to their services of imperial and foreign political news Reuters have greatly extended, especially to the Continent and to the East and the Far East, their services of commercial and financial prices and intelligence; and at the present time (1929) they conduct from the Rugby and Northolt Stations the largest wireless telegraph service of its kind in the world, consisting every twenty-four hours of over 100 emissions which are received simultaneously, and for all practical purposes instantaneously, in each of the great world business centres. (W. L. Mu.)

REUTLINGEN, a town of Germany, in the republic of Württemberg, on the Echatz, an affluent of the Neckar, 36 m. by rail S. of Stuttgart. Pop. (1925) 30,501. Reutlingen, which is first mentioned in 1213, became a free imperial town in the 13th century and was fortified by the emperor Frederick II. It came into the possession of Württemberg in 1802. Its industries include cotton spinning and weaving, dyeing and bleaching; also the manufacture of leather and machinery.

REVEL: *see* Tallinn.

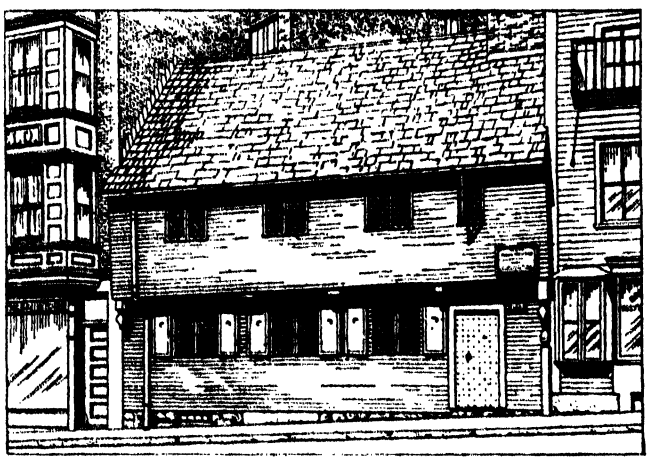
REVELATION, BOOK OF: *see* Apocalypse.

REVELSTOKE, town, British Columbia, on the Columbia river and a divisional station on the Canadian Pacific railway, 381 m. E. of Vancouver. Pop. (1921) 2,782. It is the supply centre for a mining and lumbering district, with railway shops.

REVENTLOW, CHRISTIAN DITLEV FREDERICK, Count (1748–1827), Danish statesman and reformer, born on March 11, 1748, was educated at Sörö and Leipzig, and made an extensive tour of western Europe to study economic conditions before he returned to Denmark in 1770. In 1774 he held a high position in the *Kammerkollegiet*, or board of trade, two years later he entered the Department of Mines, and in 1781 he was a member of the *Overskattedirectionen*, or chief taxing board.

In 1784, he was placed at the head of the *Rentekammeret*, which took cognisance of everything relating to agriculture. He appointed a small agricultural commission to better the condition of the crown serfs, and amongst other things enable them to turn their leaseholds into freeholds.

Reventlow induced the Crown Prince Frederick, in July 1786, to appoint a grand commission to take the condition of all the peasantry in the kingdom into immediate consideration. This agricultural commission resulted in a series of reforms of the highest importance. The ordinance of June 8, 1787, modified the existing leaseholds, greatly to the advantage of the peasantry; the ordinance of June 20, 1788, abolished villenage and completely transformed the much-abused *hoveri* system whereby the feudal tenant was bound to cultivate his lord's land as well as his own; and the ordinance of Dec. 6, 1799, did away with *hoveri* altogether. Reventlow also started public credit banks enabling small cultivators to borrow money on favourable terms.



But the financial distress of Denmark, the jealousy of the duchies, the ruinous political complications of the Napoleonic period, and, above all, the Crown Prince Frederick's growing jealousy of his official advisers, prevented Reventlow from completing his reforms. On Dec. 7, 1813, he was dismissed, and retired to his estates in Laaland, where he died on Oct. 11, 1827.

See Adolph Frederik Bergsöe, *Grev. C. D. F. Reventlows Virksomhed* (Copenhagen, 1837); Louis Theodor Alfred Bobe, *Efterl. Papirer fra den Reventlowske Familiekreds* (Copenhagen, 1895–97).

REVENUE, income, return, or profit; more particularly the receipts from all sources of a Government or State (O. Fr. *revenu*, from *revenir*, to return). The revenue of a State is largely made up of taxation, and the general principles of taxes are discussed in TAXATION and in a number of articles to which a guide will be found under FINANCE. In some countries the public or State domain may contribute substantially to the revenue, as do the forests in Russia, while in other countries important contributions are made from the State railways, post and telegraph services, etc. (*See* CUSTOMS AND EXCISE; INLAND REVENUE.)

REVERBERATORY FURNACE: *see* FURNACES, METALLURGICAL.

REVERE, PAUL (1735–1818), American engraver and patriot, was born in Boston, Mass., on Jan. 1, 1735. He had a meagre schooling, and in his father's shop learned the trade of a gold- and silversmith. In 1756 he was 2nd lieutenant of artillery in the expedition against Crown Point, and for several months was stationed at Ft. Edward, in New York. He became a proficient copper engraver, and engraved several anti-British caricatures in the years before the American revolution. He was one of the Boston grand jurors who refused to serve in 1774 because parliament had made the justices independent of the people for their salaries; was a leader in the Boston Tea Party; was one of the 30 north end mechanics who patrolled the streets to watch the movements of the British troops and Tories; and in Dec. 1774 was sent to Portsmouth, N.H., to urge the seizure of military stores there, and induced the colonists to attack and capture Ft. William and Mary—one of the first acts of military force in the war. His midnight ride from Charlestown to Lexington on April 18–19, 1775, to give warning of the approach of British troops from Boston, is Revere's most famous exploit; it is commemorated by Longfellow, who, however, has "paid little attention to exactness of fact" (Justin Winsor). In 1775 Revere was sent by the Massachusetts provincial congress to Philadelphia to study the working of the only powder mill in the colonies, and although he was allowed only to pass through the building, obtained sufficient information to enable him to set up a powder mill at Canton. He was commissioned a major of infantry in the Massachusetts militia in April 1776; was promoted to the rank of lieutenant-colonel of artillery in November; was stationed at Castle William, defending Boston harbour, and finally received command of this fort. He served in an expedition to Rhode Island in 1778, and in the following year participated in the unsuccessful Penobscot expedition. After his return he was accused of having disobeyed the orders of the commanding officer, was tried by court martial, and was acquitted. After the war he engaged in the manufacture of gold- and silverware, and became a pioneer in the production in America of copper-plating and copper spikes for ships. In 1795, as grand master of the Masonic fraternity, he laid the cornerstone of the new State House in Boston. He died in Boston on May 10, 1818.

BY COURTESY OF THE HALLIDAY HISTORICAL PHOTOGRAPH CO., BOSTON

THE HOUSE OF PAUL REVERE IN BOSTON, MASS.; BUILT ABOUT 1676, THE DIAMOND WINDOW PANES BEING A RESTORATION

See Charles F. Gettemy, *The True Story of Paul Revere* (Boston, 1905).

REVERE, a city of Suffolk county, Massachusetts, U.S.A., on Massachusetts bay, adjoining Boston on the north-east. It is served by the Boston and Maine and the Boston, Revere Beach and Lynn railways. Pop. (1920) 28,823 (31% foreign-born white); 1928 local estimate 38,000. It is a residential suburb and pleasure resort. Revere beach, extending from the promontory of Winthrop on the south to the Point of Pines on the north, is to Boston what Coney Island is to New York. The first settlement here (called Rumney Marsh) was made in 1626. It was part of Boston until 1739, and then of the town of Chelsea until in 1846 North Chelsea was set off and incorporated as a separate town. In 1871 North Chelsea changed its name to Revere (in honour of Paul Revere) and in 1914 it was incorporated as a city.

REVEREND, a term of respect or courtesy, now especially used as the ordinary prefix of address to the names of ministers of religion of all denominations. The uses of Med. Lat. *reverendus* do not confine the term to those in orders; Du Cange (*Gloss. s.v.*) defines it as *titulus honorarius, etiam mulieribus potioris dignitatie concessus*, and in the 15th century in English it is found as a term of respectful address. In the Church of England deans are addressed as "very reverend," bishops as "right reverend," archbishops as "most reverend." The Moderator of the Church of Scotland is also styled "right reverend."

REVERSING LAYER, of the sun or stars, the layer where the absorption indicated by the dark lines in the spectrum occurs. The reversing layer proper lies near the top of the photosphere where the pressure is usually about $\frac{1}{10,000}$ of an atmosphere: but some of the dark lines are due to absorption at higher levels in the chromosphere.

REVERSION, in biology, the phenomenon of an organism "throwing back" to some remote ancestor. (*See* ATAVISM.)

For reversion in law, *see* REMAINDER.

REVILLAGIGEDO, an isolated, uninhabited group of rocky islands in the North Pacific, 18° N., 112° W., belonging to Mexico, and forming part of the State of Colima. They are about 420m. from the Mexican coast and comprise the large island of Socorro (San Tomás), 24m. long by an average of 9m. wide, and the three widely separated islets of San Benedicto, Roca Partida and Clarion, with a total area of 320sq.m. The island of Socorro has an extinct volcano 3,660ft. high. The archipelago derives its name from the Spanish viceroy who governed Mexico from 1746 to 1755.

REVIVAL, RELIGIOUS, is a renewed interest in religion, coming, as a rule, after a period of indifference or decline. Revivalism and evangelism are frequently used as identical terms, but evangelism stands for a certain interpretation of Christianity, emphasizing the objective atonement of Christ, the necessity of a new birth or conversion, and salvation through faith. *Revivalism*, on the other hand, connotes certain methods of presenting evangelical doctrine, and the religious awakening resulting therefrom.

Revivalism, in the modern sense, begins with the Wesleyan revival in England in the year 1737 when a little group of Oxford students, who had been known as Methodists at the university, moved to London and began to preach to the masses. The leaders of this movement were John and Charles Wesley and George Whitefield. Whitefield above everything else was a preacher; Charles Wesley was one of those sweet spirits gifted in the writing of religious verse, and his hymns were soon being sung in every corner of the kingdom. But the centre of the movement, and the organizer of its results was John Wesley. He was able through

the Methodist movement to offer a permanent contribution, not alone to the religious life of the 18th century, but to the religious life of the world. The method used to bring the gospel to the people was through a system of itinerant preachers, who travelled definite circuits, preaching wherever an opportunity was afforded, and then gathering the converts into small groups for encouragement and instruction, called "classes" under "leaders." The whole work in England, Scotland, Wales and Ireland and finally America was under John Wesley, who by the middle of the century was annually touring the United Kingdom, travelling from 4,000 to 6,000 m. each year, making during his long life 42 visits to Ireland alone. The Methodist revival was, until after the death of John Wesley, a movement within the Church of England, and a strong and permanent evangelical party was developed within the Church. When Wesley died there were 100,000 Methodists.

While the Wesleyan revival was getting under way in England, a great revival known as the Great Awakening was sweeping over the English colonies in America. This revival movement had three distinct phases, the first being the New England revival which began at Northampton, Mass., in 1734 under the earnest preaching of the Congregational minister, Jonathan Edwards. Before the winter was over more than 300 professed conversion in that little frontier town. This was but the beginning of a movement which swept throughout the New England colonies and continued through several years. The second phase of the Great Awakening was in the Middle colonies, where the movement was led by Theodorus J. Frelinghuysen, minister of the Dutch Reformed Church at Raritan, N.J., and the four sons of Rev. William Tennent, Presbyterian minister at Neshameny, Pa., all of whom, with 12 others, had been educated at his "log college." Gilbert Tennent, Presbyterian minister at New Brunswick, N.J., became the centre of the movement. Both in New England and the middle colonies, as well as in Virginia and the other southern colonies, the revival movement was greatly strengthened by the evangelistic tours in America of George Whitefield. Seven times Whitefield visited America from 1739 to 1770, making preaching tours from New England to Georgia. The last phase of the American revival was the Virginia Awakening, first among the Presbyterians, then among the Baptists and finally among the Methodists and continuing from about 1760 to 1790.

One of the most remarkable revivals of modern times was that which swept over the western part of the United States during the years 1797 to 1805 and called the Great Revival of the West or the Kentucky revival. It had its beginnings among the Presbyterians, but soon spread to the Baptists and the Methodists, and eventually affected all the churches. Meetings were held in the woods and were attended by great emotional excitement, people often falling unconscious, or being taken with such strange exercises as the "shakes" and the "jerks," or the "laughing" or "barking" exercise. Out of the western revival came the camp meeting, an institution which was destined to exercise a great influence on the religious life of the newer sections of the United States.

Undoubtedly the outstanding revivalist both in England and America of the last quarter of the 19th century was Dwight L. Moody. He was a layman and without education, but from 1861 to his death in 1899 he was constantly employed and with great success in revivalistic efforts. He made three extensive visits to England and Scotland (1873–75, 1881–83, 1891–92) and thousands of people professed conversion under his persuasive preaching. Associated with Moody was a remarkable singer, Ira D. Sankey, whose gospel songs added greatly to the effectiveness of the meetings. Also associated with Moody in Edinburgh was Henry Drummond, who later, when he became professor of natural science in the University of Glasgow, continued his evangelistic efforts, especially in the interest of young men students in the universities of Scotland.

In more recent years revivals have occurred in Wales (1904–06) and in various parts of the United States and Great Britain. Recent revivalists have been largely imitators of Moody and Sankey, such as J. W. Chapman, William A. Sunday, R. A. Torrey and "Gypsy" Smith. Modern psychology has given considerable attention to the study of *conversion* and the *revival*, especially since the publication of E. D. Starbuck's *Psychology of Religion* in 1899, and of William James' *Varieties of Religious Experience* in 1902.

(W. W. S.)

REVOLUTIONARY TRIBUNAL, THE (*le tribunal révolutionnaire*), a court which was instituted in Paris by the Convention during the French Revolution for the trial of political offenders, and became one of the most powerful engines of the Terror. The news of the failure of the French arms in Belgium gave rise in Paris to popular movements on March 9 and 10, 1793, and on March 10 on the proposal of Danton, the Convention decreed the establishment in Paris of an extraordinary criminal court, which received the official name of the Revolutionary Tribunal by a decree of Oct. 29, 1793. It was composed of a paid jury, a public prosecutor, and two substitutes, all nominated by the Convention; and from its judgments there was no appeal. With M. J. A. Hermann as president and Fouquier-Tinville as public prosecutor, the tribunal preserved, at first, at least the forms of a court of justice, but on June 10, 1794, was promulgated the infamous law of 22 Prairial, which deprived prisoners of the right to be represented by counsel, suppressed the hearing of witnesses and made death the sole penalty. Before 22 Prairial the tribunal had pronounced 1,220 death-sentences in 13 months; during the 49 days between the passing of the law and the fall of Robespierre 1,376 persons were condemned, including many innocent victims. The tribunal was suppressed on May 31, 1795.

REVUE: *see* MUSICAL COMEDY.

REWA, an Indian state in the Bagelkhand agency of Central India. It is the only large state in Bagelkhand, and the second largest in Central India, having an area of about 13,000 sq.m. The population of the state in 1921 was 1,401,524. Many of the inhabitants of the hilly tracts are Gonds and Kols. More than one-third of the area is covered with forests, yielding timber and lac; but the State possesses also valuable coal deposits in the Umaria field.

The history of the state, until it came under British guarantee in 1812, was a record of almost continuous warfare. In the Mutiny of 1857, the chief gave valuable help to the British. The present ruler has the title of Maharaja and a salute of 15 guns. He is Rajput of the Baghela branch of the Solanki race.

The town of Rewa is 131 m. south of Allahabad. Pop. (1921), 20,977. It has a high school, also the Victoria and Zenana hospitals and a model gaol. The political agent for Bagelkhand resides at Satna, on the East Indian railway: pop. (1921) 7,998.

REWA KANTHA, a political agency or collection of native states in India, subordinate to the government of Bombay. It stretches for about 150 m. between the plain of Gujarat and the hills of Malwa, from the river Tapti to the Mahi, crossing the Narbada or Rewa, from which it takes its name. The number of separate states is 61. The only important one is Rajpipla (*q.v.*). It includes also five second-class states entitled Chota Udaipur, Baria, Santh, Lunavada and Balasinor. Total area, 4,946 sq.m. In 1921 the population was 665,099.

REWARD. In English law the offering of rewards presents two distinct aspects: (1) with reference to the nature of the information or act for the giving or doing whereof the reward is offered; (2) with reference to the nature of the relation created between the person offering and the person claiming the reward.

1. Courts of assize and quarter sessions are empowered to order the payment of rewards to persons who have been active in or towards the apprehension of persons charged with certain specified crimes against person and property (Criminal Law, 1826, ss. 28, 29; Criminal Justice Administration act, 1851, ss. 7, 8). The rewards are payable according to a scale fixed by the home secretary. (*See* LARCENY.)

2. Where a reward is lawfully offered for information the person who first supplies the required information, *i.e.*, satisfies the conditions on which the reward is payable, is entitled to recover by action the reward offered. Performance of the conditions is an acceptance of the offer (*Carlill* v. *Carbolic Smoke Ball Co.*, 1893, 1 Q.B. 256,270).

In the United States the law is practically the same.

REWARI, a town of British India, in Gurgaon district of the Punjab, 32 m. S.W., of Gurgaon. Pop. (1921) 23,129. It is an important centre of trade. The chief manufacture is brassware.

REWBELL, JEAN FRANÇOIS (1747–1807), French politician, was born at Colmar (then in the department of Haut-Rhin) on Oct. 8, 1747. He sat in the constituent and legislative assemblies and in the Convention. He took part in the reactionary movement which followed the fall of Robespierre, and became a member of the reorganized committees of public safety and general security. His moderation caused his election by 17 departments to the Council of Five Hundred. Appointed a member of the Directory on Oct. 1, 1795, he became its president in 1796, and retired in 1799. He then entered the Council of Ancients. After the *coup d'état* of 18 Brumaire he retired from public life, and died at Colmar on Nov. 23, 1807.

See L. Sciout, *Le Directoire* (1895–97).

REYMONT, LADISLAS STANISLAS (1867–1925), Polish novelist, was born at Kobiele Wielkie in the county of Piotrkow on May 7, 1867. He spent his youth in various occupations and his first novels were written when he was superintendent of a small railway sector. *The Comédienne* (1896, Eng. trans. 1921), *Ferments* (2 vol., 1897) and *Lily* (1899) were objective novels describing the every day life of a troupe of provincial actors. In 1899 appeared *The Promised Land* (2 vol., Eng. trans. 1928) modelled on Zola and describing industrialism in Łódź. Reymont's best-known work, *The Peasants*, appeared in four volumes 1904–09 (Eng. trans. 1925–26). He describes the four seasons' labours of a peasant and brings to light his primitive instincts, inward dignity and almost religious attachment to the land. This great peasant epic brought Reymont the Nobel Prize for literature in 1924. While *The Peasants* was being prepared, a number of novels and short stories appeared, the most important of which are *Before Dawn* (1902), *Komurasati* (1903), *From a Diary* (1903) and *The Storm* (1907). As a historical novelist, Reymont, primarily an observer of the direct processes of life, was less successful: the trilogy *1794* (*The Last Diet*, 1913, *Nil Desperandum*, 1916 and *The Insurrection*, 1918), though not lacking in literary merit, revealed a lack of historical exactness. He died on Dec. 5, 1925. (*See* POLISH LITERATURE.)

REYNARD THE FOX, a beast-epic, current in French, Dutch and German literature. The cycle of animal stories collected round the names of Reynard the Fox and Isengrim the Wolf in the 12th century seems to have arisen on the borderland of France and Flanders. The tales, like those of "Uncle Remus," were amusing in themselves; they were based on widely diffused folklore, and Reynard and his companions were not originally men disguised as animals. Jacob Grimm (*Reinhart Fuchs*, 1834) maintained their popular origin.

The principal names of the Reynard cycle were German. Reynard himself (Raginohardus, strong in counsel), Bruin the Bear, Baldwin the Ass, Tibert the Cat, Hirsent the She-wolf, had German names, most of which were used as person-names in Lorraine. But it was in France that the cycle obtained its greatest vogue. The *Roman de Renart* as printed by Méon (4 vols., 1826) runs to over 40,000 lines. *Renart* was a popular epic parodying feudal institutions as represented in the romances of chivalry.

The early French originals are lost, the most ancient existing fragments being in Latin. The fable of the lion's sickness and his cure by the wolf's skin occurs in the *Ecbasis cujusdam captivi per Tropologiam* (ed. E. Voigt; Strasbourg, 1875), written about 940. *Ysengrimus* (ed. E. Voigt; Halle, 1884), a clerical satire written by Nivard of Ghent about 1148, includes the story of the lion's sickness and the pilgrimages of Bertiliana the Goat. Most later versions of Reynard have been derived from the Flemish *Van den vos Reinarde* (ed. E. Martin, Paderborn, 1874), written about 1250 in East Flanders by Arnout and Willem. The Flemish epic is a poem of 3,476 lines. The corresponding branch of the French *Roman de Renart* (for which *see* FRENCH LITERATURE) is one of the earliest and best of the great French cycle.

The fable was known in England. The English poem of the *Fox and the Wolf* dates from the 13th century; and the "Nonne Preestes Tale" of Chaucer in which, however, the fox is Rossel and the ass Brunel, is a genuine Reynard history. A Dutch version of the Reynard poem, *Hystorie van Reynaert die Vos*, was printed at Gouda in 1479. On this Caxton based his *Historye of reynart the foxe* (reprinted by E. Arber, 1878), which he finished on June 6, 1481. As a satire on the church, especially on monks and nuns, *Reynard* became popular with reformers, and numerous versions followed in England and Germany. The modern German version (1794) of Goethe has been often reprinted, notably in 1846, with illustrations by Wilhelm von Kaulbach.

BIBLIOGRAPHY.—The best edition of the *Roman de Renart* is by Ernest Martin (3 vols., Strasbourg and Paris, 1881–87). *See* also Jacob Grimm, *Sendschreiben an C. Lachmann über Reinhart Fuchs* (Leipzig, 1840); Léopold Sudre, *Les Sources du roman de Renard* (Paris, 1890); Gaston Paris, "Le Roman de Renard" in the *Journal des savants* (Dec. 1894 and Feb. 1895); Kaarle Krohn, *Bär und Fuchs* (Helsingfors, 1888); H. Gagering, *Van den Vos Reynaerde* (Münster, 1910). A modernized version of Caxton's translation appeared in 1926.

REYNOLDS, JOHN FULTON (1820–1863), American soldier, was born at Lancaster (Pa.), Sept. 20, 1820, and graduated from West Point in 1841. He was breveted captain and major for gallantry in the Mexican War. In 1859 he was made commandant of cadets at West Point. At the outbreak of the Civil War in 1861 he was made a lieutenant colonel of infantry and some time later brigadier general of volunteers. In Nov. 1862, after having been in numerous actions, he was commissioned major general of volunteers, and appointed to command the I. Corps of the Army of the Potomac, took part in the battle of Fredericksburg and gave Gen. Meade his whole-hearted support in the three critical days preceding the battle of Gettysburg (*q.v.*). He was placed in command of the left wing and thrown forward to Gettysburg to cover the concentration of the army of the Potomac. The battle which ensued there, July 1, 1863, took its shape from Reynolds's resolution to support Buford's cavalry with the I. and XI. Corps. Reynolds himself was killed very early in the day by a rifle bullet. A bronze statue was placed on the field of Gettysburg and a portrait in the library at West Point by the men of the I. Corps. The State of Pennsylvania erected a granite shaft where he fell, and an equestrian bronze statue stands in Philadelphia.

REYNOLDS, SIR JOSHUA (1723–1792), the most prominent figure in the English school of painting, was born at Plympton Earl, in Devonshire, on July 16, 1723. He received a fairly good education from his father, who was a clergyman and the master of the free grammar school. At seventeen, the lad was apprenticed in London to Thomas Hudson, a native of Devonshire, who, though a mediocre artist, was popular as a portrait painter. Reynolds remained with Hudson for two years, and in 1743 he returned to Devonshire, where, settling at Plymouth Dock, he employed himself in portrait painting. By the end of 1744 he was again in London. He was well received by his old master, from whom he appears previously to have parted with some cold-

ness. Hudson introduced him to the artists' club that met in Old Slaughter's, St. Martin's Lane, and advised him as to his work. Reynolds now painted a portrait of Captain the Hon. John Hamilton, the first that brought him any notice, with those of other people of some repute.

Meanwhile Reynolds had made the acquaintance of Lord Edgcumbe, who introduced him to Captain (afterwards Viscount) Keppel. Keppel was made aware of Reynolds' desire to visit Italy; and, as he had just been appointed to the command of the Mediterranean squadron, he invited the artist to accompany him in his ship, the "Centurion." The offer was gladly accepted. While Keppel was conducting his negotiations with the dey of Algiers, relative to the piracy with which that potentate was charged, Reynolds resided at Port Mahon, the guest of the governor of Minorca, painting portraits; and in December 1749 he sailed for Leghorn, and then made his way to Rome. Of the early Italians he praises the "simplicity and truth" and observes that they "deserve the attention of a student much more than many later artists." In Venice he made memoranda of the gradations of light and shade in the pictures, "and this without any attention to the subject, or to the drawing of the figures."

After more than two years in Rome, where he caught a severe cold which resulted in permanent deafness, Reynolds, in the spring of 1752, spent five months in visiting Parma, Florence, Venice and other important cities of Italy. Returning to England, Reynolds, after a brief stay in Devonshire, established himself as a portrait painter in St. Martin's Lane, London, whence he afterwards removed to Great Newport Street, and finally, in 1760, to Leicester Square, where he continued to paint till his death.

In London, Reynolds stepped at once into a foremost position as the fashionable portrait painter of the day. In this he was greatly helped by his success in society. Throughout his career his social occupations claimed the next place to his painting. Lord Edgcumbe was a generous patron, and exerted himself to obtain commissions for his protégé, of whose ability the portraits which he now produced—especially the famous full-length of his old friend Keppel—were sufficient guarantee. In 1755 his clients for the year numbered 120, and in 1757 the number of sittings recorded reached a total of 677. He maintained his position unimpaired. During his year in London he had made the acquaintance of Dr. Johnson, which became a friendship for life. To him Burke and Goldsmith, Garrick, Sterne and Bishop Percy were before long added. Most of them were members of "The (Literary) Club," established at Reynolds' suggestion, in 1764.

In 1760 the London world of art was greatly interested by the novel proposal of the Society of Artists to exhibit its works to the public. In the month of April a successful exhibition was opened, the precursor of many that followed. Reynolds contributed four portraits. In 1765 the association obtained a royal charter, and became known as "The Incorporated Society of Artists"; but much rivalry and jealousy were occasioned by the management of the various exhibitions, and an influential body of painters withdrew from the society. They had access to the young king, George III., who promised his patronage and help. In December 1768 the Royal Academy was founded, and Reynolds, whose adhesion to the movement was for a time doubtful, was hailed by acclamation its first president. In a few months the king signified his approval of the election by knighting the new president, and intimating that the queen and himself would honour him with sittings for portraits to be presented to the Academy. Reynolds did not take any part in the educational work of the new institution, but on the social side he set the Academy on the lines it has followed with the greatest worldly success ever since. At his suggestion the annual banquet was instituted. To the specified duties of his post he added the delivery of a presidential address at the distribution of the prizes, and his speeches on these occasions form the well-known "Discourses." These discourses entitle their author to literary distinction; indeed, when they were first delivered, it was thought impossible that they could be the production of a painter, and Johnson and Burke have been credited with their composition, in spite of Dr. Johnson's indignant exclamation—"Sir Joshua, sir, would as soon get me to paint for him as to write for him!"

Sir Joshua was too successful an artist to escape the jealousy of his less fortunate brethren, and it must be admitted that his attitude towards some of his contemporaries was wanting in generosity. His relations with Gainsborough, who on his part was in fault, would require more space for discussion than can here be afforded, but he was not just either to Hogarth or to Richard Wilson. Cosmo Monkhouse in the *Dictionary of National Biography* speaks of "the beauty of his disposition and the nobility of his character," but adds: "he was a born diplomatist." In 1784 Reynolds was appointed painter to the king.

In the summer of 1789 his sight began to fail; but he continued occasionally to paint till about the end of 1790, delivering his final discourse at the Academy on Dec. 10. On Feb. 23, 1792, the great artist passed peacefully away.

As a painter Reynolds stands, with Gainsborough, just behind the very first rank. There can be no question of placing him by the side of the greatest Venetians or of the triumvirate of the 17th century, Rubens, Rembrandt, Velasquez. He could not draw the figure properly; nor could he as a rule compose successfully on anything like a monumental scale.

He was all his life devoured by what he calls "a perpetual desire to advance." The weight and power of the art of Reynolds are best seen in those male portraits, "Lord Heathfield," "Johnson," "Sterne," "Goldsmith," "Gibbon," "Burke," "Fox," "Garrick," that are historical monuments as well as sympathetic works of art. In this category must be included his immortal "Mrs. Siddons as the Tragic Muse," now in the Huntington Library and Art Gallery, San Marino, Calif.

In portraits of this order Reynolds holds the field, but he is more generally admired for his studies of women and of children, of which the Althorp portraits of the Spencer family are classic examples. No portrait painter has been more happy in his poses for single figures, or has known better how to control by good taste the piquant, the accidental, the daring, in mien and gesture. "Viscountess Crosbie" is a striking instance. When dealing with more than one figure he was not always so happy, but the "Duchess of Devonshire and her Baby," the "Three Ladies decking a Figure of Hymen," and the "Three Ladies Waldegrave" are brilliant successes. He was felicitous too in his arrangement of drapery. Few painters, again, have equalled the Reynolds in dainty and at the same time firm manipulation of the brush. The richness of his deeper colouring is at times quite Venetian.

In the "Discourses" Reynolds unfolds his artistic theories. The first deals with the establishment of an academy for the fine arts, and of its value as a repository of the traditions of the best of bygone practice. In the second lecture the study of the painter is divided into three stages,—in the first of which he is busied with processes and technicalities, with the grammar of art, while in the second he examines what has been done by other artists, and in the last compares these results with Nature herself. In the third discourse Reynolds treats of "the great and leading principles of the grand style"; and succeeding addresses are devoted to such subjects as "Moderation," "Taste," "Genius," and "Sculpture." The fourteenth has an especial interest as containing a notice of Gainsborough, who had died shortly before its delivery; the concluding discourse is mainly a panegyric on Michelangelo.

His other literary works comprise his three essays in *The Idler* for 1759–1760 ("On the Grand Style in Painting," and "On the True Idea of Beauty"), notes to Du Fresnoy's *Art of Painting*, *Remarks on the Art of the Low Countries*, brief notes in Johnson's *Shakespeare*, and two singularly brilliant fragments, imaginary conversations with Johnson, which were never intended for publication, but, found among his papers after his death, were given to the world by his niece, the marchioness of Thomond.

Sir Joshua left to his niece, Mary Palmer, the bulk of his property, about £100,000, with works of art that sold for £30,000 more. There were, besides, legacies amounting to about £15,000. His body rests in St. Paul's.

In the United States, of the representative paintings by Reynolds, fourteen are in the Metropolitan Museum of Art, and others are as follows: New York Public Library, "Mrs. Billington

as 'St. Cecilia'"; the Frick collection, New York city, "Lady Elizabeth Taylor" and "Lady Selena Skipwith"; the Frick Collection, Prides Crossing (Mass.), "Lady Cecil Rice," "Lady Margaret Beaumont," and "Sir George Howland Beaumont"; the Joseph Widener Collection, Philadelphia, "Portrait of Lady Cornewall" and "Portrait of Nelly O'Brien"; Boston Museum of Fine Arts, "Kitty Fisher" and "Sir Thomas Mills"; A. E. Newton Collection, Philadelphia, "Samuel Johnson"; Chicago Art Institute, "Lady Sarah Bunberry"; Cleveland Museum of Art, "Portrait of Mrs. Collyear"; Detroit Institute of Arts, "Sir Brooke Boothby, Bart."

Technik der bildenden Künste* (Leipzig, 1893); *Discourses delivered to the Students of the Royal Academy by Sir Joshua Reynolds, Kt.*, ed. by Roger Fry (1905); M. Osborn, *Joshua Reynolds* (Künstler-Monographien, 1908).

REYNOLDS, STEPHEN (1881–1919), English author, was born at Devizes on May 16, 1881, and educated at Manchester university and the École des Mines at Paris. He became sub-editor of an Anglo-French review in 1902, and in 1903 began an association with the Woolley brothers, fishermen of Sidmouth, becoming a recognized authority on fisheries. He was a member of the committee of enquiry into Devon and Cornwall Fisheries (1912), of the departmental committee on Inshore Fisheries (1913), and in that year was appointed adviser on Inshore Fisheries to the Development Commission. In 1914 he became resident inspector of fisheries for the south-western area. He died at Sidmouth on Feb. 14, 1919. His books include *A Poor Man's House* (1908), a classic in its own kind; *Alongshore* (1910); *The Lower Deck, the Navy and the Nation* (1912); *The Holy Mountain* (a novel, 1909).

REYNOLDS, WALTER (d. 1327), archbishop of Canterbury, was the son of a Windsor baker, and became a clerk, or chaplain, in the service of Edward I. In 1307 Reynolds was appointed treasurer of England; in 1308 he became bishop of Worcester and in 1310 chancellor. When Robert Winchelsea, archbishop of Canterbury, died in May 1313 Edward II. prevailed upon Pope Clement V. to appoint his favourite to the vacant archbishopric, and Reynolds was enthroned at Canterbury in Feb. 1314. He continued the struggle for precedence between the archbishops of Canterbury and of York and in 1317 he laid London under an interdict after William de Melton (d. 1340), archbishop of York, had passed through its streets with his cross borne erect before him. Reynolds remained in general loyal to Edward II. until 1324, when with all his suffragans he opposed the king in defence of the bishop of Hereford, Adam of Orlton. In the events which concluded Edward's life and reign the archbishop played a contemptible part. Having fled for safety into Kent he returned to London and declared for Edward III., whom he crowned in Feb. 1327. He died at Mortlake on Nov. 16 following.

REZÁNOV, NICOLAI PETROVICH DE (1764–1807), Russian administrator under Catherine II., Paul I. and Alexander I. He was the first Russian to represent his country in Japan (1804), and instigated the first attempt of Russia to circumnavigate the globe (1803), commanding the expedition himself as far as Kamchatka. But Rezánov's monument for many years after his death was the great Russian-American Fur Company; and his interest to students of history centres round the policy involved in that enterprise.

Meeting (in 1788) Shelikov, chief of the Shelikov-Golikov Fur Company, Rezánov became interested in the merchant's project to obtain a monopoly of the fur trade in those distant dependencies. He became a partner, and, after the death of Shelikov in 1795, the leading spirit of the company, and resolved to obtain privileges analogous to those granted by Great Britain to the East India Company. He had just succeeded in persuading Catherine to sign his charter when she died, and he was obliged to begin again with the ill-balanced and intractable Paul. Rezánov's skill, subtlety and address prevailed, and shortly before the assassination of Paul he obtained his signature to the instrument which granted to the Russian-American Company, for a term of twenty years, dominion over the coast of N.W. America, from latitude 55 degrees northward; and over the chain of islands extending from Kamchatka northward and southward to Japan. This famous "trust," which crowded out all the small companies and independent traders, was a source of large revenue to Rezánov and the other shareholders, including members of the Imperial family, until the first years of the 19th century, when mismanagement and scarcity of food threatened it with ruin. Rezánov, his humiliating embassy to Japan concluded, reached Kamchatka in 1805, and found commands awaiting him to remain in the Russian colonies as Imperial inspector and plenipotentiary of the company, and to correct the abuses that were ruining the great enterprise. He travelled slowly to Sitka by way of the Islands.

At the end of a winter in Sitka, the headquarters of the company, he sailed for the Spanish settlements in California, purposing to trade his tempting American and Russian wares for foodstuffs, and to arrange a treaty for the provisioning of his colonies twice a year from New Spain. He cast anchor in the harbour of San Francisco early in April 1806, after a stormy voyage which had defeated his intention to take possession of the Columbia river in the name of Russia. Although he was received with courtesy, he was told that the laws of Spain forbade her colonies to trade with foreign powers, and that the governor of all the Californias was incorruptible. Rezánov, had it not been for a love affair with the daughter of the *comandante* of San Francisco, Don José Arguëllo, and for his personal address and diplomatic skill, with which he won over the clergy to his cause, would have failed again. As it was, when he sailed for Sitka, six weeks after his arrival, the "Juno's" hold was full of bread-stuffs and dried meats, he had the promise of the perplexed governor to forward a copy of the treaty to Spain at once, and he was affianced to the most beautiful girl in California. Shortly after his arrival in Sitka he proceeded by water to Kamchatka, where he despatched his ships to wrest the island Sakhalin of the lower Kurile group from Japan, then started overland for St. Petersburg to obtain the signature of the tsar to the treaty. He died of fever and exhaustion in Krasnoiarsk, Siberia, on March 8, 1807.

The treaty with California, the bare suggestion of which made such a commotion in New Spain, was the least of Rezánov's projects. It was sincerely conceived, for he was deeply and humanely concerned for his employees and the wretched natives who were little more than the slaves of the company. His correspondence with the company betrays a clearly defined purpose to annex to Russia the western coast of North America, and encourage immediate emigration from the parent country on a large scale. Had he lived, he might have accomplished his object. The treaty was never signed, the reforms of Rezánov died of discouragement, the fortunes of the colonies gradually collapsed, the Spanish girl who had loved Rezánov became a nun; and one of the ablest and most ambitious men of his time was forgotten in the cemetery of a poor Siberian town.

Russell, ed., *The Rezánov Voyage to Nueva California* (1926); A. Yarmotinsky, "A Rambling Note on the Russian Columbus," *New York Public Library Bulletin*, vol. xxxi. (1927). (G. AT.)

REZEKNE, a town of Latvia in 56° 30′ N., 27° 20′ E., at a railway junction between north-south and east-west lines. In spite of its position on the railway, it has not much trading importance and its population is under 20,000. Founded in 1285, under the name of Roziten, by the Teutonic Knights as a fort against the Lithuanians and Letts, the position of the town has rendered it perpetually subject to attack. In 1561 the Teutonic Knights gave it in pawn to Poland and, though captured by the Russians in 1567 and 1577, and dismantled by the Swedes during

the war of 1656–60, it continued Polish till 1773 when White Russia was united with the Russian empire. During the 1914–20 period the town was in the war zone and again suffered severely. In 1918 it passed from Russian to Latvian rule.

REZONVILLE, BATTLE OF. The name given by the French to the battle of Vionville–Mars-la-Tour (*q.v.*) in the Franco-German War (*q.v.*).

RHADAMANTHUS, in Greek mythology, son of Zeus and Europa, and brother of Minos, king of Crete. Homer represents him as dwelling in the Elysian fields (*Odyssey*, iv. 564). According to later legends, on account of his inflexible integrity, he was made one of the judges of the dead in the lower world, together with Aeacus and Minos.

RHAETO-ROMANCE LANGUAGES. The Rhetic, or Rhaetic, idioms consist of several patois which form three distinct groups separated one from another by tracts of territory in which German and Italian are spoken. They represent the Latin spoken in Raetia, whither it was first brought by the legions of Tiberius and Drusus (subjugation of Raetia 15 B.C.), and the Latin spoken in Noricum after the tribes inhabiting that country had been defeated by Publius Sirius (16 B.C.). From the close of the 5th century Raetia and Noricum became the scene of numerous migrations and Germanic invasions; cut off from the neighbouring romance-speaking populations (French and Italian) they pursued an evolution of their own. They fought hard and ceaselessly to maintain themselves against German and Italian inroads and assaults, but the long struggle resulted in a considerable diminution and disaggregation of the once very extensive and compact Rhaeto-romance domain. The study of documents of diverse kinds and resourceful philological device have established the foregoing facts, the data for which have been recently assembled by C. Pult in a paper entitled "Raetia Prima in the Middle Ages." (*See* LITERATURE.) There is evidence, for instance, of traces of romanization persisting round the Lake of Constance even after the 8th century, whilst at the same time there were still compact groups of *Romani* in the district of Salzburg. In certain areas of central and eastern Tirol, Ladin held out beyond the 13th century and in western Tirol beyond the 16th; it subsisted, indeed, later still in various localities round Venosta and Montafon. On the Rhine the country round Ragaz and Pfävers remained almost undilutedly romance down to the 17th century and in this region the Rhetic dialect lived on till the close of the same century. Sargans, Mels and the principality of Liechtenstein were Germanized at an earlier period. The district of Werdenberg up to Buchs as well as Flums with its environs, as regards romanization, appear to have been in like condition with Ragaz. North of Buchs as far as Hirschensprung the traces of romanization are less numerous. In the Glaris canton Germanization did not take place before the 11th century, and romance survived until considerably later in Kerenzerberg, on the south bank of the Lake of Walenstadt. The Unseren valley continued romance beyond the 11th century. In the Grisons canton, Prättigan and Schamfigg retained their Rhetic dialect till the beginning of the 15th century. The chief town of Grisons, Coire (Chur) clung to Ladin till the beginning of the 15th century. The Rhetic dialect is at present in process of extinction in the basins of the Noce and Avisio.

Manifold reasons explain this gradual shrinkage of the Rhetic idioms: their lack of cohesion, the multiplicity of patois presenting exceptional divergences between places not far apart, the impossibility of efficient literary output for lack of any predominant dialect, their state of general inferiority as towards the strongly constituted languages by which they have been ousted. In these circumstances, the activity displayed by the Rhetic idioms is the more remarkable. Their literature, an entirely artificial product, counts many poets of talent.

The three groups of Rhetic idioms are constituted as follows:—

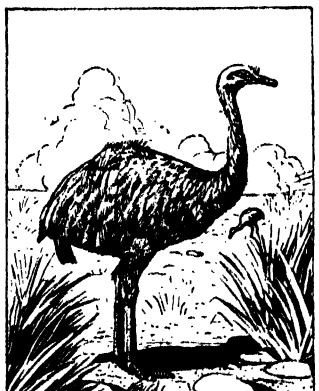
I. WESTERN GROUP.—Till recently this group was subdivided into *Romansh* and *Engadinian*. The classification now adopted is into (1) *Sursilvanian*, from the sources of the Rhine to Trins; (2) *Central Grison*, including *Subsilvanian* and *Surmeirian* (*super murum*); (3) *Engadinian*, including *Upper Engadinian* and *Lower Engadinian* (with the valley of Münster). A noteworthy fact with regard to this group is that whereas between 1850 and 1890 the population composing it declined from 42,436 to 36,472, it had risen to 37,662 in 1910 and to 39,029 in 1920.

II. CENTRAL GROUP.—This includes the patois of (1) the Burgraviato (Burggrafenamt), (2) the basin of the Noce, (3) the basin of the Avisio, (4) Livinallongo, (5) Ampezzo, (6) Comelico, (7) the basin of the Gardera, (8) Gardena, (9) Pusteria, (10) the valley of the Isarco (11) and of the Rienza; about 12,000 souls.

III. EASTERN GROUP.—Constituted by *Friulian*, at present spoken by some 450,000 persons in the province of Udine. This is divided by C. Battisti as follows:—1. *Friulano del piano*, including (a) the Udinese-goriziano group; (b) the Sacilese group (strongly penetrated with Venetian). 2. *Friulano della Carnia*, including (a) group of the Degano; (b) group of the But; (c) group of the Fella; (d) the Tolmezzano-gemonese group, which might also be called "prealpino."

(Janvier-Juin 1927), p. 157–205. *See* following numbers of the same review which in its issue of January–June 1927 announces: C. Battisti, *Rassegna critica degli studi dialettali sul friulano.* (L. B.)

RHAMPHASTIDAE: *see* TOUCAN.



RHANKAVÊS (commonly also RHANGABE), **ALEXANDROS RHIZOS** (1810–1892), Greek savant, poet and statesman, was born at Constantinople of a Phanariot family on the 25th of December 1810. He was educated at Odessa and the military school at Munich. Having served as an officer of artillery in the Bavarian army, he returned to Greece. He subsequently became ambassador at Washington (1867), Paris (1868), and Berlin (1874–1886), and was one of the Greek plenipotentiaries at the congress of 1878. After his recall he lived at Athens, where he died on June 29, 1892. He was the chief of a school of literary men whose object was to restore as far as possible the ancient classical language. Of his various works the most important are *Hellenic Antiquities* (1842–1855), *Archaeologia* (1865–1866), an illustrated *Archaeological Lexicon* (1888–1891), and a *History of Modern Greek Literature* (1877).

A complete edition of his philological works in nineteen volumes was published at Athens (1874–90), and his Ἀπομνημονεύματα (Memoirs) appeared posthumously in 1894–95.

See Sandys, *History of Classical Scholarship*, vol. iii.

RHAPSODIST, originally an epic poet who recited his own poetry; then, one who recited the poems of others (*see* HOMER).

RHATANY or **KRAMERIA ROOT,** in medicine, the dried root either of Para or of Peruvian rhatany. Its action is due to rhatania-tannic acid, and resembles that of tannic acid, being a powerful astringent. An infusion is used as a gargle for relaxed throats; and lozenges, particularly those containing rhatany and cocaine, are useful in similar cases. The powdered extract may be applied as a local haemostatic. All preparations of rhatany taken internally are powerful astringents in diarrhoea and intestinal haemorrhage.

THE RHEA (RHEA AMERICANA), FOUND ONLY IN SOUTH AMERICA

RHEA, the American "ostrich," a Ratite bird confined to South America. Three species are recognized: *R. americana*, ranging from Paraguay to Patagonia; *R. darwini*, confined to Patagonia; and *R. macrorhyncha*, of north-east Brazil. Considerably smaller than the ostrich, the rheas are further distinguished by the possession of three toes, the absence of fine plumes and the general brownish colour of the feathers, which, in *R. darwini*, are tipped with white. The feathers have a considerable market value. The rhea is polyg-

amous, and the cock bird performs the duties of incubation. Rheas frequently associate with deer or guanacos to form "mixed herds" similar to those formed by the ostrich with zebras and antelopes. *See* also OSTRICH, BIRD, RATITAE.

See C. R. Darwin, *Voyage of the Beagle;* Cunningham, *Natural History of the Straits of Magellan.*

RHEA, a Titaness, sister and consort of Cronus and mother of Zeus. For her legend, *see* CRONUS. Very little cult of Rhea existed, but she was commonly identified in historical times with Cybele (*see* GREAT MOTHER OF THE GODS). Hence such legends as that in Virgil (*Aen.*, iii. 111), that Cybele originally came from Crete; and indeed the various mother goddesses of the Mediterranean, while not actually the same, closely resemble one another and are the product of the same class of ideas and practices.

RHEINBERGER, JOSEPH GABRIEL (1839–1901), German composer, was born at Vaduz, Liechtenstein, on March 17, 1839. He studied at the Munich conservatorium from 1851 to 1854, and in 1859 became a professor there. He was from 1860 to 1866 organist of the Michelskirche, and then court conductor. His compositions include the operas *Die sieben Raben* (Munich, 1869) and *Türmers Töchterlein* (Munich, 1873), the oratorio *Christoforus*, op. 120; the well-known quartet for piano and strings in E flat, op. 38; the nonet for wind and strings, op. 139, and seventeen organ sonatas. Rheinberger's organ music is original in method, and breaks loose from the Bach tradition in many points. He died at Munich on Nov. 25, 1901.

RHEINISCH-WESTFÄLISCHE ELEKTRIZITATSWERK A.G., THE, is the largest electricity supply concern in Germany. It supplies with its combined undertakings 2·1 milliards of kilowatt hours yearly in its net-work in 115 towns and districts, distributes over 42,000 sq. kilometres in round figures, which are supplied wholly or partly with current. The power works connected by means of high tension lines produce, in round figures, 540,000 kw. or 750,000 h.p. The large power works, Goldenberg-Werk, lying in the Cologne peat coal district, the largest steam-power works in Germany, produce about 290,000 kw. Arrangements have been made to increase this to 390,000 kw.; 2,040 km. high tension lines are working and executed, to which belong 41 high tension stations. Among these there is the first installation in Europe for 220,000 volts, connecting the power works of north-western Germany and the Alps, covering about 800 km. at the utmost. The line is already working from the Rhine up to Stuttgart. The further distribution is obtained by means of medium-tension and lower-tension nets on a total length of 23,000 km. in round figures. This corresponds to about half the circumference of the equator.

The whole territory including the 15 daughter companies is marked off by contracts with the Government electro works and the Prussian State as actual spheres of interest as compared with the State undertakings from the sea coast on the Weser extending up to Frankfort on Main and thereby recognized as a natural electric exploitation district. (E. HK.)

RHENANUS, BEATUS (1485–1547), German humanist, was born in 1485 at Schlettstadt in Alsace, where his father, a native of Rheinau (hence the surname *Rhenanus*), was a butcher. He was educated at the famous Latin school of Schlettstadt, and afterwards (1503) went to Paris. In 1511 he removed to Basel, where he became intimate with Erasmus, and took an active share in the publishing enterprises of Joannes Froben (*q.v.*). In 1526 he returned to Schlettstadt, and devoted himself to a life of learned leisure, enlivened with epistolary and personal intercourse with Erasmus (the printing of whose more important works he personally superintended) and many other scholars of his time. He died at Strassburg on July 20, 1547.

His earliest publication was a biography of Geiler of Kaisersberg (1510). Of his subsequent works the principal are *Rerum Germanicarum Libri III.* (1531), and editions of *Velleius Paterculus* (ed. princeps, from a MS. discovered by himself, 1522); *Tacitus* (1519, exclusive of the *Histories*); *Livius* (1535); and *Erasmus* (with a life, 9 vols., fol., 1540–41).

See A. Horawitz, *Beatus Rhenanus* (1872), and by the same, *Des Beatus Rhenanus literarische Tätigkeit* (2 vols., 1872); also the notice by R. Hartfelder in *Allgemeine deutsche Biographie.*

RHENIUM or **DVI-MANGANESE,** a chemical element, atomic number 75, the existence of which has only been demonstrated spectroscopically; appears to occur in extremely minute traces in salts of manganese. (*See* V. Dolejšek, G. Druce, and J. Heyrovský, *Nature*, 1926.)

RHEOBASE: *see* CHRONAXIE.

RHEOSTAT, a device that is used for readily varying the resistance of an electric circuit. (*See* RESISTANCE, MEASUREMENT OF.)

RHESUS MONKEY (*Macacus rhesus*), probably the best known of all monkeys, a native of India. It is brown in colour, with long hair and a naked area on the buttocks, and is gregarious. (*See* MACAQUE.)

RHETICUS or **RHAETICUS** (1514–1576), a surname adopted by GEORGE JOACHIM, German astronomer and mathematician. Born at Feldkirch on Feb. 15, 1514, he studied at Tiguri with Oswald Mycone and afterwards went to Wittenberg, where he was appointed professor of mathematics in 1537. Being greatly attracted by the new Copernican theory, he resigned the professorship in 1539, and went to Frauenberg to associate himself with Copernicus (*q.v.*), and it was owing to his enthusiasm that Copernicus completed the *De Orbium Revolutione*. Rheticus now began his great treatise, *Opus Palatinum de Triangulis*, published in 1596, and continued to work at it while he occupied his old chair at Wittenberg, and indeed up to his death at Cassovia in Hungary, on Dec. 4, 1576.

RHETORIC, the art of using language in such a way as to produce a desired impression upon the hearer or reader. Rhetoric as an art was taught in Greece by the Sophists (*q.v.*)

The power of eloquent speech is recognized in the earliest Greek writings, but the founder of rhetoric as an art was Corax of Syracuse. In 466 a democracy was established in Syracuse. One of the immediate consequences was a mass of litigation on claims to property, urged by democratic exiles who had been dispossessed by Thrasybulus, Hieron or Gelon. Such claims, going many years back, would often require that a complicated series of details should be stated and arranged. The claimants also, in many instances, would lack documentary support, and rely chiefly on inferential reasoning. Hence the need of professional advice. The facts known as to the "art" of Corax perfectly agree with these conditions. He gave rules for arrangement, dividing the speech into five parts,—proem, narrative, arguments (ἀγῶνες), subsidiary remarks (παρέκβασις) and peroration. Next he illustrated the topic of general probability (εἰκός), showing its two-edged use: *e.g.*, if a puny man is accused of assaulting a stronger, he can say, "Is it likely that I should have attacked him?" If vice versa, the strong man can argue, "Is it likely that I should have committed an assault where the presumption was sure to be against me?" This topic of εἰκός, in its manifold forms, was in fact the great weapon of the earliest Greek rhetoric and it was further developed by Tisias, the pupil of Corax, as we see from Plato's *Phaedrus.*

Its later developments were largely due to Gorgias and Lysias, and in a greater degree to Antiphon and Isocrates (*see* their separate biographies). But the detailed study of the art begins with Aristotle's *Rhetoric* (written 322–320 B.C.)

Aristotle's "Rhetoric."—Aristotle sets out from the proposi-

tion that rhetoric is properly an art, because when a speaker persuades, it is possible to find out why he succeeds in doing so. It is, in fact, the popular branch of logic. Hitherto, Aristotle says, writers on rhetoric have concerned themselves mainly with the exciting of emotions. All this is very well, but "it has nothing to do with the matter in hand; it has regard to the judge." The true aim should be to *prove* your point, or seem to prove it.

Aristotle does not sufficiently regard the question: What, as a matter of experience, is most persuasive? Logic may be more persuasive with the more select hearers of rhetoric; but rhetoric is for the many, and with the many appeals to passion will sometimes, perhaps usually, be more effective than syllogism. No formulation of rhetoric can correspond with fact which does not leave it absolutely to the genius of the speaker whether reasoning (or its phantom) is to be what Aristotle calls it, the "body of proof" (*σῶμα πίστεως*) or whether the stress of persuading effort should not be rather addressed to the emotions of the hearers.

His statement, that the master of logic will be the master of rhetoric, is a truism if we concede the essential primacy of the logical element in rhetoric. Otherwise it is a paradox; and it is not in accord with experience, which teaches that speakers incapable of showing even the ghost of an argument have sometimes been the most completely successful in carrying great audiences along with them. Aristotle never assumes that the hearers of his rhetorician are as *οἱ χαρίεντες*, the cultivated few; on the other hand, he is apt to assume tacitly—and here his individual bent comes out—that these hearers are not the great surging crowd, the *ὄχλος*, but a body of persons with a decided, though imperfectly developed, preference for sound logic.

What is the use of an art of rhetoric? It is fourfold, Aristotle replies. Rhetoric is useful, first of all, because truth and justice are naturally stronger than their opposites. When awards are not duly given, truth and justice must have been worsted by their own fault. This is worth correcting. Rhetoric is then (1) *corrective*. Next, it is (2) *instructive*, as a popular vehicle of persuasion for persons who could not be reached by the severer methods of strict logic. Then it is (3) *suggestive*. Logic and rhetoric are the two impartial arts; that is to say, it is a matter of indifference to them, as arts, whether the conclusion which they draw in any given case is affirmative or negative. Suppose that I am going to plead a cause, and have a sincere conviction that I am on the right side. The art of rhetoric will suggest to me what might be urged on the other side; and this will give me a stronger grasp of the whole situation. Lastly, rhetoric is (4) *defensive*. Mental effort is more distinctive of man than bodily effort; and "it would be absurd that, while incapacity for physical self-defence is a reproach," incapacity for mental defence should be no reproach. Rhetoric, then, is corrective, instructive, suggestive, defensive. But what if it be urged that this art may be abused? The objection, Aristotle answers, applies to all good things, except virtue, and especially to the most useful things. Men may abuse strength, health, wealth, generalship.

The Period from Alexander to Augustus.—Aristotle's method lived on in the Peripatetic school. Meanwhile the fashion of florid declamation or strained conceits prevailed in the rhetorical schools of Asia, where, amid mixed populations, the pure traditions of the best Greek taste had been dissociated from the use of the Greek language. The "Asianism" of style which thus came to be contrasted with "Atticism" found imitators at Rome. Hermagoras of Temnos in Aeolis (*c.* 110 B.C.) did much to revive a higher conception. Using both the practical rhetoric of the time before Aristotle and Aristotle's philosophical rhetoric, he worked up the results of both in a new system—following the philosophers so far as to give the chief prominence to "invention." He thus became the founder of a rhetoric which may be distinguished as the scholastic. Through the influence of his school, Hermagoras did for Roman eloquence very much what Isocrates had done for Athens. Above all, he counteracted the view of "Asianism," that oratory is a mere knack founded on practice, and recalled attention to the study of it as an art.

Cicero's rhetorical works are to some extent based on the technical system to which he had been introduced by Molon at Rhodes. But Cicero further made an independent use of the best among the earlier Greek writers, and he could draw, at least in the later of his treatises, on a vast fund of reflection and experience. The result is certainly to suggest how much less he owed to his studies than to his genius. Some consciousness of this is perhaps implied in the idea which pervades much of his writing on oratory, that the perfect orator is the perfect man. The same thought is present to Quintilian, in whose great work, *De Institutione Oratoria*, the scholastic rhetoric receives its most complete expression (*c.* A.D. 90). He treats oratory as the end to which the entire mental and moral development of the student is to be directed. Thus he devotes his first book to an early discipline which should precede the orator's first studies, and his last book to a discipline of the whole man which lies beyond them. After Quintilian, the next important name is that of Hermogenes of Tarsus, who under Marcus Aurelius made a complete digest of the scholastic rhetoric from the time of Hermagoras of Temnos (110 B.C.) in five extant treatises, remarkable for clearness and acuteness. Hermogenes continued for nearly a century and a half to be one of the chief authorities in the schools. Longinus (*q.v.*) (*c.* A.D. 260) published an *Art of Rhetoric* which is still extant: and the more celebrated treatise *On Sublimity* (*περὶ ὕψους*), if not his work, is at least of the same period. In the later half of the 4th century Aphthonius (*q.v.*) composed the "exercises" (*προγυμνάσματα*) which superseded the work of Hermogenes. At the revival of letters the treatise of Aphthonius once more became a standard text-book. Much popularity was enjoyed also by the exercises of Aelius Theon (of uncertain date; *see* THEON). (*See* further the editions of the *Rhetores Graeci* by L. Spengel and by Ch. Walz.)

Rhetoric Under the Empire.—During the first four centuries of the empire the practice of the art was in greater vogue than ever before or since. First, there was a general dearth of the higher intellectual interests: politics gave no scope to energy; philosophy was stagnant, and literature, as a rule, either arid or frivolous. Then the Greek schools had poured their rhetoricians into Rome, where the same tastes which revelled in coarse luxury welcomed tawdry declamation. The law-courts of the Roman provinces further created a continual demand for forensic speaking. The public teacher of rhetoric was called "sophist," which was now an academic title, similar to "professor" or "doctor." In the 4th century B.C. Isocrates had taken pride in the name of *σοφιστής*, which, indeed, had at no time wholly lost the good, or neutral, sense which originally belonged to it.

Vespasian (A.D. 70–79), according to Suetonius, was the first emperor who gave a public endowment to the teaching of rhetoric. Under Hadrian and the Antonines (A.D. 117–180) the public chairs of rhetoric became objects of the highest ambition. The Rhetorical school (*θρόνοι*) had two chairs, one for "sophistic," the other for "political" rhetoric. By "sophistic" was meant the academic teaching of rhetoric as an art, in distinction from its "political" application to the law-courts. The "sophistical" chair was superior to the "political" in dignity as in emolument, and its occupant was invested with a jurisdiction over the youth of Athens similar to that of the vice-chancellor in a modern university. The Antonines further encouraged rhetoric by granting immunities to its teachers. Three "sophists" in each of the smaller towns, and five in the larger, were exempted from taxation (*Dig.* xxvii. 1, 6, §2). The wealthier sophists affected much personal splendour. The aim of the sophist was to impress the multitude. His whole stock-in-trade was style, and this was directed to astonishing by *tours de force*. The scholastic declamations were chiefly of two classes. (1) The *suasoriae* were usually on historical or legendary subjects, in which some course of action was commended or censured (*cf.* Juv. *Sat.*). These *suasoriae* belonged to deliberative rhetoric (the *βουλευτικὸν γένος*, *deliberativum genus*). (2) The *controversiae* turned especially on legal issues, and represented the forensic rhetoric (*δικανικὸν γένος iudiciale genus*). But it was the general characteristic of this period that all subjects were treated alike in the style and spirit of that third branch which Aristotle distinguished, the rhetoric of *ἐπίδειξις* or "display." This academic oratory is shown under various aspects.

and presumably at its best, by such writers as Dio Chrysostom at the end of the 1st century, Aelius Aristeides (*see* ARISTEIDES, AELIUS) in the 2nd (the chief rhetorician under the Antonines) Themistius, Himerius and Libanius in the 4th. Amid much which is tawdry or vapid, these writings occasionally present passages of true literary beauty, while they constantly offer matter of the highest interest to the student.

The Middle Ages and the Renaissance.—In the mediaeval system of academic studies, grammar, logic and rhetoric were the subjects of the trivium, or course followed during the four years of undergraduateship. Music, arithmetic, geometry and astronomy constituted the quadrivium, or course for the three years from the B.A. to the M.A. degree. These were the seven liberal arts. In the middle ages the chief authorities on rhetoric were the latest Latin epitomists, such as Martianus Capella (5th cent.), Cassiodorus (5th cent.) or Isidorus (7th cent.).

After the revival of learning the better Roman and Greek writers gradually returned into use. Some new treatises were also produced. Leonard Cox (d. 1549) wrote *The Art or Craft of Rhetoryke*, partly compiled, partly original, which was reprinted in Latin at Cracow. The *Art of Rhetorique*, by Thomas Wilson (1553), afterwards secretary of state, embodied rules chiefly from Aristotle, with help from Cicero and Quintilian. About the same time treatises on rhetoric were published in France by Tonquelin (1555) and Courcelles (1557). The general aim at this period was to revive the best teaching of the ancients. At Cambridge in 1570 the study of rhetoric was based on Quintilian, Hermogenes and the speeches of Cicero viewed as works of art. An Oxford statute of 1588 shows that the same books were used there. In 1620 George Herbert was delivering lectures on rhetoric at Cambridge, where he held the office of public orator. The decay of rhetoric as a formal study at the universities set in during the 18th century. The function of the rhetoric lecturer passed over into that of correcting written themes; but his title remained long after his office had lost its primary meaning. If the theory of rhetoric fell into neglect, the practice, however, was encouraged by the public exercises ("acts" and "opponencies") in the schools. The college prizes for "declamations" served the same purpose.

Modern Writers on Rhetoric.—The fortunes of rhetoric in the modern world, as briefly sketched above, may suffice to suggest why few modern writers of ability have given their attention to the subject. One of the most notable modern contributions to the art is the collection of commonplaces framed (in Latin) by Bacon, "to be so many spools from which the threads can be drawn out as occasion serves," a truly curious work of that acute and fertile mind, and quite in the spirit of Aristotle's treatise. The popularity enjoyed by Blair's *Rhetoric* in the latter part of the 18th and the earlier part of the 19th century was merited rather by the form than by the matter. Campbell's *Philosophy of Rhetoric*, which found less wide acceptance than its predecessor, was superior to it in depth, though often marred by an imperfect comprehension of logic. But undoubtedly the best modern book on the subject is Whately's *Elements of Rhetoric*. Starting from Aristotle's view, that rhetoric is "an offshoot from logic," Whately treats it as the art of "argumentative composition." He considers it under four heads: (1) the address to the understanding (= Aristotle's λογικὴ πίστις); (2) the address to the will, or persuasion (=Aristotle's ἠθικὴ and παθητικὴ πίστις); (3) style; (4) elocution, or delivery. But when it is thus urged that

> All a rhetorician's rules
> But teach him how to name his tools,

the assumption is tacitly made that an accurate nomenclature and classification of these tools must be devoid of practical use. The conditions of modern life, and especially the invention of printing, have to some extent diminished the importance which belonged in antiquity to the art of speaking, though modern democratic politics and forensic conditions still make it one which may be cultivated with advantage.

BIBLIOGRAPHY.—Among more modern works are J. Bascom, *Philosophy of Rhetoric* (New York, 1885); and numerous books on voice culture, gesture and elocution. For ancient rhetoric *see* Sir R. C. Jebb's translation of Aristotle's *Rhetoric* (ed. J. E. Sandys, 1909), and his *Attic Orators* (1876); also Spengel, *Artium Scriptores* (1828); Westermann, *Gesch. der Beredtsamkeit* (1833–35); Cope, in the *Cambridge Journal of Classical and Sacred Philology* (1855–57); introductions to Cicero's *De Oratore* (A. S. Wilkins) and *Orator* (J. E. Sandys); Volkmann, *Die Rhetorik der Griechen und Römer in system. Übersicht* (ed. 2, 1885); Norden, *Die Antike Kunstprosa* (1898).

(R. C. J.; X.)

RHEUMATISM, a general term for various forms of disease subdivided more accurately as follows:

Acute Rheumatism or Rheumatic Fever.—This disease, the chief characteristics of which are inflammatory affections of the joints with severe constitutional disturbances, is usually associated with inflammation of the pericardium and of the valves of the heart. In childhood the heart is especially liable to be damaged, whereas in adults joint manifestations and constitutional disturbances are more in evidence. It is essentially a disease of childhood and early adult life, first attacks being most common about the seventh or eighth year of life and later attacks up to about the twenty-fifth year. It never occurs under two years of age and is comparatively rare over forty. Heredity is commonly supposed to be a predisposing cause but it is very doubtful whether this is correct. The importance of climate is shown by the prevalence of the disease in the temperate zone and by its seasonal incidence (October to March) in England; on the other hand, troops in Egypt and South Africa suffer from the disease, Pretoria being notoriously bad. The disease is urban rather than rural in distribution and is essentially one of children of the artisan class living in damp rooms in an industrial town, attending an elementary school and suffering from tonsillar sepsis.

It is now generally agreed that rheumatism is a specific infectious disease, but there is still some difference of opinion as to the exact nature of the causal micro-organism. Most authorities, however, agree that the causative organism belongs to the group of streptococci (*see* BACTERIOLOGY) and gains entrance to the body through the tonsils. Evidence has been produced that in children whose tonsils have been removed a subsequent attack of rheumatism is likely to be less severe in all its manifestations except chorea. (*See* below.)

Symptoms.—Although the main features of the disease in children and adults are different, it is probably all one disease, having periods during which it remains latent for a longer or shorter time between acute exacerbations. In childhood a history of sore throats and indefinite pains—"growing pains"—can usually be obtained; the constitutional symptoms are often ill-marked and the child does not appear very ill. This insidious onset makes the disease of vast importance to the country, as in many cases its presence is not recognized until irreparable damage has been caused to the heart. Chorea or St. Vitus's dance is a common manifestation in children, and in these cases the heart is less likely to be damaged. Small, painless, rather hard subcutaneous nodules attached to tendons may appear and indicate that the disease is passing into a chronic condition.

In adults the most marked feature is the affection of the joints. The onset is abrupt, being fully developed in 24 hours. The attack begins with a feeling of malaise and pain in one or more joints generally of medium or large size. Usually only one or two joints are affected at first, but soon others become attacked very often symmetrically. The affected joints are swollen, hot and acutely painful; the temperature is raised to about 101° to 103° F; the tongue is coated with a thick fur and the body bathed in a profuse perspiration which has a characteristic sour smell: the face is flushed and the pulse rapid. The attacks are of variable duration up to some weeks, and relapses are common during convalescence. The most dangerous complication is hyperpyrenia or rapid and extreme rise of temperature (*see* FEVER) possibly up to 110° F, when death speedily ensues unless prompt measures are taken such as tepid sponging or icepacks. This is not a common complication and for some unknown reason is becoming rarer; it appears most commonly in the second week of the first attack but never in a person under 12 years of age. The disease is not fatal, the mortality not exceeding 3%, and is less virulent than formerly; it is, however, the cause of much chronic disease in later life owing to its effect upon the heart. It is estimated that in England and Wales 25,000 persons die annually

from heart disease of rheumatic origin.

Treatment.—Absolute rest in bed is essential to prevent damage to the heart if possible. The patient should lie between blankets and wear flannel garments; the affected joints should be given complete rest and be wrapped in cotton wool and the weight of the bed clothes supported over them. Sodium salicylate appears to have a specific effect in the acute stages by relieving pain, lowering temperature and cutting short the attack. It should be given frequently and in fairly large doses for the first 24 hours and then the interval lengthened and the dose decreased; care must be exercised not to produce toxic symptoms. The drug is of less use in children than in adults as it does not seem to have any influence in arresting the cardiac inflammation. Aspirin may succeed when salicylates fail. Some authorities render the urine alkaline with sodium bicarbonate.

Subacute Rheumatism.—No definite dividing line exists between this and the acute condition. All symptoms are less marked, heart lesions are common and the duration may be long.

Chronic Rheumatism.—This is a term loosely applied to pain and stiffness in the joints. Some think it cannot be separated from rheumatoid arthritis (*q.v.*), others that it is an inflammation of the fibrous tissues round a joint. One or more joints may be affected and become slightly swollen, and after a time they may be felt to creak on movement. It is usually brought on by cold and wet, and the pain is most marked after rest. The general health is little affected unless the pain be severe and continuous. It rarely follows acute rheumatism.

Muscular Rheumatism.—This is a painful affection of voluntary muscles due to inflammation of their fibrous and tendinous attachments. It results from overstrain and exposure to cold and damp. There is intense pain on attempted movement involving the muscles affected; when the muscles are at rest the pain disappears. The commonest forms are: (1) *Lumbago* (*q.v.*), affecting the lower part of the back. Stooping, and more especially rising again, cause severe pain; (2) *Torticollis* or stiff neck, affecting the muscles on one side of the neck. Salicylates are sometimes of use in the chronic varieties, but active treatment is usually required such as the various applications of heat, massage, hot douches or electricity. In chronic rheumatism the waters at various spas are often of great benefit, and wintering in a warm, dry, sunny climate is an advantage when practicable. In muscular rheumatism rest of the affected muscles is essential.

Special clinics for rheumatic diseases are in existence in Europe apart from that treatment given to chronic forms in the various spas. (*See* MINERAL WATERS.) At the time of writing the British Red Cross is proposing to establish in thickly populated centres of the country fully equipped clinics for the treatment of rheumatism in adult sufferers. The project is receiving cordial support by the Ministry of Health, various friendly societies and trade unions and the medical profession.

(P. L.-B.)

RHEUMATOID ARTHRITIS, a disease characterized by destructive changes in the joints. Its origin is unknown but it is probably caused either by micro-organisms themselves affecting the joints or by the absorption of the toxins of micro-organisms in some other site such as the intestine, or mouth. In many cases injury appears to be the determining factor and any condition tending to lower the general health may act as a predisposing cause.

In adults there are two main groups:

(1) *The Acute or peri-articular type* in which the onset is usually between 20 and 40 years of age and women are more often affected than men. It is usually acute and many joints may be affected at the outset, the condition being mistaken for acute rheumatism; pain is variable but often severe except at rest. The joints become swollen and fusiform in shape and tender to the touch; those most frequently attacked are (*a*) hands and feet; (*b*) wrists; (*c*) ankles; (*d*) knees; but any other joint may be affected. The temperature in the acute onset may rise to 103° F but is often less. As the attack subsides the swelling diminishes but there is usually considerable muscular wasting and marked contractures which may result in severe deformity, fixation and loss of function of the joints, the patient becoming a complete cripple.

(2) *The Chronic or Osteo-Arthritic Type.*—The onset is usually between 40 and 60 years of age, the causes assigned being injury, general ill-health and exposure to cold and wet. Pyorrhoea alveolaris or decayed or deficient teeth are practically always present. The onset is chronic and generally polyarticular; pain is variable and may be slight throughout. The swelling of the joints is nodular in shape and practically confined to the joint itself, affection of the periarticular structures being slight. When the condition is polyarticular usually a few large joints are affected, but none are immune; when monarticular the hip or knee is most likely to be affected. The formation of the new bone occurs and may cause great limitation of movement or even ankylosis; when this occurs in the spine the condition known as "pokerback" results. In the later stages the limitation of movement and muscular wasting may render the patient absolutely helpless but the condition is then often quiescent and painless.

(3) A third type of arthritis which occurs in children is known as *Still's disease.* The onset at about three to six years of age is usually insidious but may be acute. The joints become swollen and fusiform in shape and there is severe muscular wasting and limitation of movement. There is generalized enlargement of glands, sweating is common and the temperature is often persistently about 100° F.

The prognosis of all forms is bad, exacerbations and advance being the rule; in children an intercurrent disease is often fatal.

Early diagnosis is essential for successful treatment. Search should be made for a septic focus, which should be removed if found. The general health should be attended to and improved, the diet not being stinted: meat and vegetables may be given freely but indigestible articles avoided. The patient should live on a dry soil. In the acute stage the joints should be given complete rest in a good position and oil of wintergreen applied. In the chronic forms and as the acute stage passes off the joints should not be kept completely at rest, massage and passive movement followed later by active movement up to a moderate amount of exercise being desirable to counteract muscular wasting and contractures. Spa treatment, radiant heat, hot-air baths and electrical treatment are also of use, and in recent years radium has been used. If an X-ray photograph shows that bony outgrowth is limiting movement, an operation for its removal should be considered; similarly adhesions may have to be broken down forcibly under an anaesthetic. Whatever the form of treatment adopted it must be persevered with for some weeks before being given up as of no value.

(P. L.-B.)

RHEYDT, a town in the Prussian Rhine province, situated on the Niers, 19 m. W. of Düsseldorf, on the main line of railway to Aix-la-Chapelle, and at the junction of lines to Crefeld and Stolberg. Pop. (1925) 45,095. Rheydt is an ancient place, but its industrial importance is of very recent growth, and it only received municipal rights in 1856. The principal products of its numerous factories are silk, cotton, woollen and mixed fabrics, velvet, iron goods, machinery, shoes, cables, soap and cigars. Dyeing, brewing and distilling are also carried on.

RHIANUS, Greek poet and grammarian, a native of Crete, friend and contemporary of Eratosthenes (275–195 B.C.). Suidas says he was at first a slave and overseer of a palaestra, but obtained a good education later in life, and devoted himself to grammatical studies, probably in Alexandria. Of his works none have been preserved except eleven epigrams. But he was chiefly known as a writer of epics, the most celebrated of which was the *Messeniaca* in six books, dealing with the second Messenian war and the exploits of Aristomenes. Other similar poems were the *Achaica, Eliaca, Thessalica* and *Heracleia.*

Fragments in A. Meineke, *Analecta Alexandrina* (1843); for Rhianus's work in connection with Homer, *see* C. Mayhoff, *De Rhiani Studiis Homericis* (Dresden, 1870); also W. Christ, *Geschichte der griechischen Literatur* (1898).

RHIGAS, CONSTANTINE, known as Rhigas of Velestinos (Pherae), or Rhigas Pheraios (1760–1798), Greek patriot and poet, was born at Velestinos, and was educated at Zagora and at Constantinople, where he became secretary to Alexander Ypsilanti. In 1786 he entered the service of Nicholas Mavrogenes, hospodar of Wallachia, at Bucharest, and when war broke out between Turkey and Russia in 1787 he was inspector of the troops at Craiova. Rhigas then became interpreter at the French Consulate at Bucharest, where he wrote the famous Greek version of the *Marseillaise,* well known in Byron's paraphrase as "sons of the Greeks, arise." He founded the patriotic society called the Hetaireia. He went to Vienna to organize a revolutionary movement among the exiled Greeks and their foreign supporters in 1793, or possibly earlier. There he founded a Greek press, but his chief glory was the collection of national songs (posthumously printed 1814) which, passed from hand to hand in MS., roused patriotic enthusiasm throughout Greece. While at Vienna Rhigas entered into communication with Bonaparte, to whom he sent a snuff-box made of the root of a laurel tree taken from the temple of Apollo, and he set out to meet him at Venice. But before leaving Vienna he forwarded papers, amongst which is said to have been his correspondence with Bonaparte, to a compatriot at Istria. These fell into the hands of the Austrian government, and Rhigas was arrested at Trieste and handed over with his accomplices to the Turkish authorities at Belgrade. His five companions were secretly drowned, and Rhigas was shot.

See Rizos Néroûlos, *Histoire de la révolution grecque* (Paris, 1829); I. C. Bolanachi, *Hommes illustres de la Grèce moderne* (Paris, 1875); and Mrs. E. M. Edmonds, *Rhigas Pheraios* (London, 1890).

RHINE, one of the most important rivers in Europe. It is about 850 m. in length. It rises in Switzerland, later forms the boundary between Switzerland and Austria, then between Switzerland and Germany, France and Germany, then flows through Germany and finally through Holland to enter the North sea.

Switzerland.—In the Swiss portion two mountain rivers, the *Hinter Rhein* and the *Vorder Rhein,* unite at Reichenau, 6 m. south-west of Coire, to form the main stream. The principal stream the *Hinter Rhein,* issues (7,271 ft.) from the glaciers of the Rheinwaldhorn (Adula group) west of Splügen and flows eastward through the Rheinwald as a subsequent stream, parallel to the strike of the tectonic structures at this point (for geology *see* Alps). On reaching the Schams valley it is diverted northward and flows towards Reichenau parallel to a number of consequent streams (their direction having been determined by the original structural surface of the land) some of which the *Vorder Rhein* has already beheaded. It receives many tributaries, the most important being the Albula (right) below Thusis.

The *Vorder Rhein,* a subsequent stream flowing along the strike of the structures, rises in Toma lake (7,691 ft.) near the Oberalp pass and is joined by a number of consequent (right) and obsequent streams (left) as it flows eastward past Disentis and Ilanz to Reichenau.

The valley of the combined river now becomes wider and is alluvium-filled. The consequent northward direction is again followed below Coire (Chur) as far as Lake Constance. The largest affluents still join it on the right.

Below Buchs the valley becomes wider, the river meanders about, "is corrected" in many places, shortened by a canal at Diepoldsau and finally enters Lake Constance (*q.v.*) across a marshy delta. Between Sargans and the lake it forms the boundary between Switzerland and Liechtenstein and Austria. On leaving the lake at Constance the Rhine flows westward as far as Basle. It drops 400 ft. along this stretch, the first part of which is across the Tertiary and Jurassic rocks of eastern Switzerland.

Between Constance and Basle it receives important affluents along its left bank. Draining the northern slopes of the Glarus and Bernese Alps are a number of consequent streams the most important being the Linth (Limmat), Reuss and the Aar.

Germany.—At Basle the Rhine turns sharply northward and assumes an entirely new complexion. Its course lies through the famous rift valley of the Rhine between the Vosges and the Black forest massifs and was initiated in Lower Oligocene times. It meanders as a wide stream with low banks and containing many islands. The river, which in the interests of navigation has been frequently "corrected," lies in a flat valley 20 m. wide which ends abruptly against the massifs on both sides. Also flowing in the valley is the tributary (left), the Ill, which rises near Basle and flows parallel to the Rhine for over 50 m. to join it below Strasbourg.

The Rhine forms the boundary between France and Germany from Basle to near Lauterbourg, opposite Karlsruhe, beyond which the river, flowing through Germany, passes Mannheim, where it is joined by the Neckar (right), Worms and Mainz, where it is joined by the Main (right). Here its course is blocked by the Armorican range of the Taunus and so the river turns sharply westward through a steep sided gorge to Bingen where it is joined by the Nahe (left). After Bingen it again resumes a northerly course but its valley is still a narrow cut through contorted Devonian slates and greywackes. It is joined by the Lahn (left) and then at Coblenz by the Moselle (left) which rises in the Vosges and drains, with its tributary the Saar, the region between the Vosges and the Ardennes. At Coblenz the valley becomes wider only to narrow again as the river passes on to Bonn, between the Eifel and the Westerwald uplands.

At Bonn the river leaves the Armorican ranges and passes on to Tertiary, glacial and alluvial deposits, but the hills continue to rise on the right of the river as far as Düsseldorf. The Rhine now passes through the great industrial region of western Germany, is very sluggish and meanders over an almost level plain.

Holland.—In Holland its course is again westward. Almost immediately after entering this country the river divides into two arms, the larger of which, carrying off about two-thirds of the water, diverges to the west and is called the Waal, whilst the smaller, which is still called the Rhine, sends off another arm, the Ijssel, to the Zuider Zee. The Waal is joined on the left by the Maas (Meuse) and after passing Nijmegen and Dordrecht enters the North sea by way of the Hollandsch Diep.

Further subdivision takes place and the entire district between the Waal and the Ijssel in reality belongs to the delta of the famous river, built by alluvium from the Alps and Britain in preglacial times, covered by glacial deposits and latterly in places again covered with mud of the great river.

Navigation.—The Rhine has been one of the chief waterways of Europe from the earliest times; and its channel has been comparatively easy to keep open. The position of the river is highly favourable for the development of its trade. It flows through regions rich in mineral resources and the most populous of Europe, to discharge into one of the most frequented seas opposite Great Britain. Besides serving as a natural outlet for Germany, Belgium and Holland, it is connected with a great part of central and southern France by the Rhine-Rhone and the Rhine-Marne and other canals, and with the basin of the Danube by the Ludwigskanal.

In 1831 a system was agreed upon which practically gave free navigation to vessels of the riverine states, while imposing a moderate tariff upon foreign ships. After the war of 1866, Prussia negotiated with Baden, Bavaria and Hesse-Darmstadt with a view to the removal of all tolls, but it was not until 1868 that the river was thrown open without any restriction. The management of the channel and navigation was then vested in a central commission meeting at Mannheim each year. The treaty of Versailles (1920), while deciding that the act of Mannheim should under certain conditions continue to regulate navigation on the Rhine, put the vessels of all nations on the same footing as vessels belonging to the Rhine navigation. The composition of the central commission was modified by the admission of Switzerland, Belgium, Great Britain and Italy. The Versailles terms were completed in 1921 by a protocol of adhesion on the part of the Netherlands. The Barcelona convention (1921) applies to the Rhine and takes precedence, if necessary, over the Mannheim convention. For details of the international régime *see* Inland Water Transport.

The introduction of steam has greatly increased the shipping

on the Rhine, and small steamers ply also on the Main, Neckar, Maas and Moselle. The steamboat traffic has especially encouraged the influx of tourists. Large passenger boats ply regularly between Mainz and Düsseldorf, and sometimes extend their journey as high up as Mannheim, and as far in the other direction as Rotterdam. The river is navigable without interruption from Basle to its mouth, a distance of 550 m. Above Spires, however, the river craft are comparatively small. Between Basle and Strasbourg the depth of water is sometimes not more than 3 ft., between Strasbourg and Mainz it varies from 5 to 25 ft., while below Mainz it is never less than 9 or 10 feet. The efforts of the river authorities are being directed to the deepening and improvement of the navigable channel from the sea to Strasbourg. Two navigable channels of sufficient depth for all vessels which ply up and down that part of the stream, have been blasted out where rapids occur near Bingen. The difficulties in the river channel above Strasbourg, which are augmented by a steep gradient and swift current, are such that any plans to improve the river in this stretch are too expensive to be feasible. A parallel canal in the lateral plains of Alsace to the left is the solution proposed. It will begin at Huningue, where a huge dam will be constructed to regulate the water, and continue to Strasbourg, having at each of its eight locks a gigantic power plant. The total power generated by the plants should be about 700,000 h.p. which will be available for the industrial establishments in the region, and help also to pay the cost of the project.

At the chief river-mouth ports, Rotterdam, Antwerp and Amsterdam, merchandise is transferred from ocean steamers to river steamers or *vice versa*. Nearly three-fourths of the Rhine traffic passes through Rotterdam which is the only one of these ports directly on the Rhine. Amsterdam is connected by the Merwede canal and the difficulties of navigation in the canal have considerably reduced this port's share of the traffic. The passage to Antwerp is indirect and plans are going forward to connect the Belgian city directly with the Rhine by extending the Scheldt-Meuse canal to Ruhrort. Duisburg, Ruhrort and Cologne are the principal export ports in the central reaches of the river. They have expanded rapidly with the exploitation of the coal mines and the building up of the great industrial region of the Ruhr valley. Capacious harbours have been formed in the low-lying basins of the valley, and river facilities are supplemented by the Herne canal which traverses the heart of the Ruhr section and continued as the Ems canal connects with the intricate inland waterway system of central and northern Germany. The chief ports of the Upper Rhine—Mannheim, Rheinau, Ludwigshafen and Strasbourg—are places of transfer from river to railway. They deliver and collect from the southern markets of Germany and Switzerland. From Mainz there is passage via the Main river and the Ludwig canal, which it is expected to improve or supplement, to the Danube river.

Four-fifths of the Rhine traffic is made up of fuels, ores and cereals, all heavy commodities. Trade in them thrives best when they may be shipped by water routes. Coal at present constitutes the principal cargo. Originating in the Ruhr district it supplies Holland and Belgium at the mouth of the river, reaches Switzerland and even Italy to the South and supplies the extensive industrial and domestic demands of the territory in between. Its presence has given value to the ores which form the second most important cargo and the two in combination have given rise to the extensive metallurgical industries of the Rhine region which have built up the Rhine cities and increased the density of population. In the demands of the latter originates the cereal cargo, made necessary since the Rhine raises little of its foodstuffs. The cereals come principally from Russia, Rumania, the United States and Argentina, being trans-shipped from the river-mouth ports. London, Hamburg, Bremen and the chief Baltic ports also participate in the Rhine traffic. These extensive ramifications have made the control of Rhine navigation an international problem rather than one affecting only Rhine states.

The commerce carried on by the river itself is supplemented by the numerous railways which skirt its banks and converge to its principal towns. Before the introduction of railways, there were no permanent bridges across the Rhine below Basle; but now trains cross it at a dozen different points in Germany and Holland.

The Rhine has always exercised a fascination over the German mind. "Father Rhine" is the centre of the German's patriotism and the symbol of his country. In his literature it has played a prominent part from the *Nibelungenlied* to the present day; and its romantic legends have been alternately the awe and delight of his childhood. The Rhine was the classic river of the middle ages.

But of late years the beauties of the Rhine have become sadly marred; the banks in places, especially between Coblenz and Bonn, disfigured by quarrying, the air made dense with the smoke of cement factories and steam-tugs, commanding spots falling a prey to the speculative builder and villages growing up into towns.

For the demilitarization of the Rhine under the Versailles Treaty *see* Rhineland, The, below.

Antoine, *L'aménagement du Rhin de Bâle à Strasbourg* (1922).

RHINELAND, THE. In the loose political sense the word "Rhineland" is used to designate the Prussian province called *Rhein-provinz* as well as parts of the Prussian province of Hesse-Nassau, parts of the Free State of Hesse, the Bavarian Palatinate and most of the Free State of Baden. The Prussian Rhine province, situated on both banks of the Rhine, embraces 24,547 sq.km. with 7,256,978 inhabitants (exclusive of the nearly 1,910 sq.km. of the Saar with 770,000 inhabitants).

French Plans and the Treaty Settlement.—The old Rhenish territory, a medley of feudal states partly lay, partly clerical, had been annexed by France by the peace of Lunéville 1801. Most of them were handed over to Prussia by the Congress of Vienna on Feb. 10, 1815. On the conclusion of the World War French policy aimed at detaching the left bank of the Rhine, which would cut away from Germany 8% of her territory, 11% of her population, 12% of her coal supply and 80% of her iron ores, including Alsace, in order to ensure the security of France. In the end a compromise was effected: 1. The left bank of the Rhine remained German. 2. It was to be occupied together with the bridgeheads by allied troops in three zones for 15 years, the northern zone to be evacuated after five, the next after ten, the third after 15 years, if Germany faithfully carried out the conditions of the peace. (Art. 428–29.) The left bank of the Rhine and a strip of 50 km. on the right bank was to be completely demilitarized. (Art. 42–44.) The occupation was to serve the double purpose of guarantee for the execution of the treaty, and of security to France against military aggression.

An interallied commission was set up by a separate Rhineland agreement, composed of representatives of France, England, Belgium and the United States, with the right to issue ordinances for the security of the Allied forces. It was not to interfere with the ordinary civil German administration, but might erect a custom barrier in order to safeguard the economic interests of the population (Art. 270).

The Separatist Movement.—France had allowed the Rhineland to remain part of the German republic, on the understanding that a pact of guarantee would be made with her by England and the United States. As the United States refused to ratify it, this guarantee lapsed completely. Even before this failure, French military authorities had fostered separatist movements on the left bank of the Rhine. An old established anti-Prussian prejudice of the Catholic population of the Rhine province had been worked up by a fear of the spread of Bolshevism. A genuine movement for decentralization had arisen, whose demands went as far as the creation of a new Rhineland State within the German republic. The French military authorities strongly supported Dr. Dorten's enterprise to create an independent Rhenish republic though all German parties kept aloof from it. It failed from the start as the commander in chief of the American expeditionary forces refused to have anything to do with it (May 22, 1919). When Dr. Dorten was arrested on German unoccupied territory

(July 24, 1920) the French high commissioner demanded his extradition to the occupied territory and his subsequent release.

The occupation of the Ruhr (*q.v.*) by French and Belgian troops (Jan. 10, 1923) extended to Karlsruhe (March 2, 1923) and to the districts between the bridgeheads on the right bank of the Rhine (Feb. 25). The American army withdrew on Jan. 10, 1923. The British thereafter were in a minority on the Rhineland commission. They prevented however the extension of its rule over the newly occupied districts, which were put under military control. But they could not stop the Rhineland commission from stretching its powers and from issuing decrees for the Rhineland, identical with those made by the military for the Ruhr district, though they did not carry them out in the Cologne zone, a British zone, which for some time was almost blockaded by the French.

The expulsion of German officials and leading citizens and the disarmament of the people gave the Separatist movement new life. Though official cognizance was strongly denied, preparation as well as execution were favoured by the French (and Belgian) military authorities. In many cases the Separatists had been armed with their connivance, whilst the local police when fighting them was either disarmed or arrested or otherwise hampered by the military. Notwithstanding their support, the rising in Düsseldorf (Sept. 30, 1923) was quickly quelled by the local authorities. The Rhineland republic proclaimed in Aix-la-Chapelle (Oct. 21, 1923) lasted until Nov. 2, when under pressure of the British the Belgian government disavowed the movement. The "Putsch" in Coblenz, Wiesbaden and Mainz organized by Dorten and Matthes quickly collapsed in the first month of the new year.

It was only in the Bavarian Palatinate that the movement, which was almost officially fathered by General de Metz, lingered a little longer. He informed the Bavarian government on Oct. 25 that the Palatinate had ceased to be part of Bavaria. The Separatists ejected nearly 20,000 people with French help. The population strongly retaliated and there was a kind of civil war, in which the Separatists fared badly. Early in February the legitimate officials returned. But it was only in March 1924 that complete order was restored. The transfer of General de Metz in Nov. 1924 definitely marked the end of this episode.

The expenditure for the passive resistance in Rhine and Ruhr had completely drained Germany's financial resources. After stabilization it was doubtful whether she would be able to go on supporting the occupied provinces. The complete cessation of all relief was suggested. This being done, the responsibility for Rhine and Ruhr was to be thrown on the Allies. At no time since the armistice, was the French policy of wrenching the Rhineland from the *Reich* nearer its goal than during Nov. 1923.

The Dawes Plan and Locarno.—The acceptance of the Dawes plan led to the evacuation of the Ruhr and later on of Düsseldorf, Duisburg and Ruhrort. The changed attitude of the new French Government placed the discussion of the Rhine problem on a new basis. On Jan. 10, 1925 the evacuation of the northern zone was to take place if Germany had faithfully carried out the conditions of the Treaty (§ 429). The reparation question having been settled for the time being, difference of opinion arose over disarmament. Germany insisted that her disarmament was complete; the Allies announced that evacuation could not take place on the appointed day (Jan. 10), as the final report of the military control commission could not be ready by that time. During the ensuing protracted negotiations England advocated evacuation as soon as Germany had carried out the outstanding disarmament terms, whilst France interpreted the fulfilment clauses in the wider sense of giving her complete security.

The Locarno negotiations for a security pact enabled the Allies to concentrate on disarmament proper. By presenting Germany with a list of her shortcomings as to disarmament, most of which Germany was ready to amend, an agreement was reached. Cologne was evacuated on Nov. 30, 1926, by the British, whilst the last vestiges of the occupation of the northern zone disappeared at midnight Jan. 31, 1926. The occupation had lasted over a year longer than had been foreseen in the Treaty of Versailles. The Locarno treaty had separated the security problem from the occupation problem, basing the former on quite different principles.

After the evacuation of the Ruhr, Germany suggested a pact between the powers interested in the Rhine which should give a mutual guarantee for the existing frontiers. The so-called Locarno Pact was signed on Oct. 16, 1925, and by it this mutual guarantee was given. The conclusion of the Locarno agreement was almost automatically followed, though not immediately, by Germany's entry into the League of Nations.

Immediately after the entry of Germany into the League the possibilities of an early complete evacuation were discussed between Stresemann and Briand. As a price the French suggested the marketing of German reparation bonds, which could not be done without further financial concessions from Germany. This might give France a capital sum, which would enable her to start the stabilization of the franc. The plan failed, being premature from a financial point of view. The German government insisted on a reduction of the strength of the occupying army. They maintained, moreover that, as Germany was a member of the League of Nations, the continuation of occupation was quite illogical. Germany had carried out all her obligations as set down in the Treaty—apart from the reparation payments, which had become subject to a separate régime, to which occupation guarantees were no longer applicable (Art. 430).

At the meeting of the League in Geneva Sept. 1928 and again at the League Council's meeting at Lugano, they strongly pressed their legal point of view that, Germany having complied "with all the undertakings resulting from the (present) Treaty" (Art. 431) —apart from reparations which were rearranged by the Dawes Agreement—the occupying forces should be withdrawn immediately. The French and British Governments interpreted clauses 429 to 431 in a different way. But the British Government declared their willingness to consider the questions involved not as legal, but as political issues, to be settled by negotiations in the spirit of Locarno. The way to such negotiations is opened by the following resolution passed at Geneva:

> (1) The opening of official negotiations relating to the request put forward by the German chancellor regarding the early evacuation of the Rhineland,
>
> (2) The necessity for a complete and definite settlement of the reparation problem and for the constitution for this purpose of a committee of financial experts to be nominated by the six Governments.

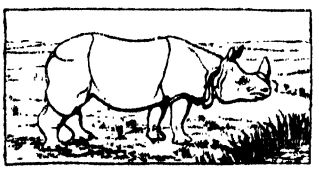
RHINELANDER, a city of northern Wisconsin, U.S.A., on the Wisconsin river, 254 m. N.N.W. of Milwaukee; the county seat of Oneida county. It is on Federal highway 8; has a municipal airport; and is served by the Chicago and North Western and the Soo Line railways. Pop. 6,654 in 1920 (82% native white). It is in the midst of the great north pine woods, and there are 232 lakes within a radius of 12 miles. The city has important manufacturing industries, including large saw and planing mills, paper mills, veneer works, a refrigerator factory, iron works, boiler shops and creameries. Rhinelander was settled in 1882 and chartered as a city in 1894. Since 1926 it has had a city-manager form of government.

RHINE PROVINCE or RHINELAND, the most westerly province of Prussia, bounded on the north by Holland, on the east by the Prussian provinces of Westphalia and Hesse-Nassau, and the Republic of Hesse, on the south-east by the Bavarian Palatinate, on the south and south-west by Lorraine, and on the west by Luxemburg, Belgium and Holland. The small district of Wetzlar in the midst of the province of Hesse-Nassau also belongs to the Rhine province, which, on the other hand, surrounds the Oldenburg province of Birkenfeld. The districts of Eupen and Malmedy in the West were ceded to Belgium in 1920. The extent of the Rhine province is 9,474 sq.m., excluding the Saar District, which has an area of 574 sq. miles. It includes about 200 m. of the course of the Rhine, which forms the eastern

frontier of the province from Bingen to Coblenz, and then flows through it in a north-westerly direction.

The southern and larger part of the Rhine province, belonging geologically to the Devonian formations of the lower Rhine, is hilly. On the left bank are the elevated plateaus of the Hunsrück and the Eifel, separated from each other by the deep valley of the Mosel, while on the right bank are the spurs of the Westerwald and the Sauerland, the former reaching the river in the picturesque group known as the Seven Mountains (*Siebengebirge*). The highest hill in the province is the Walderbeskopf (2,670 ft.) in the Hochwald, and there are several other summits above 2,000 ft. on the left bank, while on the right there are few which attain a height of 1,600 ft. Most of the hills are covered with trees, but the Eifel (*q.v.*) is a barren and bleak plateau. To the north of a line drawn from Aix-la-Chapelle to Bonn the province is flat, and marshy districts occur near the Dutch frontier. The climate varies considerably with the configuration of the surface. That of the northern lowlands and of the sheltered valleys is the mildest and most equable in Prussia, with a mean annual temperature of 50°, while on the hills of the Eifel the mean does not exceed 44°. The annual rainfall varies in the different districts from 18 to 32 inches. Almost the whole province belongs to the basin of the Rhine, but a small district in the north-west is drained by affluents of the Meuse. Of the numerous tributaries which join the Rhine within the province, the most important are the Nahe, the Mosel and the Ahr on the left bank, and the Sieg, the Wupper, the Ruhr and the Lippe on the right. The only lake of any size is the Laacher See, the largest of the extinct crater lakes of the Eifel.

Little except oats and potatoes can be raised on the high-lying plateaus in the south of the province, but on the lower ground cereal crops and fruit are grown, and tobacco, hops, flax, rape, hemp and beetroot (for sugar) are cultivated for commercial purposes. Vine-culture occupies about 30,000 acres, about half of which are in the valley of the Mosel, a third in that of the Rhine itself, and the rest mainly on the Nahe and the Ahr. The choicest varieties of Rhine wine, however, such as Johannisberger and Steinberger, are produced higher up the river, beyond the limits of the Rhine province. In the hilly districts more than half the surface is sometimes occupied by forests, and large plantations of oak are formed for the use of the bark in tanning. Considerable herds of cattle are reared on the rich pastures of the lower Rhine, but the number of sheep is small. The wooded hills are well stocked with deer, and a stray wolf occasionally finds its way from the forests of the Ardennes into those of the Hunsrück. The salmon fishery of the Rhine is very productive, and trout abound in the mountain streams.



The Rhine province is very rich in mineral resources. Besides parts of the carboniferous measures of the Saar and the Ruhr, it also contains important deposits of coal near Aix-la-Chapelle. Iron ore is found in abundance near Coblenz, the Bleiberg in the Eifel possesses an apparently inexhaustible supply of lead, and zinc is found near Cologne and Aix-la-Chapelle. The mineral products of the district also include lignite, copper, manganese, vitriol, lime, gypsum, volcanic stones (used for millstones) and slates. By far the most important item is coal. Of the numerous mineral springs the best known are those of Aix-la-Chapelle and Kreuznach.

The mineral resources of the Prussian Rhine province, coupled with its favourable situation and the facilities of transit afforded by its great waterway, have made it the most important manufacturing district in Germany. The industry is mainly concentrated round two chief centres, Aix-la-Chapelle and Düsseldorf (with the valley of the Wupper), while there are naturally few manufactures in the hilly districts of the south or the marshy flats of the north. The largest iron and steel works are at Essen, Oberhausen, Duisburg, Düsseldorf and Cologne, while cutlery and other small metallic wares are extensively made at Solingen, Remscheid and Aix-la-Chapelle. The cloth of Aix-la-Chapelle and the silk of Crefeld form important articles of export. The chief industries of Elberfeld-Barmen and the valley of the Wupper are cotton-weaving, calico-printing and the manufacture of turkey red and other dyes. Glass is manufactured in the Saar district and beetroot sugar near Cologne. Though the Rhineland is *par excellence* the country of the vine, beer is largely produced; distilleries are also numerous, and large quantities of sparkling Moselle are made at Coblenz. The imports consist mainly of raw material for working up in the factories of the district, while the principal exports are coal, fruit, wine, dyes, cloth, silk and other manufactured articles of various descriptions.

The population of the Rhine province in 1925 was 7,214,533, excluding the Saar District, then under the administration of the League of Nations, and estimated to contain 571,872 inhabitants. The great bulk of the population is of Teutonic stock, and about a quarter of a million are of Flemish blood. The province contains a greater number of large towns than any other province in Prussia and more than half the population is industrial and commercial. There are universities at Bonn (founded 1786 and refounded 1818) and Cologne (refounded 1918). For purposes of administration the province is divided into the five districts of Coblenz, Düsseldorf, Cologne, Aix-la-Chapelle and Trier. Coblenz is the official capital, though Cologne is the largest and most important town.

The province is a modern creation, formed in 1815 out of the duchies of Cleves, Berg, Gelderland and Jülich, the ecclesiastical principalities of Trier and Cologne, the free cities of Aix-la-Chapelle and Cologne, and nearly a hundred small lordships and abbeys.

RHINOCEROS, the name for such perissodactyle mammals (*see* PERISSODACTYLA) as bear one or two median horns on the head, and for their extinct relatives. Rhinoceroses are large, massively built animals, with little intelligence and a bad temper. The horns, which are composed of modified hairs, are borne on the nose and are used as weapons. The animals are dull of sight, but their hearing and scent are very acute. They are vegetarian in diet and largely nocturnal. The skin is very thick and tough. In the Miocene and Pliocene, rhinoceroses inhabited both eastern and western hemispheres, but they are now restricted to tropical Africa and Asia. An interesting feature is that the horn appears to have been independently evolved in several separate groups of rhinoceroses. Living forms fall into three sub-genera: (1) With a single nasal horn and the thick skin raised into folds on the shoulders and thighs. There are two species. The Indian rhinoceros (*Rhinoceros unicornis*), standing 5–5¾ft. high at the shoulder, with a horn 1ft. in length, is now confined to the Assam plain. The Javan rhinoceros (*R. sondaicus*) is smaller and in the female the horn is often absent. It inhabits Bengal, Burma, the Malay peninsula, Java, Sumatra and Borneo. It prefers hilly forests. (2) With a large nasal and a small frontal horn and the skin not thrown into folds. The only species is the Sumatran rhinoceros (*R.* [*Dicerorhinus*] *sumatrensis*) with the same range as the Javan species, except that it does not extend into Java. It reaches a height of 4½ft. and inhabits hilly forests. A form with hairy ears and skin is regarded as a local race. (3) With two horns, no skin folds and no lower incisors. This group (*Diceros*) is confined to Africa and comprises two species. The black rhinoceros (*R.* [*D.*] *bicornis*) is the smaller, weighing just over a ton, with a pointed, prehensile upper lip. It inhabits Africa south of Abyssinia, though in reduced and diminishing numbers, dwelling in the wooded, watered districts. The white rhinoceros (*R.* [*D.*] *simus*) is the largest living land mammal except the elephant and feeds largely on grass. It now inhabits only a reserve in Zululand and the Lado enclave on the Upper Nile. It may stand 5ft. 8in. at the shoulder and measure 15ft. in length, but is very swift of foot. The flesh is said to be excellent to eat, especially in the autumn and winter.

BY COURTESY OF THE N.Y. ZOOLOGICAL SOCIETY

GREAT INDIAN RHINOCEROS (RHINOCEROS UNICORNIS)

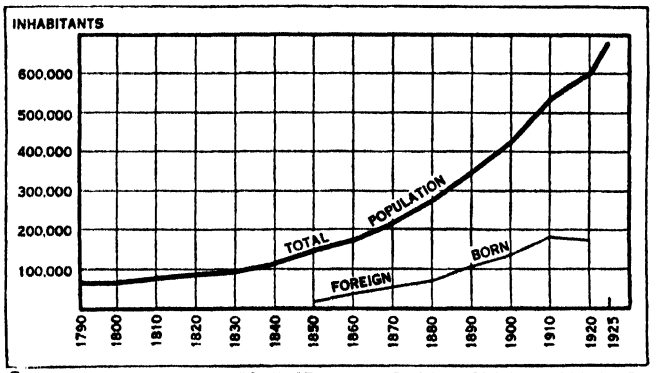
The woolly rhinoceros (*R. antiquitatis*), which inhabited Europe, became extinct during the glacial epoch.

RHINTHON (*c.* 323–285 B.C.), Greek dramatist, son of a potter. He was probably a native of Syracuse and afterwards settled at Tarentum. He invented the *hilarotragoedia*, a burlesque of tragic subjects. He was the author of thirty-eight plays, of which only a few titles (*Amphitryon, Heracles, Orestes*) and lines have been preserved chiefly by the grammarians, as illustrating dialectic Tarentine forms. The metre is iambic, in which the greatest licence is allowed. The *Amphitruo* of Plautus, although probably imitated from a different writer (Archippus of the Middle Comedy), may be taken as a specimen of the manner in which such subjects were treated. There is no doubt that the hilarotragoedia exercised considerable influence on Latin comedy, the *Rhinthonica* (*i.e.* fabula) being mentioned by various authorities amongst other kinds of drama known to the Romans. Scenes from these travesties are probably represented in certain vase paintings from Lower Italy, for which *see* H. Heydemann, "Die Phlyakendarstellungen auf bemalten Vasen," in *Jahrbuch des archäologischen Instituts*, i. (1886).

Fragments in monograph by E. Völker (Leipzig, 1887); *see* also E. Sommerbrodt, *De Phlyacographia Graecorum* (Breslau, 1875); W. Christ, *Geschichte der griechischen Literatur* (1898).

RHIZOPODA, the name given by Dujardin (*pro parte*, 1838) to a group of Sarcodine Protozoa. They are distinguished by their pseudopods, simple or branched, passing by wide bases into the general surface, never fine radial nor fusing into complex networks; skeleton absent or a simple shell ("test," "theca"), never (?) a calcareous shell, nor represented by a siliceous network, nor spicules. Reproduction by binary fission; by division or abstriction of buds after the body has become multi-nucleate; or by the resolution of the body into numerous uninucleate zoospores (amoebulae or flagellulae) which may conjugate as gametes; plasmodium formation unknown; encystment (in "resting cysts" or "hypnocysts") common. Without a knowledge of the history it is impossible to distinguish a naked Lobose from the Amoebula (pseudopodiospore) of a Myxomycete or Proteomyxan. As to the name, Dujardin included the thecate Lobosa, the Filosa, and the Reticularia or Foraminifera. For further particulars *see* PROTOZOA.

RHODE ISLAND, popularly known as "Little Rhody," is a North Atlantic State of the American Union, belonging to the New England group, and lying between 41° 18′ and 42° 3′ N. and 71° 8′ and 71° 53′ W. It is bounded, north and east, by Massachusetts; south, by the Atlantic ocean; and west, by Connecticut, from which it is separated in part by the Pawcatuck river. Rhode Island is the smallest State in the Union, having an extreme length, north and south, of 48 m., an extreme width, east and west, of 37 m. and a total area of 1,248 sq.m., of which 181 sq.m. are water-surface.



Physical Features.—The region of which Rhode Island is a part was at one time worn down to a gently rolling plain near sea-level, but has since been uplifted and somewhat dissected by stream action. As a result the topography is characterized by low, rounded hills but is nowhere mountainous. Since the uplift and stream dissection a slight depression has allowed the sea to invade the lower portions of the river valleys, forming the bays known as Narragansett bay, Providence "river," Sakonnet "river," etc. Glaciation has disturbed the river systems.

In the north-west is Durfee Hill, which attains an elevation of 805 ft., and is the highest point within Rhode Island. The mean elevation for the entire State is 200 feet. The coast-line, including the shores of the bays and islands, is extensive; its western portion is only slightly indented, but its eastern portion is deeply indented by Narragansett bay, a body of water varying in width from 3 to 12 m., and extending inland for about 28 miles. Within Narragansett bay there are the numerous islands characteristic of an area which has suffered comparatively recent depression, the largest being Rhode Island (or Aquidneck), Conanicut Island and Prudence Island. Of these the most important is Rhode Island, 15 m. long and 3 m. wide, which has given the State its name. Lying about 10 m. off the coast and south of the central part of the State is Block Island.

The rivers of the State are short and of no great volume, but they flow swiftly and are useful in supplying power for manufactories. The Providence river is really an arm of Narragansett bay, into which flow the waters of the Pawtuxet and the Blackstone rivers. The latter stream at Pawtucket has a fall of about 50 ft., and the Pawtuxet river also has a number of falls along its course. Mount Hope bay is a north-eastern arm of Narragansett bay and is also the estuary of the Taunton river. The Sakonnet river is a long bay separating Aquidneck or Rhode Island from the mainland on the east. The Pawcatuck river forms the boundary between Rhode Island and Connecticut.

Climate.—Rhode Island has a more moderate climate than that of the northern sections of New England. There are no great extremes of either heat or cold, and a number of the towns and cities, especially Newport and Narragansett Pier, have become noted summer resorts. Narragansett Pier has a mean annual temperature of 49°, a mean summer temperature (for June, July and August) of 68°, and a mean winter temperature (for December, January and February) of 29°. The mean annual temperature at Providence is 49·8°; the mean for the summer, 70·9°; and for the winter, 29·3°; while the highest and lowest temperatures ever recorded are respectively 100° and −12°. The mean annual precipitation is about 50 in.

Population.—The population of Rhode Island on July 1, 1928 was 716,000, according to the U.S. census bureau estimate.

GRAPH OF GROWTH OF POPULATION IN RHODE ISLAND (1790–1925) WITH PERCENTAGE OF FOREIGN BORN

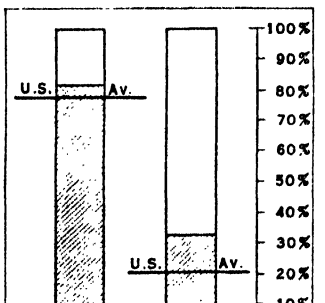
The population of the State at certain of the decennial censuses was as follows: 68,825 in 1790; 69,122 in 1800; 108,830 in 1840; 174,620 in 1860; 276,531 in 1880; 345,506 in 1890; 428,556 in 1900; 542,610 in 1910; and 604,397 in 1920. The State enumeration in 1925 showed a population of 679,260. The increase from 1910–20 was 61,787 or 11·4%; and that from 1920–25, 74,863 or 12·4%. Rhode Island was still, in 1920, the most densely populated State in the Union, having 566·4 inhabitants to the square mile. The percentages of urban and of rural population in 1925 were 97·8% and 2·2% respectively; as compared with urban, 96·7%, and rural, 3·3% in 1910. The following are the cities of Rhode Island having a population of over 20,000 in 1925 and percentage increase in the 1920–25 period:—

	1925	1920	% Increase 1920–25	1927 estimate
Providence	267,918	237,595	12·8	280,600
Pawtucket	69,760	64,248	8·6	72,100
Woonsocket	49,681	43,496	14·2	52,300
Cranston	34,471	29,704	17·2	36,600
Newport	27,757	30,255	8·3*	..
East Providence	26,088	21,793	19·7	..
Central Falls	25,403	24,174	5·1	..

*Decrease.

Of the total population in 1920, 98·3% were white and 1·7% were negroes. The proportion of native whites in 1925 was 71·7%, as compared with 69·6% in 1920; of foreign-born whites in 1925, 26·7%, as compared with 28·7% in 1920. The Irish were the largest foreign-born element until 1910. In both 1920 and 1925 the Irish were numerically inferior to the English, the French-Canadian and the Italian. In 1925 the French-Canadian

numbered 35,548; the Italian, 34,671; the English, 26,885; the Irish, 19,800 and the English-Canadian, 5,303.



Government.—Rhode Island is governed under the Constitution of 1842, with amendments adopted in 1854, 1864, 1886, 1888, 1889, 1892, 1893, 1900, 1903, 1909, 1911 and 1916. Amendments to the Constitution must be passed by both houses of the general assembly at two consecutive sessions, and must then be ratified by three-fifths of the electors of the State voting thereon.

Citizenship.—All native or naturalized citizens of the United States residing in Rhode Island are citizens of the State. To vote a citizen must be at least 21 years of age and have resided in the State for one year and in a Rhode Island town or city at least six months preceding the election.

Administration.—The executive and administrative officers elected by the people at elections held in November of even-numbered years are a governor, a lieutenant-governor, a secretary of State, an attorney-general and a treasurer. The State auditor is elected by the general assembly triennially, and the commissioner of education is appointed annually by the State board of education. In addition to the officers above named, there are numerous commissions, boards and commissioners, such as the State board of public roads, the public utilities commission, the State board of agriculture, the public welfare commission, the State board of health, the State board of education, the commissioner of labour, the factory inspectors, etc. The powers of the governor are small.

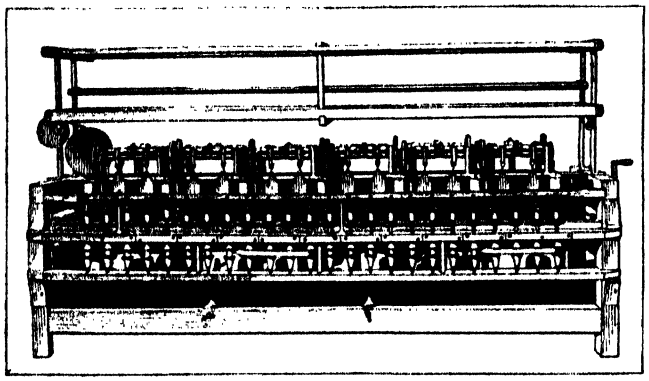
Legislative Power.—The legislative power is vested in the general assembly, which consists of a senate made up of the lieutenant-governor and of one senator from each of the 39 cities and towns in the State, and a house of representatives of 100 members, apportioned according to population, but with the proviso that each town or city shall have at least one member and none shall have more than one-fourth of the total. Members of the general assembly are elected biennially in November.

Judiciary.—At the head of the judicial system is the supreme court with final revisory and appellate jurisdiction. Below this are the superior court, the 12 district courts, the juvenile courts, the town councils, probate courts in the more populous towns and justices of the peace. The five judges of the supreme court, the eight judges of the superior court and the district judges are elected by the general assembly; the supreme and superior court justices hold office until dismissed by the general assembly or found guilty of official misdemeanours, and the district judges hold office for a term of three years. The judges of the district courts also hold the juvenile courts. Probate courts are held by either the town council or a judge appointed by that body. Justices of the peace are appointed by the governor triennially. Each county has a sheriff elected by the general assembly for a term of three years. The town is the unit of local government, the county being recognized only for judicial purposes and to a certain extent in the appointment of several State administrative boards. There are five counties and 39 towns and cities.

PERCENTAGE OF POPULATION (TEN YEARS OF AGE AND OVER) EMPLOYED IN GAINFUL OCCUPATIONS IN RHODE ISLAND (1920)

Finances.—The valuation of ratable property in the several towns and cities, as returned by the boards of assessors, as of June 15, 1926, was $1,237,174,813. The rate of State tax in 1927 was nine cents on each $100, and an additional tax of three cents for the care of State roads. For the fiscal year ending Nov. 30, 1926, receipts were $9,402,766; expenditures $10,196,648; funded debt $14,039,000; and sinking fund $2,978,865. The estimated receipts and expenditures for the fiscal year 1927 were $10,232,253 and $10,748,544 respectively. The chief sources of revenue in the order named were: automobile licences, the direct State tax on local property valuations, the corporate excess and franchise tax, the tax on savings deposits, the tax on insurance premiums, the tax on public service corporations, receipts from the United States for roads, the gasoline tax and the inheritance tax. The principal expenditures were for highways, parks and bridges $3,976,118; penal, corrective and charitable $2,263,794; education $1,296,605; and administrative $1,163,411. On June 30, 1926, there were 38 banking institutions within the State with resources of $531,992,000, and deposits of $458,282,000.

Education.—The public school system of Rhode Island was established in 1800, abolished in 1803, and re-established in 1828. At the head of it is a commissioner of education, appointed annually by the State board of education, which is composed of the governor, the lieutenant-governor and six members elected by the general assembly (two biennially) for six years. Each town has a school committee elected by the people and independent of the town or city council. School attendance is compulsory for children between the ages of seven and 16. An act to promote Americanization was passed in 1919 obliging illiterate minors (16–21) to attend evening school. Rhode Island in 1917 accepted the provisions of the Federal vocational act, and a part time trade school was opened for boys over 14 years of age at Providence. The total population between four and 21 years of age as shown by the Jan. 1926 school census was 201,055. The average number attending the public schools in 1925–26 was 101,132; the total expenditure for school purposes in 1924–25 was $9,178,575.



The institutions of higher education supported by the State are the Rhode Island College of Education at Providence and Rhode Island State College at Kingston, a land grant college under the Morrill Acts of 1862 and subsequent acts. There are training-schools for teachers at Providence, Cranston, Bristol, Burrillville, Central Falls, Cumberland, East Providence, Jamestown, Pawtucket, Newport, South Kingstown, Warren, Warwick, Westerly and West Warwick. The State also makes appropriations ($25,000 in 1926) to the Rhode Island school of design at Providence. Institutions for higher education other than those supported by the State, are Brown university (*q.v.*) and Providence college, both at Providence.

Charities and Corrections.—The majority of the charitable and penal institutions of the State are under control of the State Public Welfare Commission. The institutions under the control of the commission in 1928 were the Exeter school (for feeble-minded) in the town of Exeter; the State home and school for children at Providence; and a group of institutions situated upon what is known as the State farm, in the city of Cranston, including the State hospital for mental diseases, the State infirmary, the State reformatory for women, the State prison and Providence county jail, the Sockanosset school for boys, and the Oaklawn school for girls. The two latter institutions are departments of the State reform school. In addition to the institutions under the Public Welfare Commission there are four others supported wholly or in part by the State: the Rhode Island School for the Deaf at Providence, The Soldiers' Home at Bristol, Butler Hospital (for insane) at Providence and the State Sanatorium.

Agriculture.—Rhode Island, with a total crop value in 1926 estimated at $4,700,000, ranked at the bottom of the list as an agricultural State. Chief among the reasons for this low rank are the smallness of the State and the sterile nature of the soil. The boulder clay or "hard pan" of which most of the surface lands are composed, form a very indifferent support for vegetation. The farm acreage declined from 443,308 ac. in 1910 to 309,013 ac. in 1925. Of this total only 76,003 ac. were classified as crop land and only 69,368 ac. produced crops for harvest in 1924. The number of farms fell from 5,292 in 1910 to 3,911 in 1925; but the average area per farm (79 ac.) decreased but slightly. Only 472, or 12·1% of the farms were cultivated by tenants. In the total value of all farm property there was a slight increase during the period 1910–25, the values being $32,990,739 and $33,446,425 respectively. The chief crop in 1926 was cultivated hay. The 45,000 ac. devoted to hay produced 58,000 tons valued at $1,450,000. The crop next in value was potatoes, which had a yield of

450,000 bu. valued at $810,000. The only cereal crops produced on a commercial scale were Indian corn and oats. Apples were the principal orchard crop. The live stock products of Rhode Island are of greater value than the field crops. Live stock on the farms on Jan. 1, 1927, consisted of about 5,000 horses, 4,000 swine, 2,000 sheep and 27,000 cattle. Of the latter 21,000 were kept for dairy purposes.

Minerals.—Rhode Island, in mineral wealth, ranked 47th among the States of the Union. The total value of all mineral

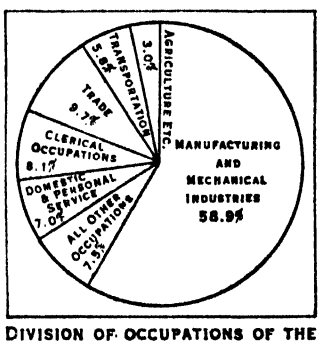
BY COURTESY OF THE U.S. NATIONAL MUSEUM, WASHINGTON, D.C.

SLATER'S SPINNING FRAME OF 1790, AFTER THE ORIGINAL IN THE U.S. NATIONAL MUSEUM IN WASHINGTON

products of the State in 1925 was $1,151,857, and of this total granite was valued at $724,428.

Fisheries.—Whaling was early an established industry in Rhode Island. As late as 1846 about 50 whaling vessels sailed annually from Rhode Island ports; but by the close of the century the industry had become practically extinct. Rhode Island, in 1924, ranked fourth among the new England States in the number of persons engaged, investment and yield of her fisheries. The total number of persons employed was 1,176, of whom 840 were in the shore and boat fisheries. The total catch amounted to 20,535,327 lb., valued at $1,818,858.

Manufactures.—Rhode Island is essentially a manufacturing State; of the 275,000 persons in the State engaged in gainful occupation in 1920, 161,920 or 58·8% were employed in manufacturing and mechanical pursuits. Boat-building was an early industry, and large vessels were built at Newport. During the Revolutionary War the State offered a premium for every pound of steel made within its boundaries. Cotton was first imported to Providence from Spain in 1785; a company to carry on cotton-spinning, formed at Providence in 1786, established there in the following year a factory containing a spinning jenny of 28 spindles (the first machine of its kind to be used in the United States), and also a carding machine and a spinning frame with which was manufactured a kind of jean. The fly shuttle was also apparently first introduced at Providence in 1788. The prohibition of the exportation from England of machinery, models or drawings, had retarded mechanical improvement in America, but in 1790 an industrial company was formed at Providence to carry on cotton spinning, and in December of that year there was established at Pawtucket a factory equipped with Arkwright machines constructed by Samuel Slater, an immigrant from England. This machine was operated by water-power, then first used in the United States for the spinning of cotton thread; and from this may be dated the beginning of the factory system in Rhode Island. The first power-loom used in the United States was invented about 1812, and was set up at Peacedale, in 1814. Textile manufacturing by improved methods, however, was hardly well established in Rhode Island before 1825. The manufacture of jewellery, which was established in Providence in 1784, was greatly promoted ten years later by Nehemiah Dodge's invention of the process of "gold-filling," and was still further improved in 1846 by Thomas H. Lowe. Rhode Island's water power has been its only natural resource which has aided its development.



The State, in 1925, ranked 22nd in the value of its manufactured products. The manufacturing industries in 1925 show a decrease from the figures for 1923. Textiles held in 1925 the first place among the manufactures of the State, employing over one-half the persons engaged in manufacturing. In the manufacture of worsted goods, Rhode Island was surpassed by Massachusetts only. The State ranked fourth in the dyeing and finishing of textiles; fifth in the manufacture of cotton goods; and sixth in the manufacture of silk. Rhode Island has long been a leader in the manufacture of jewellery; the product of the State in 1925 was exceeded by that of New York only. The table below shows the 10 principal manufacturing industries in 1925, the number of active establishments, and wage-earners and value of products.

Industry	No. of establishments	Wage-earners	Value
Worsted goods	66	18,923	$125,503,602
Cotton goods	75	29,276	107,708,169
Dyeing and finishing textiles	63	9,860	47,163,824
Silk manufacturing	32	6,087	34,855,263
Jewellery	220	7,039	31,616,003
Woollen goods	28	3,283	21,141,962
Textile machinery	47	3,781	17,508,719
Electrical machinery and supplies	15	1,302	12,431,768
Knitted goods	23	1,821	10,605,476
Foundry and machine-shop products	49	2,154	10,200,701

The chief industrial centres were Providence ($212,117,987), Pawtucket ($108,281,019), Woonsocket ($83,357,763) and Central Falls ($25,541,848).

Transportation and Commerce.—The steam railway mileage in Rhode Island never has been great because the cities are unfavourably situated to be the termini of interstate railway systems. The total mileage within the State decreased from 211 m. in 1920 to 196 m. in 1925. At the close of the year 1925 the mileage of electric railways, chiefly interurban, in the State was 381 miles. This total shows a decrease of 73 m. since 1917. Much attention has been given to the State's highway system. The total mileage in the State system of highways on Jan. 1, 1927, was 822 m.; of this total 452 m. were surfaced. In 1925, $3,046,000 were spent by the State for the construction and maintenance of roads.

Rhode Island has water outlets at Providence (by far the largest), Newport, Pawtucket, Bristol, Tiverton and Wickford. There are also harbours of refuge at Block Island and Point Judith. The water-borne traffic of Providence in 1926 consisted of 5,294,370 tons of cargo valued at $437,480,340 and of 254,573 passengers. There was also an "in transit" traffic (to and from Pawtucket river) of 338,000 tons, valued at $55,131,000. Providence has since 1910 become the oil distributing centre of New England (106,216 tons brought in by water in 1910; 2,436,875 tons in 1926). The coal and lumber were also of great importance. The commerce at Newport in 1926 consisted of 137,486 tons, valued at $9,314,464, and of 123,452 passengers. There was an important ferry traffic between Newport and Jamestown.

DIVISION OF OCCUPATIONS OF THE 265,377 PERSONS GAINFULLY EMPLOYED (1920)

History.—Rhode Island was founded by refugees from Massachusetts, who went there in search of religious and political freedom. The first settlements were made at Providence by Roger Williams (*q.v.*) in June 1636 and at Portsmouth on the island of Aquidneck by the Antinomians, William Coddington (1601–78), John Clarke (1609–76) and Anne Hutchinson (1591–1643), in March–April, 1638. Becoming dissatisfied with conditions at Portsmouth, Coddington and Clark removed a few miles farther south in April 1639, and established a settlement at Newport. In a similar manner Warwick was founded in Jan. 1643 by seceders from Providence under the lead of Samuel Gorton. The union of Portsmouth and Newport, March 12, 1640, was followed by the

consolidation of all four settlements, May 19, 1647, under a patent of March 14, 1644, issued by the parliamentary board of commissioners for plantations. The particularistic sentiment was still very strong, however, and in 1651 the union split into two confederations, one including the mainland towns, Providence and Warwick; the other, the island towns, Portsmouth and Newport. A reunion was effected in 1654 by Roger Williams, and a charter was secured from Charles II. on July 8, 1663.

In the patent of 1644 the entire colony was called Providence Plantations. On March 13, 1644, the Portsmouth-Newport General Court changed the name of the island from Aquidneck to the Isle of Rhodes or Rhode Island. The official designation for the province as a whole in the charter of 1663, therefore, was Rhode Island and Providence Plantations. The charter was suspended at the beginning of the Andros régime in 1686, but was restored again after the Revolution of 1689. The closing years of the 17th century were characterized by a gradual transition from agricultural to commercial activities. Newport became the centre of an extensive business in piracy, privateering, smuggling and legitimate trade. Cargoes of rum, manufactured from West Indian sugar and molasses, were exported to Africa and exchanged for slaves to be sold in the southern colonies and the West Indies. The passage of the Sugar Act of April 5, 1764, and the steps taken by the British Government to enforce the Navigation acts seriously affected this trade.

The people of Rhode Island played a prominent part in the struggle for independence. On June 9, 1772, the "Gaspee," a British vessel which had been sent over to enforce the acts of trade and navigation, ran aground in Narragansett bay and was burned to the water's edge by a party of men from Providence. Nathanael Greene, a native of Rhode Island, was made commander of the Rhode Island militia in May 1775, and a major-general in the Continental army in Aug. 1776, and in the latter capacity he served with ability until the close of the war. In the year 1776, Gen. Howe sent a detachment of his army under General Henry Clinton to seize Newport as a base of operations for reducing New England, and the city was occupied by the British on Dec. 8, 1776. To capture this British garrison, later increased to 6,000 men, the co-operation of about 10,000 men (mostly New England militia) under Maj.-Gen. John Sullivan, and a French fleet carrying 4,000 French regulars under Count D'Estaing, was planned in the summer of 1778. On Aug. 9, Sullivan crossed to the north end of the island of Rhode Island, but as the French were disembarking on Conanicut Island, Lord Howe arrived with the British fleet. Count D'Estaing hastily re-embarked his troops and sailed out to meet Howe. For two days the hostile fleets manoeuvred for positions, and then they were dispersed by a severe storm. On the 20th, D'Estaing returned to the port with his fleet badly crippled, and only to announce that he should sail to Boston to refit. The American officers protested but in vain, and on the 30th the Americans, learning of the approach of Lord Howe's fleet with 5,000 troops under Clinton, decided to abandon the island. The British evacuated Newport on Oct. 25, 1779, and the French fleet was stationed here from July 1780 to 1781.

The influence of Roger Williams' ideas and the peculiar conditions under which the first settlements were established have tended to differentiate the history of Rhode Island from that of the other New England States. In 1640 the General Court of Massachusetts declared that the representatives of Aquidneck were "not to be capitulated withal either for themselves or the people of the isle where they inhabit," and in 1644 and again in 1648 the application of the Narragansett settlers for admission to the New England Confederacy was refused except on condition that they should pass under the jurisdiction of either Massachusetts or Plymouth. Rhode Island was one of the first communities to advocate and to put into practice religious freedom and political individualism.

The individualistic principle was shown in the jealousy of the towns toward the central Government, and in the establishment of legislative supremacy over the executive and the judiciary. The legislature migrated from county to county up to 1854, and there continued to be two centres of government until 1900. The dependence of the judiciary upon the legislature was maintained until 1860, and the governor is still shorn of certain powers which are customary in other States. In the main the rural towns have adhered most strongly to the old individualistic sentiment, whereas the cities have kept more in touch with the modern nationalistic trend of thought. This was shown, for example, in the struggle for the ratification of the Federal Constitution. Under the Articles of Confederation it was principally Rhode Island that defeated the proposal to authorize Congress to levy an impost duty of 5% mainly as a means of meeting the debts of the central Government. When the Constitutional Convention met in Philadelphia in 1787 to frame a Constitution for a stronger Federal Government, the agriculturists of Rhode Island were afraid that the movement would result in an interference with their local privileges, and the State refused to send delegates, and not until the Senate had passed a bill for severing commercial relations between the United States and Rhode Island, did the latter, in May 1790, ratify the Federal Constitution, and then only by a majority of two votes. Rhode Island, like the rest of New England, was opposed to the War of 1812 and the Mexican War. During the Civil War it sent 23,457 men into the service of the Union.

Providence possesses superior water-power facilities and has therefore become one of the leading manufacturing centres of New England, whereas Newport is now known only as a fashionable summer resort.

The charter of 1663 and franchise law of 1724 established substantial equality of representation among the towns, and restricted the suffrage to freeholders. In the course of time, therefore, the small towns came to be better represented proportionally than the large cities, and the growing class of artisans was entirely disfranchised. Providence issued a call for a Constitutional Convention in 1796, and similar efforts were made in 1799, 1817, 1821, 1822 and 1824, but nothing was accomplished. About 1840 Thomas W. Dorr (1805–54), a young lawyer of Providence, began a systematic campaign for an extension of the suffrage, a reapportionment of representation and the establishment of an independent judiciary. The struggle, which lasted for several years, and in fact is not yet entirely over, was one between the cities and the country, between the manufacturers and the agriculturists.

A convention summoned without any authority from the legislature, and elected on the principle of universal manhood suffrage, met at Providence, Oct. 4, to Nov. 18, 1841, and drafted a frame of Government which came to be known as the People's Constitution. A second convention met on the call of the legislature in Feb. 1842 and adopted the so-called Freeman's Constitution. On being submitted to popular vote (on Dec. 27, 28, 29, 1841) the former was ratified by a large majority, while the latter was rejected (on March 21, 22, 23, 1842), by a majority of 676. At an election held on April 18, 1842, Dorr was chosen governor. The supreme court of the State and the President of the United States (Tyler) both refused to recognize the validity of the People's Constitution, whereupon Dorr and a few of his more zealous adherents decided to organize a rebellion. They were easily repulsed in an attack upon the Providence town arsenal, and Dorr, after a brief period of exile in Connecticut, was convicted of high treason on April 26, 1844, and was sentenced to imprisonment for life. He was released by act of the Assembly in June 1845, and restored to the rights and privileges of citizenship in May 1851.

The Freeman's Constitution, modified by another convention, which held its session at Newport and East Greenwich on Sept. 12 to Nov. 5, 1842, was finally adopted by popular vote on Nov. 21–23, 1842. Only a partial concession was made to the demand for reform. The suffrage was extended to non-freeholders, but only to those of American birth. But a constitutional amendment of 1888 extended to naturalized citizens the right of suffrage in State and national elections, and an amendment of 1909 partially remedied the evils in the system of apportionment.

Inequalities still exist, however, as can best be illustrated by Providence, which, with a population in 1927 of 280,600 out of a total of 740,000, had one member in a senate of 39 and 25 members in a house of representatives of 100. The Republican machine finds it comparatively easy to maintain control over the

State Government; the majority occasionally protests by electing a Democratic governor. In 1922 the Democratic candidates for governor, lieutenant-governor, attorney-general and treasurer were elected, although the Republicans retained control of both branches of the general assembly. A long struggle in the senate culminated in the Republican members leaving for Rutland, Mass., on June 19, 1924, where they stayed until Jan. 5, 1925. The Democratic minority continued to meet daily, however, until the newly elected senate took office. The legislative business of the State was practically at a standstill for a year, and the failure of passage of the annual appropriation bill in 1924 led to the advancing of money to the State by private individuals and by 23 Rhode Island banks.

The corner stone of the marble State house at Providence was laid in Oct. 1896, and the building was opened to use on Jan. 1, 1901.

In common with other New England States Rhode Island's cotton manufacturing industries have suffered from Southern competition. The South's advantage of raw material and cheap labour has been overcome in part, however, by Rhode Island's manufacturing its own mill machinery and by training skilled workers in her textile schools, to produce a higher quality of goods. In economic and social legislation Rhode Island has kept up with the changing order of society. In 1921 a workmen's compensation act was passed; in 1923 a mother's aid law came into effect; and a State law raising the minimum working age to 15 years (with certain exceptions) came into effect in 1924. Rhode Island ratified the 19th (Woman Suffrage) amendment to the Federal Constitution; but failed to ratify the 18th (Prohibition) amendment.

In the presidential elections the State has been Federalist, 1792–1800; Democratic Republican, 1804; Federalist, 1808–12; Democratic Republican, 1816–20; Adams (Republican), 1824–28; National Republican, 1832; Democratic, 1836; Whig, 1840–48; Democratic, 1852, and Republican since 1856, except for the Democratic victory in 1912.

RHODES, CECIL JOHN (1853–1902), British colonial and Imperial statesman, was born on the 5th of July 1853, at Bishop Stortford, in Hertfordshire. His father was a clergyman, but he claimed descent from yeoman stock. Cecil John Rhodes was the fifth son in a large family of sons and daughters. The boy was educated at the grammar school of Bishop Stortford, where his father held the living, with the intention of preparing for the Church; but at the age of sixteen his health broke down, and in the latter part of 1870 he joined his eldest brother Herbert, then engaged in farming in Natal. In that year diamonds were discovered in the Kimberley fields. By the end of 1871 Rhodes and his brother were among the successful diggers. The dry air of the interior restored his health, and before he was nineteen he found himself financially independent and physically strong.

Rhodes next spent eight months in a solitary journey through the then little known parts of the country lying to the north of the Orange and Vaal rivers. He went through Bechuanaland to Mafeking, thence to Pretoria, Murchison, Middelburg and back through the Transvaal to Kimberley, passing in an ox-wagon at a rate of some 15 to 20 miles a day, through vast spaces of rolling veld. He saw one of the healthiest countries in the world barely occupied. He knew the agricultural possibilities of Natal and its mineral wealth. The effect of the combined influences on his mind was profound. He was filled with desire that that fine country be secured for occupation by the British race, and that no power but Great Britain be allowed to dominate in the administration of South Africa. He had found an object to which he proposed to devote his life. It was nothing less than the governance of the world by the British race. A will exists written in Rhodes's own handwriting, when he was still only twenty-two, in which he states his reasons for accepting the aggrandizement and service of the British empire as his highest ideal of practical achievement. It ends with a single bequest of everything of which he might die possessed for the furtherance of this great purpose. Five-and-twenty years later his final will carried out, with some difference of detail, the same intention.

The share which he allotted to himself was the extension of the area of British settlement in Africa. He returned to Oxford, where he matriculated at Oriel. In 1873 his health again failed, and he was sent back under what was practically a death sentence. Years afterwards, as an older man, he saw the entry of his own case in the diary of the eminent physician whom he consulted with a note "Not six months to live." South Africa again restored him to health. Three years later he was back at Oxford, and from 1876 to 1878 he kept his terms. During this period he spent the Long Vacation each year in South Africa, where his large financial interests were daily increasing in importance. He was a member of the Cape ministry when after a further lapse of years he kept his last term and took his degree. He did not read hard at Oxford and was more than once remonstrated with in the earlier terms for non-attendance at lectures. But he passed his examinations; and though he was never a student in the university sense of the term, he was to the end of his life a keen devourer of books. He kept always a special liking for certain classic authors. Aristotle was the guide whom as a lad he followed in seeking the "highest object" on which to exercise the "highest activity of the soul." Marcus Aurelius was his constant companion. There exists at Groote Schuur a copy of the *Meditations* deeply scored with his marks.

During this Oxford time and to 1881 Rhodes was occupied with the amalgamation of the larger number of the diamond mines of Kimberley with the De Beers Company, an operation which established his position as a practical financier in the business world. To many admirers who shared his views on public questions his connection with the financial world and his practical success were a stumbling block. It was often wished for him that he "had kept himself clear of all that." But this was not the view he took of the matter. His ideals were political and practical. To him the making of money was a necessary preliminary to the realization of his political ideals, and he was proud of his practical ability in this direction. He was a man of simple tastes. His immense fortune was spent in the furtherance of his ideas, and it has been justly said of him that he taught the world a new chapter of the romance of wealth.

In 1881 Mr. Rhodes entered the Cape assembly as one of the two members for Barkly West and kept the seat for life. It was the year of the Majuba settlement. South Africa was convulsed

with questions between the British and the Dutch, and leaders of Dutch opinion at the Cape spoke openly of the formation of a United States of South Africa under its own flag. The British party needed a rallying-ground, when Cecil Rhodes offered to Dutch and British alike the ideal of a South African Federation governing itself within the empire, and extending, by its gradual absorption of native territories, the range of Imperial administration. Local self-government was, in his opinion, the only enduring basis on which the unity of the empire could be built, and throughout his life he was as keen a defender of local rights as he was of Imperial unity. There was a time when his advocacy of the elimination of direct Imperial interference in local affairs caused him to be viewed in certain quarters as a Separatist. Such suspicions were strengthened at a critical moment in the struggle for Home Rule in Ireland by his contributing £10,000 to the funds of the Nationalist party. The subsequent publication of his correspondence on the subject with Mr. Parnell demonstrated, however, that Rhodes's contribution was made strictly subject to the retention of the Irish members at Westminster. He remained of the opinion that the Home Rule movement, wisely treated, would have had a consolidating effect upon the empire.

In South Africa the influence which he acquired over the local independents and over the Dutch vote was subsequently an important factor in enabling him to carry out the scheme of northern expansion which he had fully developed in his own mind at Oxford in 1878. In 1881 the Bechuana territory was a sort of no man's land through which ran the trade routes to the north. It was evident that any power which commanded the trade routes would command the unknown northern territory beyond. The Pretoria Convention of 1881 limited the westward expansion of the Transvaal to a line east of the trade routes; but the irregular overflow into native territories made Rhodes fear that British expansion would be permanently blocked by Dutch occupation. One of his first acts as a member of the Cape assembly was to urge the appointment of a delimitation commission. He served on it in person, and obtained from Mankodoane, who claimed about half of Bechuanaland, a formal cession of his territories to the British government of the Cape. The Cape government refused to accept the offer. In February 1884 a second convention signed in London again defined the western frontier of the Transvaal, Bechuanaland being left outside the republic. With the consent of Great Britain, Germany had occupied, almost at the same time, the territory on the Atlantic coast later known as German South-West Africa. In August 1884 Rhodes was appointed resident deputy commissioner in Bechuanaland, where Boers had ousted the natives from considerable areas and set up the so-called republics of Goshen and Stellaland. An old Dutchman said privately to Rhodes, "This is the key of South Africa." The question at issue was whether Great Britain or the Transvaal was to hold the key. It was a question about which the British public knew and cared nothing. Rhodes made it his business to enlighten them. President Kruger, speaking for the government of the Transvaal, professed to regard the Dutch commandoes as freebooters, whom he was unable to control. Largely as the result of Rhodes's exertions the Warren expedition of 1884–85 was sent out. In the presence of British troops and Rhodes upon the frontier President Kruger withdrew the commandoes without any fighting, and south Bechuanaland became British territory, while a British protectorate was declared over the northern regions up to the 22nd parallel (September 1885).

It was the first round in the long duel between Cecil Rhodes, representative of British interests, and President Kruger, head of the militant Dutch. The score was to Rhodes. The entrance to the interior was secured, but the 22nd parallel was far short of the limits to which Rhodes hoped to see British influence extend, and he feared lest Germany and the Transvaal might together bar his progress. The discovery of gold on the Witwatersrand in 1886, by adding to the wealth and importance of the Transvaal, gave substance to this fear.

The territory north of the 22nd parallel was under Lobengula, chief of the Matabele, a native potentate celebrated alike for his ability and for his despotic character. There were rumours of Dutch and German emissaries at his kraal engaged in persuading him to cede portions of his territory. Portugal also was putting forward shadowy claims to the country. Rhodes conceived the idea of forming a British Chartered Company, which should occupy the territory for trading and mining purposes as far as the Zambezi, and bring the whole under the protection of Great Britain. Rhodes's first emissaries were sent to Lobengula in 1887 and the charter of the British South Africa Company was granted in October 1889. Crossing the Zambezi at the back of the Portuguese settlements, Rhodes obtained permission to extend the territories of the Chartered Company to the southern end of Lake Tanganyika and the British settlements already made in Nyasaland. He hoped to create a connected chain of British possessions which might justify the words, "Africa British from the Cape to Cairo," but the treaty between Great Britain and Germany in 1890, by extending the German sphere of influence to the frontier of the Congo Free State, defeated this hope. But Rhodes did not even then wholly renounce the idea. In 1892 when the question of the retention or abandonment of Uganda hung in the balance at home, he threw all the weight of his influence into the scale of retention, and offered at his own personal expense to connect that territory by telegraph with Salisbury. In 1893, a war with the Matabele added to the British empire about 450,000 square miles of country, of which large portions consist of healthy uplands suitable for white colonization. The pioneer party crossed the frontier at the end of 1889. In six years, though the country had passed through the trial of a war, two native rebellions, and the scourge of rinderpest, it had become Rhodesia, a well-settled province of the British empire, with a white population of some 12,000 persons.

In 1890, Rhodes became prime minister of the Cape. Maintained in power very largely by the Dutch vote, which he spared no pains to conciliate, and having won the confidence of both sections of the colony, he was practically a despot in South Africa. He did much to elevate and to enlarge the field of local politics. He frankly declared and worked for the policy of uniting British and Dutch interests in South Africa; he took a keen interest in local education. He restricted the franchise, introducing an educational test and limiting the vote to men with an income equal to a labourer's wage—thus abolishing, without making any distinction of colour, the abuses of the "blanket" vote.

His native policy was far from being one of simple restriction. He liked the natives; he employed them by thousands in the mining industry, and was successful in dealing with them. The first canon of his native policy was that liquor should be kept from them; the second, that they should be guaranteed the earnings of their labour; the third, that they should be educated in the practical arts of peace. He appreciated the full importance of raising their territorial condition from one of tribal to individual tenure; and while he protested against the uncivilized Kaffir voting on questions of highly civilized white policy, he believed in the principle of self-government in native affairs. Of these views some received practical embodiment in the much-disputed act known as the Glen Grey Act of 1894. In this connection it may also be noted that he was one of the warmest and most convinced supporters of Lovedale, the very successful missionary institution for the education of natives in South Africa.

The position of benevolent despot has obvious drawbacks. In Rhodes's case the dependence which the populations of Cape Colony were led to place on him had its reaction on the public in a demoralizing loss of self-reliance, and for himself it must be admitted that the effect on the character of a man already much disposed to habits of absolutism in thought and action was the reverse of beneficial. Rhodes felt himself to be far stronger than any man in his own surroundings; he knew himself to be actuated by disinterested motives in the aims which he most earnestly desired to reach. He was profoundly impressed by a sense of the shortness of life, and he so far abused his power as to become intolerant of any sort of control or opposition. The inevitable result followed, that though Rhodes did much of great and good work during the six years of his supreme power, he entirely failed during that period to surround himself, as he

might have done, with a circle of able men fit to comprehend and carry on the work to which his own best efforts were directed. To work with him was practically impossible for those who were not willing to accept without demur the yoke of dogmatic authority. He had a few devoted personal friends, who appreciated his aims and were inspired by his example; but he was lacking in regard for individuals, and a great part of his daily life was spent in the company of satellites and instruments, whom he used with cynical unconcern for the furtherance of his ends.

In 1896 the brilliant period of his premiership was brought to an end by the Jameson Raid. Rhodes, as a large mine-owner, was a member of the mining population, and was asked to give his countenance to the rising of the Johannesburgers, although he was also prime minister of the Cape. The subsequent finding of a Cape committee, which he accepted as accurate, was to the effect that "in his capacity as controller of the three great joint-stock companies, the British South Africa Company, the De Beers Consolidated Mines, and the Gold Fields of South Africa, he directed and controlled the combination which rendered such a proceeding as the Jameson Raid possible." He gave money, arms and influence to the movement; and he allowed Dr. Jameson, who was then administrator of the British South Africa Company in Rhodesia, to move an armed force of some 500 men upon the frontier. A cipher correspondence, seized and published by the Boers, left no doubt as to Rhodes's share in the preparation for the Raid. Subsequent inquiries held by committees of the Cape parliament and of the British House of Commons acquitted him of responsibility for Dr. Jameson's final movement, but both committees found that he had acted in a manner which was inconsistent with his duty as prime minister of the Cape and managing director of the British South Africa Company.

He made no concealment of his own share in the catastrophe; he took full responsibility for what had been done by subordinates, and accepted the consequences which ensued. He resigned his premiership of the Cape (January 1896), and turned his attention to the development of Rhodesia. His design was to live in the country, and to give all the stimulus of his own presence and encouragement to the development of its resources. The Matabele rebellion of March 1896 intervened and in June Imperial troops were sent up and drove the natives to a practically impregnable position in the Matoppo Hills. The prospect before the British was one of continued war with a renewal of a costly campaign in the following spring. Rhodes conceived the idea that he might effect single-handed the pacification which military skill had failed to compel. To succeed, it was essential that he should trust and be trusted. He moved his tent away from the troops to the base of the Matoppo Hills, and lay there quietly for six weeks, in the power of the enemy if they had chosen to attack. Word was circulated among the natives that he had come alone and undefended to hear their side of the case. A council was held by them in the very depths of the hills, where no armed force could touch them. He was invited to attend it. It was a case of staking his life on trust. He displayed no hesitation, but mounted and rode unarmed with the messenger. Three friends rode with him. They met the assembled chiefs who laid the native grievances before them. At the end of a long discussion Rhodes, having exacted such concessions as he thought fit, asked the question, "Now, for the future is it peace or is it war?" And the chiefs, laying down their sticks as a symbol of surrendered arms, declared, "It is peace." Rhodes, riding away, characterized the scene as one of those "which make life worth living."

His life was drawing towards its end. He had still a few years before him, however, and he devoted them with success to the development of the country which bore his name. The railroad was now brought to Bulawayo, and arrangements were made for carrying the line on in sections as far as the south end of Lake Tanganyika, a construction which was part of his pet scheme for connecting the Cape by a British line of communication with Cairo. He also concluded arrangements for carrying a telegraphic land line through to Egypt. The mineral development of the country also was fairly started. But the federal union of South Africa, the aim towards which he had always worked as the secure basis of the extension of British rule in the southern half of the continent, was not for him to see. The South African War broke out in 1899. Rhodes took his part at Kimberley in sustaining the hardships of a siege; but his health was broken, and though he lived to see victory practically assured to British arms, peace had not been concluded when, on March 26, 1902, he died at Muizenberg, near Cape Town.

His life's work did not end actually with his death. He left behind him a will in which he left the bulk of his vast wealth for the purpose of founding scholarships at Oxford of the value each of £300 a year, to be held by students from every important British colony, and from every State and Territory of the United States of America. The sum so bequeathed was very large; but it was not for the munificence of the legacy that the will was received with acclamation throughout the civilized world: it was for the striking manifestation of faith which it embodied in the principles that make for the enlightenment and peace and union of mankind, and for the fine constancy of Rhodes's conviction that the British Empire, which he had been proud to serve, was among the greatest of organized forces uniting for universal good. A codicil, signed during the last days of his life, gave evidence of some enlargement of his views as to the association of races necessary in order to secure the peace of the world, and added a certain number of scholarships to be held at the disposal of German students.

The publication of the will silenced Mr. Rhodes's detractors and converted many of his critics. It set a seal upon his completed life, and his name passed at once to the place which it is probably destined to take in history, as one of the makers of the British Empire.

RHODES, JAMES FORD (1848–1927), American historian, was born in Cleveland, O., on May 1, 1848. He studied at New York university, at the University of Chicago, and at the Collège de France in 1867–68, and in 1868 served as occasional Paris correspondent to the Chicago *Times*. He then took a course in metallurgy in the School of Mines, at Berlin; subsequently inspected iron and steel works in western Germany and in Great Britain; and in 1870 joined his father in the iron, steel and coal business in Cleveland, becoming a member of the firm in 1874. He retired from business with an ample fortune in 1885, and after two years devoted to general reading and travel he began his *History of the United States from the Compromise of 1850*, which was published in eight volumes in 1893–1917 (rev. ed. 1920). In 1909 he published a volume of *Historical Essays;* in 1913, *Lectures on the American Civil War;* in 1917, *History of the Civil War;* and in 1922, *The McKinley and Roosevelt Administration 1897–1909*. The merit of his work earned him numerous honorary degrees in England and America. He died in Brookline, Mass., on Jan. 22, 1927.

Lynch, *Some Historical Errors of James Ford Rhodes* (Boston, 1922); A. W. Lowell, "James Ford Rhodes," *Mass. Hist. Soc. Proc. 1926–27*, vol. lx., p. 122–128 (Boston, 1927), and J. T. Morse, "Memoir of James Ford Rhodes," ib., p. 178–192.

RHODES, the most easterly island of the Aegean sea, about 10 m. S. of Cape Alypo in Asia Minor (length about 45 m. from north-east to south-west, greatest breadth 22 m., area nearly 424 sq.m.). It was taken by Italy from the Turks in 1912 and is now capital of the administration of Dodecanese (*q.v.*). The population of the island is about 32,000.

The island is diversified in its surface and is traversed from north to south by an elevated mountain range, the highest point of which is called Atairo (anc. *Atabyris* or *Atabyrium*) (4,560 ft.).

It commands a view of the elevated coast of Asia Minor towards the north, and of the archipelago, studded with its numerous islands, on the north-west; while on the south-west is seen Mount Ida in Crete, often veiled in clouds, and on the south and south-east the vast expanse of waters which wash the African shore. The rest of the island is occupied in great part by ranges of moderately elevated hills, on which are found extensive woods of ancient pines, planted by the hand of nature. These forests were formerly very thick, but they were subsequently greatly thinned by the Turks, who cut them down and took no care to plant others in their place. Beneath these hills the surface of the island falls lower, and several hills in the form of amphitheatres extend their bases as far as the sea, forming a series of beautiful pictures.

Rhodes has been famed at all times for its delightful climate. The winds blow from the west, often with violence, for nine months in the year; at other times, from the north, moderating the summer heats, except during July and August, when hot winds blow from the mainland.

Rhodes, in addition to its fine climate, is blessed with a fertile soil, and produces a variety of the finest fruits and vegetables. Around the villages are extensive cultivated fields and orchards containing fig, pomegranate and orange trees. On the sloping hills carob trees, and others, both useful and agreeable, still grow abundantly; the vine also holds its place, and produces a species of wine which was highly valued by the ancients, though it seems to have degenerated greatly in modern times; a strong red wine is still exported. The valleys afford rich pastures, and the plains produce every species of grain.

Under Turkish rule Rhodes was a distributing centre for European manufactures to the neighbouring islands and mainland, receiving cattle, foodstuffs and other produce in return. Under Italian rule its commercial position has changed and is still uncertain. Italian, French and Greek steamships call frequently, and tourists are becoming more numerous.

The only town is the capital, Rhodes, at the north-east extremity, rising from the sea in the form of an amphitheatre, surrounded with walls and towers and defended by a moated castle. These are the work of the Knights of St. John, almost unimpaired. But few traces remain of the splendour of the ancient city, with its regular streets, well-ordered plan and numerous public buildings. The modern city of Rhodes is in general the work of the Knights of St. John and has altogether a mediaeval aspect. The picturesque fortifications also by which the city is surrounded remain almost unaltered as they were in the fifteenth century. Principal buildings are the church of St. John, now the principal mosque; the hospital, transformed into a museum; the palace of the grand master; and the senate-house. The picturesque Street of the Knights is perfectly straight, formed of old houses, on which remain armorial bearings of members of the order, including those of royal and noble houses of Europe.

Relics of classical antiquity, inscribed altars, bases of statues and architectural fragments are found in court-yards and gardens in the suburbs, the whole of which were within the limits of the ancient city. The foundations also of the moles between the harbours are of Hellenic work, though the superstructures were erected by the Knights.

Rhodes has two harbours. The lesser lies towards the east, and admits cargo steamers, which can also anchor outside in fair weather. The larger is silted and only admits small craft. The two harbours are separated by a mole and at the eastern entrance is the fort of St. Elmo, with a lighthouse.

History.—Archaeological remains of the Late Minoan age show that the early Aegean culture maintained itself in Rhodes comparatively unimpaired until the historic period. Legend also peopled primitive Rhodes with skilful workers in metal, the "Telchines," and with bold navigators, "Children of the Sun." In Homeric legend there was already a Heracleid settlement, and in historic times Rhodes was occupied by a Dorian population, mainly from Argos and subsequent to the "Dorian invasion" of Greece. The three Homeric cities refounded by these settlers—Lindus, Ialysus and Camirus—belonged to the "League of Six Cities," by which Dorian colonists in Asia Minor protected themselves against the neighbouring mainland. The early history of these towns records brisk commercial expansion and active colonization, illustrated by the rich tombs of Camirus. Rhodian colonies extended not only eastward along the southern coast of Asia Minor, but also to the westernmost parts of the Greek world. Examples are Phaselis in Lycia, Soli in Cilicia, Salapia on the east Italian coast, Gela in Sicily, the Lipari islands, and Rhoda in north-east Spain. In home waters the Rhodians dominated Carpathos and other islands.

The history of Rhodes during the Persian wars is quite obscure. In the 5th century B.C. the three cities were enrolled in the Delian League, and were democracies. In 412 the island revolted from Athens and became the headquarters of the Peloponnesian fleet. Four years later the inhabitants concentrated in the newly founded city of Rhodes, laid out on an exceptionally fine site according to a scientific plan by the architect Hippodamus of Miletus. This soon rose to considerable importance and attracted much Aegean and Levantine commerce which had hitherto been in Athenian hands. In the 4th century B.C. political development was arrested by constant struggles between oligarchs and democrats, who in turn brought the city under the control of Sparta (412–395, 391–378), of Athens (395–391, 378–357), and of the Carian dynasty of Mausolus (357–340). About 340 it was conquered for the Persian king by his Rhodian admiral, Mentor. In 332 it submitted to Alexander the Great, but on his death, the people expelled the Macedonian garrison, and henceforth not only maintained their independence but acquired great political influence. The expansion of Levantine trade in the Hellenistic age brought especial profit to Rhodes, whose standard of coinage and code of maritime law became widely accepted in the Mediterranean. Under modified democracy, in which the six *πρυτάνεις* found a powerful executive, the city long enjoyed a good administration. In foreign politics it prudently avoided the ambitious schemes of Hellenistic monarchs, but gained prestige by energetic interference against all who threatened the balance of power or the security of the seas. Chief incidents are a memorable siege by Demetrius Poliorcetes in 304, who sought in vain to force the city into active alliance with King Antigonus; a severe earthquake in 227, the damages of which all Hellenistic States contributed to repair, because they could not afford to see the island ruined; some vigorous campaigns against Byzantine, Pergamene and Pontic kings, who threatened the Black sea trade route (220 *sqq.*), and against the pirates of Crete. In accordance with their settled policy the Rhodians supported the Romans when these made war upon Philip V. of Macedon and Antiochus III. of Syria on behalf of the minor Greek States. During the Third Macedonian War a false step deprived them of possessions in Lycia, and partially diverted their trade to Delos (167). Nevertheless, during the two Mithridatic wars they remained loyal to Rome, and in 88 successfully stood a siege. The Rhodian navy did further good service for Pompey in his campaigns against the pirates and against Julius Caesar. But in 43 C. Cassius besieged and ruthlessly plundered the people for refusing to submit to his exactions, and though Rhodes continued a free town for another century, its commercial prosperity was crippled and extensive earthquakes after A.D. 155 completed its ruin.

In the days of its greatest power Rhodes became famous as a centre of pictorial and plastic art; it had a school of eclectic oratory whose chief representative was Apollonius Molon, the teacher of Cicero; it was the birthplace of the Stoic philosopher Panaetius; the home of the poet Apollonius Rhodius and the historian Posidonius. Protogenes embellished the city with his paintings, and Chares of Lindus with the celebrated colossal statue of the sun-god, which was 105 ft. high. The colossus stood for 56 years, till an earthquake prostrated it in 224 B.C. Its enormous fragments continued to excite wonder in the time of Pliny, and were not removed till A.D. 656, when Rhodes was conquered by the Saracens, who sold the remains for old metal to a dealer, who employed 900 camels to carry them away. The notion that the colossus once stood astride over the entrance to the harbour is a mediaeval fiction. During the later Roman empire Rhodes was the capital of the "province of the islands." Its history under the Byzantine rule is uneventful, but for some temporary occupations by the

Saracens (653–658, 717–718), and the gradual encroachment of Venetian traders since 1082. In the 13th century the island stood as a rule under the control of Italian adventurers, who were, however, at times compelled to acknowledge the overlordship of the emperors of Nicaea, and failed to protect it against the depredations of Turkish corsairs. In 1309 it was conquered by the Knights Hospitallers of St. John of Jerusalem at the instigation of the pope and the Genoese, and converted into a great fortress for the protection of the southern seas against the Turks. Under their mild and just rule both the native Greeks and the Italian residents were able to carry on a brisk trade. But the piratical acts of these traders, in which the knights themselves sometimes joined, and the strategic position of the island between Constantinople and the Levant, necessitated its reduction by the Ottoman sultans. A siege in 1480 by Mohammed II. led to the repulse of the Turks with severe losses; after a second investment, during which Sultan Suleiman I. is said to have lost 90,000 men out of a force of 200,000, the knights evacuated Rhodes under an honourable capitulation (1522). The population henceforth dwindled in consequence of pestilence and emigration, and although the island recovered somewhat in the 18th century under a comparatively lenient rule, it was brought to a very low ebb owing to the severity of its governor during the Greek revolution. The sites of Lindus, Ialysus and Camirus, which in the most ancient times were the principal towns of the island, are clearly marked, and the first of the three is still occupied by a small town with a mediaeval castle, both of them dating from the time of the knights, though the castle occupies the site of the ancient acropolis, of which considerable remains are still visible. There are no ruins of any importance on the site of either Ialysus or Camirus, but excavations at both places have produced valuable and interesting results in the way of ancient vases and other antiquities, which are now in the British Museum and in the local collection at Rhodes. In mediaeval times its pottery, a lustre ware at first imitated from Persian, developed into an independent style of fine colouring and rich variety of design. Since the Italian occupation in 1912 a considerable modern quarter on European lines has grown up west of the city of the knights; carriage roads are being constructed and the harbours improved.

RHODESIA. The name covers the territory extending from the Transvaal border northward to the boundaries of the Belgian Congo and of Tanganyika Territory. It is bounded on the east by Portuguese East Africa, Nyasaland and the Tanganyika Territory, and on the west by Belgian Congo, Portuguese West Africa and Bechuanaland. The region north of the Zambesi is Northern Rhodesia, a British territory; south of the Zambesi lies Southern Rhodesia, a British crown colony, which includes the areas of Matabeleland and Mashonaland. In this article Northern Rhodesia and Southern Rhodesia are treated separately from the geographical and administrative point of view. The historical section deals with both areas.

NORTHERN RHODESIA

Northern Rhodesia formerly consisted of two distinct provinces, North-Western Rhodesia and North-Eastern Rhodesia. The combined area is 291,000 sq. miles. The country includes much of the land lying between the Zambezi and the Congo. It is bounded on the north and north-east by the Belgian Congo, Lake Tanganyika and Tanganyika Territory, on the east and south-east by Nyasaland and Portuguese East Africa, on the south-east and south by Southern Rhodesia, on the west by Angola, and on the north-west and north by the Belgian Congo.

Topography.—Much of the country consists of high plateau, the Congo-Zambezi watershed rising, in places, to 5,000 feet. The highest land forms a ridge known as the Muchinga mountains, running north-east to south-west, to the south-east of Lake Bangweulu. Still higher land occurs in the Tanganyika District, near the southern end of Lake Tanganyika. In the valleys of the Lower Zambezi, the Luangwa and the Kafue, the altitude falls below 3,000 feet. Within the territory lie Lake Bangweulu (*q.v.*) and half of Lake Mweru (*q.v.*).

Flora and Fauna.—A large part of the region is covered with tropical or sub-tropical savannah. The tall tropical forests of the West African type are poorly represented, and occur chiefly near Lake Tanganyika. The country is fairly well provided with big game. Elephants are to be found in nearly all localities; hippopotami occur in all the larger rivers; the black rhinoceros and giraffe must be included, and large herds of eland, roan antelope, hartebeeste and zebra are to be seen. A list of all the animals would be a long one, but it would include sable antelope, waterbuck, lechwe, sitatunga, impala, reed buck, bush buck, oribi, duiker, etc. Lions are not uncommon. Game reserves have been established, and some of the rarer animals are protected.

Government.—Northern Rhodesia is administered by a governor, assisted by an executive council of five official members. For its constitution *see* the section *Rhodesian History.*

Population.—The European population in December 1925 was 4,624, and the native population about a million. The natives belong to over 50 different tribes, among the chief of which, numerically, are the Awemba, Achewa, Angoni, Asenga, Awisa, Alala, Batoka, Barozi, Baila, Baleaye, Bakaonde, etc.

Communications.—Over much of the country, owing to the occurrence of tsetse fly, transport is done by human porters. On parts of the Zambezi and Luapula, and in the swamps about Lake Bangweulu, native canoes are used. The country is traversed by a railway, linking with Southern Rhodesia and South Africa, and running through Livingstone and Broken Hill to Elisabethville and the Belgian Congo. Roads are few, but a motor road runs from Fort James on to Blantyre.

Occupations.—The economic development by Europeans is, of course, dependent on transport facilities. Within 30m. of the railway in the Batoka and Luangwa districts, farms have been taken up, and maize is the chief crop, though tobacco, cotton, fibre, etc., are also grown. Cattle ranching appears to be successful near the Kafue and in the Kalomo area. Tobacco cultivation is being developed about Fort Jameson, and its extension will be helped by railway development in Nyasaland. A few farms have also been alienated in the Tanganyika district, where cattle thrive, but there is, as yet, no outlet for the produce of this area, until development in Tanganyika Territory provides a way from the lake to Dar-es-Salaam. Hopes are entertained for the development of the northern part of the Kasempa District, which will have a market at Elisabethville, and will receive an impetus on the completion of the Lobito Bay railway. Mining is carried on at Broken Hill, where lead and zinc deposits occur, and at the Bwana M'kuba copper mine. The total value of the mineral production in 1926 was £111,560.

Education and Health.—There are six Government schools of primary grade, three farm schools, and one aided school for Europeans. There is a Government school for natives at Mongu, and many mission schools. In the Lusaka area Afrikaans is taught. Malaria, blackwater fever and dysentery are not uncommon, and sleeping sickness occurs in the Luangwa valley.

Customs.—The country is divided into two parts. (1) The "Congo Basin" comprises that part of North-Eastern Rhodesia lying to the north-west of the Muchinga mountains. It is included in the conventional zone of the Congo, and no preference may be given to the imported products of any country. The duty on imports does not exceed 10% ad valorem. (2) The "Zambezi Basin" is a party to the South African customs agreement. South African produce, except spirits and manufactured tobacco, is admitted free of duty. Goods may be imported in bond through South Africa or Southern Rhodesia, which allows British goods to benefit by lower import duties than those entering the Union of South Africa.

See the annual reports on *Northern Rhodesia* issued by the British Colonial office. (R. U. S.)

SOUTHERN RHODESIA

Southern Rhodesia, separated from Northern Rhodesia by the Zambezi river, is bounded on the north-east and east by Portuguese East Africa, on the south by the Transvaal and on the south-west and west by the Bechuanaland Protectorate. It consists of Matabeleland and Mashonaland and covers approximately 152,000 sq. miles. The country lies between 15° 36′ and 22° 25′ S. and 25° 14′ and 33° 4′ E.

Physical Features.—Southen Rhodesia forms part of the great South African plateau. The highest part runs from south-west to north-east and forms a broad watershed between the basin of the Zambezi and the basins of the Limpopo and Sabi. It is along this central axis that the railway runs from Plumtree, through Bulawayo to Salisbury. In this central area the elevation ranges from above 4,000 to over 5,000 feet. On each side the elevation decreases, falling to below 2,000 about the Zambezi, and to below 1,000 ft. in the south-east. About 24% of the total area lies above 4,000 feet. The surface consists for the most part of gently undulating plains, diversified by steep-sided hill ranges and isolated kopjes. The highest point occurs 48 m. N. of Umtali in Inyangeni Mountain, 8,250 feet. Here a definite mountain range runs north and south and forms the eastern border of the country.

Climate.—The temperature varies of course with the latitude, altitude and distance from the sea. On the whole the considerable altitude partly compensates for the low latitude. Though the days are hot throughout the year the nights may frequently be cool, and frost is liable to occur during June, July and August. From the middle of August the temperature increases to its maximum in October, when the mean maximum is 85·2, taking the country as a whole. Rains and cloud usually appear about October and bring a little coolness. Sometimes the rains are late and the high temperatures continue to be rather trying during November and December. The thermometer may rise to over 100° even on the high veld. During the late spring heat the relative humidity of the atmosphere may fall below 20% in the middle of the day, and at 9 A.M. is often between 30 and 40%. The rainy season may be said to last from October to March.

Vegetation.—About two-thirds of the country is covered with trees and shrubs. There are comparatively few open stretches. The prevailing plant association is savannah, forming park-like territory. At favourable spots on the mountainous, eastern border, close evergreen forests occur in patches, some of the trees attaining a height of 200 feet. On the upper slopes Lussonia umbellifera and Eugenia spp. are dominant, and here they grow to heights up to 80 feet. The so-called Rhodesian teak (native Igusi: *Baikiaea plurijuga*) is about 50% harder than real teak. From the bark of the baobab the natives obtain a fine fibre which they use for making nets.

Fauna. (*See* also SOUTH AFRICA, UNION OF.)—The country is rich in antelopes, the most common species being the duiker, the stembok and the rietbok. Other herbivorous animals are the buffalo, giraffe, zebra, elephant, rhinoceros and hippopotamus. The carnivora include the lion, leopard, cheetah and various wild cats. Crocodiles occur in the rivers. Beetles, butterflies and moths abound. White ants (termites) and locusts are troublesome. Among the largest of the birds are ostriches, secretary birds, paauws, korhaans, cranes, storks, vultures and eagles. Guinea fowl, partridge, duck, geese and teal are shot. Many of the small birds have brilliant plumage, the most distinguished being what is known as the blue jay, with a brilliant iridescent light blue colour. Good shooting is to be had, but the following are royal game, and so are protected: Eland, elephant, giraffe, gemsbok, hippopotamus, inyala, ostrich, rhinoceros, springbuck and zebra.

Population.—In 1926 the population consisted of 39,174 Europeans, 834,473 natives, and about 3,500 Asiatic and coloured people. The natives include Amandabele, Amatshangana, Basuto and numerous tribes who are often grouped together as "Mashona." (*See* separate articles.) Ninety-three per cent of the white population speaks English. A certain amount of Afrikaans, however, is spoken in the country districts.

Towns and Communications.—Salisbury and Bulawayo are described in separate articles. Umtali, which is the centre of a gold mining area, has a white population of 1,964 and a racecourse. Other towns are Gwelo, Enkeldoorn, Melsetter, and Hartley.

The railways are operated by a railway commission acting for the two Rhodesias and Bechuanaland (Railway Act 1926). The colony is well served, and is connected with Beira, the nearest port, the Belgian Congo and the Union of South Africa. There is through communication by the Rhodesian system from Capetown to the Congo border and, via Bulawayo and Salisbury, to Beira on the Indian Ocean. The lines, as far as possible, follow the watersheds. The standard gauge is 3 ft. 6 inches.

Agriculture and Pastoralism.—Farming exists in several forms, from ranching to tobacco-growing. Mixed farming is becoming more common, and dairying is practised on the smaller farms near the towns and mines. Maize is the chief crop. The acreage under crops (1925) was maize, 232,947; tobacco, 8,441; winter wheat, 4,526; ground-nuts, 5,067; cotton, 62,858. Citrus fruit for export can only be grown on land that can be irrigated during the winter months. Irrigation is still in its infancy, but several large citrus orchards are already producing, and in 1923, 44,760 boxes of oranges were exported. Ranching is favoured by the climate, which allows the cattle to run out on the veld throughout the winter and to find sufficient food. There are about two million cattle in the country, more than half being owned by Europeans, generally in herds of from 600 to 1,000. They are grass fattened for market, or are sent on to agricultural farms for the final preparation.

Mining.—Gold is still the chief mineral produced in the country. Most of the mines are on the high veld, and are widely distributed. The metal occurs in the ancient schists and in lodes within the margins of the granite. In 1927 the gold output was valued at £2,458,862. In the same year other mineral production included: asbestos, 33,176 tons; coal, 1,001,724 tons; chrome ore, 218,018 tons; and silver, 113,241 oz.

Government.—For the constitution under the letters patent of 1923 *see* RHODESIAN HISTORY below.

Education.—There were 75 primary and eight secondary schools for Europeans in 1925, and in addition a large number of state-aided farm schools. There were 1,297 schools for native and six for coloured children.

RHODESIAN HISTORY

The Ancient Gold Field.—The regions of South-Central Africa, now known as Rhodesia (North and South) include what was probably the greatest gold field of the ancient world. The remains of the mines, sunk to a vertical depth of sometimes 150ft. in gold-bearing rock, are found in an area 500 miles long by 400 broad; and it is estimated by the mining engineers of to-day that, allowing for imperfect methods of extraction, gold of a value equivalent to at least £75,000,000 must have been won from these pre-historic workings. Even so, enough was left to make this very ancient gold field one of the chief resources of the youngest self-governing colony of the British Empire; and eleven-twelfths of the 120,000 claims registered in 1910 were pegged out on the site of mines of varying antiquity. In this gold-bearing area numbers of non-indigenous plants, fruits, and trees of Indian habitat are found, and there may have been a Hindu colonisation and supremacy here as there was in Java in the centuries preceding the Mohammedan conquest of that island. Another solution is that the gold area was mined by the Sabaeo-Phoenicians of Yemen with Indian labour, and that while the Ophir of King Solomon was the south-west corner of Arabia, most of the gold of this Ophir[1] (and of the Graeco-Roman world) came from South-East Africa. A glance at the map will show how easily the Sabaeans could reach by land and sea the east coast of Africa. In addition to the ancient gold workings there are two other classes of remains which reveal something of the early history of the country. As many as 426 Bushman rock paintings have been found in caves. They are generally hunting scenes and animals, but nine of them depict the Victoria Falls. Until the discovery at Broken

[1]The word "ophir," like "tharshish," is a generic term indicating any conspicuous source of natural products or merchandise.

hill in 1920 of the skull of what is thought to be an extinct species of man (Homo rhodesiensis), comparable to the Neanderthal species of Europe which perished at the close of the last glacial period, the Bushmen were taken to be the earliest inhabitants. This discovery (the actual skull is in the British Museum; a plaster cast of it is in the museum at Bulawayo) in conjunction with the prevalence of palaeolithic hand-axes and other implements similar to those of the Neanderthal men in Europe, suggests that the country was peopled by this extinct species of man thousands of years before the era of the Bushmen (?1000 B.C.). The other class of remains consists of the ruined stone buildings, at least 400 in number, of which the Great Zimbabwe is the most remarkable. Some hold that, while these ruins are of varying periods, ancient, mediaeval, and comparatively recent, the oldest must be associated with the Asiatic rock-miners. Others believe that they are exclusively mediaeval, or post-mediaeval.

Monomotapa.—The gold area of South-Central Africa emerges as the Bantu kingdom of Monomotapa with the capture of the East Coast ports from the Arabians by the Portuguese in A.D. 1500–20. At that time the fertile and temperate uplands which lay inland behind the fever-stricken coast lands were peopled by industrial Bantu, who, migrating from the north many centuries before, had perhaps mingled with, and absorbed, a decadent remnant of the Sabaean, or Indian, or Persian, gold-mining population of the Graeco-Roman era. The ancient rock-mining had been long abandoned, and the gold was won by river-sand washing and such rude methods of quartz crushing as were known to the Bantu. The paramount chief was styled grandiloquently the Monomotapa, or Lord of All; and the territory of the dynasty is shown on the 16th and 17th century maps as Monomotapae Imperium. Although the Portuguese desired from the first to obtain possession of the gold area, they made no permanent settlements in the interior except where the waterway of the Zambezi gave easy communication from the coast. The missionaries, however, whose reports on the Monomotapa, or Kafir, mission are preserved in the archives of the Propaganda and in the Vatican library at Rome, penetrated to the great chief's "court" and converted him to Christianity. As the result of the relations thus established, the Monomotapa of the day granted, by treaty in 1629, the "gold mines" to the king of Portugal. This acquisition failed to yield even a moderate revenue at the time, but 250 years later it brought the Portuguese a very substantial advantage. For it was this treaty with the cross of the Bantu chief affixed to the words, "Manuza, emperor of Monomotapa," that enabled Portugal to make good her claim to Delagoa bay in the MacMahon arbitration of 1875.

Matabele Conquest.—But possession of the country had passed from the industrial to the military Bantu. In 1837 Moselekatse, chief of the Amandabele (corrupted to Matabele), a military tribe akin to the Zulus, having failed to kill the white men north of the Orange river, was himself driven across the Limpopo by the Boers. There he almost exterminated the light-skinned, industrial Ma-Kalanga population, and established himself and his tribe in the best of their lands—thereafter Matabeleland. Three years later the Mashonas were reduced to slavery and vassalage. They also, like the Ma-Kalanga, were industrial Bantu, living in open villages with land under permanent cultivation, and practising the arts of metal-working, pottery, and weaving; and the supremacy of Moselekatse and his successor Lobengula was maintained over them by the despatch of the Matabele warriors once a year to work indiscriminate murder and robbery throughout their villages.

THE FOUNDING OF RHODESIA

Cecil Rhodes.—The first conception of Rhodesia came to Rhodes at Oxford in 1878. Sir Sidney Shippard, who afterwards succeeded him as commissioner in Bechuanaland, has recalled how, walking in Christchurch meadows, Rhodes and he "discussed and sketched out the whole plan of British advance in South and Central Africa." In 1888, with the prestige of an unexampled financial achievement, vast wealth, and an idealistic temperament that refused to recognize as permanent the hostility either of men or circumstances, Rhodes was ready to give effect in Africa to the thoughts which had first germinated in his mind ten years before at Oxford. There was no time to lose. In 1887 Portugal joined (on paper) Mozambique to Angola by claiming the whole of the interior between them—a claim to which Germany and France assented, but which the British Government at once repudiated. In the same year it was known at the Cape that the Boers were preparing to make a settlement in Mashonaland. This news spurred to action Rhodes, who was then deputy resident commissioner in Bechuanaland. On his motion, but with the sanction of the high commissioner, J. S. Moffat, the British Resident at Bulawayo, made on Feb. 11, 1888, a treaty, under which Lobengula bound himself not to enter into correspondence with any foreign power without the knowledge and consent of the high commissioner. On Oct. 30, again with the high commissioner's sanction, Rochford Maguire and two others obtained from Lobengula, in return for a monthly payment of £100 and a supply of rifles and ammunition, a concession of the right to search for, and work, minerals within his territory. This concession was then transferred to an association which Rhodes had formed, in consideration of the association's undertaking to provide the capital necessary to put it into effect, and to share the net receipts with the concessionaires. On April 30, 1889, the association's proposals for the formation of a company to develop the Bechuanaland Protectorate were submitted to the British Government. The objects of the proposed company were: (1) to extend northwards the railway and telegraph systems; (2) to encourage emigration and colonisation; (3) to promote trade and commerce; and (4) to develop and work mineral and other concessions under the management of one powerful organisation, thereby obviating conflicts and complications between the various interests that had been acquired within those regions, and securing to the native chiefs and their subjects the rights reserved to them under the several concessions.

British South Africa Company.—The Company received its charter on Oct. 29, 1889. Rhodes, as general manager in South Africa, arranged to carry the railway northward from Kimberley, and enrolled a force of 500 police to protect the settlers, who were to be established on the Mashonaland plateau: and nine months later the Company took possession of what an agent of the French Government termed not ineptly "the pick of Central Africa on both sides of the Zambesi." The pioneer expedition of 200 European settlers, 150 African labourers, and the police, broke camp on the Matcloutsie river on June 28, 1890; and, commanded by General Pennefather and guided by Selous, reached Fort Salisbury, a distance of 400 miles through virgin country, on Sept. 12. The cost of the expedition, exclusive of grants of land and mineral rights to the pioneers, was £89,285 10s.; and the occupation was effected "without the loss of a single life, and without the necessity of firing a shot." The Company's police, however, came into collision almost at once with the Portuguese authorities on the eastern border at Massikessi. Further conflict was avoided by the *modus vivendi* of Nov. 11, and the terms of this arrangement were embodied, together with the settlement of the limits of the Portuguese territories east and west, in the Anglo-Portuguese convention of June 11, 1891. Under this instrument, which governs the relations of Rhodesia to Mozambique, Portugal undertook to construct, or allow the construction of, a railway from Beira, the natural port of the interior, to the Rhodesian frontier; to limit the duties upon goods in transit to and from British territory through Mozambique to 3%; and to recognize the Zambezi and Shire rivers as international waterways. A year later, when the first administrator, A. R. Colquhoun, had been succeeded by Dr. (afterwards Sir L. S.) Jameson, the Company's possession was again challenged. In 1891 a Boer trek, 4,000 strong, was organized by Col. Ferreira to effect a settlement in Mashonaland, but was defeated by the firm action of Jameson and Lord Loch, the high commissioner.

The early years of Rhodesia[1]—the name was given to the Company's territories by proclamation of May 3, 1895—were arduous

[1] *i.e.*, Southern Rhodesia (152,000 sq.m.). Northern Rhodesia (290,000 sq.m.) is treated subsequently.

and eventful. The 1,500 settlers, Rhodes told the shareholders at their annual meeting on Nov. 29, 1892, "went to work to find their reefs, but they were removed 1,700 miles from the coast, and their food cost them £70 a ton." To provide means of transport and communication was the first duty of the Company, and Rhodes set about it at once. The work was interrupted three times; by the Matabele war in 1893, by the Jameson Raid and the subsequent native insurrection in 1896, and by the great South African war of 1899–1902. The most serious of these interruptions was the second. On Jan. 6, 1896, Rhodes resigned his premiership of the Cape Colony on account of his complicity in the raid, and went to London to see the colonial secretary (Joseph Chamberlain) and do what he could for Jameson and the other raiders, who were being sent home for trial. While there the news of the native insurrection reached him, and he hastened to Rhodesia, travelling by the Suez Canal to Beira. By the help of the railway then being made he got to Salisbury in time to join the column which set out on April 18 for the relief of Bulawayo, where the settlers had just gone into laager with 10,000 Matabele rebels on the hills around. It was then that, at the risk of his life, in the Matopo hills he won the Matabele indunas to a prompt submission, and drove the railway up from Palapye 229 miles to Bulawayo, in the amazingly short time of five months. The settlers increased in numbers, industries were established, public offices, law-courts, churches, schools and hospitals were built, the administration became more efficient, and by 1905 Rhodesia had "turned the corner." In that year with a gold export of £1,500,000, she took her place among the gold-producing countries of the empire; and in that year the first train steamed slowly across the majestic span of the Victoria Falls bridge. Bulawayo, Gwelo, Salisbury, and Umtali were all connected by rail with each other and with both Beira and Cape Town; and the main trunk line was starting from Livingstone just across the Zambezi, on its way through Northern Rhodesia to join, ten years later, the railways of the Belgian Congo.

Development of Rhodesia.—During the remaining 18 years of the Company's rule (1905–23) the resources of the colony were steadily developed, while, with the increase of European population, the elected minority in the legislative council, introduced in 1899, grew into a majority of 12 to six in 1914. There was no rapid increase of the European population. Between 1904 and 1911 it rose from 12,506 to 23,606; and at the close of the Company's rule it was returned, by the census of 1921, as 33,260. There is a reason for its relatively slow growth. In Rhodesia, as in South Africa, manual labour was provided, broadly speaking, by the 500,000 native Africans already in the country, and there was, therefore, no room for British emigrants of the wage-earning, and most numerous class, from which the North American and Australasian colonies received their great accessions of population in the 19th century. But the character of this European population is correspondingly high. Its proportion of well-educated and well-bred immigrants is unusually large. It is 90% British; and, unlike the Union of South Africa, Rhodesia is free from the bi-lingual incubus, with its double notices and mediums of instruction, and its frequent incitements to social and political dissension. Industry, on the other hand, showed a high rate of progress. Rhodes recognized from the first that the mineral production must be supplemented by the more permanent resources of agriculture and stock-raising. And after his death (1902) the Company, so soon as the economic disturbances caused by the South African war had passed, endeavoured to administer the colony in this, and other respects, on the lines he had laid down. In 1907 Jameson, then prime minister of the Cape Colony, and other directors of the company, visited Rhodesia to investigate the grievances of the settlers and devise measures for increasing production. As the result, the acquisition of agricultural land was made easier and less costly, and government advice and assistance was given to farmers, cattle-ranchers, and planters. In particular the cultivation of tobacco was promoted, and in 1911 the value of the export was £34,810. At the same time the development of the mineral wealth of the country continued, and the gold export of 1900, £2,623,708 in value, placed the colony fourth among the gold-producing countries of the empire. During the World War (1914–18), although Rhodesia contributed its full quota to the British armies, the production of copper and other base-metals, as well as that of maize and chilled meat, was actually increased.

End of the Company's Rule.—With the expiry of the 25 years' term of the Company's charter on Oct. 29, 1914, among other alternative courses, three especially claimed the attention of the settlers. When, in 1908–9, the National Convention met to frame the Union of South Africa, Rhodesian delegates followed the deliberations in the interests of the country, and provision was made in the Imperial Act of 1909 for its subsequent, and voluntary, entry into the Union. That course was open. A second was to support a renewal of the charter, and a third to press for self-government. The development of events under the predominantly Dutch ministry of Gen. Botha made Rhodesians hesitate to join the Union, and in 1913 a movement for responsible government took shape. The process of taking over the administration from the Company, however, presented so many difficulties that 11 out of the 12 members elected to the Legislative Council in March 1914 were pledged to maintain the Company's rule for the time being. A month later the council defined its policy. It affirmed the right of the settlers to self-government and instituted the proceedings necessary to ascertain what sources of revenue the Company would hand over to the administration that succeeded it. In these circumstances the British Government renewed the charter for ten years, with the proviso—in which the Company concurred—that responsible government should be granted before the term expired, if, and when, the settlers could show that they were capable of administering the colony. The directors of the Company were ready to surrender their powers, but they had to consider the interests of the shareholders. One difficult problem was the ownership of the unalienated land. The Company's expenditure on administration had exceeded greatly the revenue collected. The directors looked to the sale of these lands to make good the loss under this head, and with this purpose in view, they had declared formally in 1913 that the unalienated land, as well as its mineral rights and railway interests, was the property of the Company. The Legislative Council, on the other hand, maintained that the land, being vested in the Company merely as "an administrative and public asset," would pass, on the expiry of the Company's administrative powers, to the colony. A privy council judgment (1918) decided that while the unalienated land was the crown property, the Company was entitled to dispose of it until its administrative losses had been recovered. A royal commission—the Cave commission—assessed the amount thus due to the Company at £4,435,000 (Jan. 1921). On the recommendation of the Buxton committee, and in response to a petition from those who were in favour of entering the Union, both a draft constitution conferring responsible government and the specific terms offered by Gen. Smuts for admission to the Union were placed before the Rhodesian electors in 1922. The question was decided on Oct. 27 by a referendum, in which 5,989 electors voted for entry into the Union and 8,774 for responsible government. This majority—all the more significant in view of the generosity of the terms offered by the Union—led to the intervention of the British Government. The Company agreed to accept in satisfaction of its administrative claims in respect of both Northern and Southern Rhodesia the sum of £3,750,000 in lieu of the royal commission assessment of £4,435,000, but it retained its mineral rights and obtained an assurance that these and its interests in the railways would be respected by the governments which replaced it. The £3,750,000 was paid in cash on Oct. 31, 1923. Of this sum, £1,750,000 was the gift of Great Britain, and the remaining £2,000,000, raised by loan, was paid by Southern Rhodesia, which at the same time repaid the British Government a sum of £300,000, advanced to the Company for administrative losses incurred since March 31, 1918, the end of the period covered by the award of the royal commission. In the meantime, on Sept. 12 (1923), the 32nd anniversary of the arrival of the pioneer force at Fort Salisbury, Southern Rhodesia was formally annexed to the British Crown.

UNDER RESPONSIBLE GOVERNMENT

Southern Rhodesia.—Under the new constitution, granted by Letters Patent on Oct. 1, legislation affecting the African population, the unalienated land, the railways, and the mineral rights of the company is subject to disallowance by the Crown, but in other respects Southern Rhodesia was endowed with the institutions of a self-governing oversea British state. A legislature of two chambers was constituted, of which the Legislative Council is composed of the ministry under the presidency of the governor of the Colony, and the Legislative Assembly of 30 members elected in 11 electoral districts. The first general election was held on April 29, 1924, and the first ministry was then formed by Sir Charles Coghlan, who remained in office, as prime minister, until his death in 1927, when he was succeeded by Mr. H. U. Moffat. The franchise is most liberal. Persons possessing the necessary qualifications are admitted to the electorate without distinction of sex or race. The first concern of the colonial government was to augment the European element, and recent immigration returns indicate that their efforts have been successful. In the first nine months of 1927 the unprecedented number of 3,574 immigrants were received; and in the following year the European population, which was returned in the census of May 4, 1926, as 39,174, was estimated to be 50,000. Apart from this, two important questions occupied the ministry. As the result of negotiations with the company and the governments concerned, the administration of the railways in Southern Rhodesia, Northern Rhodesia, and the Bechuanaland protectorate were placed under a railway commission composed of a chairman and three other members. The powers and duties of this body are set out in the Railway Act, 1926. The chairman, who must have a practical experience of railway working, is appointed by the three governments jointly after consultation with the railway companies and with the approval of the Colonial Office, and the three other members respectively by the three governments. The appointment of the Hilton Young commission (*see* below) in 1927 brought into prominence again the question of the amalgamation of the two Rhodesias, which had been raised in 1914. The ministry by requesting that the colony should be included in the scope of the commission, and by public declarations (Oct. 5, 1927), showed its intention to consider favourably any proposals on this head that might come from Northern Rhodesia.

Northern Rhodesia.—The Company's territory north of the Zambezi was inhabited by a relatively sparse population of industrial Bantu, but, unlike the high plateaux south of the river, it was tropical in climate.

Up to 1911 this vast territory of 287,950sq.m., twice as large as Southern Rhodesia, was divided into North-West and North-East Rhodesia. From that year onwards the territory was administered in the form of a single government as Northern Rhodesia. At the time of the amalgamation its European population was 1,434, and the annual value of its imports and exports respectively £127,064 and £128,458. In 1924 the territory was taken over by the British Government; and under the constitution, granted by Order-in-Council of Feb. 20, the colony of Northern Rhodesia is administered by a governor, with an executive council composed of the chief officials, and a legislative council of 14 members, five of whom are non-official and elected. By the census of 1921, the colony then had a European population of 3,634, and an African population of 979,905; and in 1927 the former was estimated to have risen to between 5,000 and 6,000. The first governor, Sir Herbert (then Mr. H. J.) Stanley took office on April 1, 1924. The natives are left as much as possible to the authority of the chiefs, but there is a European magistrate in each of the nine districts into which the colony is divided. The Barotse district, which is a "native reserve," is ruled by the paramount chief, and the council of lesser chiefs, common to the Bantu peoples, has a recognized official status. As, under the terms of transfer, the company retains the mineral royalties and 50% of the land revenues, the Crown administration is placed in a disadvantageous financial position.

Although the colony is under one administration the conditions of North-West and North-East Rhodesia differ materially; 85% of the Europeans and the seat of government are in North-West Rhodesia, in proximity to the railway which, carried from Southern Rhodesia across the Zambezi by the Victoria Falls bridge in 1905, runs northward from Livingstone, the capital, to the Belgian Congo. The European population of North-East Rhodesia, on the other hand, is almost limited to the (approximately) 500 settlers engaged in the tobacco plantations. The separation of the two areas has been emphasized by an almost complete lack of communications—a factor which must continue to operate until the new east to west road from Fort Jameson to the Cape to Cairo railway has been made. As it is, the tobacco production of North-East Rhodesia, to the expansion of which the recent improvement in the finances of the colony is due, is carried 300 miles by motor lorries to railhead at Blantyre in Nyasaland, and thence by rail to be shipped at Beira. While, therefore, circumstances connect North-West Rhodesia with Southern Rhodesia, the outlook of North-East Rhodesia is to Nyasaland and the East. Although the climatic and other conditions of the territory are not unsuitable for European colonisation, the company made little effort to introduce settlers, and, broadly speaking, under its rule the development of Northern Rhodesia was subordinated to the interests of Southern Rhodesia.

Hilton Young Commission.—In these circumstances the appointment of the Hilton Young commission in 1927 was of special importance to the colony. Under the terms of reference Northern Rhodesia was classed officially as a member of the East Coast group of British Colonies. The Commission did not find themselves in complete agreement as to the disposal of the colony, but in their report (Command 3234), published in Feb. 1929, they advised that "in the present state of communications the main interests of Nyasaland and Northern Rhodesia, economic and political, lie not in association with the Eastern African territories but rather with one another and with the self-governing colony of Southern Rhodesia." It recommended, however, that the co-operation which already exists between the northern territories and Nyasaland, Northern Rhodesia and Zanzibar should be continued and through conferences links should be retained. (W. B. W.)

RHODES SCHOLARSHIPS. Cecil Rhodes provided by his will for the maintenance at Oxford university of about 200 scholars for a term of three years each. The value of each scholarship is now £400 a year. Thirty-four scholars come each year from the British empire, distributed substantially as follows: One scholar is elected annually from each province or State of Canada, Australia, New Zealand and South Africa; from four specified schools in the Cape Province of South Africa and from the colonies of Newfoundland, Jamaica and Bermuda. Rhodesia elects three scholars each year, and Malta one every third year. Thirty-two scholars are elected annually from among the 48 States of the United States. Five annual scholarships were allotted to Germany, but these were annulled by Parliament in 1916.

In his will Rhodes emphasized the value of such scholarships: (1) In giving "young colonists" breadth of view, instruction in life and manners, and in instilling into their minds the advantages of a united empire; (2) in creating in American students an attachment to the country from which they originally sprang without weakening their sympathy for their own, and so fostering the cause of the union of English-speaking people.

Rhodes believed that his objects would be best attained by bringing together for education at Oxford young men selected for four groups of qualities which he defined as follows: literary and scholastic ability and attainments; qualities of manhood, truth, courage, devotion to duty, sympathy for and protection of the weak, kindliness, unselfishness and fellowship; exhibition during school days of moral force of character and of instincts to lead and to take an interest in his school-mates; fondness for sports.

Method of Selection.—Subject to ratification by the trustees, the nomination of scholars is in the hands of local committees, which are appointed by the trustees, and on which ex-Rhodes scholars sit. Candidates must be citizens of the country, dominion or colony, which they are to represent, with at least five years' domicile, and unmarried; and they must have passed their 19th and not have passed their 25th birthday by Oct. 1 of the year for which they are elected. Candidates are judged on their records and after a personal interview with the selection committee. But, except in certain exceptional cases, candidates are obliged to have attended a recognized, degree-granting college or university for two years at least. At Oxford the scholars are distributed, as Rhodes desired, among all the colleges of the university, as far as possible in accordance with their own wishes, but acceptance of any scholar is determined by the colleges themselves. No college undertakes to accept more than between two and five Rhodes scholars in any one year. The offices of the trust are at 17, Waterloo place, London, S.W.1. The Association of American Rhodes Scholars has headquarters at the Bank of Manhattan, 40 Wall st., New York. (P. K.)

RHODIUM, a metal always found in platinum ores but never in large quantities, was first discovered by Wollaston and announced by him in the memoir disclosing the discovery of palladium (*Phil. Trans.*, 1804). (Symbol Rh, atomic number 45, atomic weight 102·9.) Its name is due to the rose-red colour of its salts (*ῥόδον*, a rose).

If a platinum ore is treated with aqua regia, most of the osmium, iridium and ruthenium is left undissolved (some rhodium is also left if much is present). The platinum can be nearly all removed from the solution by precipitation with ammonium chloride and, if the acid solution is treated with scrap iron ("footed"), the remaining metals are deposited. If this precipitate is fused with potassium bisulphate the rhodium is all converted into potassium rhodium sulphate which on extraction with water and recrystallization gives the pure salt. Another method is to heat the above metallic precipitate with common salt in a stream of chlorine, when the double sodium rhodium chloride, Na_3RhCl_6, is formed; this is extracted with water and crystallizes with 12 molecules of water in dark red crystals appearing almost black by transmitted light. For other and more complicated methods of extraction, *see* Claus, *T. Prakt. Chem.*, (1843–45); Gibbs, *ibid.* (1861) p. 65, (1865) p. 10.

Rhodium in the massive state is a slightly bluish-white metal having a specific gravity of about 12·1. It fuses at about 1940° C and volatilizes at a somewhat higher temperature. It oxidizes superficially when heated in the air, becoming coated with a film of a blue oxide. It is practically insoluble in either hydrochloric or nitric acid or in aqua regia, but it is attacked by hot concentrated sulphuric acid or on fusion with potassium bisulphate—an unique property amongst the platinum metals; when alloyed with other metals and especially with lead, it is soluble in other strong acids. Fused with nitre and caustic potash it is oxidized to RhO_2. From the commonest commercial salt, sodium rhodium chloride, Na_3RhCl_6, $12H_2O$, other rhodium salts may be readily prepared by precipitating from its solution the yellow hydroxide $Rh(OH)_3$ with an equivalent amount of caustic potash (the hydroxide is soluble in excess), filtering and washing the precipitate, and dissolving it in the desired acid. The hydroxide being a stronger base than that of most of the other metals of this group, rhodium salts, even of organic acids, may easily be prepared by this process.

Four oxides of rhodium are known, Rh_2O, RhO, Rh_2O_3 and RhO_2; of these Rh_2O_3 is of some importance as being the oxide from which ordinary rhodium salts are derived. It is a black, sparingly soluble powder produced by heating the corresponding hydroxide.

Rhodium chloride, $RhCl_3$, can be produced either by heating finely divided rhodium in a stream of chlorine or by dissolving the corresponding hydroxide in hydrochloric acid. The latter process first gives a yellow solution, which on heating assumes a rose-red colour, and on careful evaporation gives a residue of a gummy, deliquescent hydrated chloride. This on further heating loses its water and becomes insoluble. Two new chlorides of rhodium, $RhCl$ and $RhCl_2$, have been prepared by Wöhler and Müller (1926). The simple chloride $RhCl_3$ readily produces double chlorides with the chlorides of the alkali metals having the general formula M_3RhCl_6, xH_2O.

Rhodium sulphate, $Rh_2(SO_4)_3$, $12H_2O$, is formed from the yellow hydroxide by solution in dilute sulphuric acid. The double sulphate $K_3Rh_2(SO_4)_6$, produced by fusing rhodium with potassium bisulphate, is soluble in water and gives rose-coloured crystals on evaporation to dryness. Rhodium sulphate also combines with alkaline sulphates to form true alums isomorphous with ordinary alum. The best known example is potassium rhodium alum, K_2SO_4,$Rh_2(SO_4)_3$,$24H_2O$. (*See* ALUMS.)

Rhodium forms several series of compounds with ammonia: the best known are the roseo, purpureo and luteo compounds which are similar to the corresponding cobalt compounds (*see* COBALT). Technically, little use has been found for rhodium compounds, although it is essential in small amounts in the manufacture of "liquid gold" (*see* GOLD). A rhodium–platinum alloy is in general use as one of the elements in a thermocouple for measuring high temperatures. (F. E. M.)

RHODOCHROSITE, a mineral consisting of manganese carbonate, $MnCO_3$, crystallizing in the rhombohedral system and isomorphous with calcite. It usually occurs as cleavable, compact or botryoidal masses, distinct crystals being somewhat rare; these have the form of the primitive rhombohedron, parallel to the faces of which there are perfect cleavages. The specific gravity varies from 3·45 to 3·60; the hardness is 4. The colour is usually rose-red, but may sometimes be grey to brown. The name rhodochrosite, from the Greek *ῥόδο-χρως* (rose-coloured), has reference to the characteristic colour of the mineral: manganese-spar and dialogite are synonyms. It is found in mineral veins with ores of silver, lead, copper, etc., or in deposits of manganese ore. The mineral is used in making spiegeleisen and ferromanganese.

RHODODENDRON, a large genus of shrubs and trees belonging to the heath family (Ericaceae). No adequate distinction can be drawn between this genus and *Azalea* (*q.v.*). The rhododendrons are trees or shrubs, never herbs, with simple, evergreen or deciduous leaves, and flowers in terminal clusters surrounded in the bud by bud-scales but not as a rule by true leaves. The flowers are remarkable for the frequent absence or reduced condition of the calyx. The funnel- or bell-shaped corolla, on the other hand, with its five or more lobes, is usually conspicuous, and in some species so much so as to render these plants greatly prized in gardens. The free stamens are usually ten, with slender filaments and anthers opening by pores at the top. The ovary is five- or many-celled, ripening into a long woody pod which splits from top to bottom into a number of valves, liberating a large number of small bran-like seeds.

The species, which exceed 300 in number, are for the most part natives of the mountainous regions of the northern hemisphere, extending as far south as the Malay archipelago and New Guinea, but not hitherto found in South America or Australia; none are natives of Great Britain. They vary greatly in stature, some of the alpine species being mere pygmies with minute leaves and tiny blossoms, while some of the Himalayan species are moderate-sized trees with huge flowers. Some are epiphytal, growing on the branches of other trees, but not deriving their sustenance from them. Several notably handsome species are natives of North America. Among these are the great rhododendron (*R. maximum*), called also great laurel and rose bay, found from Nova Scotia and Ontario and southward to Georgia; the Catawba or Carolina rhododendron or mountain rose bay (*R. catawbiense*), of the high Appalachian mountains; the western rhododendron

(*R. californicum*), found from British Columbia to California, and adopted as the state flower of Washington; and the delicate rhodora (*q.v.*), of the north-eastern States. The great laurel and the mountain rose are widely planted; less frequently *R. minus* and *R. carolinianus*, both small evergreen shrubs with showy flowers, native to the mountains of the south-eastern States, are grown as ornamentals.

The varieties grown in gardens are mostly grafted on the Pontic species (*R. ponticum*) and the North American *R. catawbiense*. The common Pontic variety is excellent for game-covert, from its hardiness, the shelter it affords, and the fact that hares and rabbits rarely eat it. Variety of colour has been infused by crossing or hybridizing the species first named, or their derivatives, with some of the more gorgeously coloured Himalayan-American varieties.

The hardy evergreen kinds are readily propagated by seed, by layers and by grafting. Grafting is resorted to only for the propagation of the rarer and more tender kinds. Loamy soil containing a large quantity of peat or vegetable humus is essential, the roots of all the species investigated being associated with a fungus partner or mycorrhiza (*q.v.*). An excess of lime or chalk in the soil proves fatal to rhododendrons and their allies, sooner or later. The hardy deciduous kinds are valuable for forcing, and withstand cold-storage treatment well.

RHODONITE, a member of the pyroxene group of minerals, consisting of manganese metasilicate, $MnSiO_3$, and crystallizing in the anorthic system. It commonly occurs as cleavable to compact masses with a rose-red colour; hence the name, from the Greek *ῥόδον* (a rose). Crystals often have a thick tabular habit; there are perfect cleavages parallel to the prism faces. The hardness is 5½–6½, and the specific gravity 3·4–3·68. Rhodonite is liable to alteration, and in certain cases forms the primary source of very important deposits of ores of manganese, mainly in the form of oxides; such are a considerable part of the manganese ores of India, now exploited on a very large scale. In the iron and manganese mines at Pajsberg near Filipstadt and Långban in Vermland, Sweden, small brilliant and translucent crystals ("pajsbergite") and cleavage masses occur.

Rhodonite occurs as large, rough crystals, somewhat resembling pink felspar, with franklinite and zinc ores, in granular limestone at Franklin Furnace in New Jersey.

RHODORA (*Rhododendron canadense*), a beautiful North American flowering shrub of the heath family (Ericaceae), native to bogs and wet hillsides from Newfoundland to Quebec and southward to central New York and Pennsylvania. It grows from 1 to 3 ft. high, with pinkish-purple, two-lipped, somewhat honey-suckle-like flowers, about 1½ in. broad, in terminal clusters, appearing in May or June, with or before the small, oblong, slightly hairy, pale-green leaves are fully open. (*See* RHODODENDRON.)

RHODORA (RHODODENDRON CANADENSE)
A delicate pink flower found in Canada and New England

RHOECUS, a Samian sculptor of the 6th century B.C. He and his son Theodorus were especially noted for their work in bronze. Herodotus says that Rhoecus built the temple of Hera at Samos. In the temple of Artemis at Ephesus was a marble figure of night by Rhoecus. His name has been found on a fragment of a vase which he dedicated to Aphrodite at Naucratis. His sons Theodorus and Telecles made a statue of the Pythian Apollo for the Samians.

RHONDDA, DAVID ALFRED THOMAS, 1ST VISCOUNT, cr. 1918 (1856–1918), British colliery owner and statesman, was born on March 26, 1856, in Aberdare. His father had enriched himself by speculations in coal. Thomas was educated at Clifton College, and Caius College, Cambridge, where he graduated in the mathematical tripos in 1880. Immediately he joined his father in the coal business, into which he threw himself with great energy and ability. His extraordinary commercial gifts, his insight, his foresight and the sympathy which he brought to bear on conditions of life in the mining industry, soon made him a prominent, and eventually the leading, figure in the industrial world of South Wales. His business combinations brought him great wealth, and culminated in the Cambrian supercombine, which produced some 6,000,000 tons of steam coal a year.

Though he had sat as a Liberal for Merthyr Tydvil for 22 years from 1888, and for Cardiff for a few months in 1910, Thomas achieved no political importance till the outbreak of the World War, when he rendered substantial help to Lloyd George, both at the Exchequer and at the Ministry of Munitions by organising British industrial resources. He went to America to complete some war contracts for the Government, and on his return was saved, with his daughter, from the sinking of the "Lusitania." He went back to America almost immediately, and spent seven months there at his own expense, expediting the output of munitions. He was created a baron, as Lord Rhondda, for his services, in Jan. 1916; and took office in Lloyd George's Ministry in the following Dec. as President of the Local Government Board, passing to the Food Controllership in June 1917. There, taking strong steps to put an end to speculation in the necessities of life, he gradually fixed prices and brought supplies under control.

But he will be mainly remembered as the author of the system of compulsory food rationing, which was carried out with absolute fairness and impartiality. In April 1918 he tendered his resignation; but pressure was put upon him to remain. He died on July 3 at Llanwern, Monmouthshire. Just previously he had been created a Viscount. He married Sybil Margaret Haig, a cousin of Lord Haig. Their only child, a daughter (who married Sir Humphrey Mackworth in 1908, and obtained a dissolution of their marriage in 1923), succeeded to the viscounty of Rhondda under a special remainder. In 1921 Lady Rhondda published a *Life* of her father.

RHONDDA, an urban district of Glamorganshire, South Wales, 12 m. long by about 4¾ m. across at its widest part, comprising two main valleys, named after their respective rivers, Rhondda Fawr and Rhondda Fach. The valleys are deeply incised in the coal measures of the South Wales geological basin and their lateral boundaries are formed by hills varying from 560 ft. near Trehafod to 1,340 ft. on the north-east of Maerdy in the Rhondda Fach and 1,742 ft. on the south-west of Treherbert in the main valley. The upper end of the latter valley culminates in Carn Moesen (1,950 feet). The two valleys are separated by the ridge of Cefn-rhondda, which ranges from 600 ft. above Porth to 1,690 ft. near the upper end of the district. There are tributary valleys of which Cwmparc, Clydach vale, and Cymmer are the chief.

The Rhondda valley is the centre of the eastern division of the South Wales coalfield. The development of the Rhondda coalfield was later than that of the northern sections of the South Wales area, where coal was worked early for iron smelting. It was the unsurpassed steam-raising properties of the Rhondda coal that made the region famous after the period 1860–65. With the great demands made for steam-coal by the ever increasing railway traffic, steam-ship service and navies of the last half of the 19th century, the Rhondda from being a purely pastoral upland region was transformed into a densely-populated industrial valley. No thought was given to the elongated straggling settlements that grew up or to the development of by-products to ensure employment in the region when the coal exporting phase would pass away. Furthermore, in the elongated settlements (the whole of the Rhondda valleys from Blaen-rhondda and Maerdy to Porth and Pontypridd is now one long winding street) the absence of central buildings, public squares, and shopping centres has counted against the development of a strong civic sense: a feature that has become more acute in an industrial region such as this, with no tradition of previous settlement and with a population almost all engaged on one kind of work for masters living usually far away.

The population was estimated at 23,950 in 1871, but it reached 55,632 in 1881, and 113,735 in 1901. In 1921 it reached 162,717. Area of Urban district 23,886 acres. In 1877, the ancient parish

of Ystradyfodwg (excepting the township of Rhigos) was formed into an urban district. In 1879, portions of the parishes of Llanwonno and Llantrisant were added to the urban area, the whole being consolidated in 1894 into one civil parish. In 1897, the name of the urban district was changed into Rhondda.

With the development of the coal exporting trade a number of small railway companies connected these valleys with Cardiff on the one hand and via the Blaengwynfi tunnel with Port Talbot and Swansea on the other hand. All these smaller lines are now amalgamated with the G.W. railway. The lack of demand for steam coal, trade depression, and changes in the world-market have seriously affected the region since 1921. Depopulation, unemployment and poverty are very marked.

RHÔNE, a department of south-eastern France, formed in 1793 from the eastern portion of the department of Rhône-et-Loire, and comprising the old districts of Beaujolais, Lyonnais, Franc-Lyonnais, Forez and a small portion of Dauphiné. Pop. (1926), 993,915. Area, 1,104 sq. miles. Rhône is bounded north by the department of Saône-et-Loire, east by Ain and Isère and south and west by Loire. The Saône and the Rhône form its natural boundary to the east. The department belongs almost entirely to the basin of the Rhône, to which it sends its waters by the Saône and its tributary the Azergues, and by the Gier. The mountains which cover the surface of the department constitute the watershed between the Rhône and the Loire, and from north to south form four successive groups—the Beaujolais mts., the highest peak of which is 3,320 ft.; the Tarare group; the Lyonnais mts. (nearly 3,000 ft.); and Mt. Pilat, the highest peak of which belongs to the department of Loire.

Good agricultural land is found in the valleys of the Saône and Rhône, but for the most part the soil is stony and only moderately fertile. Wheat, oats, rye and potatoes are widely grown, with colza on the banks of the Saône, but they are less important than the vine, the hills of the Beaujolais on the right bank of the Saône producing excellent wines. Mines of copper pyrites and coal and quarries of marble (at Bully) are worked. The production of silk fabrics, the chief branch of manufacture of artificial silk goods, of chemicals and machinery, together with most of the other industries of the department, are concentrated in Lyons (*q.v.*) and its vicinity. Tarare is a centre for the manufacture of velvet, muslin and embroidery. Oullins has large railway workshops belonging to the P.L.M railway, and there are important glass works at Lyons and at Givors. Cotton-spinning and weaving are carried on in several localities.

The department is served by the P.L.M. railway. The Rhône and the Saône and in the extreme south the canal of Givors are its navigable waterways. Lyons, the capital, is the seat of an archbishop and of a court of appeal and centre of an educational division (*académie*). The department is in the 14th military region. There are two arrondissements (Lyons and Villefranche) subdivided into 33 cantons and 269 communes. The principal places besides Lyons are Givors, Tarare and Villefranche (*qq.v.*).

RHÔNE, one of the most important rivers in Europe, and the chief of those which flow directly into the Mediterranean. It rises at the eastern extremity of the Swiss canton of the Valais, flows through Switzerland and France and enters the Mediterranean at the Gulf of Lyons. Its total length is 505 m., of which the Lake of Geneva, through which it flows, claims 45 m.; and its total fall is 5,898 feet. Its course (excluding the Lake of Geneva, *q.v.*) naturally falls into three divisions: (1) from its source to the Lake of Geneva (105½ m. and fall 4,679 ft.) (2) from Geneva to Lyons (124 m. and fall 689 ft.) and (3) from Lyons to the Mediterranean (230 m. and fall 530 ft.).

From its Source to the Lake the Rhône is a purely Alpine river, flowing through a great trench first in a synclinal structure between the Aar and St. Gothard massifs, then along the front of the Pennine nappes. (*See* ALPS.) It issues as a torrent, at the height of 5,909 ft., from the Rhône glacier at the head of the Valais. It is almost immediately joined (left) by the Mutt torrent, coming from a small glacier and then flows past the Gletsch hotel (where the roads from the Grimsel and the Furka pass unite). About half a mile from the glacier the river descends through a wild gorge to the more level valley, to reach the first village, Oberwald. It preserves a south-westerly direction till Martigny.

The uppermost valley of the Rhône is named Goms, its chief villages being Münster and Fiesch, whilst the river is swollen by mountain torrents, descending from the glaciers on either side, by the Geren (left), near Oberwald; by the Eginen (left), near Ulrichen; by the Fiesch (right), from the Fiesch glacier, at Fiesch; by the Binna (left), near Grengiols; by the Massa (right) from the Aletsch glaciers, above Brig. At Brig the Rhône has descended 3,678 ft. from its source in 28 m., and is already a considerable stream when joined (left) by the Saltine, descending from the Simplon Pass. Its course below Brig is less rapid and lies through wastes of alluvial deposits. The valley is wide and marshy, the river frequently overflowing its banks. Further mountain torrents fall into the Rhône: these are the Visp (left) from the Zermatt valley, at Visp; at Gampel, the Lonza (right) from the Lötschen valley; at Leuk, the Dala (right) from the Gemmi Pass; at Sierre, the Navizen (left) from the Einfisch or Anniviers valley; at Sion, the capital of the Valais, the Borgne (left) from the Val d' Hérens; below Sion, by the Morge (right), from the Sansetsch pass; and at Martigny by the Dranse (left) from the Great St. Bernard and the Val de Bagnes. At Martigny, the river bends sharply to the north-west toward the Lake of Geneva. Opposite Dorénaz it receives the Salanfe (left). Immediately below St. Maurice the Rhône rushes through a narrow and striking defile which commands the entrance of the Valais.

Beyond, the river enters the wide alluvial plain, formerly occupied by the south-eastern arm of the Lake of Geneva, but now marshy. It receives at Bex the Avançon (right) flowing from the glaciers of the Diablerets range, at Monthey the Vièze (left) from Champéry and the Val d' Illiez, and at the Aigle the Grande Eau (right), from the valley of Ormonts-dessus. It passes Port Valais, once on the lake, before expanding into the Lake of Geneva, between Villeneuve (right) and St. Gingolph (left). During all this portion of its course the Rhône is not navigable, but its valley forms an artery into the Alps which is followed by the railways and roads.

The Upper Rhône, being fed by glacial streams, is overladen with sediment, much of which is deposited along the course, the remainder settling down in the Lake of Geneva, in the blue waters of which it is possible to follow the whiter course of the stream for some distance before it disappears.

From Geneva to Lyons.—About ½ m. below Geneva the blueness of the water of the Rhône is again disturbed by the Arve (left), from the glaciers of the Mont Blanc range, the two currents for some distance refusing to mix. The Rhône is here forced southward by the sweep of the Jura folds through which it breaks in a number of narrow gorges or *cluses*. It continues southward until joined near Corbelin by the Guier (left), from the Grande Chartreuse mountains and it continues the direction of this tributary thus rounding the southern spur of the Juras.

About 12 m. south of Geneva the Rhône enters France. At Bellegarde the Valserine flows in (right), and then the river resumes its southerly direction, from which a great gorge has deflected it for a while. Some way below Bellegarde, between Le Parc and Pyrimont, the Rhône becomes officially "navigable" though as far as Lyons the navigation consists almost entirely of flat-bottomed boats. Above Seyssel the Usses (left) joins the Rhône, while just below that village the Fier (left) flows in from the Lake of Annecy. Below the junction of the Fier the hills sink on either side, the channel of the river widens and it leaves the mountains for the plains. The Geneva-Paris railway follows the river as far as Culoz. The Rhône receives the waters from Lake Bourget by a canal (left). The last of the *cluses* is at the Pont du Saut or Sault, a little south of Lagnieu. The river now widens but the neighbouring country is much exposed to inundations.

It receives the Ain (right), which descends from the French slope of the Jura and is navigable for about 60 m., above its

junction with the Saône, just below Lyons. The Saône (*q.v.*) which has received (left) the Doubs, is the real continuation of the lower Rhône, both from a geographical and a commercial point of view, and it is by the means of canals branching off from the course of the Saône that the Rhône communicates with the basins of the Loire, the Seine, the Rhine and the Moselle.

Below Lyons, the Rhône becomes one of the great historical rivers of France. It was up its valley that various civilizations penetrated from the Mediterranean to Lyons. From Lyons downwards the left bank serves as a great medium of commerce by which central France sends its products to the sea. During this half of its course it flows over an alluvium-filled valley resting on Jurassic and Cretaceous rocks, and it can boast of having on its left bank (the right bank is very poor in this respect) such historical cities at Vienne, Valence, Avignon, Tarascon and Arles, while it receives (left) the Isère, the Drôme, the Aygues and the Durance rivers, all formed by the union of many streams from the Dauphiné Alps.

The Ardèche is the only considerable affluent from the right. Near Arles, about 25 m. from the sea, and by rail 175¼ m. from Lyons, the river breaks up into two main branches, the Grand Rhône running south-east and the Petit Rhône south-west; they enclose between them the delta of the Camargue, which is cultivated on the banks of the river only, but elsewhere is simply a great alluvial plain, composed of scanty pasturages and of great salt marshes. Changes in sea level have taken place in the Rhône delta in recent times. R. D. Oldham (*Nature*, vol. cxvi. [1925] pp. 16, 52, 100), shows that in Pre-Roman times the sea-level was 15 ft. higher than today. A rise was followed by a subsidence which occurred in about the 8th century when the river ended far inland in a shallow land-locked inlet which it proceeded to fill up with alluvium until in the 17th century it had regained the sea-front. Even since that time it has greatly modified its form by changes of channels, etc.

The Rhône river system is dominated by two tectonic features, the Alps and the Central Plateau of France. Below Chalon-sur-Saône, the Saône-Rhône flows along the eastern side of the central plateau and most of the course is determined by a north to south fault. The remainder of the river system is determined by the structure of the Alps (*q.v.*). The greater length of the river and of its Alpine affluents is parallel to the trend of the structures, as above Martigny, between the Lake of Geneva and Corbelin, the Arve in the Chamonix valley and parts of the Isère and of the Durance. On the other hand other portions flow radially to the trend, as between Martigny and the Lake of Geneva, parts of Isère, the Drôme, the Aygues, the Durance and numerous other tributaries.

RHOXOLANI, a Sarmatian tribe defeated in the Crimea by Diophantus, general of Mithradates, *c.* 100 B.C., and by the Romans on the lower Danube *c.* A.D. 60, and also under M. Aurelius. They seem to have finally succumbed to the Goths.

RHUBARB. This name is applied both to a drug and to a vegetable.

1. The drug has been used in medicine from very early times, being described in the Chinese herbal *Pen-king*, which is believed to date from 2700 B.C. It is still produced in the four northern provinces of China. In England the culture of rhubarb for medicinal purposes began in 1777 at Banbury in Oxfordshire and is still carried on there. Later it extended to France and other parts of Europe.

The botanical origin of Chinese rhubarb is uncertain. *Rheum palmatum*, *R. officinale*, *R. palmatum*, var. *tanguticum*, *R. colinianum* and *R. Franzenbachii* have been variously stated to be the source of it, but the roots produced by these species under cultivation in Europe do not present the characteristic network of white veins exhibited by the best specimens of the Chinese drug. The Banbury rhubarb appears to be a hybrid between *R. rhaponticum* and *R. undulatum*—the root, according to E. Colin, not presenting the typical microscopic structure of the former. More recently very good rhubarb has been grown at Banbury from *Rheum officinale*, but these two varieties are not equal in medicinal strength to the Chinese article, yielding less extract—Chinese rhubarb affording, according to H. Seier, 58%, English rhubarb 21% and *R. officinale* 17%.

Two varieties of the drug are known, *viz.*, kiln-dried and sun-dried. So-called "Turkey" rhubarb was the Chinese drug which reached Europe from Aleppo and Smyrna, having travelled to Asia Minor by way of Persia and the Caspian.

Chemistry.—The most important constituent of this drug, giving it its purgative properties and its yellow colour, is chrysarobin, $C_{30}H_{30}O_7$, formerly known as rhein or chrysophan. The rhubarb of commerce also contains chrysophanic acid, a dioxymethyl anthra-quinone, $C_{14}H_6(CH_3)O_2(OH)_2$, of which chrysarobin is a reduction product. Nearly 40% of the drug consists of calcium oxalate, which gives it the characteristic grittiness. There is also present rheotannic acid, which is of some practical importance. There are numerous other constituents, such as emodin, $C_{15}H_{10}O_5$, mucilage, resins, rheumic acid, $C_{20}H_{16}O_9$, aporrhetin, etc.

The dose of rhubarb is from ½ up to 30 grains, according to the action which is desired. The Pulvis Rhei Compositus of the British Pharmacopoeia, or Gregory's powder, is composed of 2 parts of rhubarb, 6 of heavy or light magnesia and 1 of ginger. The dose is 20 to 60 gr.

Rhubarb in small doses—½ to 2gr.—is an astringent tonic, since it stimulates all the functions of the upper part of the alimentary canal. Its more characteristic action, however, is purgation, which it causes in doses of 15gr. and upwards. The action occurs within seven or eight hours, a soft, yellow motion being produced. Rhubarb also increases the amount of bile formed by the liver. The drug is apt to cause colic, and should therefore never be given alone. Purgation is succeeded by definite constipation, hence rhubarb is obviously worse than useless in the treatment of chronic constipation, which it only aggravates. On the other hand, it is valuable when diarrhoea has been caused by unsuitable food. The drug removes the indigestible residue and then gives the bowel rest.

Some chrysarobin is absorbed and is excreted in the urine, which it slightly increases and colours a reddish brown. The colour is discharged by the addition of a little dilute hydrochloric acid to the urine.

2. The rhubarb used as a vegetable consists of the leaf stalks of *R. rhaponticum* and its varieties, and *R. undulatum*. It is known in America as pie-plant. Several other species, such as *R. palmatum*, *R. officinale*, *R. nobile* and others, are cultivated for their fine foliage and handsome inflorescence, especially in wild gardens, margins of shrubberies and similar places.

RHYL, a watering-place and urban district of Flint, North Wales, 30 m. N.W. of Chester on the L.M.S.R. Pop. (1921) 13,490. It is situated on a sandy coast near the mouth of the Clwyd. It was originally a small fishing village with a little coastal trade, and is now an important watering-place.

RHYME, more correctly spelt RIME, from a Provençal word *rim* (its customary English spelling is due to a confusion with *rhythm*), a literary ornament or device consisting of an identity of sound in the terminal syllables of two or more words. In the art of versification it signifies the repetition of a sound at the end of two or more lines in a single composition. This artifice was practically unknown to the ancients, and, when it occurs, or seems to occur, in the works of classic Greek and Latin poets, it must be considered to be accidental. Conscious rhyme came later. The name given to lines with an intentional rhyme in the middle is *Leonine verse*, the invention being attributed to a probably apocryphal monk Leoninus or Leonius, who is supposed to be the author of a history of the Old Testament preserved in the Bibliothèque Nationale of Paris. This "history" is composed in Latin verses, all of which rhyme in the centre. Recent criticism has been inclined to look upon the African church-Latin of the age of Tertullian as the starting-point of modern rhyme, and it is probable that the ingenuities of priests, invented to aid worshippers in hearing and singing long pieces of Latin verse in the ritual of the Catholic church produced the earliest conscious poems in rhyme. It is certain that by the 4th century a school of rhymed sacred poetry had come into existence, classical examples of which we still possess in the "Stabat Mater" and the "Dies Irae." In

the course of the middle ages, alliteration, assonance and end-rhyme held the field without a rival in vernacular poetry. After the 14th century, in the north of Europe, and indeed everywhere except in Spain, where assonance held a powerful position, end-rhyme became universal and formed a distinctive indication of metrical construction. It was not until the invention of blank verse (*q.v.*) that rhyme found a modern rival. Certain forms of poetry are almost inconceivable without rhyme, though efforts have been made to compose even rhymeless sonnets. In the hey-day of Elizabethan literature a serious attempt was made in England to reject rhyme altogether, and to return to the quantitative measures of the ancients. The prime mover in this heresy was a pedantic grammarian of Cambridge, Gabriel Harvey (1545?–1630). For a short time he actually seduced no less melodious a poet than Edmund Spenser to abandon rhyme and adopt a system of accented hexameters and trimeters. From 1576 to 1579 the genius of Spenser seems to have been obscured by this error of taste, but he shook it off completely when he composed *The Shepherd's Calendar*. Thomas Campion, in a tract published in 1602, advocated the omission of rhyme from lyrical poetry. By dint of a prodigious effort, he produced some unrhymed odes, which were not without charm, but the best critics of the time, such as Daniel, repudiated the innovation.

In Germany a determined attack on rhyme was made early in the 17th century, particularly by a group of aesthetic critics in the Swiss universities. Lessing recalled the German poets to a sense of the beauty and value of rhyme, but the popularity of Klopstock and his imitators continued to exercise a great influence. Goethe and Schiller, without abandoning rhyme, permitted themselves a great liberty in the employment of unrhymed measures and in imitation of classic metres. This was carried to greater lengths by Platen and Heine, the rhymeless rhythm of the last of whom was imitated in English verse by Matthew Arnold and others. In France, on the other hand, the empire of rhyme has always been triumphant, and in French literature the idea of rhymeless verse could till recently scarcely be said to exist.

In Italian literature the excessive abundance and facility of rhyme has led to a rebellion against its use. It was the influence of German aesthetics which forced upon the notice of Leopardi the possibility of introducing rhymeless lyrical measures into Italian verse, an innovation which he carried out with remarkable hardihood and success. The rhymeless odes of Carducci are also worthy of admiration. At the close of the 19th century, particularly in France, where the rules of rhyme had been most rigid, an effort was made to modify and minimize the restraints of rhyme. The laws of rhyme, like other artificial regulations, may be too severe, but there is no evidence that the natural beauty which pure rhyme introduces into poetry is losing its hold on the human ear or is in any real danger of being superseded by accent or rhythm.

See J. B. Schutze, *Versuch einer Theorie des Reimes nach Inhalt und Form* (Magdeburg, 1802); J. Minor, *Neuhochdeutsche Metrik* (Strassbourg, 1893); J. B. Mayer, *A Handbook of Modern English Metre* (1903); Egerton Smith, *The Principles of English Metre* (Oxford, 1923).

RHYMNEY, an urban district of Monmouthshire, England, on the borders of Glamorganshire, 22 m. N. by W. of Cardiff, on the G.W.R. Pop. (1921) 11,690. The Rhymney river, in the upper valley of which this town lies, forms almost throughout its course, the boundary between England and Wales (Monmouthshire and Glamorganshire). The district belongs to the South Wales iron field.

RHYNIE: *see* CHERT.

RHYOLITE, the group name of a type of volcanic rock, occurring mostly as lava flows, characterized by a highly acid composition, and so called from Gr. ῥύαξ, to flow (because of the frequency with which they exhibit fluxion structures). They are the most siliceous of all lavas, and, with the exception of the dacites, are the only lavas with free primary quartz. In chemical composition they very closely resemble the granites, the corresponding rocks of plutonic or deep-seated origin; their minerals also present many points of similarity to those of granite though they are by no means entirely the same. Quartz, orthoclase and plagioclase felspars, and biotite are the commonest ingredients of both rocks, but the quartz of rhyolites is full of glass enclosures and the potash felspar is pellucid sanidine, while the quartz of granite contains dust-like fluid cavities of very minute size and its potash felspar is of the turbid variety which is properly called orthoclase. The granites also are holocrystalline, while in the rhyolites there are usually porphyritic crystals floating in a fine ground-mass. Rhyolites have also been called liparites because many of the lavas of the Lipari Islands are excellent examples of this group. Above all rocks they have a disposition to assume vitreous forms, as when fused they crystallize with great difficulty; the vitreous forms are known as obsidian, perlite and pumice (*qq.v.*).

Mineral Constituents.—The minerals of the first generation, or phenocrysts, of rhyolite are generally orthoclase, oligoclase, quartz, biotite, augite, or hornblende. The felspars are usually glassy clear, small but of well-developed crystalline form: the potash felspar is sanidine, usually Carlsbad twinned; the soda-lime felspar is almost always oligoclase, with characteristic polysynthetic structure. Both of these may be corroded and irregular in their outlines; their cleavage and twinning then distinguish them readily from quartz. The quartz occurs as blebs or sub-rounded grains, which are corroded double hexagonal pyramids. In some rhyolites apparent crystals of quartz or felspar are found under the microscope to consist of a micrographic intergrowth of the two. Biotite is always deep brown or greenish brown, in small hexagonal tablets, generally blackened at their edges by magmatic corrosion. Muscovite is not known in rhyolites. Hornblende may be green or brown; in the quartz-pantellarites it sometimes takes the form of strongly pleochroic brown crossyrite. Like biotite it is idiomorphic but often corroded in a marked degree. Augite, which is equally common or more common than the other ferro-magnesian minerals, is always green; its crystals are small and perfectly shaped, and corrosion phenomena are very rarely seen in it. Zircon, apatite and magnetite are always present in rhyolites, their crystals being often beautifully perfect though never large. Olivine (fayalite) is never a normal ingredient, but occurs in the hollow spherulites or lithophysae of some rhyolites with garnet, tridymite, topaz and other minerals which indicate pneumatolytic action.

Types of Texture.—The ground-mass of rhyolitic rocks is of three distinct types which are stages in crystalline development, viz., the vitreous, the felsitic or cryptocrystalline, and the microcrystalline. Mixtures of the different kinds occur; thus a vitreous rhyolite has often felsitic areas in its ground-mass, and in the same lava flow some parts may be vitreous while others are felsitic. The vitreous rhyolites are identical in most respects with the obsidians, from which they can only be separated in an artificial classification; and in their glassy base the banded or eutaxitic, spherulitic and perlitic structures of pure obsidians are very frequently present (*see* OBSIDIAN: PERLITE). The felso-liparites or liparites with stony ground-mass are specially common among the pre-Tertiary igneous rocks, as liparite glass is unstable and experiences devitrification in course of time. Many of these felsites have fluxion banding, spherulites and even perlitic cracks, which are strong evidence that they were originally glassy. In other cases a hyaloliparite, obsidian or pitchstone becomes felsitic along its borders and joint planes, or even along perlitic cracks, and we may assume that the once glassy rock has changed into felsite under the action of percolating moisture or even by atmospheric decomposition. In many rhyolites the felsite is original and represents an incipient crystallization of the vitreous material which took place before the rock was cold. The felsite in turn is liable to change; it becomes a fine mosaic of quartz and alkali felspar; and in this way a matrix of the third type, the microcrystalline, may develop. This is proved by the occurrence of the remains of spherulitic and perlitic structures in rocks which are no longer felsitic or glassy. Many microcrystalline rhyolites have a ground-mass in which much felsitic matter occurs; but as this tends to recrystallize in course of time, the older rocks of this group show least of it. Whilst no quartz-bearing rhyolites are known to have been erupted in recent years, Lacroix proved that portions of the "spine" which rose as a great

tower or column out of the crater of Mont Pelée after the eruption in 1906 contained small crystals of quartz in the ground-mass. The microcrystalline ground-mass of rhyolites is never micrographic as in the porphyries (granophyres); on the other hand it is often micropoikilitic, consisting of small felspars, often subrectangular, embedded in little rounded or irregular plates of quartz.

Changes of Ground-mass.—The ground-mass of rhyolites is liable to other changes, of which the most important are silicification, kaolinization and sericitization. Among the older rocks of this group it is the exception to find that secondary quartz has not been deposited in some parts of them. Often indeed the matrix is completely replaced by silica in the form of finely crystalline quartz or chalcedony; and these rocks on analysis prove to contain over 90% of silica. In the recent rhyolites of Hungary, New Zealand, etc., the deposit of coarse opal in portions of the rock is a very common phenomenon.

Kaolinization may be due to weathering, and the stony dull look of the matrix of many microcrystalline rhyolites is due to the decomposed state of the felspar grains in them; it is even more typically developed by fumarole action, which replaces the felspars with soft, cloudy white products belonging to a mineral of the kaolin group. Sericitization, or the development of fine white mica after felspar, is usually associated with shearing, and is commonest in the older rhyolites.

Vesicular structure is very common in rhyolites; in fact the pumiceous obsidians have this character in greater perfection than any other rocks (*see* PUMICE); but even the felso-rhyolites are very often vesicular. The cavities are usually lined with opal and tridymite; in the older rocks they may be filled with agate and chalcedony. The "mill-stone porphyries," extensively used in Germany for grinding corn, are porous rhyolites; the abundance of quartz makes them hard, and their rough surfaces render them peculiarly suitable for this purpose. In some of them the cavities are partly secondary. These rocks are obtained in the Odenwald, Thuringerwald and Fichtelgebirge.

Occurrence.—In Britain a pale grey Tertiary rhyolite occurs at Tardree, Antrim, and in Skye. Felsitic rhyolites occur among the Old Red rocks of Scotland (Pentland Hills, Lorne, etc.), in Devonshire, and in large numbers in North Wales. The Carnarvonshire rhyolites are often much altered and silicified; many of them have a nodular structure which is very conspicuous on weathered surfaces. The spheroids may be two or three in. in diameter; some are built up of concentric shells. Rhyolites are also known from Fishguard, Malvern, Westmorland and Co. Waterford. One of the oldest volcanic rocks of Britain (pre-Cambrian, Uriconian) is the spherulitic rhyolite of the Lea Rock near Wellington, Shropshire. It shows bright red spherulites in great numbers and is probably an obsidian completely devitrified. Perlitic structure is also visible in it.

In other parts of Europe rhyolites have a fairly wide distribution though they are not numerous. In Hungary (Hlinik, etc.) there are many well-known examples; they extend along the margin of the Carpathians and are found also in Siebenburgen. In Italy they occur in the Euganean Hills and in the Lipari Islands; the latter being the principal source of pumice at the present day. Rhyolites of Recent age occur in Iceland (Myvatn, etc.), where they are characterized by the frequent absence of quartz, and the presence of much plagioclase and pyroxene. Some of these rocks have been called trachyte-obsidians, but they seem to be rhyolites which contain an exceptionally large amount of soda. The older rhyolites, which are generally called quartz-porphyries in Germany, are mostly of Permian or Carboniferous age and are numerous in the Vosges, Odenwald, Thuringerwald, etc. They are often accompanied by basic rocks (melaphyres). Permian rhyolites occur also at Lugano in Italy. Rhyolites are known also in Asia Minor and the Caucasus, in New Zealand, Colorado, Nevada and other parts of western North America. In the Yellowstone National Park there is a well-known cliff of obsidian which shows remarkably perfect columnar jointing. Some of the rhyolites of Nevada are exceedingly rich in porphyritic minerals, so that they appear at first sight to be holocrystalline rocks, since the ground-mass is scanty and inconspicuous. To this type the name nevadite has been given, but it is rare and local in its distribution.

In Pantellaria, south-west of Sicily, there are rocks of rhyolitic affinities which present so many unusual features that they have been designated pantellarites. They contain less silica and alumina and more alkalis and iron than do ordinary rhyolites. Their felspars are of the anorthoclase group, being rich in soda together with potash, and are very variable in crystalline development. Aegirine-augite and forms of soda-amphibole are also characteristic of them, while dark brown aenigmatite or cossyrite often occur. Quartz is not very plentiful; other ingredients are olivine, arfvedsonite and tridymite. The ground-mass varies much, being sometimes quite vitreous, at other times a glass filled with swarms of microliths, while in certain pantellarites it is a microcrystalline aggregate of quartz and alkali felspar. The absence of plagioclase and biotite are marked distinctions between these rocks and the rhyolites, together with the scarcity of quartz and the prevalence of soda-bearing pyroxenes and amphiboles. Comendites are practically identical rocks. They occur in Sardinia, Corsica, British East Africa, East Siberia, West Texas and the East Indies.

Among the Palaeozoic volcanic rocks of Germany there is a group of lavas, the quartz-keratophyres, which are of acid composition and rich in alkali felspar. Their dominant alkali is soda: hence their felspars are albite and cryptoperthite, not sanidine as in rhyolites. Quartz occurs sometimes as corroded phenocrysts, but is often scarce even in the ground-mass. Porphyritic biotite or augite are very rare, but occur in the matrix along with felspars and quartz. Micropegmatite is not infrequent in these rocks, and they may be silicified like the rhyolites. As quartz-keratophyres mostly occur in districts where there has been a good deal of folding, they are often crushed and more or less sericitized. They are best known from the Devonian rocks of Westphalia and the Harz, but are also found in New South Wales, and similar rocks have been described (as soda-felsites) from Ireland. The rocks which they accompany are usually dolerites and spilites.

Composition.—The following analyses show the composition of some of the principal types of rhyolites:—

	SiO_2	Al_2O_3	Fe_2O_3	FeO	CaO	MgO	K_2O	Na_2O	H_2O
I.	76·34	13·22	1·93		1·85	0·21	3·67	2·84	0·61
II.	72·15	13·50	3·12		0·93	0·16	4·54	4·20	0·85
III.	77·59	12·75	0·67	n.f.	0·04	0·16	3·99	2·56	1·54
IV.	67·48	9·70	7·42	2·21	1·45	0·77	2·94	7·21	0·96
V.	70·97	13·84	3·21	0·78	1·26	0·20	1·57	6·27	0·74
VI.	74·76	11·60	3·50	0·10	0·07	0·18	4·92	4·35	0·64

I. Rhyolite, Telki Banya, Hungary.
II. do. Mafahlid, Iceland.
III. do. Omahu, New Zealand.
IV. Pantellarite, Pantellaria.
V. Quartz-keratophyre, Muhlenthal, Harz.
VI. Comendite, Sardinia.

We note in the rhyolites I.–III. the very high silica, with alkalis and alumina also in considerable amount, while lime, magnesia and iron are very low. In the pantellarite, keratophyre and comendite the silica tends to be less abundant, while the alkalis, especially soda, increase; they have less alumina but are richer in iron and magnesia. It is easy to see why the latter types contain less quartz, felspars often very rich in soda, and ferric minerals which contain iron and alkalis in notable amounts such as aegirine, riebeckite and arfvedsonite. (J. S. F.)

RHYTHM, a certain swing or balance in bodily movement, music, verse or prose; often extended by metaphor to apply in other spheres (*e.g.*, "rhythm of life"). The early critic of prosody, Aristoxenus (*c.* 320 B.C.), distinguished three elements in rhythm—the speech (λέξις), the melody (μέλος) and the bodily motion (*κίνησις σωματική*); but the later tendency has been to separate these elements, and to emphasize more and more the distinction between them. Precision, however, has hardly yet been reached; and there are few subjects on which opinions, even among experts, differ more widely. In a short article it will be necessary to make controversial statements without defending them by argument.

Rhythm in Verse.—The line between rhythm and metre is hard to draw. Aristotle is very vague on the question: Suidas says that rhythm is the father of metre, and Quintilian that rhythm is male and metre female. Such sayings merely prove the difficulty of measuring a delicate instinct by rule of three. It would appear, however, that to the Greeks metre was concerned with the measurements of poetic periods, and rhythm with their effective chanting or recitation; it cannot therefore have depended largely on *ictus* or stress, and the word is therefore often applied to prose as well as to verse. It is probable that, in a quantitative language like Greek, this stress (as it is in modern French) was far less strongly marked than (*e.g.*) in English; but it is a mistake to think it entirely absent, as, conversely, it is a mistake to think that in English, though accent is, of course, predominant, quantity is unimportant.

As Schipper says, "in English long and short syllables have no constant length, no constant relation; they depend on the context. They do not *determine* rhythm, but they help to *regulate* it." No rigid laws, therefore, can be laid down as to the proper employment of rhythmic balance. A subtle *feeling* must govern the periodic progress of sounds in harmony with the emotions it is desired to express. When the ear is satisfied, we feel that the rhythm is adequate; and a very brief study will show us that the ear demands different rhythms for an expression of different emotions. The genius of the poet is, on this side, revealed by the unforced skill with which he selects the appropriate rhythm. Ecstasy, *e.g.*, takes a quick, eager, rising movement; sadness is full, slow and emphatic; meditation deliberate; mystery and suspense are faint, languorous and throbbing; often, indeed, the rhythm is so intimately linked with human feeling that no analysis can disentangle them.

Pauses, again, are an almost essential element in modern rhythm. In Shakespeare and Milton, *e.g.*, a pause may take the place of a whole beat; and the right use of such pauses often lends a variety which increases the beauty of a passage. Still more important is what has been called the "free musical paragraph," of which Milton, in *Paradise Lost*, is so consummate a master. Here the balance, overstepping the limits of the verse-form, and felt over wide spaces, is perhaps the chief glory of the poet's style; and the skill with which one "paragraph" is set against another forms, so to speak, a larger rhythm containing and holding up the smaller rhythms of the single paragraphs and of the verse-form. In rhymed verse this larger rhythm is represented by the progression of the stanza in itself, and by the linking of the stanzas into harmonious wholes. Thus in the full meaning of the term, rhythm depends at least as much on the orderly arrangement of the thought as on the balance of the words.

Rhythm in Prose.—We perceive then that there is a rhythm in prose no less than in verse; and this appears not only in the balance of the sentence, but in the arrangement of the sentences in paragraphs and in the building up of paragraphs into chapters. Here, as in everything else, the art must be concealed. A mechanical, epigrammatic balance, like that of Johnson, is too obvious, and ere long tends to weary. The truly rhythmic prose-writer satisfies at once the ear and the mind as a skilled dancer satisfies at once the ear and the eye, without drawing attention to the means by which the effect is attained.

On the special laws of rhythm in the poetry of different nations—Greek, Hebrew, Old English, and the like—it is impossible to speak here; the works of scholars should be studied.

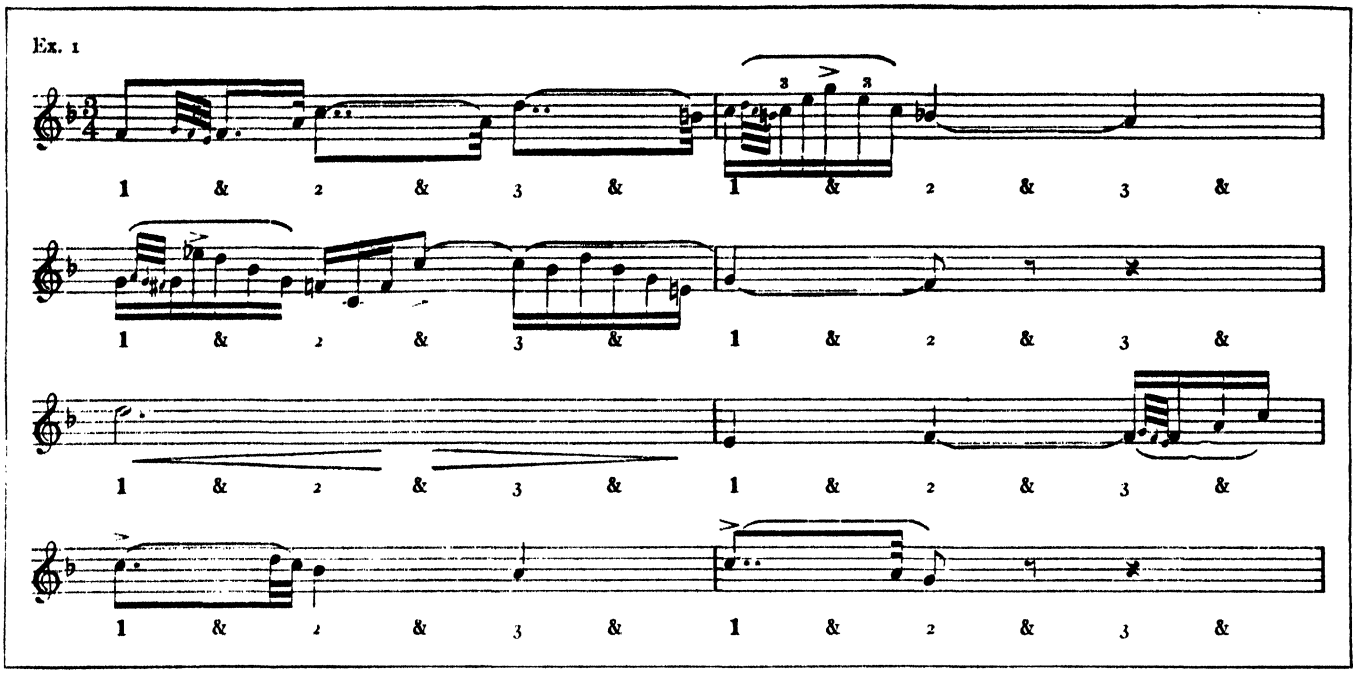
RHYTHM IN MUSIC

Like all artistic categories musical rhythm must be studied historically, to avoid Philistinism towards the rhythms of early periods. But the musical rhythms of the 18th and 19th centuries are so much more familiar to us than any others, and so radically different from speech-rhythms, that we shall do well to analyse them first. Their true relation to speech-rhythms will then become much clearer, and the study of older rhythms will be greatly simplified.



1. **Body-rhythm and Speech-rhythm.**—These are two prehistoric elements in musical rhythm; and in modern music they are in equipoise, though apart from music they are incompatible. Dance-rhythm is too narrow a term for the one, and speech-rhythm is a satisfactory term for the other. We may coin the term body-rhythm as giving the necessary extension to the notion of dance-rhythm. Musical body-rhythm, even in the slowest paces, is enormously stronger than anything known to prosody. It is no exaggeration to say that it is as strong as the pace of a horse. Not even Browning could have recited "How they brought the good news from Ghent to Aix" with comfort while riding a galloping horse; but Schubert's Characteristic Marches (op. 121) do not merely imitate that pace but go far to stimulate it if played to a body of cavalry. Gentler rhythms may be less immediately understood, but, once grasped, are not more easily changed. The music must brace itself up for any abrupt change of its fundamental rhythm. But that fundamental rhythm may be very slow and lie very deep. The melody (p. 274, Ex. 1) by Haydn has an underlying rhythm of thrice two beats. The beat is a quaver, for which one second is not too slow a tempo for this particular composition.

The whole group of six beats is invariable $3 \div 2$ and never $2 \div 3$. In this kind of music change from the one division to the other would be impossible without either violence or vagueness; unless it were a permanent change of metre. So important is the notion of $3 \div 2$ that it is not counted as 6 at all, but as **1** & 2 & 3, etc. Of these beats the first bears the chief stress, the second and third bear less, and there is no rule to give either more stress than the other. We are not, at present, considering the case of three beats quick enough to mark the rhythm without subdivision. Obviously the subdivisions (counted by "&") have no accent, except in relation to their own further subdivisions. Musical rhythms are measured from accent to accent; and of pairs of accents the first is stronger than the second. In larger groups, if the rhythm is binary the third accent will be stronger than the second, but not as strong as the first or fifth. At a very quick pace the difference of strength between the first accent and the fifth may become perceptible, but the rhythm would be inartistically stiff if such distinctions were not soon obliterated.

Triple rhythm, whether slow and subdivided or quick and undivided, also falls readily into larger binary periods with the same relative strengths of accent. There is nothing to prevent it from falling into ternary periods, but the mind ceases to apprehend a high power of three rhythmically, for we cannot know that the third period of a slow group is not the first of a new pair.

On these data it is now possible to analyse the rhythm of Ex. 1. It begins on the main accent, with no anacrusis. Between the first and second quaver beats there is a group of grace-notes. In actual time these should come on the second quaver and reduce the length of the second main note instead of that of the first, but they have no accent, and the second main note has its due stress and is not noticed to have arrived late, even if the grace-notes have been taken with some deliberation. They are like the consonants in the word *three:* it is easy to pronounce the word at a given moment, and nobody thinks of dividing it as thr-ee, though the consonants really take an appreciable time.

During the second bar of six beats the accompaniment (not given here) takes its cue from the melody and divides the quaver-beats by 3 (and the crotchets by 6). This motion thereafter pervades the whole composition, sometimes in the melody, and

always in the accompaniment, except when the whole orchestra pauses. These triplet semiquavers become equivalent to the average length of syllables in speech-rhythm, and the mind automatically measures all pauses by them. Besides the indeterminate grace-notes there are definite shorter values.

No rhythm in poetry or prose ever contemplated giving one syllable seven times the length of another, as we see in the double-dotted quavers with their complementary demisemiquavers. But in the fifth bar we have the whole six beats occupied by one sustained note, eighteen times the length of the average syllable. Yet so cogent is the body-rhythm of these long and complex bars that a deviation from the symmetry of an 8-bar period is permissible only when a change of key introduces new topics, as happens immediately after this quotation. But this will lead us to the separate topic of *phrasing*. Irregularities in the lengths of the bars themselves would be quite impossible, except in the case of a dramatic or final pause. Haydn has one opportunity for a dramatic pause in the course of the movement, yet he does not leave it at that, but expands it to two entire normal bars filled with organized rhythms.

Musical rhythm is not often as ornate as this, nor is this elaboration capable of much contrast or development, but the example at once carries us far away from the rhythms of poetry and includes all the musical principles so far mentioned. From it we can move a step nearer towards considering the simple relations between musical and poetic rhythm.

The technical terms of prosody are of no use here, with the solitary exception of the word anacrusis, which may be generalized to mean anything that happens before the first principal accent. When Rockstro tells us that "the theme of Weber's Rondo brillante in E flat (op. 62) is in Anapaestic Tetrameter Brachycatalectic, very rigidly maintained," this tells us less about the music than Weber's brilliant theme tells us about these solemn terms. A more scientific idea of Weber's theme, and of the prosodic technicalities, may be obtained from the following paradigm, to be recited *prestissimo*. Each dash at the end of the line represents a quarter of a beat.

Prestissimo.

Diddle | dum diddledum diddledum diddledum diddle | dum diddledum diddledum:— —
1 & 2 & 1 & 2 &

Diddle | dum diddledum diddledum diddledum diddle | dum diddledum diddledum:— —
1 & 2 & 1 & 2 &

After which Weber ceases to maintain his anapaestic-etcetera so rigidly, and proceeds for two lines with:—

Diddle | diddle diddle diddle diddle diddle diddle dum dum | dum dum dum dum Di d-
1 & 2 & 1 & 2

Such rapid rhythms at once remind us of Aristophanes or Gilbert, though they can move faster than syllables can be pronounced. If they coalesce into uniformity for a long period (e.g., *diddle-diddle* for several bars without a single *dum*) they cease to resemble speech-rhythm and subside into vibration, unless melodic interest sets up larger rhythms by illuminating a peak here and there. A common defect in second-rate music is the composer's failure to know when his quick motion has settled down into mere vibration.

2. **Time.**—The body-rhythm underlying Weber's Rondo brillante is an unchangeable binary rhythm, counted (as the paradigm shows) in a slow two or a quick four. Classical music uses only binary and ternary times, which, so long as vertebrate anatomy continues to develop with bilateral symmetry, are the only ones that yield a strong body-rhythm naturally, the elements of triple time giving just enough resistance to be overcome by a pleasant compromise.

The kinds of time, *i.e.*, of invariable rhythmic molecules underlying each continuous piece of music, are classed not only as *duple* and *triple* but also as *simple* and *compound*. Compound time is the result of dividing simple time by three. Division by two is ignored: thus the evidently highly compound time of Ex. 1 is reckoned as simple triple time. All beats are reckoned as binary divisions and subdivisions of the modern standard note, the semibreve: the time-signature given at the beginning of a composition is a fraction, with a numerator showing the number of beats in a bar, and a denominator showing the size of the beat. Thus $\frac{3}{4}$ signifies three crotchets (quarters) in a bar. Compound time does not indicate the main beats at all, but counts the smaller beats as normal fractions of the semibreve. The main beats are written as *dotted* notes, in which the dot lengthens the note by one half. Accordingly $\frac{6}{8}$ is the compound time of two dotted crotchets divided by three quavers; $\frac{9}{8}$ is that of three dotted crotchets: $\frac{1}{8}^2$ of four. When the division by three is only local, *triplets* are used. Triplets are groups of three equal notes crowded into the time of two.

Binary and ternary subdivision answers every ordinary purpose of musical rhythm, being capable of expressing distinctions far more subtle than have ever been regulated in speech. It is impossible to pronounce a syllable in less than a tenth of a second; but it is easy to play 16 notes in a second on the pianoforte. In such rapid notes a single break twice in a second would have an effect directly measured by the ear. If the broken series were

levelled into an even series of fourteen notes a second, the rhythmic effect would be appreciably different, though the actual difference of pace would be only $\frac{1}{56}$ of a second.

The special sign for triplets is readily adapted to other subdivisions. In most cases such adaptation is not meant to produce abstruse rhythms, but to secure an effect of free declamation. Freedom is as necessary in music as it is in speech; but fine playing, whether in obvious *tempo rubato* or in apparent strictness, bases this freedom on the superlative accuracy of good rhythmic notation.

3. **Tempo.**—The time-signature tells us nothing about the pace of the music, for the choice of the denominator is determined by a tangle of historic associations, so that $\frac{4}{8}$ may mean (as in Beethoven's C minor concerto) the slowest movement ever written, and $\frac{4}{4}$ may be a scherzo-tempo in which only one beat in a bar is countable.

The sense of tempo is a larger aspect of the body-rhythm, and in classical music it is very steady. A fundamental law of all musical rhythm is that a hurrying or slackening of tempo has no power to alter the rhythmic organization. If your phrase is too short a *ritardando* will not make it aesthetically any the longer; nor will an *accelerando* get rid of a redundant bar. On the contrary, it is crowded detail that will best profit by slackening, and loose-knit passages that have most to gain by an unobtrusive mending of the pace.

The genuine *tempo rubato* is, as its name implies, a rhythmic robbing of Peter to pay Paul. Chopin said that his left hand conducted in strict time while his right declaimed freely. The truth is that sound is as full of illusions as sight. One such illusion has already been illustrated by the grace-notes of Ex. 1, and other illusions are of much the same kind. The tick of metronome measures average time-intervals; and if it is set to measure a naturally rhythmic performance it will seem to hustle the player in some passages and to drag upon him in others, however carefully we select its pace.

In the classics from Bach to Brahms a movement may give more legitimate scope for *tempo rubato* than some purists care to admit, but it will not drift from one tempo to a radically different tempo, unless towards the end, or as evidence of imminent break-up. The gradual drift from one tempo to another first becomes something better than a weakness when the whole nature of musical movement becomes capable of continuity over hours, as in Wagnerian opera. Then, and not before, can we view one and the same tempo from opposite directions. Thus, in *Tristan und Isolde* the last part of the love-duet in the second act is a quick movement in $\frac{3}{2}$ time. Isolde's *Liebestod* ends the opera with an exact recapitulation of this (differing only in the voice part and absolutely unaltered in the orchestra) in rather slow $\frac{4}{4}$ time. By metronome the two tempi should be identical, though the impulse in the duet is energetic and that of the *Liebestod* reposeful. Wagner merely feels that the broader notation better suits Isolde's dying vision; and the listener, who may know and care nothing about the notation, agrees with Wagner.

Ex. 2

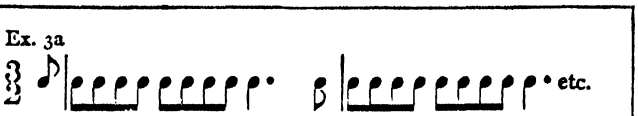
It is partly a question of accent and comes under the heading of phrasing.

4. **The Rhythm of Classical Music in Relation to Poetry.**—We can now return, furnished with new criteria, to the relation between musical and poetic rhythm. Even a simple musical setting of poetry will stretch the words in ways which speech does not normally admit. The naïve poet will unhesitatingly accept this as in the nature of singing. Only the half-baked musical *littérateur* objects, when Mozart makes Ottavio sing *Dalla sua pace la mia dipende* (Ex. 2) five times as slowly as any speaker could naturally utter the words, and then puts the top note and chief accent on the unimportant *la*. The poet would be glad to sing it that way if he could. It is quite good Italian prosody to give a nearly equal stress to *la* and *mia:* and the climax on *la* is more than counterbalanced by the fact that the important word *mia* falls on a harmonically sensitive note. The grammatical sense might have been clearer if a similar but slighter emphasis had been given to *sua*. But Ottavio is not giving instructions to a servant, but expressing his inmost feelings in solitude. Language does not base its emotional accents on logical analysis. Dr. Johnson corrected a clergyman for saying "Thou *shalt* not steal" instead of "Thou shalt *not* steal." If Johnson was right, how in the world did "shall not" ever become "shan't"?

The sensitive note on *mia* shows one of the four main degrees of freedom in musical accent. There is first the normal time-accent. Many critics of musical declamation seem to know no other forms of stress; but it can be completely eclipsed by putting the highest note of the melody elsewhere. The highest note can in its turn be eclipsed by the longest note. And in Ex. 2, both together are eclipsed by the most sensitive note. Moreover, and without recourse to anything so drastic as syncopation, the weakest note in the phrase may be given a special accent stronger than a main beat. This is beautifully shown in the third bar of Ex. 1, where the accented E♭, normally quite the weakest note in the bar, could certainly bear the chief syllable in a sentence if words for Haydn's wonderful rhythm could be found at all. Lastly, such a displaced accent may have a double meaning, the note retaining its original lightness in spite of its borrowed stress. Weber has been blamed for his bad declamation in the following famous passage:—

Ex. 3

Weber, *Der Freischütz, Act II.*

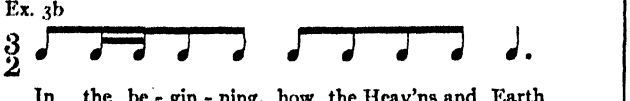


Trübe Augen, Liebchen, taugen, etc.

But, by your leave, this is a triumph of musical gesture. The lively Aennchen might even point a playful finger at the anxious Agathe with each false accent that Weber so explicitly marks. Meanwhile the orchestra corrects the declamation in waltz-rhythm.

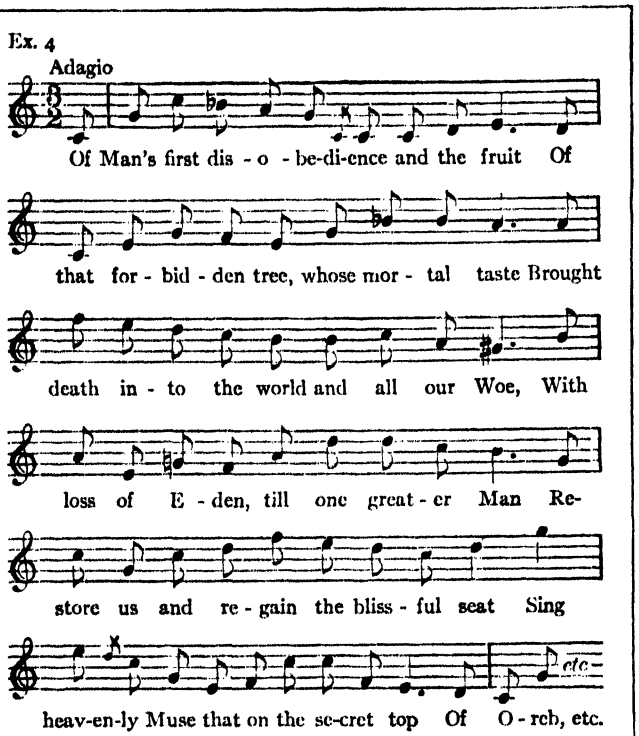
By the interplay of these varieties of accent the strophic song, with the same time to several stanzas, condemned as lazy and low by our prose critics of music, becomes, as Brahms always maintained, the highest achievement of a song-writer. The interplay does not annihilate right and wrong in declamation, nor does it prove that the classics are infallible; but it forms a musical technique as disciplined as prosody and as unlike prose. In such ways artistic factors reconcile their conflicts, and without such conflicts there is neither art nor life. Wagner and Wolf are perfect masters of a musical declamation that follows the rules of prose; but when we are told that there are no other rules, and that the classics from Bach to Brahms merely blundered insensitively, it is time to point out that musical rhythm cannot be learnt from a bell-metronome nor poetry from a pronouncing dictionary.

Let us now try a few experiments in setting blank verse to music. The first step will be to find a constant musical rhythm to represent the average line. This average rhythm will horrify the poetic ear if it is put forward as a specimen of blank verse, and probably if a line could be found that fitted it exactly that line would be a very ugly one. Still, the fact remains that the musician's average idea of blank verse is accurately represented by the following scheme, which represents two lines:



Ex. 3a

Now read the first paragraph of *Paradise Lost* rigidly to this scheme at the rate of two syllables to a metronome-beat of 80 to the minute. You will not satisfy the poet's ear; but you will find



that the lines accommodate themselves better to this than to any other uniformity; that extra syllables can be managed by grace-notes, and that the interval of two quavers between each line is a natural part of the scheme. We can proceed thus for eight lines, with rheumatic pains but not complete disaster. The imperative "Sing" is a heavy word to put into anacrusis, even of double length, and our three main beats must override many accents in lines that so often have four. Also the interlinear pause of two beats is irksome when the sense runs on. In the ninth line we must alter the scheme, for no anacrusis can digest any part of "In the beginning." So we must "invert" the first foot thus:—

Ex. 3b

But before we condemn the scheme let us see how far the torture is mitigated by merely adding musical rise and fall:—

Ex. 4

Blank verse has been worse recited than this. The rigid musical timing proves unexpectedly flexible already; and the rubato of a good singer can go far to improve it without becoming vulgar.

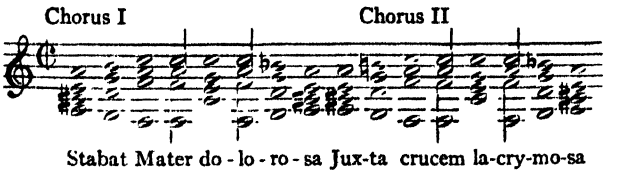
Now let us legalize the singer's rubato, and, without altering the two-quaver intervals between the lines, help the *enjambement* by a pianoforte accompaniment that makes the ear expect the resolution of a discord. Sensitive harmonies will further aid the rhythmic sense. The $\frac{3}{2}$ notation is now becoming troublesome; so that bars are divided into three and the lengths of the notes doubled. But the original $\frac{3}{2}$ scheme is nowhere violated. (*See* Ex. 4.)

After this point any attempt to continue this literal interpretation of the metre would make the music drag hopelessly. Already the first two lines would be the better for running over the pause and doubling the pace of "that forbidden tree." But this would mean using two time-scales and would take us into free composition. The object of this illustration is not to show how these words ought to be set, nor to prove the very doubtful proposition that they are singable to any kind of music; but simply to bring out the most elementary relations between music and verse.

5. **Phrasing.**—The higher art of phrasing is chiefly observable in groups of very much simpler bars than those of our illustrations so far. Two facts, often ignored, must be realized before we can understand phrasing at all. First, music, being in time and not in space, is never apprehended in a *coup d'oeil*, but always in a momentary present connecting a remembered past with an imperfectly anticipated future. Consequently we miss half the aesthetic values of rhythm if we insist on knowing all about it from the first note. Rhythms have as much right to change their meaning while we listen to them as the cats of Wonderland have to grin; and "they all can and most of them do."

The second point is that the bar represents no fundamental rhythmic fact. It did not come into existence so long as music was printed only in parts. When music began to be printed with all the parts ranged legibly on one page, it was necessary to score the pile of parts with vertical strokes to range them in partitions and guide the eye. Hence the word *score*, and the French *partition* and German *Partitur*. The nascent body-rhythm grew stronger and gradually made it convenient that the bars should coincide with the groups indicated by the time-signature, and this gave rise (but only in recent times) to the delusion that the bar was the permanent unit. It is often obviously not so. When Mozart writes in moderate common time his phrasing is sure to make an odd number of half-bars somewhere so that a theme that originally lay on **1**, 2, 3, 4 now lies on 3, 4, **1**, 2. In such a case it is pedantic to say that the accent has changed and still more pedantic to blame Mozart for not either taking shorter bars throughout or changing to them according to the rhythm. If the half-bar displacement is really awkward Mozart will put it right, as when he rebarred the duet "Bei Männern welche Liebe fühlen" in *Die Zauberflöte*. But long bars imply delicate accents and these accents become no harder when the phrasing contracts.

Beethoven writes his scherzos, and some very powerful other movements, in the shortest possible bars, and it is often difficult to tell whether the first of such bars is a main accent or an anacrusis. In the first movement of the C minor sonata (op. 10, No. 1) when we reach bar 22 it becomes manifest that bar 9 must have been in anacrusis; but we cannot have noticed that at the time, for when theorists go back to bar 1 and say that that initial bump was in anacrusis we can only smile. In three late works Beethoven helps the players by the words *Ritmo di tre battute* and *Ritmo di quattro battute*. The most famous of these passages is in the scherzo of the ninth symphony. Why did Beethoven not use there $\frac{9}{4}$ or $\frac{12}{4}$ bars so that his *ritmo di tre battute* became self-evident as a change to $\frac{9}{4}$? Because if you wish to ride this Pegasus you must please to rise on your stirrups once in Beethoven's bar, and not only once in 3 or 4. The change to 3-bar rhythm is obvious enough; but the return to 4 is not, as Grove said, effected by the drums; but comes where nobody can possibly detect it. And Beethoven, having helped the conductor at this point, is quite content, as in earlier works, *passim*, that the listeners should gradually become aware that the 3-bar swing is no longer in being. In the trio, Beethoven wishing to indicate that 2 of its crotchets correspond to 3 of the scherzo, first wrote in $\frac{2}{4}$ time. But this made the lilt as unrecognizable as the true proportions of Iceland at the top of a map on Mercator's projection. So he changed it to alla-breve bars $\frac{4}{2}$.



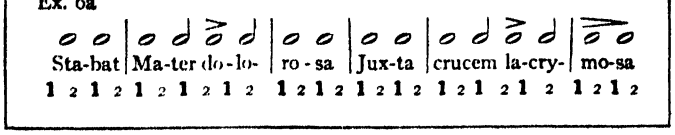
The common sense of the whole matter is that hard accents and soft accents are equally liable in the long run to obliterate the distinction between the first and the third of four beats, and may go far to weaken that between the first and the second. We shall never find that Beethoven's short bars will fit any one interpretation throughout a piece, nor shall we often be able to fix the point at which the rhythmic angle is shifted. And when we have fixed everything some overlap will upset us or some extra bar make us hold our breath. Four-bar rhythm is more important to music than limericks are to literature, but the limerick is hardly more adequate or historically qualified to be taken as the fundamental basis for rhythm. And we must not take a lofty timeless view of rhythmic inequalities and changes. Farmer Giles is mistaken in the idea that the lady he finds sketching in the woods where you can't see round the corner would find a better subject on the top of a hill where you can see six counties.

Ex. 5

6. **Older Musical Rhythms.**—In measuring the distance between the musical rhythms, the most familiar to us and those of the 16th and earlier centuries, the first thing we must dismiss is our strong body-rhythm. Only the lightest ballets and fa-las of our great madrigalists have any such element. The greater part of

Ex. 6

the 16th century polyphony is held together by a time-system which merely counts semibreves and settles whether the semibreve is to be *perfect* and equal to 3 minims or *imperfect* and equal to 2, and also whether three or only two semibreves are to go to a breve. The law of accent holds with pairs of minims about as strongly as in modern music, but it is already very much weakened with pairs of semibreves. Examine the first two lines of Palestrina's *Stabat Mater,* which is as wonderful in rhythm as it is in harmony.



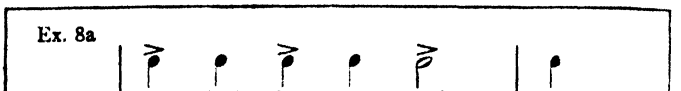
The music of the second line is identical with that of the first, and both lines are an exact quantitative rendering of the verses, with longs twice the size of shorts. The time signature tells us that the breve contains 2 semibreves and the semibreve two minims. Accordingly the modern editor draws bar-strokes at regular breve-distances throughout the score. Then comes the modern choir-master, warm from a rehearsal of *Be Not Afraid* in *Elijah,* and beats four in a bar, down, left, right, up, while the dutiful double choir sings

Sta-bat	Ma-ter do	(sniff) lo ro	Sa jux
1 2 3 4	1 2 3 4	1 2 3 4	1 2 3 4
Ta cru	Cem la (sniff) cry		mo sa
1 2 3 4	1 2 3 4		1 2 3 4

But now let each singer, at a starting signal from the conductor, merely move one finger regularly up and down in minims, downwards for accented beats and upwards for unaccented. It will then be found perfectly easy to override these gentle accents

whenever the sense dictates, and the choir will find itself declaiming the words beautifully.

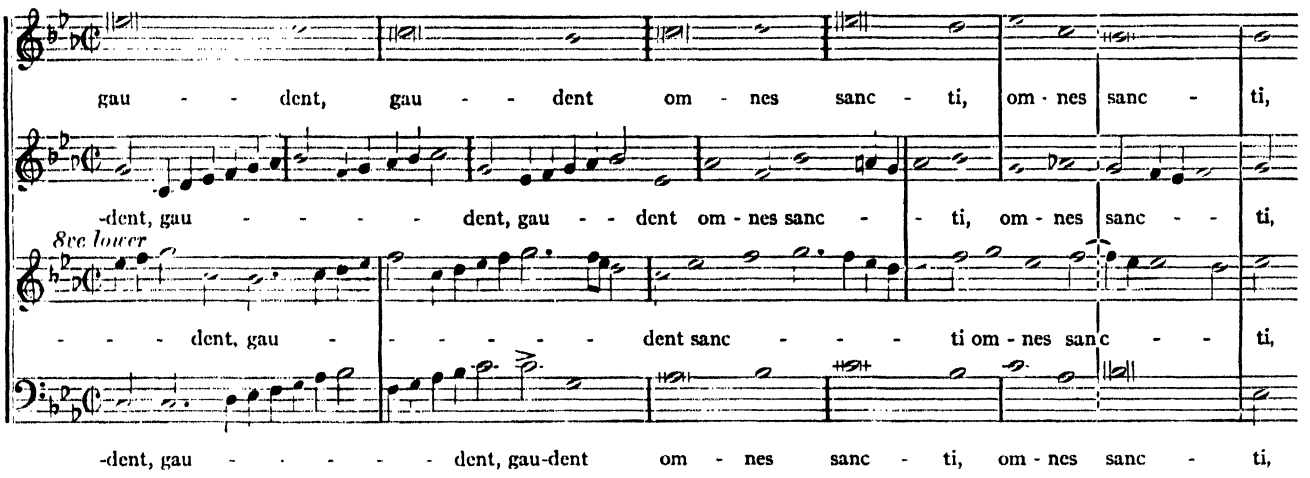
Ex. 6a



If bars must be drawn let them come only where there is a normal accent. We must not put a bar-line after *mater,* because this would come in the middle of a semibreve, or, as Morley calls it, a stroke. The examples of Victoria and Josquin given in the articles MASS, MOTET and MUSIC are barred freely by these rules, but no such single scoring is adequate for an elaborate polyphony. Ex. 7 gives a passage from Victoria's *O quam gloriosum* in full score barred so as to display what cannot be shown in the short score given with MOTET.

tinually obliterates the difference between $2 \div 3$ and $3 \div 2$, as in example 8a by Lasso.

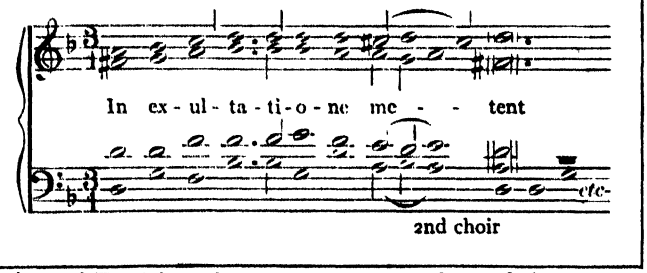
This swing from 3 to a 3 twice as slow is called *hemiole* and survives as late as Bach and Handel. Thus, in the first chorus of *The Messiah* the hemiole which Handel always uses in triple-time closes gives the cadential accentuation:



Ex. 8a

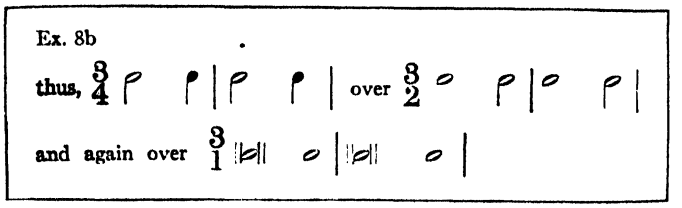
The opposite swing from $\frac{3}{2}$ to $\frac{6}{4}$ with a curious bump in the last ($\frac{6}{4}$) bar, characterizes the French courantes of Couperin and Bach.

Before Palestrina we find in England a fairly steady slow triple time (3 divided by 2 or 4) in Tallis; but a little earlier we find Obrecht writing music which abounded in amazing complexities,



Ex. 7

From this we can see Victoria's Miltonic art of finishing a big paragraph. The lower voices enjoy their own rhythms until the slow swing of the soprano draws the bass along with it. Then the alto joins, and the tenor is compelled to regard his own rhythm as a syncopation against this majority.



Little has been said so far about syncopation, and little now remains to be said. Its main point, even in the 16th century, as Ex. 7 shows, is that it requires a strong body-rhythm to contradict. A common fallacy of self-centred composers is to write syncopations that never encounter opposition at all. We must not confuse this with the legitimate case of a rhythm the meaning of which first appears later in the course of the music, nor with the case of an intentional vagueness. Nor, to return to the 16th century, must we put the unanimous speech-rhythm syncopations of Ex. 6 into the same category as those of the tenor at the end of Ex. 7.

Ex. 8

Triple time in the 16th century was very different from what it is in music with a strong body-rhythm. For one thing, it consometimes three depths of triple rhythm:—

Ex. 8b

The complexity is illusory, for the ear makes nothing of it, and the same is the case with the capacity of the ancient time-system of mode, time and prolation to multiply triple rhythms up to 27 beats. The fact that the process was by multiplication shows at once that no real rhythmic effects are concerned, and that the system is only a device by which the long-suffering tenors may count out the enormous notes of some unrecognizable *canto fermo.* If we want genuine highly compound times we must leave these multiplication tables and study the last movement of Beethoven's sonata Op. 111, where the theme and first variation are in triple time divided by 3 ($\frac{9}{16}$); the second variation divides the half-beat by 3, producing $\frac{18}{32}$ (which Beethoven misnames $\frac{6}{16}$; the third variation divides the quarter-beats, producing $\frac{36}{64}$ (misnamed $\frac{12}{32}$); and the fourth variation returns to $\frac{9}{16}$ time and divides it by a uniform triplet vibration of 27 notes to a bar, afterwards surmounted by the unmeasured vibration of a trill. All this is sublime in its cogent clearness.

Genuine complexity was achieved by Palestrina in the second Kyrie of his *Missa* "L'homme armé," a work as beautiful as it is ingenious. But Mozart achieved something unsurpassed in the ballroom scene in *Don Giovanni,* putting his vigorous body-

rhythms to the supreme test of making the characters actually dance and pass remarks in them.

7. **Recent Rhythmic Developments.**—Rhythms other than binary and ternary cannot develop a very strong ictus, though Holst manages in the ballet of *The Perfect Fool* to make some good dance-rhythms of $\frac{7}{8}$. But they tend to flow like speech-rhythms, and they are very reluctant to change their pattern. A rhythm of 5 falls into either 3+2 or 2+3. The famous 5-time movement in Tschaikowsky's *Pathetic* symphony is 2+3 and is in absolutely square 8-bar rhythm throughout. Again 7-time will be some form of 4 and 3, or will suggest 8 with a beat clipped. Ravel, in his pianoforte trio, showed that it is possible to divide 8 into 3+2+3 so inveterately that no listener can possibly hear it as 4+4. The effect is excellent, and other versions of it are used in a much quicker tempo and with more variety by Holst in his Fugal Overture. But we must call things by their right names and not say that a thing is complex when it clings like grim death to its one pattern and falls into phrases of 2+2 for pages together. The *Pantoum* of Ravel's trio blends an impish $\frac{3}{4}$ with a sanctimonious $\frac{4}{2}$ very amusingly. An early pianoforte sonata by Cyril Scott attempts to get away from all regularities. Its 13s and 3s do not always succeed in avoiding straightening out into plain 16 = 4 × 4; and when successful are conscientious rather than impulsive. The rhythms of Greek tragedy, interpreted syllabically, are suggestive, and so are many oriental rhythms. But they are not body-rhythms; and it may be doubted whether any great increase in variety of strong body-rhythms is imminent at present. (D. F. T.)

RHYTINA, the northern sea-cow (*Rhytina stelleri*), a gigantic relative of the manati and dugong (*qq.v.*), formerly inhabited Bering and Copper islands, in the north Pacific, where it was discovered during Bering's voyage in 1741, and described by Steller, who accompanied that expedition as a naturalist. About the year 1768 the species, which was the sole representative of its genus, became exterminated. The *Rhytina* was the largest member of the order *Sirenia,* attaining a length of nearly 20ft.; and had a thick, bark-like skin. The jaws, which were bent downwards, were unprovided with teeth but carried ridged horny plates. The tail was deeply forked; and the flippers were short and truncated, lacking the terminal joints of the digits.

When discovered, these Sirenians were numerous in the bays of Bering island, where they browsed upon the abundant sea-tangle. Their extirpation is due to the Russian sailors and traders who visited the island in pursuit of seals and sea otters.

RIAZ PASHA (*c.* 1835–1911), Egyptian statesman, born about 1835, was of a Circassian family, but said to be of Hebrew extraction. Ismail Pasha discovered him, and made him one of his ministers, to find, to his chagrin, that Riaz was possessed of a remarkable independence of character. When Ismail's financial straits compelled him to agree to a commission of inquiry Riaz was vice-president of the commission. He filled this office with distinction, but not to the liking of Ismail. The khedive, however, felt compelled to nominate Riaz minister of the interior in the first Egyptian cabinet (Sept. 1878–April 1879). When Ismail dismissed the cabinet and attempted to resume autocratic rule, Riaz fled the country. Upon the deposition of Ismail, June 1879, Riaz was sent for by the British and French controllers, and he formed the first ministry under the khedive Tewfik. His administration was overthrown by the agitation which had for figure-head Arabi Pasha (*q.v.*). On the evening of the 9th of September 1881, after the military demonstration in Abdin Square, Riaz was dismissed; broken in health he went to Europe, remaining at Geneva until the fall of Arabi. After that event Riaz accepted office as minister of the interior under Sherif Pasha. Had Riaz had his way Arabi and his associates would have been executed forthwith, and when the British insisted that clemency should be extended to the leaders of the revolt Riaz resigned (Dec. 1882). He took no further part in public affairs until 1888, when, on the dismissal of Nubar Pasha (*q.v.*), he was summoned to form a government. He worked in harmony with the British agent (Sir Evelyn Baring—afterwards Lord Cromer) until May 1891. In the February following he again became prime minister under Abbas II., being selected as comparatively acceptable both to the khedivial and British parties. In April 1894 Riaz finally resigned office on account of ill-health. Superior, probably, both intellectually and morally to his great rival Nubar, he lacked the latter's broad statesmanship as well as his pliability. Riaz's standpoint was that of the benevolent autocrat; he believed that the Egyptians were not fitted for self-government and must be treated like children, protected from ill-treatment by others and prevented from injuring themselves. In 1889 he was made an honorary G.C.M.G. Riaz died on June 18, 1911.

RIBADENEIRA, PEDRO A. (1527–1611), hagiologist, was born at Toledo on Nov. 1, 1527. As a lad he repaired to Rome for study, and there on Sept. 18, 1540, was admitted by Ignatius Loyola, in his thirteenth year, as one of the Society of Jesus, which had not yet received papal sanction. He pursued his studies at Paris (1542) in philosophy and theology. Loyola, in 1555, sent him on a mission to Belgium; in pursuance of it he visited England in 1558. In 1574 he settled in Madrid, where he died on Sept. 10, 1611. His most important work is the *Life of Loyola* (1572). That Ribadeneira was, though an able, a very credulous writer, is shown by his lives of the successors of Loyola in the generalship of the Society, Lainez and Borgia; and especially by his *Flos Sanctorum* (1599–1610), a collection of saints' lives, entirely superseded by the labours of the Bollandists.

See his autobiography in his *Bibliotheca Scriptorum Societatis Jesu* (1602 and 1608, supplemented by P. Alegambe and N. Sotwell in 1676); H. F. De Puy, *An Early Account of the Establishment of Jesuit Missions in America* (1921).

RIBAULT or **RIBAUT, JEAN** (*c.* 1520–1565), French navigator, was born at Dieppe, about 1520. Appointed by Admiral

Coligny to take French Protestants to America. Ribault sailed on Feb. 18, 1562, with two vessels, and on May 1 landed at Florida at St. John's river, or, as he called it, Rivière de Mai. Having settled his colonists at Port Royal harbour (now Paris Island, S.C.), and built Fort Charles for their protection, he returned to France. In 1563 he appears to have been in England and to have issued *True and Last Discoverye of Florida* (Hakluyt Soc., vol. vii.). In April 1564 Coligny despatched another expedition under René de Laudonnière, but meanwhile Ribault's colony, destitute of supplies, revolted against their governor and attempted to make their way back to Europe in a boat which was happily picked up by an English vessel. In 1565 Ribault was again sent out to satisfy Coligny as to Laudonnière's management of his new settlement, Fort Caroline, on the Rivière de Mai. While he was still there the Spaniards attacked the French ships at the mouth of the river. Ribault set out to retaliate but his vessels were wrecked near Matanzas Inlet and he had to return to Fort Caroline by land. The Spaniards by this time had slaughtered all the colonists except a few who got off with two ships under Ribault's son. Induced to surrender by false assurances, Ribault and his men were put to the sword in Oct. 1565.

RIBBON-FISHES: *see* OARFISH and DEALFISH.

RIBBONISM, the name given to an Irish secret-society movement, which began at the end of the 18th century in opposition to the Orangemen (*q.v.*), and which was represented by various associations under different names, organized in lodges, and recruited all over Ireland from the lowest classes of the people. The actual name of Ribbonism (from a green badge worn by its members) became attached to the movement later, about 1826; and after it had grown to its height, about 1855, it declined in force, and was practically at an end in its old form when in 1871 the Westmeath Act declared Ribbonism illegal. (*See* also IRELAND: *History*.)

RIBBONS. By this name are designated narrow webs, commonly of silk or velvet, used primarily for binding and tying in connection with dress, but also applied for innumerable useful, ornamental, and symbolical purposes. Along with that of tapes, fringes, and other small wares, the manufacture of ribbons forms a special department of the textile industries.

RIBEAUVILLÉ (Rappoltsweiler), a town of France, in the department of Haut-Rhin. Pop. (1926) 4,031. It lies at the entrance of the valley of the Strengbach, under the Vosges mountains, 33 m. S.W. of Strasbourg on the railway to Basle. It is in part surrounded by ancient walls, and has many mediaeval houses and two fine Gothic churches, of St. Gregory and St. Augustine. The Carolabad, a saline spring with a temperature of 64°, made Ribeauvillé a watering-place.

Rappoltsweiler, known in the 8th century as Rathaldovilare, passed from the bishops of Basel to the lords of Rappoltstein, famous nobles of Alsace. The lord of Rappoltstein was the protector of wandering minstrels. When the family became extinct in 1673 this office of king of the pipers (*Pfeiferkönig*) passed to the counts palatine of Zweibrücken-Birkenfeld. The minstrels had a pilgrimage chapel near Rappoltsweiler, dedicated to their patron saint, Maria von Dusenbach, and here they held an annual feast on Sept. 8. Near the town are the ruins of three famous castles, Ulrichsburg, Girsberg and Hohrappoltstein.

RIBEIRA, a town of north-western Spain, in the province of Corunna, on the extreme south-west of the peninsula formed between the Ria of Muros and Noya and Arosa bay. Pop. (1920) 15,834. Ribeira is in a hilly country, abounding in wheat, wine, fruit, fish and game. Its port is Santa Eugenia de Ribeira.

RIBEIRO, BERNARDIM (1482–1552), the father of bucolic prose and verse in Portugal, was a native of Torrão in the Alemtejo. He studied at the University of Lisbon, was introduced by one of his relatives to the court of King Manoel, and became secretary to King John III. in 1524. Ribeiro's early verses are to be found in the *Cancioneiro Geral* of Garcia de Resende (*q.v.*). He took part in the historic *Serões do Paço*, or palace evening entertainments, which largely consisted of poetical improvisations; there he met and earned the friendship of the poets Sá de Miranda (*q.v.*) and Christovão Falcão who soon became his literary comrades and the confidants of his romantic passion for a lady who has been variously identified by literary historians. All that is certain is that the upshot of the affair was banishment from court. Ribeiro had poured out his heart in five beautiful eclogues, the earliest in Portuguese, written in the popular octosyllabic verse. He is said to have gone to Italy, and possibly was there when he wrote his moving knightly and pastoral romance *Menina e Moça*, in which he related the story of his passion, personifying himself under the anagram of "Bimnarder," and the lady under that of "Aonia." When he returned home in 1524, the new king, John III., restored him to his former post. But his mind was already unhinged by trouble. About 1534 a long illness supervened, then melancholia. In 1549 the king gave him a pension; in 1552 he died insane in All Saints hospital in Lisbon.

The *Menina e Moça* was not printed until after Ribeiro's death (Ferrara, 1554.) It is divided into two parts, the first of which is certainly the work of Ribeiro (ed. Dr. José Pessanha, Oporto, 1891), while as to the second opinion is divided.

See Visconde Sanches de Baena, *Bernardim Ribeiro* (1895); Dr. Theophilo Braga, *Bernardim Ribeiro e o Bucolismo* (Oporto, 1897); A. F. G. Bell, *Portuguese Literature* (1922).

RIBERA, GIUSEPPE (1588–1652), called LO SPAGNOLETTO or "little Spaniard," a leading painter of the Spanish and partly Neapolitan school. He was born at Játiba near Valencia in Spain on Jan. 12, 1588. He studied painting under Francisco Ribalta (*c.* 1551–1628), the Spanish Caravaggio, whose "tenebroso technique" with marked contrast of light and shade, he acquired. He then proceeded to Italy. In Rome he studied Raphael's frescoes in the Vatican; in Parma Correggio's works; he probably also visited Padua and Venice. Eventually he settled at Naples, where he married Catarina Azzolino, the daughter of a painter, in 1616. His work attracted the attention of the Spanish viceroy, the duke of Ossuna, who favoured him, and whose patronage was continued by his successors, among whom was Count Monterey. For this nobleman he painted the wonderful "Conception" (1635) in the Augustine monastery of Salamanca. After 1637 he was employed on important work in the Carthusian church of S. Martino at Naples. Commissions flowed in upon Ribera. In 1626 he was elected a member of the Academy of St. Luke in Rome; he was decorated by the pope with the insignia of the order of "the Abito di Cristo" in 1644. Velasquez is said to have visited him at Naples. His influence was felt throughout Italy and Spain, and the popularity of the painters known as the *Tenebrosi* and naturalists depended as much on the example of Ribera as on that of Caravaggio. Luca Giordano was his most distinguished pupil. The close of Ribera's career was shadowed by his grief over the abduction of his second daughter by Don Juan of Austria.

Ribera was one of the most able naturalist painters, but he was also a poet. His drawing was precise and also powerful; his figures are true in form but also full of feeling, especially those of old men. In his earlier style, founded on Ribalta (some say on Caravaggio), he displays an excessive love of strong shadows. His later work was more luminous and of a rich golden tone. Pacheco rightly called him one of the great colourists of Spain. Ribera's religious pictures are free from sentimentality and essentially Roman Catholic in spirit. Owing to his realistic rendering of scenes of martyrdom of Christian saints it has been said that he delighted in subjects of horror. Thus to quote Byron: "Spagnoletto tainted his brush with all the blood of all the sainted" (*Don Juan*, XIV. 71). Among Ribera's principal works we may mention: "The Martyrdom of St. Bartholomew" (1630) in the Prado; "The Pietà" (1637) in S. Martino, Naples; "St. Agnes" (1641) in the Dresden gallery; "The Descent from the Cross" (1644) in the Neapolitan Certosa: "St. Januarius emerging from the Furnace" (1646) in the cathedral, Naples; and "The Adoration of the Shepherds" (1650) in the Louvre. He also painted mythological subjects such as "The Silenus" (1626) in the gallery of Naples and "Venus and Adonis" (1637) in the Galleria Nazion-

ale, Rome. He was the author of several fine male portraits such as "The Musician" from the Stroganoff collection now in the museum of Toronto, Canada. The Prado, Madrid, contains no less than 50 of his paintings.

As an etcher he belonged to the Italian school, and his plates all date from a late period (1621–48). They are masterpieces in direct drawing especially "the Drunken Silenus with Satyrs" (1628) and "Don Juan on Horseback" (1648). Bartsch enumerates 18 plates, of which three are studies of features.

See C. Bermudez, *Diccionario Historico;* Dominici, *Vite de' Pittori* (Naples 1840–46); A. L. Mayer, *Ribera* (Leipzig, 1923).

RIBOT, ALEXANDRE FÉLIX JOSEPH (1842–1923), French statesman, was born at St. Omer on Feb. 7, 1842. After a brilliant career at the University of Paris, he rapidly made his mark at the bar. He was secretary of the conference of advocates and one of the founders of the *Société de législation comparée.* After entering the Chamber of Deputies in 1878 he devoted himself especially to financial questions, and in 1882 was reporter of the budget. He became one of the most prominent republican opponents of the Radical party, distinguishing himself by his attacks on the short-lived Gambetta ministry. He refused to vote the credits demanded by the Ferry cabinet for the Tongking expedition, and shared with M. Clémenceau in the overthrow of the ministry in 1885. At the general election of that year he was defeated, but re-entered the chamber in 1887. After 1889 he sat for St. Omer. His fear of the Boulangist movement converted him to the policy of "Republican Concentration," and he entered office in 1890 as foreign minister in the Freycinet cabinet. He gave a fresh direction to French policy by the understanding with Russia, declared to the world by the visit of the French fleet to Cronstadt in 1891, and subsequently ripened into a formal treaty of alliance. He retained his post in the Loubet ministry (Feb.–Nov. 1892), and on its defeat became himself president of the council, retaining the direction of foreign affairs. The government resigned in March 1893 on the refusal of the chamber to accept the Senate's amendments to the budget. On the election of Félix Faure as president of the Republic in Jan. 1895, Ribot again became premier and minister of finance. On June 10 he made the official announcement of a definite alliance with Russia. On Oct. 30 the ministry fell. After the fall of the Méline ministry in 1898 Ribot tried in vain to form a cabinet of "conciliation." The policy of the Waldeck-Rousseau ministry on the religious teaching congregations broke up the Republican party, and Ribot was among the seceders; but at the general election of 1902, though he himself secured re-election, his policy suffered a severe check. He actively opposed the policy of the Combes ministry and denounced the alliance with Jaurès, and on Jan. 13, 1905, he was one of the leaders of the opposition which brought about the fall of the cabinet. Nevertheless, he now announced his willingness to recognize a new régime to replace the Concordat, and gave the government his support in the establishment of the *Associations cultuelles*, while he secured some mitigation of the severities attending the separation.

In June 1914 M. Poincaré summoned Ribot to form a cabinet. He succeeded in doing so but his Government did not survive the first ministerial declaration. He returned to office in Aug. 1914 as minister of finance in M. Viviani's reconstituted ministry of national defence. He held the same office in the ministry formed by M. Briand on Oct. 29, 1915, and again in the reduced cabinet of Dec. 1916. In March 1917 he succeeded M. Briand as prime minister and minister of foreign affairs. He gave way in Sept. of the same year to M. Painlevé, in whose Government he retained the ministry of foreign affairs, which he resigned in the following month. M. Ribot was a member of the Académie Française and of the Académie des Sciences Politiques et Morales. He died in Paris Jan. 13, 1923.

See M. Laurent, *Nos gouvernements de guerre* (1920).

RIBOT, THEODULE ARMAND (1839–1916), French psychologist, was born at Guingamp on Dec. 18, 1839, and died on Dec. 9, 1916. In 1888 he became professor of psychology at the Collège de France. His thesis for his doctor's degree, republished in 1882, *Hérédité: étude psychologique* (5th ed., 1889), is his most important and best known book. Following the experimental and synthetic methods, he collected instances of inherited peculiarities; he pays particular attention to the physical element of mental life, ignoring all spiritual or non-material factors in man.

Of his works the following have been translated into English:—*English Psychology* (1873); *Heredity: a Psychological Study of its Phenomena, Laws, Causes, and Consequences* (1875); *Diseases of Memory: An Essay in the Positive Psychology* (1882); *Diseases of the Will* (1884); *German Psychology of to-day*, tr. J. M. Baldwin (1886); *The Psychology of Attention* (Chicago, 1890); *Diseases of Personality* (Chicago, 1895); *The Psychology of the Emotions* (1897); *The Evolution of General Ideas*, tr. F. A. Welby (Chicago, 1899); *Essay on the Creative Imagination*, tr. A. H. N. Baron (1906).

RICARDO, DAVID (1772–1823), English economist, was born in London on April 19, 1772, of Jewish origin. His father, who was of Dutch birth, was a successful member of the Stock Exchange. In 1786 Ricardo entered his father's office, where he showed much aptitude for business, but in consequence of his adoption of the Christian faith about 1793, when he married Miss Wilkinson, he was separated from his family and thrown on his own resources. He continued a member of the Stock Exchange and by 1797 was sufficiently wealthy to be able to turn to scientific pursuits; but, having read Adam Smith's great work, he threw himself into the study of political economy.

His publication of a tract on *The High Price of Bullion, a Proof of the Depreciation of Bank Notes*, in 1809, gave a fresh stimulus to the controversy respecting the resumption of cash payments, and indirectly led to the appointment of a committee of the House of Commons, commonly known as the Bullion Committee, to consider the question. The report of the committee confirmed Ricardo's views, and recommended the repeal of the Bank Restriction Act, but the House of Commons declared that paper had undergone no depreciation. In 1811 he met James Mill, who, while influencing Ricardo politically, was under obligations to him in the economic field. Mill said, in 1823, that he himself and J. R. M'Culloch were Ricardo's only genuine disciples.

In 1815, when the Corn Laws were under discussion, Ricardo published his *Essay on the Influence of a Low Price of Corn on the Profits of Stock*, directed against a tract by Malthus entitled *Grounds of an Opinion on the Policy of Restraining the Free Importation of Foreign Corn.* His arguments were based on the theory of rent, which, as Ricardo admitted, had been clearly enunciated by Malthus in his *Inquiry into the Nature and Progress of Rent*, and which had earlier been stated by Anderson. In this essay are set forth the essential propositions of the Ricardian system, such as, that an increase of wages does not raise prices; that profits can be raised only by a fall in wages and diminished only by a rise in wages; and that profits, in the whole progress of society, are determined by the cost of the production of the food which is raised at the greatest expense. These ideas were afterwards incorporated in the *Principles of Political Economy.* In the field of the theory of banking and currency some of Ricardo's best work appears. His main ideas are expressed in three pamphlets: (1) *The High Price of Bullion* (1810), in which he discusses the available means of testing the value of paper money, and the power of the Bank of England to regulate the supply. (2) *Proposals for an Economical and Secure Currency* (1816), in which he elucidates the quantity theory, and pronounces in favour of a mono-metallic standard. (3) *A Plea for a National Bank* (1824), which was, in fact, an indictment of the methods of the existing bank, particularly in connection with its issue of paper money.

Ricardo's chief work, *Principles of Political Economy and Taxation*, appeared in 1817. The fundamental doctrine of this work is that, on the hypothesis of free competition, exchange value is determined by the labour expended in production. Ricardo's theory of distribution has been briefly enunciated as follows: "(1) The demand for food determines the margin of cultivation; (2) this margin determines rent; (3) the amount necessary to maintain the labourer determines wages; (4) the difference between the amount produced by a given quantity of labour at the margin and the wages of that labour determines profit." These theorems require much modification to adapt them to real life. His theory

of foreign trade has been embodied in the two propositions: "(1) International values are not determined in the same way as domestic values; (2) the medium of exchange is distributed so as to bring trade to the condition it would be in if it were conducted by barter." A considerable portion of the work is devoted to a study of taxation, which requires to be considered as a part of the problem of distribution. A tax is not always paid by those on whom it is imposed; it is therefore necessary to determine the ultimate, as distinguished from the immediate, incidence of every form of taxation. Smith had already dealt with this question. Ricardo, in developing and criticising his results, arrives at the conclusion that a tax on raw produce falls on the consumer, but will also diminish profits; a tax on rents falls on the landlord; taxes on houses will be divided between the occupier and the ground landlord; taxes on profits will be paid by the consumer, and taxes on wages by the capitalist.

Having retired from business and become a landed proprietor, Ricardo entered parliament as member for Portarlington in 1819. He contributed to bringing about the change of opinion on the question of free trade which led to the legislation of Sir Robert Peel on that subject, and made some valuable speeches on economic questions. In 1820 he contributed to the supplement of the *Encyclopædia Britannica* (6th ed.) an "Essay on the Funding System." In this besides giving an historical account (founded on Dr. Robert Hamilton's valuable work *On the National Debt,* 1813, 3rd ed., 1818) of the several successive forms of the sinking fund, he urges that nations should defray their expenses, whether ordinary or extraordinary, at the time when they are incurred, instead of providing for them by loans.

Ricardo died on Sept. 11, 1823, at his seat (Gatcomb Park) in Gloucestershire, from a cerebral affection. James Mill, who was intimately acquainted with him, says (in a letter to Napier of November 1818) that he knew not a better man, and on the occasion of his death published a highly eulogistic notice of him in the *Morning Chronicle.* A lectureship on political economy, to exist for ten years, was founded in commemoration of him, M'Culloch being chosen to fill it.

In forming a general judgment respecting Ricardo, we must have in view not so much the minor writings as the *Principles,* in which his economic system is expounded as a whole. By a study of this work we are led to the conclusion that he was an economist rather than a social philosopher like Adam Smith or John Mill, for there is no evidence of his having had any but the narrowest views of the great social problems. He shows no trace of that sympathy with the working classes which is apparent in the *Wealth of Nations;* and he regards the labourer as merely an instrument in the hands of the capitalist. Ricardo's main contributions to economics relate to foreign trade, money, and paper issues and rent. He was responsible for the doctrine of comparative costs, as applied to foreign trade, a clear statement of the quantity theory, and a rather involved discussion of the nature of rent. His work suffers from ambiguity of expression, which has led to erroneous interpretations by his successors.

The criticisms to which Ricardo's general economic scheme is open do not hold with respect to his treatment of the subjects of currency and banking. These form precisely that branch of economics where the operation of purely mercantile principles is most immediate and invariable. They were, besides, the departments of the study to which Ricardo's early training and practical habits led him to give special attention; and they have a lasting value independent of his systematic construction.

Ricardo's collected works were published, with a notice of his life and writings, by J. R. M'Culloch in 1846. The *Principles* were edited, with an introduction, bibliography, and notes, by G. C. K. Gonner (1891), who also edited the *Economic Notes* (1923). *See* also *Letters to T. R. Malthus* (ed. J. Bonar, 1887); *Letters to J. R. M'Culloch* (ed. J. H. Hollander, 1895); *Letters to H. Trower and Others* (ed. J. Bonar and J. H. Hollander, 1899); *Notes on Malthus' Principles of Political Economy* (ed. J. H. Hollander and T. E. Gregory, 1928). A French translation of the *Principles* by F. S. Constancio, with notes by J. B. Say, appeared in 1818; the whole works, trans. F. S. Constancio and A. Fonteyraud, form vol. xiii. (1847) of the *Collection des principaux economistes,* with important notes. *See* also E. Baumstark, *David Ricardo's Grundgesetze der Volkswirthschaft und die Besteuerung übersetzt und erläutert* (1837), also J. H. Hollander, *David Ricardo* (1910) and A. Graziani, *Ricardo e J. S. Mill* (1921).

RICASOLI, BETTINO, BARON (1809–80), (*rē-kah'sō-lī*), Italian statesman, born at Broglio March 19, 1809. In 1847 he founded the journal *La Patria,* and sent to the grand duke of Tuscany a memorial suggesting remedies for the difficulties of the state. In 1848 he was for a short time gonfaloniere of Florence. As Tuscan minister of the interior in 1859 he promoted the union of Tuscany with Piedmont. Elected Italian deputy in 1861, he succeeded Cavour in the premiership. As premier he admitted the Garibaldian volunteers to the regular army, revoked the decree of exile against Mazzini, and attempted reconciliation with the Vatican; but his efforts were rendered ineffectual by the *non possumus* of the pope. He found himself obliged in 1862 to resign office, but returned to power in 1866. On this occasion he refused Napoleon III.'s offer to cede Venetia to Italy, on condition that Italy should abandon the Prussian alliance, and also refused the Prussian decoration of the Black Eagle because Lamarmora, author of the alliance, was not to receive it. After the French troops left Rome in 1866 he attempted to conciliate the Vatican with a convention, in virtue of which Italy would have restored to the Church the property of the suppressed religious orders in return for the gradual payment of £24,000,000. He conceded the *exequatur* to 45 bishops inimical to the Italian régime. The Vatican accepted his proposal, but the Italian Chamber proved refractory, and, though dissolved by Ricasoli, returned more hostile than before. Without waiting for a vote, Ricasoli resigned office. He died at Broglio on Oct. 23, 1880. His private life and public career were marked by a rigid austerity which earned him the name of the "iron baron."

See Tabarrini and Gotti, *Lettere e documenti del barone Bettino Ricasoli,* 10 vols. (Florence, 1886–94); Passerini, *Genealogia e storia della famiglia Ricasoli* (1861); Gotti, *Vita del barone Bettino Ricasoli* (1894).

RICCATI, JACOPO FRANCESCO, COUNT (1676–1754), Italian mathematician, was born at Venice on May 28, 1676, and died at Treviso on April 15, 1754. He studied at the University of Padua, where he graduated in 1696. His authority on all questions of practical science was referred to by the senate of Venice. He corresponded with many of the European savants of his day, and contributed largely to the *Acta Eruditorum* of Leipzig. He was offered the presidency of the academy of science of St. Petersburg (Leningrad), but he declined, preferring the leisure and independence of life in Italy. Riccati's name is best known in connection with his problem called Riccati's equation, published in the *Acta Eruditorum,* Sept. 1724. A very complete account of this equation and its various transformations was given by J. W. L. Glaisher in the *Phil. Trans.* (1881).

His works were collected and published by his sons (1758, 4 vols.).

RICCI, MATTEO (1552–1610), Italian missionary to China, was born of a noble family at Macerata in the March of Ancona on Oct. 7, 1552. After some education at a Jesuit college in his native town he went to study law at Rome, where in 1571, in opposition to his father's wishes, he joined the Society of Jesus.

In 1577 Ricci and other students offered themselves for the East Indian missions. Ricci, without visiting his family to take leave, proceeded to Portugal. His comrades were Rudolfo Acquaviva, Nicolas Spinola, Francesco Pasio and Michele Ruggieri, all afterwards, like Ricci himself, famous in the Jesuit annals. They arrived at Goa in Sept. 1578. After four years spent in India, Ricci was summoned to the task of opening China to evangelization.

Several fruitless attempts had been made by Xavier, and since his death, to introduce the Church into China, but it was not till the arrival at Macao of Alessandro Valignani on a visitation in 1582 that work in China was really taken up. For this object he had obtained the services first of M. Ruggieri and then of Ricci. After various disappointments they found access to Chow-king-fu on the Si-Kiang or West River of Canton, where the viceroy of the two provinces of Kwangtung and Kwangsi then had his residence, and by his favour were able to establish themselves there for some years. Their proceedings were very

cautious and tentative; they excited the curiosity and interest of even the more intelligent Chinese by their clocks, their globes and maps, their books of European engravings, and by Ricci's knowledge of mathematics, dialling and the projection of maps. Eventually troubles at Chow-king compelled them to seek a new home; and in 1589, with the viceroy's sanction, they migrated to Chang-chow in the northern part of Kwangtung, not far from the well-known Meiling Pass.

During his stay here Ricci was convinced that a mistake had been made in adopting a dress resembling that of the bonzes, a class who were the objects either of superstition or of contempt. With the sanction of the visitor it was ordered that in future the missionaries should adopt the costumes of Chinese literates, and, in fact, they before long adopted Chinese manners altogether.

Chang-chow, as a station, did not prove a happy selection, but it was not till 1595 that an opportunity occurred of travelling northward. For some time Ricci's residence was at Nan-changfu, the capital of Kiang-si; but in 1598 he was able to proceed under favourable conditions to Nanking, and thence for the first time to Peking, which had all along been the goal of his missionary ambition. But circumstances were not then propitious, and the party had to return to Nanking. The fame of the presents which they carried had, however, reached the court, and the Jesuits were summoned north again, and on Jan. 24, 1601, they entered the capital. Wan-li, the emperor of the Ming dynasty, in those days lived in seclusion, and saw no one but his women and the eunuchs. But the missionaries were summoned to the palace; their presents were immensely admired, and the emperor had the curiosity to send for portraits of the fathers themselves.

They obtained a settlement, with an allowance for subsistence, in Peking, and from this time to the end of his life Ricci's estimation among the Chinese was constantly increasing, as was at the same time the amount of his labours. Visitors thronged the mission house incessantly; and inquiries came to him from all parts of the empire respecting the doctrines which he taught, or the numerous Chinese publications which he issued. As head of the mission, which now had four stations in China, he also devoted much time to answering the letters of the priests under him, a matter on which he spared no pains or detail. In May 1610 he broke down, and after an illness of eight days died on the 11th of that month.

Ricci's work was the foundation of the subsequent success attained by the Roman Catholic Church in China. When the missionaries of other Roman Catholic orders made their way into China, twenty years later, they found great fault with the manner in which certain Chinese practices had been dealt with by the Jesuits. The controversy burned for considerably more than a century with great fierceness. (For a list of the controversial works *see* Cordier, *Bibliographie de la Chine*.)

Probably no European name of past centuries is so well known in China as that of *Li-ma-teu*, the form in which the name of Ricci (*Ri*-cci *Mat-teo*) was adapted to Chinese usage, and by which he appears in Chinese records. The works which he composed in Chinese are numerous; a list of them (apparently by no means complete, however) will be found in Kircher's *China Illustrata*, and also in Abel Rémusat's *Nouveaux Mélanges Asiatiques* (ii. 213–15).

The chief facts of Ricci's career are derived from the account brought home by P. Nicolas Trigault, *De Expeditione Christiana apud Sinas Suscepta ab Soc. Jesu*, extracted from Ricci's commentaries and published at Augsburg and at Lyons. (H. Y.; X.)

RICCOBONI, MARIE JEANNE (1714–1792), *née* Laboras de Mézières, was born at Paris in 1714. She married in 1735 Antoine François Riccoboni, a comedian and dramatist, from whom she soon separated. She herself was an actress, but did not succeed on the stage. Her works are examples of the novel of "Sensibility," and the nearest English parallel to her work is to be found in the work of Henry Mackenzie (*q.v.*). *Lettres de mistress Fanny Butler* (1757); the remarkable *Histoire du marquis de Cressy* (1758); *Milady Juliette Catesby* (1759–1760), like her other books, in letter form; *Ernestine* (1798), which La Harpe thought her masterpiece; and three series of *Lettres* in the names of *Adelaide de Dammartin* (*comtesse de Sancerre*) (2 vols., 1766), *Elizabeth Sophie de Vallière* (2 vols., 1772), and *Milord Rivers* (2 vols., 1776) were among her works. Deprived by the Revolution of her small pension from the crown, she died on Dec. 6, 1792, in great indigence.

See Julia Kavanagh, *French Women of Letters* (2 vols., 1862), where an account of her novels is given; J. Fleury, *Marivaux et le marivaudage* (1881); J. M. Quérard, *La France littéraire* (vol. vii., 1835); and notices by La Harpe, Grimm and Diderot prefixed to her *Oeuvres* (9 vols., 1826); E. A. Crosby, *Une Romancière oubliée, Mme. Riccoboni* (1926).

RICE, EDMUND IGNATIUS (1762–1844), Irish philanthropist, founder of the "Irish Christian Brothers," was born at Westcourt, near Callan, Kilkenny, on June 1, 1762. He abandoned his provision merchant business to devote himself to education and in 1808 he and nine others, meeting at Waterford, took religious vows from their bishop, assumed a "habit" and adopted an additional Christian name, by which, as by the collective title "Christian Brothers," they were thenceforth known. Schools were established in Cork (1811), Dublin (1812), and Thurles and Limerick (1817). In 1820 Pope Pius VII. issued a brief sanctioning the order of "Religious Brothers of the Christian Schools (Ireland)," the members of which were to be bound by vows of obedience, chastity, poverty and perseverance, and to give themselves to the free instruction, religious and literary, of male children, especially the poor. Rice held the office of superior general of the order from 1822 to 1838. He died on Aug. 29, 1844.

RICE, JAMES (1843–1882), English novelist, was born at Northampton on Sept. 26, 1843. Educated at Queens' college, Cambridge, where he graduated in law in 1867, he was called to the bar at Lincoln's Inn in 1871. In the meantime (1868) he had bought *Once a Week*, which proved a losing venture for him, but which brought him into touch with Walter Besant, a contributor. (*See* Besant's preface to the Library Edition [1887] of *Ready-money Mortiboy*.) There ensued a close friendship and a literary partnership between the two men which lasted ten years until Rice's death. The first of their joint works was *Ready-money Mortiboy* (1872), dramatized by them later and unsuccessfully produced at the Court theatre in 1874. In rapid succession followed *My Little Girl* (1873); *With Harp and Crown* (1874); *This Son of Vulcan* (1876); *The Golden Butterfly* (1876); *The Monks of Thelema* (1878) and others. (*See* BESANT, SIR WALTER.) James Rice died at Redhill on April 26, 1882.

RICE, a well-known cereal, botanical name *Oryza sativa*. According to Roxburgh, the Indian botanist, the cultivated rice with all its numerous varieties has originated from a wild plant, called in India Newaree or Nivara, which is indigenous on the borders of lakes in the Circars and elswhere in India, and is also native in tropical Australia. The rice plant is an annual grass with long linear glabrous leaves, each provided with a long sharply pointed ligule. The spikelets are borne on a compound or branched spike, erect at first but afterwards bent downwards. Each spikelet contains a solitary flower with two outer small barren glumes, above which is a large, tough, compressed, often awned, flowering glume, which partly encloses the somewhat similar pale. Within these are six stamens, a hairy ovary surmounted by two feathery styles which ripens into the fruit (grain), and which is invested by the husk formed by the persistent glume and pale. The cultivated varieties are extremely numerous, some kinds being adapted for marshy land, others for growth on the hillsides. Carleton gives the following provisional arrangement of wild and cultivated rices:—(1) *Oryza granulata* (wild rice), (2) *Oryza officinalis* (wild rice), (3) *Oryza sativa* (cultivated rice), (*a*) *utilissima*, (i.) *communes* (large kernelled rice), (ii.) *minuta* (small kernelled rice), (*b*) *glutinosa* (glutinous rice).

See G. Watt, *Dictionary of the Economic Products of India* (1908); C. B. Carleton, *The Small Grains* (1916); W. W. Robbins, *The Botany of Crop Plants* (1924). (V. H. B.)

World Trade in Rice.—The rice plant is grown in many lands, but most successfully in hot countries with plenty of water obtainable. By far the greater part of the enormous crop is grown in the plains, with the roots standing in water; there is, however, so-called hill rice, which is sown broadcast on ordinary arable land

and never irrigated.

World Crops
(Tons of clean rice)

	1926	Average 1909 to 1913
British India	34,000,000	27,500,000
Japan	6,200,000	5,600,000
Korea	2,700,000	1,100,000
Formosa	700,000	500,000
Indo-China	3,700,000	3,300,000
Dutch East Indies	3,200,000	2,500,000
Siam	2,800,000	1,700,000
Philippine Islands	1,200,000	500,000
Other Countries	2,900,000	2,200,000
*World Total	57,400,000	44,900,000

*China not included, crop estimated at about 30,000,000 tons.

Exports in the year 1926 were 6,300,000 tons, of which 2,360,000 were furnished by British India, 1,200,000 by Indo-China and 1,100,000 by Korea and Formosa. China imported 1,050,000, Dutch East Indies 600,000, Japan 340,000 and Ceylon 470,000 tons, the rest being shared round amongst many countries. The United Kingdom imported 72,000 tons of cleaned and 46,000 tons of broken rice. British India supplied 43,000, Spain 25,000 and the United States 7,000 tons, the remainder coming in smaller lots from many countries.

RICE (ORYZA SATIVA), SHOWING GENERAL HABIT OF GROWTH
A. Single flower with part removed to show branched stigma and 6 stamens
B. Single stamen (Both A and B are enlarged)

Preparation of Rice.—All parts of the rice plant are useful; even the husk is valuable as fuel for the mills. Rice is good food, but it cannot be said to be very popular with Western people and there is no record of any civilized community discarding other cereals and making rice its main food. A diet limited to polished rice renders Eastern people very liable to a disease known as beri-beri. But this disease can be avoided by mixing some pulse with the ration and, strange to say, parboiled rice is innoxious. The rice is parboiled before the skin is removed, then it is dried in the sun. It appears that the process fixes the vitamin of the cuticle in the rice berry.

Rice milling is almost a lost industry in Great Britain, only three mills now being at work. Continental and Eastern millers have captured the trade, by reason of their lower working costs. Special machines are used for husking, for milling or whitening (removing the cuticle by attrition), grading, polishing and facing. Such terms as husking, whitening and grading are almost self-explanatory, but it may be useful to mention that grading is necessary to remove the rough broken rice, which is then further graded as to size and finally put on the market as "broken rice," of which there are several classes. Facing and glazing give the rice an attractive appearance and have no other value, except that the facing may protect the surface and save the rice from deterioration. Oiled rice is obtained by running the white rice through a special mixing machine with the bran containing the oily germ. The rice bran, which contains small broken grains, is used as cattle food and is in much request for the manufacture of special feeding cakes. The broken rice is used for brewing and distilling, for the manufacture of starch and to a small extent for the manufacture of rice flour. (G. J. S. B.)

RICE BIRD: *see* BOBOLINK.

RICE PAPER. The substance which has received this name in Europe, through the mistaken notion that it is made from rice, consists of the pith of a small tree, *Aralia papyrifera*, which grows in the swampy forests of Formosa. The cylindrical core of pith is rolled on a hard flat surface against a knife, by which it is cut into thin sheets of a fine ivory-like texture. Dyed in various colours, rice paper is extensively used for the preparation of artificial flowers, while the white sheets are employed by native artists for water-colour drawings.

RICH, BARNABE (*c.* 1540–1617), English author and soldier, was a distant relative of Lord Chancellor Rich. He fought in the Low Countries, rising to the rank of captain, and afterwards served in Ireland. He shared in the colonization of Ulster, and spent the latter part of his life near Dublin. In the intervals of his campaigns he produced many pamphlets on political questions and romances. He died on Nov. 10, 1617. His best-known work is *Riche his Farewell to Militarie Profession conteining verie Pleasaunt discourses fit for a peaceable tyme* (1581). Of the eight stories contained in it, five, he says, "are forged only for delight, neither credible to be believed, nor hurtful to be perused." The rest are translations from the Italian. Among his euphuistic tales are *The Strange and Wonderful Adventures of Don Simonides* (1581), with its sequel (1584); and *The Adventures of Brusanus, prince of Hungaria* (1592). His authenticated works number 24, and includes works on Ireland.

See "Introduction" to the Shakespeare Society's reprint of *Riche his Farewell* (1846); P. Cunningham's "Introduction" to Rich's *Honesty of this Age* (reprinted for the Percy Society, 1844); and the life by S. Lee in the *Dict. Nat. Biog.*

RICH, JOHN (1692–1761), English actor, the "father of English pantomime," was the son of Christopher Rich (d. 1714), the manager of Drury Lane, with whose quarrels and tyrannies Colley Cibber's *Apology* is much occupied. John Rich opened the new theatre in Lincoln's Inn Fields left unfinished by his father, and here, in 1716, under the stage name of Lun, he first appeared as Harlequin in a piece which developed into an annual pantomime. Rich was less happy in his management of Covent Garden, which he opened in 1733, until Garrick's arrival (1746), when a most prosperous season ensued, followed by a bad one when Garrick went to Drury Lane. During Rich's management occurred the rival performances of *Romeo and Juliet*—Barry and Mrs. Cibber at Covent Garden, and Garrick and Miss Bellamy at Drury Lane—and the competition between the two rival actors in *King Lear*. Rich died on Nov. 25, 1761. Garrick has described his acting in pantomime:

> When Lun appeared, with matchless art and whim,
> He gave the power of speech to every limb:
> Tho' masked and mute, conveyed his quick intent,
> And told in frolic gesture what he meant.

RICH, PENELOPE, LADY (*c.* 1562–1607), the Stella of Sir Philip Sidney's *Astrophel and Stella,* was the daughter of Walter Devereux, 1st Earl of Essex. She was a child of fourteen when Sir Philip Sidney accompanied the queen on a visit to Lady Essex in 1576, on her way from Kenilworth, and must have been frequently thrown into the society of Sidney, in consequence of the many ties between the two families. Essex died at Dublin in Sept. 1576. He had sent a message to Philip Sidney from his death-bed expressing his desire that he should marry his daughter, and later his secretary wrote to the young man's father, Sir Henry Sidney, in words which seem to point to the existence of a definite understanding. But her relative and guardian, Henry Hastings, earl of Huntingdon, secured Burghley's assent in March 1581 for her marriage with Robert Rich, 3rd Baron Rich. Penelope is said to have protested in vain against the alliance with Rich, who is represented as a rough and overbearing husband. The evidence against him is, however, chiefly derived from sources as interested as Sir Philip Sidney's violent denunciation in the twenty-fourth sonnet of *Astrophel and Stella,* "Rich fooles there be whose base and filthy hart." Sidney's serious love for Penelope appears to date from her marriage with Rich. The eighth song of *Astrophel and Stella* narrates her refusal to accept him as a lover.

Lady Rich was the mother of six children by her husband when she contracted in 1595 an open liaison with Charles Blount, 8th Lord Mountjoy, to whom she had long been attached. Rich obtained a legal separation in 1601, and Mountjoy acknowledged her five children born after 1595. Mountjoy was created earl of Devonshire on the accession of James I., and Lady Rich was in high favour at court. In 1605 they legitimized their connection by a marriage celebrated by William Laud, the earl's chaplain. This proceeding, carried out in defiance of canon law, was followed by their banishment from court. Devonshire died on April 3, 1606, and his wife within a year of that date.

See the editions of *Astrophel and Stella* by Dr. A. B. Grosart, E. Arber and A. W. Pollard; also the various lives of Sir Philip Sidney, and Mrs. Aubrey Richardson's *Famous Ladies of the English Court* (London, 1899). *See* also references under SIDNEY.

RICH, RICHARD, 1ST BARON RICH (*c.* 1490–1567), English lord chancellor, was born about 1490, in St. Laurence Jewry, London. After holding various preferments, he was knighted in 1533, and became solicitor-general, acting under Thomas Cromwell in the demolition of the monasteries. He played a malicious part in the trials of Sir Thomas More and Bishop Fisher. Rich became first chancellor (1536) of the court of Augmentations, and benefited vastly by its disposal of the monastic revenues. In the same year, he was speaker in the House of Commons. He was a Roman Catholic by conviction, and was a willing agent in the Catholic reaction after the fall of Thomas Cromwell.

Rich was one of the executors of Henry VIII.'s will. In 1548 he became Baron Rich of Leez. As chancellor in succession to Wriothesley he supported Protector Somerset until Oct. 1549, when he deserted to Warwick, and presided over the trial of his former chief. At the close of 1551 he retired from the chancellorship on the ground of ill-health at the time of the final breach between Warwick (now Northumberland) and Somerset.

Lord Rich was an active persecutor during the restoration of the old religion in Essex under Mary's reign. He died at Rochford, Essex, on June 12, 1567, and was buried in Felsted church.

The chief authorities are the official records of the period covered by his official life, calendared in the Rolls Series. *See* also A. F. Pollard, *England under Protector Somerset* (1900); P. Morant, *History of Essex* (2 vols., 1768); R. W. Dixon, *History of the Church of England* (6 vols., 1878–1902); and lives in J. Sargeaunt's *History of Felsted School* (1889); Lord Campbell's *Lives of the Lord Chancellors* (1845–69); and C. H. and T. Cooper's *Athenae Cantabrigienses* (2 vols., 1858–61).

RICH, RICHARD (*fl.* 1610), English soldier and adventurer, the author of *Newes from Virginia,* sailed from England on June 2, 1609, for Virginia, with Captain Christopher Newport and the three commissioners entrusted with the foundation of the new colony. In his verse pamphlet he relates the adventures undergone by the expedition, and describes the resources of the new country, with the advantages offered to colonists. The only known copy of this tract, dated 1610, is in the Huth Library. A reprint edited by J. O. Halliwell-Phillips appeared in 1865.

RICHARD, ST., of Wyche (*c.* 1197–1253), English saint and bishop, was named after his birthplace, Droitwich in Worcestershire. Educated at Oxford, he soon began to teach in the university, of which he became chancellor, probably after he had studied in Paris and in Bologna. About 1235 he became chancellor of the diocese of Canterbury under Archbishop Edmund Rich, and he was with the archbishop during his exile in France. Having returned to England some time after Edmund's death in 1240 he became vicar of Deal and chancellor of Canterbury for the second time. In 1244 he was elected bishop of Chichester, being consecrated at Lyons by Pope Innocent IV. in March 1245, although Henry III. refused to give him the temporalities of the see, the king favouring the candidature of Robert Passelewe (d. 1252). In 1246, however, Richard obtained the temporalities. He died at Dover in April 1253. It was generally believed that miracles were wrought at his tomb in Chichester cathedral, which was long a popular place of pilgrimage, and in 1262 he was canonized at Viterbo by Pope Urban IV.

His life by his confessor, Ralph Bocking, is published in the *Acta Sanctorum* of the Bollandists, with a later life by John Capgrave.

RICHARD (d. 1184), archbishop of Canterbury, was a Norman, who became a monk at Canterbury, where he acted as chaplain to Archbishop Theobald and was a colleague of Thomas Becket. In 1173, more than two years after the murder of Becket, it was decided to fill the vacant archbishopric of Canterbury; there were two candidates, Richard, at that time prior of St. Martin's, Dover, and Odo, prior of Canterbury, and in June Richard was chosen, although Odo was the nominee of the monks. Objections were raised against this election both in England and in Rome, but in April 1174 the new archbishop was consecrated at Anagui by Pope Alexander III., and he returned to England towards the close of the year. The ten years during which Richard was archbishop were disturbed by disputes over the respective rights of the sees of Canterbury and York. Richard died at Rochester on Feb. 16, 1184, and was buried in his cathedral.

See the article by W. Hunt in the *Dict. Nat. Biog.* vol. xlviii. (1896); and W. F. Hook, *Lives of the Archbishops of Canterbury.*

RICHARD I. (1157–1199), king of England, nicknamed "Coeur de Lion" and "Yea and Nay," was the third son of Henry II. by Eleanor of Aquitaine. Born in Sept. 1157, he received at the age of 11 the duchy of Aquitaine, and was formally installed in 1172. In his new position he was allowed, probably from regard to Aquitanian susceptibilities, to govern with an independence which was studiously denied to his brothers in their shares of the Angevin inheritance. Yet in 1173 Richard joined with the young Henry and Geoffrey of Brittany in their rebellion; Aquitaine was twice invaded by the old king before the unruly youth would make submission. Richard was soon pardoned and reinstated in his duchy, where he distinguished himself by crushing a formidable revolt (1175) and exacting homage from the count of Toulouse. In a short time he was so powerful that his elder brother Henry became alarmed and demanded, as heir-apparent, that Richard should do him homage for Aquitaine. Richard having scornfully rejected the demand, a fratricidal war ensued; the young Henry invaded Aquitaine and attracted to his standard many of Richard's vassals, who were exasperated by the iron rule of the duke. Henry II. marched to Richard's aid; but the war ended abruptly with the death of the elder prince (1183).

Richard, being now the heir to England and Normandy, was invited to renounce Aquitaine in favour of Prince John. The proposal led to a new civil war; and, although a temporary compromise was arranged, Richard soon sought the help of Philip Augustus, to whom he did homage for all the continental possessions in the actual presence of his father (Conference of Bonmoulins, Nov. 18, 1188). In the struggle which ensued the old king was overpowered, chased ignominiously from Le Mans to Angers, and forced to buy peace by conceding all that was demanded of him; in particular the immediate recognition of Richard as his successor.

But the death of Henry II. (1189) at once dissolved the friendship between Richard and Philip. Not only did Richard continue the continental policy of his father, but he also refused to fulfil his contract with Philip's sister, Alais, to whom he had been betrothed at the age of three. An open breach was only delayed by the desire of both kings to fulfil the crusading vows which they had recently taken. Richard, in particular, sacrificed all other interests to this scheme, and raised the necessary funds by the most reckless methods. He put up for auction the highest offices and honours; even remitting to William the Lion of Scotland, for a sum of 15,000 marks, the humiliating obligations which Henry II. had imposed at the Treaty of Falaise. By such expedients he raised and equipped a force which may be estimated at 4,000 men-at-arms and as many foot-soldiers, with a fleet of 100 transports (1191).

Richard did not return to his dominions until 1194. But his stay in Palestine was limited to 16 months. On the outward journey he wintered in Sicily, where he employed himself in quarrelling with Philip and in exacting satisfaction from the usurper Tancred for the dower of his widowed sister, Queen Joanna, and for his own share in the inheritance of William the Good. Leaving Messina in March 1191, he interrupted his voyage to conquer Cyprus, and only joined the Christian besiegers of Acre in June. The reduction of that stronghold was largely due to his energy and skill. But his arrogance gave much offence. After the fall of Acre he inflicted a gross insult upon Leopold of Austria; and his relations with Philip were so strained that the latter seized the first pretext for returning to France, and entered into negotiations with Prince John (*see* JOHN, king of England) for the partition of Richard's realm.

Richard also threw himself into the disputes respecting the crown of Jerusalem, and supported Guy of Lusignan against Conrad of Montferrat with so much heat that he incurred grave, though unfounded, suspicions of complicity when Conrad was assassinated by emissaries of the Old Man of the Mountain. None the less Richard, whom even the French crusaders accepted as their leader, upheld the failing cause of the Frankish Christians with valour and tenacity. He won a brilliant victory over the forces of Saladin at Arsuf (1191), and twice led the Christian host within a few miles of Jerusalem. But the dissensions of the native Franks and the crusaders made it hopeless to continue the struggle; and Richard was alarmed by the news which reached him of John's intrigues in England and Normandy. Hastily patching up a truce with Saladin, under which the Christians kept the coast-towns and received free access to the Holy Sepulchre, Richard started on his return (Oct. 9, 1192).

His voyage was delayed by storms, and he appears to have been perplexed as to the safest route. The natural route overland through Marseilles and Toulouse was held by his enemies; that through the empire from the head of the Adriatic was little safer, since Leopold of Austria was on the watch for him. Having adopted the second of these alternatives, he was captured at Vienna in a mean disguise (Dec. 20, 1192) and strictly confined in the duke's castle of Dürenstein on the Danube. His mishap was soon known to England, but the regents were for some weeks uncertain of his whereabouts. This is the foundation for the tale of his discovery by the faithful minstrel Blondel, which first occurs in a French romantic chronicle of the next century. Early in 1193 Leopold surrendered his prize, under compulsion, to the emperor Henry VI., who was aggrieved both by the support which the Plantagenets had given to the family of Henry the Lion and also by Richard's recognition of Tancred in Sicily. Although the detention of a crusader was contrary to public law, Richard was compelled to purchase his release by the payment of a heavy ransom and by doing homage to the emperor for England. The ransom demanded was 150,000 marks; though it was never discharged in full, the resources of England were taxed to the utmost for the first instalments; and to this occasion we may trace the beginning of secular taxation levied on movable property.

Richard reappeared in England in March 1194; but his stay lasted only a few weeks, and the remainder of his reign was entirely devoted to his continental interests. He left England to be governed by Hubert Walter (*q.v.*), and his personal authority was seldom asserted except by demands for new subsidies. The rule of the Plantagenets was still popular in Normandy and Aquitaine; but these provinces were unable or unwilling to pay for their own defence. Though Richard proved himself consistently the superior of Philip in the field, the difficulty of raising and paying forces to resist the French increased year by year. Richard could only stand on the defensive; the keynote of his later policy is given by the building of the famous Château Gaillard at Les Andelys (1196) to protect the lower courses of the Seine against invasion from the side of France. He did not live to see the futility of such bulwarks. In 1199 a claim to treasure-trove embroiled him with the viscount of Limoges. He harried the Limousin and laid siege to the castle of Châlus; while directing an assault he was wounded in the shoulder by a crossbow bolt, and, the wound mortifying from unskilful treatment or his own want of care, he died on April 6, 1199. He was buried by his own desire at his father's feet in the church of Fontevrault. Here his effigy may still be seen[1]. Though contemporary, it does not altogether agree with the portraits on his Great Seal, which give the impression of greater strength and even of cruelty. The Fontevrault bust is no doubt idealized.

The most accomplished and versatile representative of his gifted family, Richard was, in his lifetime and long afterwards, a favourite hero with troubadours and romancers. This was natural, as he belonged to their brotherhood and himself wrote lyrics of no mean quality. But his history shows that he by no means embodied the current ideal of chivalrous excellence. His memory is stained by one act of needless cruelty, the massacre of over two thousand Saracen prisoners at Acre; and his fury, when thwarted or humbled, was ungovernable. A brave soldier, an experienced and astute general, he was never happier than when engaged in war. As a ruler he was equally profuse and rapacious. Not one useful measure can be placed to his credit; and it was by a fortunate accident that he found, in Hubert Walter, an administrator who had the skill to mitigate the consequences of a reckless fiscal policy. Richard's wife was Berengaria, daughter of Sancho VI., king of Navarre, whom he married in Cyprus in May 1191. She was with the king at Acre later in the same year, and during his imprisonment passed her time in Sicily, in Rome and in France. Husband and wife met again in 1195, and the queen long survived the king, residing chiefly at Le Mans. She died soon after 1230. Berengaria founded a Cistercian monastery at Espau.

BIBLIOGRAPHY.—The more important of the general chronicles are: the *Gesta Henrici Secundi,* ascribed to Benedict of Peterborough (Rolls Series, 2 vols., 1867); the *Chronica* of Roger of Hoveden (Rolls Series, 4 vols., 1868–71); the *Chronica* of Gervase of Canterbury (Rolls Series, 1879); the *Imagines Historiarum* of Ralph of Diceto (Rolls Series, 2 vols., 1876); the *Historia Rerum Anglicarum* of William of Newburgh (in *Chronicles of the Reigns of Stephen,* etc., Rolls Series, 2 vols., 1884–85); the *De rebus gestis Ricardi Primi* of Richard of Devizes (in *Chronicles of the Reigns of Stephen,* etc., vol. iii., Rolls Series, 1886); the *Chronicon Anglicanum* of Ralph of Coggeshall (Rolls Series, 1875); the *Flores Historiarum* of Roger of Wendover (Rolls Series, 3 vols., 1886–89); the *Gesta Philippi Augusti* of Rigord (*Société de l'histoire de France,* Paris, 1882) and of Guillaume le Breton (*op. cit.*). A detailed narrative of Richard's crusade is given in *L'Estoire de la guerre sainte,* a rhyming French chronicle by the minstrel Ambroise (ed. Gaston Paris, Paris, 1897), and in the Latin prose version known as the *Itinerarium O. Peregrinorum et gesta Regis Ricardi;* this last, with some valuable historical letters, is printed in W. Stubbs's *Chronicles and Memorials of the Reign of Richard I.* (Rolls Series, 2 vols., 1864–65). Of modern works the following are useful: W. Stubbs's preface to vols. iii. and iv. of Hoveden; the same author's *Constitutional History of England,* vol. i. (Oxford, 1897); Miss K. Norgate's *England under the Angevin Kings,* vol. ii. (1887) and *Richard the Lion Heart* (1924); Sir J. H. Ramsay's *Angevin Empire* (1903); R. Röhricht's *Geschichte des Königreichs Jerusalem* (1898); W. B. Stevenson's *Crusaders in the East* (Cambridge, 1907); A. Cartellieri's *Philipp II. August* (Leipzig, 1899, etc.).

RICHARD II. (1367–1400), king of England, younger son of Edward the Black Prince by Joan "the Fair Maid of Kent," was born at Bordeaux on Jan. 6, 1367. He was brought to Eng-

[1]The remains of Richard, together with those of Henry II. and his queen Eleanor, were removed in the 17th century from their tombs to another part of the church. They were rediscovered in 1910 during the restoration of the abbey undertaken by the French Government.

land in 1371, and after his father's death was, on the petition of the Commons in parliament, created prince of Wales on Nov. 20, 1376. When Edward III. died, on June 21, 1377, Richard became king. Popular opinion had credited John of Gaunt with designs on the throne. This was not justified; nevertheless, the rivalry of the boy-king's uncles added another to the troubles due to the war, the Black Death and the prospect of a long minority. At first the government was conducted by a council appointed by parliament. The council was honest, but the difficulties of the situation were too great. The ill-considered poll-tax of 1381 was the occasion, though not the real cause, of the Peasants' Revolt in that year. The ministers were quite unequal to the crisis, and when Wat Tyler and his followers got possession of London, Richard showed a precocious tact and confidence in handling it. He met and temporized with the rebels on June 13 at Mile End, and again next day at Smithfield; and with courageous presence of mind, he saved the situation when Tyler was killed, by calling on them to take him for their leader.

From this time Richard began to assert himself. His chief ministers, appointed by parliament in 1382, were the earl of Arundel and Michael de la Pole. Arundel Richard disliked, and dismissed next year, when he began his personal government. Pole, whom he retained as chancellor and made earl of Suffolk, was a well-chosen adviser. But others, and especially his youthful favourite Robert de Vere, promoted to be marquess of Dublin and duke of Ireland, were less worthy. Further, Richard made his own position difficult by lavish extravagance and by outbursts of temper. He chafed under the restraint of his relatives, and therefore encouraged John of Gaunt in his Spanish enterprise.

Thereupon, Thomas of Gloucester, supported by Arundel, attacked his nephew's ministers in the parliament of 1386, and by open hints at deposition forced Richard to submit to a council of control. When Richard, with the aid of his friends and by the advice of subservient judges, planned a reversal of the parliament, Gloucester, at the head of the so-called lords appellant, anticipated him. Richard had been premature and ill-advised. Gloucester had the advantage of posing as the head of the constitutional party. The king's friends were driven into exile or executed, and he himself forced to submit to the loss of all real power (May 1388). Richard changed his methods, and when the lords appellant had lost credit, asserted himself constitutionally by dismissing Gloucester's supporters from office, and appointing in their place well-approved men like William of Wykeham. In the next parliament of 1390 the king showed himself ready to meet and conciliate his subjects. The simultaneous return of John of Gaunt from Spain put a check on Gloucester's ambition. For seven years Richard ruled constitutionally and on the whole well.

In Jan. 1383 Richard had married Anne of Bohemia (1366–1394), daughter of the emperor Charles IV. Her death on June 7, 1394 was a great shock to Richard, and incidentally had important consequences. Richard sought distraction by an expedition to Ireland, the first visit of an English king for more than two centuries. In his policy there he showed a wise statesmanship. At the same time he was negotiating for a permanent peace with France, which was finally arranged in Oct. 1396 to include his own marriage with Isabella, daughter of Charles VI., a child of seven. Gloucester criticized the peace openly, and there was some show of opposition in the parliament of Feb. 1397.

Period of Absolute Monarchy.—But there was nothing to foreshadow the sudden stroke by which in July Richard arrested Gloucester and his chief supporters, the earls of Arundel and Warwick. The others of the five lords appellant, Henry of Bolingbroke, afterwards King Henry IV., and the earl of Nottingham, now supported the king. Richard's action was apparently in deliberate revenge for the events of 1387–88. Gloucester, after a forced confession, died in prison at Calais, smothered by his nephew's orders. Arundel, in a packed parliament, was condemned and executed; his brother Thomas archbishop of Canterbury was exiled. The king's friends, including Nottingham and Bolingbroke, made dukes of Norfolk and Hereford, were all promoted in title and estate. Richard himself was rewarded for ten years' patience by the possession of absolute power. He might perhaps have established it if he could have exercised it with moderation. But he declared that the laws of England were in his mouth, and supported his court in wanton luxury by arbitrary methods of taxation. By the exile of Norfolk and Hereford in Sept. 1398 he seemed to have removed the last persons he need fear. He was so confident that in May 1399 he paid a second visit to Ireland, taking with him all his most trusted adherents.

Rebellion and Deposition.—Thus when Henry landed at Ravenspur in July he found only half-hearted opposition, and when Richard himself returned it was too late. Ultimately Richard surrendered to Henry at Flint on Aug. 19, promising to abdicate if his life was spared. He was taken to London riding behind his rival with indignity. On Sept. 30, he signed in the Tower a deed of abdication, wherein he owned himself insufficient and useless, reading it first aloud with a cheerful mien and ending with a request that his cousin would be good lord to him. The parliament ordered that Richard should be kept close prisoner, and he was sent secretly to Pontefract. There in Feb. 1400 he died: no doubt of the rigour of his winter imprisonment, rather than by actual murder as alleged in the story adopted by Shakespeare. The mystery of Richard's death led to rumours that he had escaped, and an impostor pretending to be Richard lived during many years under the protection of the Scottish government. But no doubt it was the real Richard who was buried without state in 1400 at King's Langley, and honourably reinterred by Henry V. at Westminster in 1413.

Richard II. is a character of strange contradictions. It is difficult to reconcile the precocious boy of 1381 with the wayward and passionate youth of the next few years. Even if it be supposed that he dissembled his real opinions during the period of his constitutional rule, it is impossible to believe that the apparent indifference which he showed in his fall was the mere acting of a part. His violent outbursts of passion perhaps give the best clue to a mercurial and impulsive nature, easily elated and depressed. He had real ability, and in his Irish policy, and in the preference which he gave to it over continental adventure, showed a statesmanship in advance of his time. But this, in spite of his lofty theory of kingship, makes it all the more difficult to explain his extravagant bearing in his prosperity. In appearance Richard was tall and handsome, if effeminate. He had some literary tastes, which were shown in fitful patronage of Chaucer, Gower and Froissart. Richard's second queen, Isabella (1389–1409), was born in Paris on Nov. 9, 1389, and was married to the English king at Calais in October, or November, 1396, but on account of the bride's youth the marriage was never consummated.

When Richard lost his crown in 1399 Isabella was captured by Henry IV.'s partisans and sent to Sonning, near Reading, while her father, Charles VI., asked in vain for the restoration of his daughter and of her dowry. In 1401 she was allowed to return to France; in 1406 she became the wife of the poet, Charles, duke of Orleans, and she died on Sept. 13, 1409.

Bibliography.—The best contemporary authorities are the *Chronicon Angliae* down to 1388, Walsingham's *Historia Anglicana*, the *Annales Ricardi II.*, Knighton's *Chronicle* (all these in the Rolls Series), the *Vita Ricardi II.* by a Monk of Evesham (ed. T. Hearne), and the *Chronique de la traison et mort* (English Hist. Soc.). Froissart wrote from some personal knowledge. A metrical account of Richard's fall, probably written by a French knight called Creton, is printed in *Archaeologia*, xx. The chief collections of documents are the *Rolls of Parliament* and the *Calendar of Patent Rolls*. H. A. Wallon's *Richard II.* (Paris, 1864) is the fullest life, though now somewhat out of date. For other modern accounts *see* W. Stubbs, *Constitutional History*, and C. W. C. Oman, *The Political History of England*, vol. iv., and *The Great Revolt of 1381*. (C. L. K.)

RICHARD III. (1452–1485), king of England, youngest son of Richard, duke of York, by Cicely Neville, was born at Fotheringhay on Oct. 2, 1452. After the second battle of St. Albans in Feb. 1461, his mother sent him with his brother George for safety to Utrecht. They returned in April, and at the coronation of Edward IV. Richard was created duke of Gloucester. As a mere child he had no importance till 1469–70, when he supported his brother against Warwick, shared his exile and took part in his triumphant return. He distinguished himself at Barnet and Tewkesbury; according to the Lancastrian story, after the latter battle

he murdered the young Edward of Wales in cold blood; this is discredited by the authority of Warkworth (*Chronicle*, p. 18); but Richard may have had a share in Edward's death during the fighting. He cannot be so fully cleared of complicity in the murder of Henry VI., which probably took place at the Tower on the night of May 22, when Richard was certainly present there.

Richard shared to the full in his brother's prosperity. He had large grants of lands and office, and by marrying Anne (1456–1485), the younger daughter of Warwick, secured a share in the Neville inheritance. This was distasteful to George, duke of Clarence, who was already married to the elder sister, Isabel. The rivalry of the two brothers caused a quarrel which was never appeased. Richard does not, however, seem to have been directly responsible for the death of Clarence in 1478; Sir Thomas More, who is a hostile witness, says that he resisted it openly "howbeit somewhat (as men deemed) more faintly than he that were heartily minded to his wealth." Richard's share of the Neville inheritance was chiefly in the north, and he resided usually at Middleham in Yorkshire. In May 1480 he was made the king's lieutenant-general in the north, and in 1482 commanded a successful invasion of Scotland. His administration was good, and brought him well-deserved popularity.

Protectorate.—On Edward's death he was kept informed of events in London by William, Lord Hastings, who shared his dislike of the Woodville influence. On April 29, 1483, supported by the duke of Buckingham, he intercepted his nephew at Stony Stratford and arrested Lord Rivers and Richard Grey, the little king's half-brother. It was in Richard's charge that Edward was brought to London on May 4. Richard was recognized as protector, the Woodville faction was overthrown, and the queen with her younger children took sanctuary at Westminster. For the time the government was carried on in Edward's name, and June 22 was appointed for his coronation. Richard was nevertheless gathering forces and concerting with his friends. In the council there was a party, of whom Hastings and Bishop Morton were the chief, which was loyal to the boy-king. On June 13 came the famous scene when Richard appeared suddenly in the council baring his withered arm and accusing Jane Shore and the queen of sorcery; Hastings, Morton and Stanley were arrested and the first-named at once beheaded. A few days later, probably on June 25, Rivers and Grey were executed at Pontefract. On June 22 Dr. Shaw was put up to preach at Paul's Cross against the legitimacy of the children of Edward IV. On the 25th a sort of parliament was convened at which Edward's marriage was declared invalid on the ground of his precontract with Eleanor Talbot, and Richard rightful king. Richard, who was not present, accepted the crown with feigned reluctance, and from the following day began his formal reign.

Usurpation of the Throne.—On July 6, Richard was crowned at Westminster, and immediately afterwards made a royal progress through the Midlands, on which he was well received. But in spite of its apparent success the usurpation was not popular. Richard's position could not be secure whilst his nephews lived. There seems to be no reasonable doubt that early in August Edward V. and his brother Richard (whom Elizabeth Woodville had been forced to surrender) were murdered by their uncle's orders in the Tower. Attempts have been made to clear Richard's memory. But the report of the princes' death was believed in England at the time, "for which cause king Richard lost the hearts of the people" (*Chronicles of London*, 191), and it was referred to as a definite fact before the French states-general in January 1484. The general, if vague, dissatisfaction found its expression in Buckingham's rebellion.

Richard, however, was fortunate, and the movement collapsed. He met his only parliament in Jan. 1484 with some show of triumph, and deserves credit for the wise intent of its legislation. He could not, however, stay the undercurrent of disaffection, and his ministers, Lovell and Catesby, were unpopular. His position was weakened by the death of his only legitimate son in April 1484. His queen died also a year later (March 16, 1485), and public opinion was scandalized by the rumour that Richard intended to marry his own niece, Elizabeth of York. Thus the feeling in favour of his rival Henry Tudor strengthened. Henry landed at Milford Haven on Aug. 7, 1485, and it was with dark forebodings that Richard met him at Bosworth on the 22nd. The defection of the Stanleys decided the day. Richard was killed fighting, courageous at all events. After the battle his body was carried to Leicester, trussed across a horse's back, and buried without honour in the church of the Greyfriars.

Richard was not the villain that his enemies depicted. He had good qualities, both as a man and a ruler, and showed a sound judgment of political needs. Still it is impossible to acquit him of the crime, the popular belief in which was the chief cause of his ruin. He was a typical man in an age of strange contradictions of character, of culture combined with cruelty, and of an emotional temper that was capable of high ends, though unscrupulous of means. Tradition represents Richard as deformed. It seems clear that he had some physical defect, though not so great as has been alleged. Extant portraits show an intellectual face characteristic of the early Renaissance, but do not indicate any deformity.

BIBLIOGRAPHY.—The chief original authorities are Sir Thomas More's *History of Richard III.*, based on information supplied by Archbishop Morton, and therefore to be accepted with caution; the more trustworthy *Continuation of the Croyland Chronicle* in Fulman's *Scriptores*, the *History* of Polydore Vergil, written in a Tudor spirit; the *Chronicle of London* (ed. C. L. Kingsford, 1905), and its biased expansion in Fabyan's *Chronicle*. *See* also *Letters and Papers Illustrative of the Reigns of Richard III. and Henry VII.*, ed. J. Gairdner, in Rolls Series. Of later accounts those in Stow's *Annales* (preserving some oral tradition) and George Buck's *Richard III.* ap. Kennet *History of England* deserve mention. Horace Walpole attempted a vindication in his *Historic Doubts* (1768). The best modern account is James Gairdner's *Life of Richard III.* (2nd ed., 1898). The latest and fullest defence is given in Sir Clements Markham's *Richard III., His Life and Character* (1906); G. B. Churchill's *Richard the Third up to Shakespeare* (*Palaestra* x., 1900) is a valuable digest of material. (C. L. K.)

RICHARD, earl of Cornwall and king of the Romans (1209–1272), was the second son of the English king John by Isabella of Angoulême. Born in 1209, Richard was the junior of his brother, Henry III., by fifteen months; he was educated in England and received the earldom of Cornwall in 1225. From this date to his death he was a prominent figure on the political stage. In the years 1225–27 he acted as governor of Gascony; between 1227 and 1238, owing to quarrels with his brother and dislike of the foreign favourites, he attached himself to the baronial opposition and bade fair to become a popular hero. But in 1240 he took the command of a crusade in order to escape from the troubled atmosphere of English politics. He was formally reconciled with Henry before his departure; and their amity was cemented on his return by his marriage with Sancha of Provence, the sister of Henry's queen (1243). In 1257 a bare majority of the German electors nominated Richard as king of the Romans, and he accepted their offer at Henry's desire.

In the years 1257–68 Richard paid four visits to Germany. He obtained recognition in the Rhineland, which was closely connected with England by trade relations. Otherwise, however, he was unsuccessful in securing German support. In the English troubles of the same period he endeavoured to act as a mediator. On the outbreak of civil war in 1264 he took his brother's side, and his capture in a windmill outside Lewes, after the defeat of the royalist army, is commemorated in the earliest of English vernacular satires; he remained a prisoner till the fall of Montfort. But after Evesham he exerted himself, not without success, to obtain reasonable terms for those who had suffered from the vengeance of the royalist party. He died on April 2, 1272. His end is said to have been hastened by grief for his eldest son, Henry of Almain, who had been murdered in the previous year by the sons of Simon de Montfort at Viterbo.

Authorities.—The original sources and general works of reference are the same as for the reign of Henry III. G. C. Gebauer's *Leben und Thaten Herrn Richards von Cornwall* (Leipzig, 1744), H. Koch's *Richard von Cornwall, 1209–1257* (Strassburg, 1888), and A. Busson's *Doppelwahl des Jahres, 1257* (Münster, 1866) are useful monographs. (H. W. C. D.)

RICHARD OF CIRENCESTER (*c.* 1335–*c.* 1401), historical writer, was a member of the Benedictine abbey at West-

minster, and his name ("Circestre") first appears on the chamberlain's list of the monks of that foundation drawn up in the year 1355. In the year 1391 he obtained a licence from the abbot to go to Rome, and in this the abbot gives his testimony to Richard's perfect and sincere observance of religion for some 30 years. In 1400 Richard was in the infirmary of the abbey, where he died in the following year. His only known extant work is *Speculum Historiale de Gestis Regum Angliae, 447–1066.* The ms. of this is in the university library at Cambridge, and has been edited for the Rolls Series (No. 30) by Professor J. E. B. Mayor (2 vols., 1863–69).

RICHARD OF DEVIZES (*fl.* 1191), English chronicler, was a monk of St. Swithin's house at Winchester. The *Chronicon de rebus gestis Ricardi Primi,* by which Richard of Devizes is chiefly known, is an account of events in England and the Holy Land during the third crusade.

See the editions of the *Chronicon de rebus gestis Ricardi Primi* by J. Stevenson (Eng. His. Soc., 1838) and by R. Howlett in *Chronicles of the Reigns of Stephen, Henry II. and Richard I.,* vol. iii. (Rolls Series, 1886); the *Annales de Wintonia* in H. R. Luard's *Annales Monastici,* vol. ii. (Rolls Series, 1864–69).

RICHARD OF HEXHAM (*fl.* 1141), English chronicler, became prior of Hexham about 1141, and died between 1163 and 1178. He wrote *Brevis Annotatio,* a short history of the church of Hexham from 674 to 1138, for which he borrowed from Bede, Eddius and Simeon of Durham. This is published by J. Raine in *The Priory of Hexham, its Chroniclers, Endowments and Annals* (Durham, 1864–65). More important is his *Historia de gestis regis Stephani et de bello Standardii,* valuable for the history of the north of England during the earlier part of the reign of Stephen, and for the battle of the Standard. It has been edited for the Rolls Series by R. Howlett in the *Chronicles of the Reigns of Stephen, Henry II. and Richard I.,* vol. iii. (1886); and has been translated by J. Stevenson in the *Church Historians of England,* vol. iv. (1856).

RICHARD OF ILCHESTER or OF TOCLYVE (d. 1188), English statesman and prelate, was born in the diocese of Bath, where he obtained preferment. Early in the reign of Henry II., however, he is found acting as a clerk in the king's court, probably under Thomas Becket, and he was one of the officials who assisted Henry in carrying out his great judicial and financial reforms. In 1162, or 1163, he was appointed archdeacon of Poitiers, but he passed most of his time in England, although in the next two or three years he visited Pope Alexander III. and the Emperor Frederick I. in the interests of the English king, who was then engaged in his struggle with Becket. For promising to support Frederick he was excommunicated by Becket in 1166. In May 1173 he was elected bishop of Winchester, being consecrated at Canterbury in October 1174. In 1176 he was appointed justiciar and seneschal of Normandy, and was given full control of all the royal business in the duchy. He died on Dec. 21 or 22, 1188, and was buried in Winchester cathedral.

See the article by Miss K. Norgate in the *Dict. Nat. Biog.,* vol. xlviii. (1896); and W. R. W. Stephens and W. W. Capes, *The Bishops of Winchester* (1907).

RICHARD OF ST. VICTOR (d. 1173), theologian and mystic of the 12th century. Very little is known of his life; he was born in Scotland or in England, and went to Paris, where he entered the abbey of St. Victor and was a pupil of the great mystic, Hugh of St. Victor. He succeeded as prior of this house in 1162. The best known of Richard's writings are the mystical treatises: *De statu hominis interioris, De praeparatione animi ad contemplationem, De gratia contemplationis, De gradibus caritatis, De arca nuptica,* and his two works on the Trinity: *De trinitate libri sex, De tribus appropriatis personis in Trinitate.* According to him, six steps lead the soul to contemplation: (1) contemplation of visible and tangible objects; (2) study of the productions of nature and of art; (3) study of character; (4) study of souls and of spirits; (5) entrance to the mystical region which ends in (6) ecstasy.

His theory of the Trinity is chiefly based on the arguments of Anselm of Canterbury. The influence of neo-Platonic terminology, as well as of the works of the pseudo-Dionysius, can be clearly detected in his works. In the *Paradiso* Dante has placed Richard among the greatest teachers of the Church. His writings came into favour again in the 16th and 17th centuries, six editions of his works having been printed between 1506 and 1650.

RICHARDS, HENRY BRINLEY (1819–1865), English pianist and composer, born at Carmarthen. He is principally remembered for writing the song "God bless the Prince of Wales" (1862).

RICHARDS, THEODORE WILLIAM (1868–), American chemist, was born in Germantown (Pa.), on Jan. 31, 1868. He graduated from Haverford college (S.B., 1885) and Harvard University (A.B., 1886; Ph.D., 1888); Göttingen, Leipzig, and the Dresden technical school. He was appointed assistant professor of chemistry at Harvard in 1894 and professor in 1901, and was made director of the Wolcott Gibbs memorial laboratory in 1912. He was best known for his researches on atomic weights. The results were generally accepted, and for his contributions he received the Nobel Prize in chemistry in 1914. He also gave much time to physico-chemical investigation, especially concerning electro-chemistry and chemical thermo-dynamics, thermometry (especially calorimetry), piezo-chemistry, and surface tension. Of these, his contributions to atomic compressibility, to the relation between the change of heat capacity and the change of free and total energy and to the thermo-dynamics of amalgams are noteworthy. In 1907 he was Harvard exchange professor at Berlin, in 1908 Lowell lecturer. He served on different chemical committees during the World War. He was president of the American Chemical Society (1914), the American Association for the Advancement of Science (1917), and the American Academy of Arts and Sciences (1919). (*See* ATOMIC WEIGHTS.)

RICHARDSON, HENRY HOBSON (1838–1886), American architect, was born in the parish of St. James, La., on Sept. 29, 1838, of a rich family, his mother being a grand-daughter of the famous Dr. Priestley, the English dissenting refugee and man of science. He was graduated from Harvard university in 1859, and went immediately to Paris to study architecture, entering the École des Beaux-Arts. The Civil War, which broke out in the United States while he was in the school, prevented his return to Louisiana, and stripped his family of their possessions. Richardson provided for his own support by working in the offices of practising architects in Paris, till the fall of 1865. He then established himself in New York, where he soon made his way into practice as an architect. In 1878 he moved to Boston, designing there most of the work that made his reputation. He married in 1867 Miss Julia Gorham Hayden of Boston; he died there on April 27, 1886.

Richardson's career was short, and the number of his works was small indeed compared with the attention they attracted and the influence he left behind him. The most important and characteristic are: Trinity church and the so-called Brattle Square church, in Boston; the alterations in the State Capitol at Albany; the county buildings at Pittsburgh; town halls at Albany, Springfield and North Easton; town libraries at Woburn, North Easton, Quincy, Burlington and Malden; Sever hall and Austin hall at Harvard university; the Chamber of Commerce at Cincinnati. Trinity church, the Pittsburgh buildings and the Capitol at Albany were works of great importance, which have had a strong influence on men who followed him.

The best known book about Richardson is Mrs. Schuyler van Rensselaer's *H. H. Richardson and his Works* (Boston, 1888).

RICHARDSON, OWEN WILLANS (1879–), English physicist, was born on April 26, 1879, at Dewsbury, Yorkshire. He was educated at Batley Grammar school and at Trinity college, Cambridge, where he became a fellow. He held the post

of professor of physics at the University of Princeton from 1906 to 1913, and was Wheatstone professor of physics at King's college, London, from 1914 to 1924. He was then appointed a Yarrow research professor by the Royal Society and director of research in physics at King's college.

Richardson's best known work is on the emission of electricity from hot bodies. He has made this subject peculiarly his own and has given it the name "thermionics." Richardson was elected F.R.S. in 1913.

He is the author of two standard works: *The Electron Theory of Matter* (1914) and *The Emission of Electricity from Hot Bodies* (1916).

RICHARDSON, SAMUEL (1689–1761), English novelist, was the son of a London joiner, who, for obscure reasons, probably connected with Monmouth's rebellion, had retired to Derbyshire, where, in 1689, Samuel was born. He was apprenticed at seventeen to an Aldersgate printer named John Wilde. Here he became successively compositor, corrector of the press, and printer on his own account; married his master's daughter according to programme; set up newspapers and books; dabbled a little in literature by compiling indexes and "honest dedications," and ultimately became Printer of the Journals of the House of Commons, Master of the Stationers' Company, and Law-Printer to the King. Like all well-to-do citizens, he had his city house of business and his "country box" in the suburbs; and, after a thoroughly "respectable" life, died on July 4, 1761, being buried in St. Bride's Church, Fleet Street, close to his shop (now demolished), No. 11 Salisbury Court.

The origin of *Pamela* dates back to a request from Rivington of St. Paul's Churchyard and Osborn of Paternoster Row, two book-selling friends who were aware of Richardson's epistolary gifts, to suggest that he should prepare a little model letter-writer for such "country readers" as "were unable to indite for themselves." The result was *Pamela; or Virtue Rewarded*. He completed it in a couple of months (Nov. 10, 1739 to Jan. 16, 1740). In Nov. 1740 it was issued by Messrs. Rivington and Osborn, who, a few weeks afterward (Jan. 1741), also published the model letter-writer under the title of *Letters written to and for Particular Friends, on the most Important Occasions*. Both books were anonymous. The letter-writer was noticed in the *Gentleman's Magazine* for January, which also contains a brief announcement as to *Pamela*, already rapidly making its way without waiting for the reviewers. A second edition, it was stated, was expected; and such was its popularity, that not to have read it was judged "as great a sign of want of curiosity as not to have seen the French and Italian dancers"—*i.e.*, Mme. Chateauneuf and the Fausans, who were then delighting the town. In February a second edition duly appeared, followed by a third in March and a fourth in May. At public gardens ladies held up the book to show they had got it; Dr. Benjamin Slocock of Southwark openly commended it from the pulpit; Pope praised it; and at Slough, when the heroine triumphed, the enraptured villagers rang the church bells for joy. The other volume of "familiar letters" consequently fell into the background in the estimation of its author, who, though it went into several editions during his lifetime, never acknowledged it.

Such a popularity, of course, was not without its drawbacks. That it would lead to *Anti-Pamelas*, censures of *Pamela* and all the spawn of pamphlets which spring round the track of a sudden success, was to be anticipated. One of the results to which its rather sickly morality gave rise was the *Joseph Andrews* (1742) of Fielding (*q.v.*). But there are two other works prompted by *Pamela* which need brief notice here. One is the *Apology for the Life of Mrs. Shamela Andrews*, a clever and very gross piece of raillery which appeared in April 1741, and by which Fielding is supposed to have alluded to *Joseph Andrews*. The second noteworthy result of *Pamela* was *Pamela's Conduct in High Life* (Sept. 1741), a spurious sequel by John Kelly of the *Universal Spectator*. Richardson tried to prevent its appearance, and, having failed, set about two volumes of his own, which followed in December, and professed to depict his heroine "in her exalted condition." It attracted no permanent attention.

About 1744 we begin to hear something of the progress of Richardson's second and greatest novel, *Clarissa; or the History of a Young Lady*, usually miscalled *Clarissa Harlowe*. The first edition was in seven volumes, two of which came out in Nov. 1747, two more in April 1748 and the last three in December. Upon the title-page of this, of which the mission was as edifying as that of *Pamela*, its object was defined as showing the distresses that may attend the misconduct both of parents and children in relation to marriage. Virtue, in *Clarissa*, is not "rewarded," but hunted down and outraged. The chief drawbacks of *Clarissa* are its merciless prolixity (seven volumes, which cover only 11 months); the fact that (like *Pamela*) it is told by letters; and a certain haunting and uneasy feeling that many of the heroine's obstacles are only molehills which should have been readily surmounted.

Between *Clarissa* and Richardson's next work appeared the *Tom Jones* of Fielding—a rival by no means welcome to the elder writer, although a rival who generously (and perhaps penitently) acknowledged *Clarissa's* rare merits.

> Pectus inaniter angit,
> irritat, mulcet, falsis terroribus implet,
> ut Magus

Fielding had written in the *Jacobite's Journal*. But even this could not console Richardson for the popularity of the "spurious brat" whom Fielding had made his hero, and his next effort was the depicting of a genuine fine gentleman—a task to which he was incited by a chorus of feminine worshippers. In the *History of Sir Charles Grandison*, "by the Editor of *Pamela* and *Clarissa*" (for he still preserved the fiction of anonymity), he essayed to draw a perfect model of manly character and conduct. In the pattern presented there is, however, too much buckram, too much ceremonial—in plain words, too much priggishness—to make him the desired exemplar of propriety *in excelsis*. Yet he is not entirely a failure, still less is he to be regarded as no more than "the condescending suit of clothes" by which Hazlitt unfairly defines Miss Burney's Lord Orville. When Richardson delineated Sir Charles Grandison he was at his best, and his experiences and opportunities for inventing such a character were infinitely greater than they had ever been before. And he lost nothing of his gift for portraying the other sex. Harriet Byron, Clementina della Porretta and even Charlotte Grandison, are no whit behind Clarissa and her friend Miss Howe. *Sir Charles Grandison*, in fine, is a far better book than *Pamela*.

Grandison was published in 1753, and by this time Richardson was sixty-four. Although the book was welcomed as warmly as it predecessors, he wrote no other novel, contenting himself instead with indexing his works, and compiling an anthology of the "maxims," "cautions" and "instructive sentiments" they contained. To these things, as a professed moralist, he had always attached the greatest importance. He continued to correspond relentlessly with a large circle of worshippers, mostly women, whose counsels and fertilizing sympathy had not a little contributed to the success of his last two books. He was a nervous, highly strung little man, intensely preoccupied with his health and his feelings, hungry for praise when he had once tasted it, and afterwards unable to exist without it; but apart from these things, well meaning, benevolent, honest, industrious and religious. Seven vast folio volumes of his correspondence with his lady friends, and with a few men of the Young and Aaron Hill type, are preserved in the Forster library at South Kensington. Parts of it only have been printed. There are several good portraits of him by Joseph Highmore, two of which are in the National Portrait Gallery.

Richardson is the father of the novel of sentimental analysis. As Sir Walter Scott has said, no one before had dived so deeply into the human heart. No one, moreover, had brought to the study of feminine character so much prolonged research, so much patience of observation, so much interested and indulgent apprehension, as this twittering little printer of Salisbury Court. That he did not more materially control the course of fiction in his own country was probably owing to the new direction which was given to that fiction by Fielding and Smollett,

whose method, roughly speaking, was synthetic rather than analytic. Still, his influence is to be traced in Sterne and Henry Mackenzie, as well as in Miss Burney and Miss Austen, both of whom, it may be noted, at first adopted the epistolary form. But it was in France, where the sentimental soil was ready for the dressing, that the analytic process was most warmly welcomed. Extravagantly eulogized by the great critic, Diderot, modified with splendid variation by Rousseau, copied (unwillingly) by Voltaire, the vogue of Richardson was so great as to tempt French critics to seek his original in the *Marianne* of a contemporary analyst, Marivaux. As a matter of fact, though there is some unconscious consonance of manner, there is nothing whatever to show that the little-letter author of *Pamela*, who was also ignorant of French, had the slightest knowledge of Marivaux or *Marianne*. In Germany Richardson was even more popular than in France. Gellert, the fabulist, translated him; Wieland, Lessing, Hermes, all imitated him, and Coleridge detects him even in the *Robbers* of Schiller. What was stranger still, he returned to England again under another form. The French *comédie larmoyante*, to which he had given a fillip, crossed the channel as the sentimental comedy of Cumberland and Kelly, which, after a brief career of prosperity, received its death-blow at the hands of Goldsmith and Sheridan.

Richardson's novels were edited by Mangin (19 vols., 1811), and an edition in 12 vols. was published by Sotheran in 1883 with preface by Sir Leslie Stephen. A *Collection of the Moral and Instructive Sentiments*, etc., was published in 1755. A selection from Richardson's *Correspondence* was published by Mrs. A. L. Barbauld in 1804, in six volumes, with a valuable Memoir. Recent lives are by Miss Clara L. Thomson, 1900, and by Austin Dobson ("Men of Letters"), 1902. A convenient reprint of the novels, with copies of the old illustrations by Stothard, Edward Burney and the rest, and an introduction by Mrs. E. M. M. McKenna, was issued in 1901 in 20 volumes.

(A. Do.; X.)

RICHBOROUGH, England, a port on the Stour, in Kent, 1¼ m. from Sandwich. Richborough castle is one of the most remarkable monuments of the Roman occupation of Great Britain. It marked the beginning of Watling street, and guarded the channel of the Wantsum, then separating the Isle of Thanet from the mainland. Richborough was a landing place and base for Roman legionaries. The extant remains of the castle include the north wall of the castellum, 460 ft. long and 22 ft. high. There is a cruciform platform of concrete, 144 ft. long and 104 ft. wide. It is believed to have borne a lighthouse. A subterranean passage runs round the foundations of the platform. During the War of 1914–18, to relieve the traffic in military stores through Dover, the old port was re-established. Work began in 1916 with the widening and deepening of the Stour, and the cutting of a canal across a large bend; 250 ac. of sea marsh were reclaimed, and nearly a mile of wharfage built and equipped. In six months regular cross-channel services of barges to Calais and Dunkirk were begun. In 1925 the port of Richborough with 1,500 ac. of land, the remaining equipment, and the fleet of ferries and barges, was sold for development in connection with the undertakings in the Kent coalfields.

RICHELIEU, ARMAND EMMANUEL SOPHIE SEPTEMANIE DU PLESSIS, Duc de (1766–1822), French statesman, was born in Paris on Sept. 25, 1766, the son of Louis Antoine du Plessis, duc de Fronsac and grandson of the marshal de Richelieu (1696–1788). The comte de Chinon, as the heir to the Richelieu honours was called, was married at fifteen to Rosalie de Rochechouart, a deformed child of twelve, with whom his relations were never more than formal. After two years of foreign travel he entered the Queen's dragoons and next year received a place at court, where he had a reputation for Puritan austerity. He left Paris in 1790 for Vienna, and in company with his friend Prince Charles de Ligne joined the Russian army as a volunteer, reaching the Russian headquarters at Bender on the 21st of November. By the death of his father in February 1791, he succeeded to the title of duc de Richelieu. He returned to Paris shortly afterwards on the summons of Louis XVI., but he was not sufficiently in the confidence of the court to be informed of the projected flight to Varennes. In July he obtained a passport from the National Assembly for service in Russia. In 1803 he became governor of Odessa. Two years later he became governor general of the Chersonese, of Ekaterinoslav and the Crimea, then called New Russia. In the eleven years of his administration, Odessa rose from a village to an important city. The central square is adorned with a statue of Richelieu (1826). A magnificent flight of nearly 200 granite steps leads from the Richelieu monument down to the harbours.

Richelieu returned to France in 1814; on the triumphant return of Napoleon from Elba he accompanied Louis XVIII. in his flight as far as Lille, whence he went to Vienna to join the Russian army, believing that he could best serve the interests of the monarchy and of France by attaching himself to the headquarters of the emperor Alexander. As the personal friend of the Russian emperor his influence in the councils of the Allies was likely to be of great service. He refused, indeed, Talleyrand's offer of a place in his ministry, pleading his long absence from France and ignorance of its conditions; but after Talleyrand's retirement he succeeded him as prime minister.

The events of Richelieu's tenure of office are noticed elsewhere. (*See* France: *History*.) It was mainly due to his efforts that France was so early relieved of the burden of the allied army of occupation. It was for this purpose mainly that he attended the congress of Aix-la-Chapelle in 1818. There he had been informed in confidence of the renewal by the Allies of their treaty binding them to interfere in case of a renewal of revolutionary trouble in France; and it was partly owing to this knowledge that he resigned office in December of the same year, on the refusal of his colleagues to support a reactionary modification of the electoral law. After the murder of the duc de Berry and the enforced retirement of Decazes, he again became president of the council (Feb. 21, 1821); but his position was untenable owing to the attacks of the "Ultras" on the one side and the Liberals on the other, and on Dec. 12 he resigned. He died of apoplexy on May 17, 1822.

Part of Richelieu's correspondence, his journal of his travels in Germany and the Turkish campaign, and a notice by the duchesse de Richelieu, are published by the Imperial Historical Society of Russia, vol. 54. *See* also L. de Crousaz-Crétêt, *Le Duc de Richelieu en Russie et en France* (1897); L. Rioult de Neuville in the *Revue des questions historiques* (Oct. 1897); R. de Cisternes, *Le Duc de Richelieu, son action aux conférences d'Aix-la-Chapelle* (1898).

RICHELIEU, ARMAND JEAN DU PLESSIS DE, Cardinal (1585–1642), French statesman, was born of an ancient family of the lesser nobility of Poitou. The cardinal's father, François du Plessis, seigneur de Richelieu (d. 1590), fought through the wars of religion, first as a favourite of Henry III., and after his death under Henry IV. His mother, Susanne de La Porte, belonged to a legal family. Armand was the third son and was born in Paris, Sept. 9, 1585. In 1606, at the age of twenty-one, he was nominated bishop of Luçon by Henry IV. As he was under the canonical age, he went to Rome to obtain a dispensation and was consecrated there in April 1607. In the winter of 1608 Richelieu went to his poverty-stricken little bishopric, and for the next six years devoted himself seriously to his episcopal duties. In 1614 he was elected by the clergy of Poitou to the last States-general which met before the Revolution. There he attracted the attention of Marie de' Medici, the queen-mother, and was chosen at its close to present the address of the clergy embodying its petitions and resolutions. After the States-general was dissolved he remained in Paris, and the next year he became almoner to Anne of Austria, the child-queen of Louis XIII. He was appointed in 1616 a secretary of state to the king. But he owed all to Concini, and his taste of power ended with the murder of his patron on Aug. 24, 1617.

The reign which Richelieu was to dominate so absolutely began with his exile from the court. He resigned himself to the post of chief adviser to Marie de' Medici in her exile at Blois. Here he sought to ingratiate himself with Luynes and the king by reporting minutely the actions of Marie and by protestations of loyalty. As this ungrateful work brought no reward, Richelieu retired once more to his bishopric. But he was exiled to Avignon, with his brother and brother-in-law, on April 7, 1618. There he wrote "A Defence of the Main Principles of the Catholic Faith," but

the escape of Marie de' Medici from Blois, on Feb. 22, 1619, again opened paths for his political ambition. Luynes and the king recalled him to the post at Angoulême with the queen-mother, who allowed him to sign the treaty of Angoulême with the Cardinal de la Rochefoucauld, acting for the king. By this treaty Marie was given liberty to live wherever she wished, and the government of Anjou and of Normandy with several castles was entrusted to her. Richelieu was made a cardinal by Pope Gregory XV., on Sept. 5, 1622.

Luynes's death on Dec. 15, 1621, made possible a reconciliation a month later between the king and his mother. Richelieu seized his opportunity. He furnished Marie de' Medici with political ideas and acute criticisms of the king's ministry, especially of the Brularts. Marie zealously pushed her favourite towards office, and eventually, in 1624, the king named him a member of his council. In August he became chief minister of Louis XIII.

Home Policy.—For the next eighteen years, he worked to make the royal power—his power—absolute and supreme at home, and to crush the rival European power of the Habsburgs. At home there were two opponents to be dealt with: the Huguenots and the feudal nobility. The former were crushed by the siege of La Rochelle and the vigorous campaign against the duc de Rohan. But the religious toleration of the edict of Nantes was reaffirmed while its political privileges were destroyed, and Huguenot officers fought loyally in the foreign enterprises of the cardinal. The suppression of the independence of the feudal aristocracy was inaugurated in 1626 by an edict calling for the destruction of castles not needed for defence against invasion. There was no serious opposition to the new minister. The first serious conspiracy took place in 1626, the king's brother, Gaston of Orleans, being the centre of it. His governor, Marshal D'Ornano, was arrested by Richelieu's orders, and then his confidant, Henri de Talleyrand, marquis de Chalais and Vendôme, the natural son of Henry IV. Chalais was executed and the marshal died in prison. The overthrow of the Huguenots in 1629 made Richelieu's position seemingly unassailable, but the next year it received its severest test. Marie de' Medici had turned against her "ungrateful" minister with a hatred intensified, it is said, by unrequited passion. In September 1630, while Louis XIII. was very ill at Lyons, the two queens, Marie and Anne of Austria, reconciled for the time, won the king's promise to dismiss Richelieu. He postponed the date until peace should be made with Spain. When the news came of the truce of Regensburg Marie claimed the fulfilment of the promise. On Nov. 10, 1630, the king went to his mother's apartments at the Luxembourg palace. Orders were given that no one should be allowed to disturb their interview, but Richelieu entered by the unguarded chapel door. When Marie had recovered breath from such audacity she proceeded to attack him in the strongest terms, declaring that the king must choose between him or her. Richelieu left the presence feeling that all was lost. The king gave a sign of yielding, appointing the brother of Marillac, Marie's counsellor, to the command of the army in Italy. But before taking further steps he retired to Versailles, then a hunting lodge, and there, listening to two of Richelieu's friends, Claude de Saint-Simon, father of the memoir writer, and Cardinal La Valette, sent for Richelieu in the evening, and while the salons of the Luxembourg were full of expectant courtiers the king was reassuring the cardinal of his continued favour and support. The "Day of Dupes," as this famous day was called, was the only time that Louis took so much as a step toward the dismissal of a minister who was personally distasteful to him but who was indispensable. The queen-mother followed the king and cardinal to Compiègne, but as she refused to be reconciled with Richelieu she was left there alone and forbidden to return to Paris. The next summer she fled across the frontiers into the Netherlands, and Richelieu was made a duke. Then Gaston of Orleans, who had fled to Lorraine, came back with a small troop to head a rebellion to free the king and country from "the tyrant." The only great noble who rose was Henri, duc de Montmorenci, governor of Languedoc, and his defeat at Castelnaudary on the 1st of September 1632, was followed by his speedy trial by the parlement of Toulouse, and by his execution. Richelieu had sent to the block the first noble of France, the last of a family illustrious for seven centuries, the head of the nobility of Languedoc. He knew no mercy. The only other conspiracy against him which amounted to more than intrigue was that of Cinq Mars in 1642, at the close of his life. This vain young favourite of the king was treated as though he were really a formidable traitor, and his friend, De Thou, son of the historian, whose sole guilt was not to have revealed the plot, was placed in a boat behind the stately barge of the cardinal and thus conveyed up the Rhone to his trial and death at Lyons.

Foreign Policy.—Richelieu's foreign policy was as inflexible as his home policy. To humble the Habsburgs he aided the Protestant princes of Germany against the emperor, in spite of the strong opposition of the disappointed Catholic party in France, which had looked to the cardinal as a champion of the faith. The year of Richelieu's triumph over the Huguenots (1629) was also that of the Emperor Ferdinand's triumph in Germany, marked by the Edict of Restitution, and France was threatened by a united Germany. Richelieu, however, turned against the Habsburgs young Gustavus Adolphus of Sweden, paying him a subsidy of a million livres a year by the treaty of Barwald of Jan. 23, 1631. The dismissal of Wallenstein was of double value to Richelieu when his Swedish ally marched south. After the treaty of Prague, in May 1635, by which the emperor was reconciled with most of the German princes, Richelieu was finally obliged to declare war, and, concluding a treaty of offensive alliance at Compiègne with Oxenstierna, and in October one at St. Germain-en-Laye with Bernard of Saxe-Weimar, he proceeded himself against Spain, both in Italy and in the Netherlands. The war opened disastrously for the French, but by 1642, when Richelieu died, his armies,—risen from 12,000 men in 1621 to 150,000 in 1638—had conquered Roussillon from Spain; they held Catalonia, which had revolted from Philip IV. of Spain, and had taken Turin and forced Savoy to allow French troops on the borders of the Milanese. In Germany Torstensson was sweeping the imperialist forces before him through Silesia and Moravia. The lines of the treaty of Westphalia, six years later, were already laid down by Richelieu; and its epochal importance in European history is a measure of the genius who threw the balance of power from Habsburg to Bourbon.

Personality.—His own personality was his strongest ally. The king himself quailed before that stern, august presence. His pale, drawn face was set with his iron will. His frame was sickly and wasted with disease, yet when clad in his red cardinal's robes, his stately carriage and confident bearing gave him the air of a prince. His courage was mingled with a mean sort of cunning, and his ambition loved the outward trappings of power as well as its reality; yet he never swerved from his policy in order to win approbation, and the king knew that his one motive in public affairs was the welfare of the realm—that his religion, in short, was "reason of state."

No courtier was ever more assertive of his prerogatives. He claimed precedence over even princes of the blood, and one like Condé was content to draw aside the curtains for him to pass, and to sue for the hand of Richelieu's niece for his son, the "Great Condé." His pride and ambition were gratified by the foundation of a sort of dynasty of his nephews and nieces, whose hands were sought by the noblest in the realm. Like all statesmen of his time, Richelieu made money out of politics. He came to court in 1617 with an income of 25,000 livres from his ecclesiastical benefices. In the later years of his life it exceeded 3,000,000 livres. He lived in imperial state, building himself the great Palais Cardinal, now the Palais Royal, in Paris, another at Rueil near Paris, and rebuilding his ancestral château in Poitou. In January 1641 the tragedy of *Mirame*, which was said to have been his own, was produced with great magnificence. Richelieu was anxious for literary fame, and his writings are not unworthy of him. But more important than his own efforts as an author were his protection and patronage of literary men, especially of Corneille, and his creation of the French Academy

in 1635. When he died, on Dec. 4, 1642, he was buried in the chapel of the Sorbonne, which still stands as he built it. His tomb, erected in 1694, though rifled at the Revolution, still exists.

Many writings are attributed to Richelieu, although owing to his habit of working with substitutes and assistants it is difficult to settle how much of what passes under his name is authentic. *Les Tuileries, La Grande Pastorale, Mirame,* and the other plays, have long been forgotten; but a permanent interest attaches to his *Mémoires* and correspondence: *Mémoire d'Armand du Plessis de Richelieu, l'année 1607 à 1610,* ed. by A. Baschet (1880); *Histoire de la mère et du fils* (Marie de Medici and Louis XIII.), sometimes attributed to Mézeray (Amsterdam, 1730) and, under title *Histoire de la régence de reine Marie de Médici, femme de Henry IV.* (The Hague, 1743); *Mémoires sur le règne de Louis XIII.,* 1610 to 1638, and of which the earlier portion is a reprint of the *Histoire de la mère et du fils,* Petitot's collection (1823, *seq.*); *Testament politique d'Armand du Plessis, cardinal de R.* (Amsterdam, 1687, *seq.*); *Journal de 1630–31* (1645); "Lettres, instructions diplomatiques, et papiers d'état," publ. by d'Avenel in the *Coll. de doc. ined.* (1853–77); these, with the *Mémoires* in J. F. Michaud and J. Poujalat's collections, are the most important sources for Richelieu's statesmanship.

RICHELIEU, LOUIS FRANÇOIS ARMAND DU PLESSIS, DUC DE (1696–1788), marshal of France, was a grandnephew of Cardinal Richelieu, and was born in Paris on March 13, 1696. As ambassador to Vienna (1725–29) he settled in 1727 the preliminaries of peace; in 1733–34 he served in the Rhine campaign. He fought with distinction at Dettingen and Fontenoy; three years afterwards he made a brilliant defence of Genoa; in 1756 he expelled the English from Minorca by the capture of the San Felipe fortress; and in 1757–58 he closed his military career by those pillaging campaigns in Hanover which procured him the sobriquet of *Petit Père de la Maraude.* In his early days he was thrice imprisoned in the Bastille: in 1711 at the instance of his stepfather, in 1716 in consequence of a duel, and in 1719 for his share in Alberoni's conspiracy against the regent Orleans. He died in Paris on Aug. 8, 1788.

See H. Noel Williams, *The Fascinating Duc de Richelieu* (1910); L. A. F. Du Plessis, *Mémoires authentiques du Maréchal de Richelieu, 1725–1757* (1918); P. d'Estrée, *Le Maréchal de Richelieu 1696–1788* (1917).

RICHEPIN, JEAN (1849–1926), French poet, novelist and dramatist, the son of an army doctor, was born at Medea (Algeria) on Feb. 4, 1849. He served as a *franc-tireur* in the Franco-German War, and was afterwards actor, sailor and stevedore. Richepin became famous with the publication, in 1876, of a volume of verse entitled *Chanson des gueux;* the outspokenness and the revolutionary defiance in these verses resulted in imprisonment and a fine for *outrage aux moeurs.* Later volumes were: *Les Caresses* (1877), *Les Blasphèmes* (1884), *La Mer* (1886), *La Bombarde* (1899). His novels developed in style from the morbidity and brutality of *Les Morts bizarres* (1876), *La Glu* (1881) and *Le Pave* (1883) to the more thoughtful psychology of *Grandes amoureuses* (1896) and *Lagibasse* (1899), and the more simple portrayal of life in *Miarka* (1883), *Truandailles* (1890) and *Flamboche* (1895). His best work is to be found in *Nana Sahib* (1883), in which he himself played with Sarah Bernhardt, *Monsieur Scapin* (1886), *Par le glaive* (1892), *Le Chemineau* (1897), *Le Chien de garde* (1898), *Les Truands* (1899), *Don Quichotte* (1905), most of which were produced at the Comédie française, of which he was for some time director. He also wrote *Miarka* (1905), adapted from his novel, for the music of Alexandre Georges, and *Le Mage* (1897) for the music of Jules Massenet. He was director of the Académie française at the time of his death. He died on Dec. 11, 1926.

His son, Jacques Richepin (b. 1880), the author of *La Reine de Tyr* (1899), *La Cavalière* (1901), *Cadet-Roussel* (1903) and *Falstaff* (1904), also made his mark on the stage.

RICHERUS (*fl.* 10th cent.), monk of St. Remi at Reims, and a chronicler of the 10th century, studied at Reims under Gerbert, afterwards Pope Silvester II. He was still living in 998, but there is no mention of him after that date. His *Historiae* has a unique value as giving us the only tolerably full account by a contemporary of the revolution of 987, which placed the Capets on the throne of France. From 969 onwards Richerus had no earlier history before him, and his work is the chief source for the period.

There are French translations by Guadet (1845, *Soc. de l'hist. de France*); Poinsignon (Reims, 1855, pub. de l'Académie de Rheims).

RICHFIELD SPRINGS, a village of Otsego county, New York, U.S.A., 22 m. S.S.E. of Utica, on Federal highway 20, near the north end of Canadargo lake; served by the Lackawanna and electric railways. Pop. (1925) 1,421 (State census). It is a health and summer resort, at an elevation of 1,500 ft. above sea-level, in the midst of beautiful scenery, and supplied with sulphur springs, of value in cases of gout, rheumatism and skin diseases.

RICHMOND, EARLS AND DUKES OF. The title earl of Richmond appears to have been in existence in England a considerable time before it was held in accordance with any strict legal principle. Alan, surnamed "Le Roux," and his brother Alan (*c.* 1040–1089), surnamed "Le Noir," relatives of Geoffrey, count of Brittany, and kinsman of William the Conqueror, took part in the latter's invasion of England; and Le Roux obtained grants of land in various parts of England, including manors formerly held by Earl Edwin in Yorkshire, on one of which he built the castle of Richmond, his possessions there being formed into the honour of Richmond, to which his brother Alan Le Noir, or Alan Niger (*c.* 1045–1093), succeeded in 1089. The latter was in turn succeeded as lord of the honour of Richmond by Stephen (d. 1137), count of Penthievre, who was either his son or another brother. These Breton counts are often reckoned as earls of Richmond, though they were not so in the strict and later sense. The same should perhaps be said of Stephen's son Alan Niger II. (*c.* 1116–1146).

This Alan married Bertha, daughter and heiress of Conan, reigning count of Brittany; and his son Conan (*c.* 1138–1171), who married Margaret, sister of Malcolm IV. of Scotland, asserted his right to Brittany, and transferred it in his lifetime to his daughter Constance (*c.* 1162–1201). As he left no sons the honour of Richmond and his other English possessions passed to the king in 1171, though Constance is also loosely spoken of as countess of Richmond in her own right. Constance was three times married, and each of her husbands in turn assumed the title of earl of Richmond, in conjunction with that of count, or duke of Brittany. They were: Geoffrey Plantagenet (1158–1186), son of Henry II., king of England; Randolph de Blundevill, earl of Chester (*c.* 1172–1232), the marriage with whom Constance treated as null on the ground of consanguinity; and Guy de Thouars (d. 1213), who survived his wife for 12 years. The only son of the first marriage, Arthur of Brittany (1187–1203), was styled earl of Richmond in his mother's lifetime, and on his murder at the hands of his uncle, King John, the earldom was resumed by the crown.

By her third husband Constance had two daughters, the elder of whom, Alice, was given in marriage by Philip Augustus, king of France, to Peter de Braine in 1213, after which date Peter was styled duke of Brittany and earl of Richmond till about 1235, when he renounced his allegiance to the king of England and thereupon suffered forfeiture of his English earldom.

In 1241 Henry III. granted the honour of Richmond to Peter of Savoy (1203–1268), uncle of Queen Eleanor, who was thereafter described as earl of Richmond by contemporary chroniclers, though how far he was strictly entitled to the designation has been disputed. By his will he left the honour of Richmond to his niece, the queen consort, who transferred it to the crown. In the same year (1268) Henry III. granted the earldom specifically to

John, duke of Brittany (1217–86), son of Peter de Braine, in whose family the title continued—though it frequently was forfeited or reverted to the crown and was re-granted to the next heir—till 1342, when it was apparently resumed by Edward III. and granted by that sovereign to his son John of Gaunt, who surrendered it in 1372. It was then given to John de Montfort, duke of Brittany, but on his death without heirs in 1399, or possibly at an earlier date through forfeiture, it reverted to the crown.

The earldom now became finally separated from the duchy of Brittany, with which it had been loosely conjoined since the Conquest, although the dukes of Brittany continued to assume the title till a much later date. From 1414 to 1435 the earldom of Richmond was held by John Plantagenet, duke of Bedford, and in 1453 it was conferred on Edmund Tudor, uterine brother to King Henry VI., whose wife, Margaret Beaufort, was the foundress of St. John's college, Cambridge, and of the "Lady Margaret" professorships of divinity at Oxford and Cambridge. (*See* RICHMOND AND DERBY, MARGARET, COUNTESS OF.) When Edmund Tudor's son Henry ascended the throne as Henry VII. in 1485, the earldom of Richmond merged in the crown, but in 1525 Henry Fitzroy, natural son of Henry VIII. by Elizabeth Blound, was created duke of Richmond and Somerset and earl of Nottingham, all these titles becoming extinct at his death without children in 1536.

Ludovic Stuart, 2nd duke of Lennox (1574–1624), who also held other titles in the peerage of Scotland, was created earl of Richmond in 1613 and duke of Richmond in 1623. These became extinct at his death in 1624, but his Scottish honours devolved on his brother Esmé, who was already earl of March in the peerage of England. (*See* MARCH, EARLS OF; and LENNOX.) Esmé's son, James, 4th duke of Lennox (1612–1655), was created duke of Richmond in 1641, the two dukedoms as well as the lesser English and Scottish titles thus becoming again united. In 1672, on the death of his nephew Charles, 3rd duke of Richmond and 6th duke of Lennox, whose wife was the celebrated beauty called "La Belle Stuart" at the court of Charles II. (*see* RICHMOND AND LENNOX, FRANCES TERESA, DUCHESS OF), his titles became extinct.

In 1675 Charles II. created his illegitimate son Charles duke of Richmond, earl of March and baron Settrington. This Charles (1672–1723), on whom his father the king bestowed the surname of Lennox, was the son of the celebrated Louise de Keroualle, duchess of Portsmouth. His son Charles, 2nd duke (1701–1750), added to the titles he inherited from his father that of duke of Aubigny in France, to which he succeeded in 1734 on the death of his grandmother the duchess of Portsmouth; these honours are still held by his descendant the present duke of Richmond.

The seven dukes of Richmond of the Lennox line have all borne the Christian name of Charles. The 2nd duke, by his marriage with Sarah, daughter of the 1st Earl Cadogan, was father of Lady Caroline Lennox, who eloped with Henry Fox, and was the mother of Charles James Fox, and of the beautiful Lady Sarah Lennox (1745–1826) with whom George III. fell in love and contemplated marriage, and who afterwards married, first, Sir Thomas Bunbury, from whom she was divorced, and secondly George Napier, by whom she was the mother of Generals Sir Charles and Sir William Napier.

Charles, 3rd duke of Richmond (1734–1806), was famous for his advanced views on the question of parliamentary reform. Having succeeded to the peerage in 1750, he was appointed British ambassador extraordinary in Paris in 1765, and in the following year he became a secretary of State in the Rockingham administration, resigning office on the accession to power of the earl of Chatham. In the debates on the policy that led to the War of American Independence Richmond was a firm supporter of the colonists. Richmond also advocated a policy of concession in Ireland, with reference to which he originated the famous phrase "a union of hearts." In 1779 the duke brought forward a motion for retrenchment of the civil list; and in 1780 he embodied in a bill his proposals for parliamentary reform, which included manhood suffrage, annual parliaments and equal electoral areas. Richmond sat in Rockingham's second cabinet as master-general of ordnance; and in 1784 he joined the ministry of William Pitt. He now developed strongly Tory opinions, and his alleged desertion of the cause of reform led to a violent attack on him by Lauderdale in 1792. Richmond died in Dec. 1806, and, leaving no legitimate children, he was succeeded in the peerage by his nephew Charles.

The 5th duke (1791–1860), while still known by the courtesy title of earl of March, served on Wellington's staff in the Peninsula, being at the same time member of parliament for Chichester. He was afterwards a vehement opponent in the House of Lords of Roman Catholic emancipation, and at a later date a leader of the opposition to Peel's free trade policy. In 1836, on inheriting the estates of his maternal uncle, the 5th and last duke of Gordon, he assumed the name of Gordon before that of Lennox. On his death in 1860 he was succeeded in his titles by his son Charles Henry, 6th duke of Richmond (1818–1903), a statesman who held various cabinet offices in the Conservative administrations of Lord Derby, Disraeli and the marquess of Salisbury; and who in 1876 was created earl of Kinrara and duke of Gordon. These honours in addition to the numerous family titles of more ancient creation passed on his death in 1903 to his son Charles Henry Gordon-Lennox (1845–1928), 7th duke of Richmond and Lennox and 2nd duke of Gordon. The 7th duke was succeeded by his son Charles Henry Gordon-Lennox (b. 1870).

RICHMOND, LEGH (1772–1827), English divine, was born on Jan. 29, 1772, at Liverpool, and was educated at Cambridge. He wrote *The Dairyman's Daughter*, of which as many as four millions in nineteen languages were circulated before 1849. A collected edition of his stories was first published in 1814 under the title of *Annals of the Poor*. He died May 8, 1827.

See T. S. Grimshawe, *A Memoire* (1828); T. Fry, *Domestic Portraiture* (1833).

RICHMOND, SIR WILLIAM BLAKE, K.B. 1897 (1842–1921), English painter and decorator, was born in London on Nov. 29, 1842. At the age of 14 William Richmond entered the Royal Academy schools, where he worked for about three years. A visit to Italy in 1859 had an important effect upon his development. His first Academy picture was a portrait group (1861), and several other pictures of the same class followed. In 1865 he returned to Italy, and spent four years there, living chiefly at Rome. On his return in 1869 he exhibited "A Procession in Honour of Bacchus" at the Academy. He became Slade professor at Oxford, succeeding Ruskin, in 1878, but resigned three years later. He was elected A.R.A. in 1888 and R.A. in 1895; he received the degree of D.C.L. in 1896, and became professor of painting to the Royal Academy. Apart from his pictures, he is notable for his work in decorative art, his most conspicuous of St. Paul's cathedral. He died at Hammersmith on Feb. 11, 1921. His portrait by George Phoenix is in the National Portrait Gallery.

See *The Richmond Papers*, ed. A. M. W. Stirling (1926).

RICHMOND: *see* MELBOURNE.

RICHMOND, a municipal borough in Surrey, England, 9 m. W.S.W. of Charing Cross, London. Pop. (1921) 35,639. It lies on the right bank of the Thames, which is here crossed by a bridge carrying the main road to Twickenham. Richmond was anciently called *Syenes* and afterwards *Schene* and *Sheen* (a name preserved in the village of East Sheen, adjacent on the London side)

until the name was in 1500 changed to Richmond by command of Henry VII., who was earl of Richmond in Yorkshire. It grew up round the royal manor house, of which nothing but a gateway remains. Edward I. received the Scotch commissioners at his manor of Sheen in 1300. The palace was rebuilt by Edward III., who died here in 1377. It was frequently used by Richard II., who afterwards caused it to be demolished. By Henry V., however, it was rebuilt, and a great tournament was held here in 1492 by Henry VII., who after its destruction by fire in 1498 restored it. Henry VIII. gave it to Wolsey to reside in, after the latter presented him with the new palace of Hampton Court. James I. settled it on his son Henry, prince of Wales, who restored it. Charles I. added to it the new deer park, Richmond park, 2,253 acres in extent surrounded by a wall. After the execution of the king, the parliament presented the park to the citizens of London, who again presented it to Charles II. at the Restoration. Though partly dismantled, the palace was the residence of the queen dowager till 1665, but it was parcelled into tenements about 1720. In the old deer park extending northwards from the site of the palace, Kew Observatory was erected in 1769, occupying the site of a Carthusian convent founded by Henry V. The White Lodge was built by George I. To the south-east of the town is Richmond hill with its famous view of the Thames. A theatre, first established in 1719, was during his later years leased by Edmund Kean. Richmond was incorporated in 1890.

RICHMOND, a municipal borough in the North Riding of Yorkshire, England, 15 m. S.W. of Darlington by a branch of the L.N.E. railway, of which it is the terminus. Pop. (1921) 3,887. It is situated on the left bank of the Swale, where the valley is still narrow and steep-sided before it emerges from the Pennines into the Vale of York.

The town is chiefly interesting because of the castle, which occupies the summit of a high cliff. The castle was founded about 1071 by Alan Rufus of Penthièvre in Brittany, who is said to have rebuilt the town on obtaining from William the Conqueror the estates of the Saxon earl Edwin, which embraced some two hundred manors of Richmond and extended over nearly a third of the North Riding. This tract was called Richmondshire at this time, but the date of the creation of the shire is uncertain. William the Lion of Scotland was imprisoned in the castle in the reign of Henry II.; otherwise the town owes its importance chiefly to its lords. It was a valuable possession in the middle ages, and was usually in royal or semi-royal hands. The whole shire reverted to the crown on the accession of Henry VII. Henry VIII. gave it to his son Henry, afterwards Duke of Richmond, and the title was also bestowed upon a son of Charles II. The original castle covered an area of 5 acres, but the only portions remaining are the Norman keep, with pinnacled tower and walls 100 ft. high by 11 ft. thick, and some smaller towers.

The name of Richmond (Richemont, Richemund) has not been traced further back than 1145, but it is probable that there was an earlier settlement on the site. As far as is known, the earliest charter was granted in 1145 giving the burgesses the borough of Richmond to hold for ever in fee farm at an annual rent of £29, but a charter dated 1146 shows that the burgesses had enjoyed some municipal liberties at an earlier period. Other charters were granted in 1150, and in 1268, the latter pointing to the existence of a market at Richmond, but there is no grant of it extant. In 1278, a yearly fair was granted and in 1328, Edward III. gave the first Royal Charter to the town.

A charter of incorporation, under the title of aldermen and burgesses was granted in 1576 by Queen Elizabeth, who also allowed a market each Saturday, an animal market every fortnight, and a fair each year on the vigil of Palm Sunday. In 1668, Charles II. granted a charter under the title of mayor and aldermen. This charter, though superseded later, was restored in the reign of James II., and, until the passing of the Municipal Reform Act of 1835, was regarded as the governing charter of the borough. Although Richmond received a summons as early as 1328, it was not represented in parliament until 1584, from which time it usually sent two members. In 1867, the number was reduced to one, and since 1885, the representation has been merged in the Richmond division of the North Riding. In 1889, Richmond became the seat of a suffragan bishop in the diocese of Ripon.

The church of St. Mary is transitional Norman, Decorated and Perpendicular, and is largely restored. The church of the Holy Trinity is ancient and was restored to use from ruins; only the nave and a detached tower remain. The tower of a Franciscan abbey, founded in 1258, still exists. Close to the town are the ruins of Easby Abbey, a Premonstratensian foundation of 1152, beautifully situated by the river. The remains include a Decorated gateway, an Early English chapel and fragments of the transepts and choir of the church, with sufficient portions of the domestic buildings to enable the complete plan to be traced. The free Grammar School was founded by Elizabeth, but the present Gothic building was not erected until 1850.

The principal trade is in agricultural produce, and as Richmond possesses the only railway station in Swaledale, the market is still important.

See R. Eale, *Registrum Honoris de Richemond* (1722); C. Clarkson, *History and Antiquities of Richmond* (Richmond 1821); T. D. Whitaker, *A History of Richmondshire* (1823); *Victoria County History: Yorkshire.*

RICHMOND, a city of Contra Costa county, California, U.S.A., on the eastern shore of San Francisco bay, adjoining Berkeley on the north, 8 m. N.E. of San Francisco, with which it is connected by passenger and automobile ferries. It is served by the Santa Fe and the Southern Pacific railways, and is a port of call for vessels operating in coastwise, inter-coastal and foreign trade. Pop. 16,843 in 1920, 21% foreign-born white; estimated locally at over 30,000 in 1928. Richmond is a rapidly growing industrial centre of the "Eastbay district," with an annual factory output valued at $110,000,000. The major industries include the largest refinery of the Standard Oil Company, terminal repair shops of the Santa Fe railroad and of the Pullman Company, a Ford assembly plant and large establishments making vitreous china, enamelled iron, roofing, linoleum, high explosives, steel barrels and containers, pressed brick, tile and various other commodities. There are 16 miles of harbour frontage. Richmond was settled about 1900 and incorporated in 1905. By 1928 it had an assessed valuation of $30,508,267. It is under a council-manager form of government.

RICHMOND, a city of Indiana, U.S.A., 68 m. E. of Indianapolis, near the Ohio state line, on the east branch of the Whitewater river; the county-seat of Wayne county. It is on Federal highways 27 and 40, and is served by the Chesapeake and Ohio and the Pennsylvania railways. The population was 26,765 in 1920, 90% native white. The city has broad, well shaded streets, several parks and substantial public buildings. It is the seat of a state hospital for the insane (1890) and of several charitable institutions under religious auspices. Adjoining its western boundary is the beautiful campus (120 ac.) of Earlham college, established in 1847 by the Society of Friends. Richmond has a large wholesale trade and important manufacturing industries. Richmond was founded by Quakers from North Carolina and Pennsylvania, and for many years was the principal centre of the Society of Friends west of Philadelphia. Settlement began in the vicinity in 1806. Richmond was incorporated as a village in 1818 and chartered as a city in 1840.

RICHMOND, a city of eastern Kentucky, U.S.A., the county seat of Madison county; 125 m. S.E. of Louisville, on Federal highway 25 and the Louisville and Nashville railroad. Pop. 5,622 in 1920, 30% negroes; estimated locally at 7,000 in 1928. It is in the blue-grass region, near the foot-hills of the Cumberland mountains, about 1,000 ft. above sea-level. There is a sulphur spring in the heart of the city. Natural gas is available, and hydro-electric power from the development on the Dix river. Richmond is an important market for thorough-bred live stock and burley tobacco, of which 10,000,000 lb. are handled in a normal season. It is the seat of the U.S. Trachoma hospital (1926) and of the Eastern Kentucky State Teachers' college (1906) which has an enrolment of 4,500 students (1928), and a beautiful 50-ac. campus, formerly occupied by Central university (founded 1874,

and consolidated in 1901 with Centre college at Danville). The trail marked in 1770 by Squire Boone, who preceded his brother Daniel, passed through Richmond, over what is now the Dixie highway, and one of the huge sandstone slabs on which he cut an inscription is now in the Court House yard. Along this trail was fought the battle of Richmond (Aug. 30, 1862) when the Confederate General Edmund Kirby Smith won a decisive victory. Ft. Boonesborough (erected 1775) and the town founded by Daniel Boone were about 12 m. south of Richmond. There are many fine old mansions in the city and its environs.

RICHMOND, the capital and largest city of Virginia, U.S.A., a port of entry, the county seat of Henrico county (but administratively independent of it), and from 1861 to 1865 the capital of the Confederate States of America; at the head of navigation on the James river, 100 m. S. by W. of Washington. It is on Federal highways 1 and 60; has a municipal airport; and is served by the Atlantic Coast Line, the Chesapeake and Ohio, the Richmond, Fredericksburg and Potomac, the Seaboard Air Line and the Southern railways, and steamship lines. Pop. 171,667 in 1920; 66% native white and 31% negroes; 89 males to 100 females; estimated at 194,400 in 1928, with an additional 30,000 in the immediate suburbs.

The city is very attractively built around a bend in the James. The original site, embracing seven hills on the north side of the river, has been extended by annexations in all directions (including the city of Manchester on the south side in 1910) until the area is 26 square miles. Two highway and four railroad bridges cross the James within the city limits. There are numerous islands, including Belle isle, the site of a Confederate prison during the Civil War, and Mayo's island, now a public park. Projects are under way for straightening the bends in the river and deepening the channel (now 18 ft.) to 30 ft. between Richmond and Hampton Roads. The State capitol, standing in a 10 ac. square, was built (1785–92) after designs prepared from a model and plans of the Maison Carrée at Nîmes, which Jefferson secured while he was minister to France. It contains the Houdon statue of Washington (1796) and a replica of the bust of Lafayette by Houdon which was presented by Virginia to the city of Paris. In this building Aaron Burr was tried (1807); the Virginia Secession Convention met (1861); and the sessions of the Confederate Congress were held. The oldest building in the city is a stone dwelling erected in 1737. St. John's Episcopal church (1740) was the meeting-place of the Virginia Convention of 1775, before which Patrick Henry made his famous speech ending, "Give me liberty or give me death!" Jefferson Davis was attending services in St. Paul's church when word reached him (April 2, 1865) from Lee that Richmond must be evacuated. The executive mansion of the Confederacy, occupied by Jefferson Davis 1862–65, a house built in 1819, is now a Confederate museum. The home of Chief Justice Marshall (built in 1795) and the war-time residence of Gen. Lee's family, also house historical collections. The Valentine museum, devised by Mann S. Valentine in 1892 as a public trust, includes many books of the 15th and 16th centuries. The State library has a valuable collection of old manuscripts. The Edgar Allan Poe shrine and the Father Tabb library commemorate those two poets.

Richmond is an important educational centre. The public schools have an annual budget of $1,700,000, and include the Virginia Mechanics' institute, founded in 1856. The University of Richmond (1832) including Richmond college for men, Westhampton college for women, and the T. C. Williams School of Law, has an extensive campus of 293 ac. in the western suburbs of the city. The Union Theological seminary (Presbyterian; 1824) has been in Richmond since 1898. The Medical college of Virginia (1838) is the oldest medical school in the South. Virginia Union university for negroes (created in 1899) combines Wayland seminary (1865), Richmond Theological seminary (1865) and Hartshorn Memorial college. Both the University of Virginia and the College of William and Mary maintain extension centres in Richmond. The daily papers (both Democratic) are the *Times-Dispatch*, formed in 1903 by the consolidation of the *Dispatch* (1850) and the *Times* (1886), and the *News-Leader* (1896).

The city has 23 public parks, covering 652 ac., and 12 playgrounds for small children. There are many fine monuments and statues, among them the Washington monument in Capitol square, designed and largely executed by Thomas Crawford, and the noble equestrian statue of Robert E. Lee, by Mercié. In Hollywood cemetery are the graves of Jefferson Davis, James Monroe, John Tyler, John Randolph of Roanoke, Commodore Matthew F. Maury, several Confederate generals, and 16,000 Confederate soldiers. Oakwood cemetery contains the graves of 18,000 Confederate soldiers. Two miles north-east of the city is a national cemetery with 6,600 graves of Union men, most of whom were killed in the actions around Richmond.

Richmond has a mayor-council form of government, with an advisory board consisting of the directors of the five departments, together with the mayor. It owns and operates its water, gas and electric plants, and has an annual budget of $8,500,000. A city plan has been adopted and zoning ordinances are in effect. The assessed valuation of property subject to taxation was $259,101,845 in 1927. Richmond is the financial and commercial metropolis of a large area of the South and the leading manufacturing city of Virginia. It is the seat of the Federal Reserve Bank of the fifth district. Bank debits in 1927 amounted to $1,711,049,000, and postal receipts totalled $2,197,000. Five insurance companies have their home offices here. The wholesale and jobbing houses do an annual business of over $150,000,000. Richmond is one of the oldest and largest tobacco markets, and one of the largest hog markets, in the United States. Its principal manufactures are cigars and cigarettes (500,000,000 and 40,000,000,000 annually), iron and steel products, paper (especially blotting paper), fertilizers, flour, articles of wood, books and periodicals.

History.—Richmond was founded in 1733 by Col. William Byrd, owner of much land along the James, who held important offices in the Colony and was the author of some of the best accounts of contemporary scenes and events, and whose family has been conspicuous in the history of Virginia since 1637. He was an ancestor of Harry F. Byrd, governor 1926–30, and of Richard E. Byrd, explorer (*q.v.*) An exploring party from Jamestown had sailed up the river in 1607 and erected a cross on one of the small islands here; a short-lived settlement had been made within the present city limits in 1609, and a second had been attempted 3 m. below by Capt. John Smith on land he bought from the Indians; and in 1645 Ft. Charles had been built as a frontier defence at the falls. Col. Byrd (who had been educated in England) called the town Richmond, probably because of the similarity of its site to that of Richmond on the Thames. It was laid out in 1737 by Maj. William Mayo and was incorporated as a town in 1742. In 1777 the public records were brought here from Williamsburg, and in May 1779, Richmond was made the capital of the State. The town was partly burned on Jan. 5, 1781, by British troops under Benedict Arnold. It was chartered as a city in 1782. At the opening of the Civil War it was an important port and commercial centre, with a population of about 38,000. On May 8, 1861, it was made the capital of the Confederacy, and for the next four years was the objective of military operations to which the greatest leaders and the finest armies were devoted. (*See* AMERICAN CIVIL WAR.) The city was defended by three encircling lines of fortifications. On March 1, 1862, President Davis placed it under martial law, together with the environs within a radius of 10 miles. The opening of McClellan's peninsular campaign (*see* YORKTOWN) in 1862 caused great apprehension in Richmond, and preparations were made to ship the government records to a safer place. On the approach of the "Monitor" and the Union gunboats many persons fled from the city and President Davis appointed a day of prayer. Confidence was restored by the checking of the fleet at Drewry's Bluff on May 15, 1862, the battle of Fair Oaks, and the Seven Days (*qq.v.*). In May 1864, Grant began the final campaign against Richmond. (*See* WILDERNESS and PETERSBURG.)

On the fall of Petersburg (April 2, 1865) Richmond was evacuated, after the ironclads, the bridges and many of the tobacco

and military warehouses had been set on fire. When the Federal troops made their entrance the next morning a serious conflagration was under way, which was not extinguished until a third of the city was in ruins. The Tredegar iron works, still a leading industry of Richmond, was the principal iron foundry of the Confederacy, where most of the cannon were cast. A tobacco warehouse and ship-chandlery (built in 1845 by Luther Libby) was used as a prison, chiefly for Federal officers, throughout the war. Frequently it was terribly overcrowded, housing at times as many as 1,200, and the sufferings and the death-rate were extreme. In 1888–89 Libby prison was moved to Chicago to be a war museum. Within 25 years after the close of the war the population of Richmond had doubled (reaching 81,388 in 1890), $14,000,000 was invested in manufacturing plants, annual jobbing sales amounted to $31,500,000 and bank clearings to $93,500,000. In the next 30 years (1890–1920) the population doubled again.

RICHMOND AND DERBY, MARGARET, COUNTESS OF (1443–1509), mother of the English king, Henry VII., and foundress of St. John's and Christ's colleges at Cambridge, was the daughter and heiress of John Beaufort, duke of Somerset, and was born on May 31, 1443. In 1455 she married Edmund Tudor, earl of Richmond, who died in the following year; she then married Henry (d. 1482), son of Humphrey Stafford, duke of Buckingham, and later Thomas Stanley, afterwards earl of Derby. She was in constant communication with her son, the future Henry VII., during his exile in Brittany, and with her husband, Lord Stanley, aided him to gain the crown in 1485. Under the influence of her confessor, John Fisher, afterwards bishop of Rochester, the countess founded the Lady Margaret professorships of divinity at the universities of Oxford and Cambridge. She completed the foundation of Christ's College, Cambridge, and much of her wealth was left for building and endowing St. John's College in the same university. She died on the 29th of June 1509.

See C. H. Cooper *Memoir of Margaret, Countess of Richmond and Derby* (1874).

RICHMOND AND LENNOX, FRANCES TERESA STEWART, DUCHESS OF (1648–1702), daughter of a physician in the household of Queen Henrietta Maria when she was in exile after 1649, was born in 1648 and was brought up in France. Henrietta Maria sent her to England, where she was appointed maid of honour to Catherine of Braganza, queen of Charles II. Charles II. became infatuated with her, and it is stated that in 1667 he was considering the possibility of obtaining a divorce in order to make her his wife. This was at a time when he feared to lose her as his mistress, since her hand was sought in marriage by Charles Stuart, duke of Richmond and Lennox. In March 1667 she eloped with Richmond and married him secretly; but on her return to court she retained her hold on the king's affections.

RICHMOND RIVER AND BASIN, together with the basins of the Tweed (*q.v.*) and Clarence Rivers, forms the largest area of coastal lowland in New South Wales, Australia (*c.* 125 miles N.-S.; 20–40 miles east-west). The area contains most of the productive portions of the North Coast Division which has 65% of its total area (6,900,000 ac.) occupied, contains nearly half of the dairying holdings and makes nearly 60% of the butter (1925–26: 63,000,000 lb.) made in the State (*e.g.*, the butter factory at Byron Bay is said to be the largest in Australia). The whole of the sugar produced in New South Wales is grown in this area (1925–26: 8,700 acres [cut], yielding 297,000 tons cane or 123,500 tons raw sugar and molasses). The district is linked by rail with Sydney (North Coast Railway) and a through connection with Brisbane is being constructed from Kyogle.

RICHTER, EUGEN (1839–1906), German politician, was born on July 30, 1839 at Düsseldorf. After attending the universities of Bonn, Heidelberg and Berlin, he entered the Government service. In 1864 he was chosen burgomaster of Neuwied; but he was already known for his Liberal opinions, and the Government refused to confirm the appointment and transferred him to Bromberg, in East Prussia. In consequence, he resigned from the public service, went to Berlin and entered journalism. A consistent advocate of the economic doctrines of the Manchester School, he was also keenly interested in the working-class co-operative movement, on which he wrote a book. In 1867 he was tried for revolutionary tendencies but acquitted. In 1867 he was elected a member of the Reichstag, and in 1869 of the Prussian parliament. A member of the Progressive party, in 1880 one of the founders, and eventually the leader, of the Freisinnige, he was always in opposition. Next to Windthorst he was Bismarck's most dangerous opponent, and leader of the opposition to the introduction of protection, to the new colonial policy introduced after 1878, and to State Socialism. He also strongly opposed all increases in the army and navy; and it was his opposition to the army measures of 1893 which finally split his party, leaving him with only a small following. In 1885 he founded the *Freisinnige Zeitung,* which he edited himself; he also wrote many political brochures and works on Prussian finances. He died at Jena, on Jan. 26, 1906

See his reminiscences *Jugenderinnerungen* (1892) and *Im alten Reichstag* (2 vols., 1894–96).

RICHTER, HANS (1843–1916), Hungarian musical conductor, born at Raab on April 4, 1843, was the son of the kapellmeister at the cathedral, whose wife, *née* Josephine Csazinsky, was an operatic singer. He studied (1860–65) at the Vienna Conservatoire.

In 1871 Richter was appointed conductor of the Hungarian National Opera at Budapest, and in May 1875 began his long connection with the Vienna Opera, which terminated only with the century. In 1876 he directed the rehearsals and performances of *Der Ring* at Bayreuth, and in 1877 paid his first visit to England to conduct the Wagner Festival at the Albert Hall. There in 1879 he founded the Richter Concerts and quickly established himself as a prime favourite with the London musical public. Later, in 1892, he conducted a famous series of performances of Wagner's works (including the first in England of *Die Meistersinger* and *Tristan*) at Drury Lane; while special performances of German opera were also conducted by him at Covent Garden from 1904 onwards. In 1900 he became conductor of the Hallé Orchestra in Manchester doing splendid service in this capacity, while previously in 1885 he had established an equally happy connection with Birmingham as conductor of the Birmingham Triennial Festival. His last performance of *Die Meistersinger* was given at Bayreuth in 1911, and his last years were spent in retirement there. He died on Dec. 5, 1916. As a conductor Richter was supreme in the interpretation of Wagner, though hardly less great in that of Mozart, Beethoven, Brahms and all the other great classical masters.

RICHTER, JOHANN PAUL FRIEDRICH (1763–1825), usually called JEAN PAUL, famous German author, was born at Wunsiedel, in Bavaria, on March 21, 1763. His father was a school master and organist at Wunsiedel, but in 1765 he became a pastor at Joditz near Hof, and in 1776 at Schwarzenbach, where he died in 1779. After attending the gymnasium at Hof, Richter went in 1781 to the university of Leipzig. Unable to maintain himself at Leipzig he returned in 1784 to Hof, where he lived with his mother. From 1787 to 1789 he served as a tutor at Töpen, a village near Hof; and afterwards he taught the children of several families at Schwarzenbach.

Richter's first work was *Grönländische Prozesse* and *Auswahl aus des Teufels Papieren,* the former of which was issued in 1783–84, the latter in 1789. In later life Richter had little sympathy with their satirical tone. His next book, *Die unsichtbare Loge,* a romance, published in 1793, had all the qualities which were soon to make him famous, and its power was immediately recognized. He then produced in rapid succession *Hesperus* (1795), *Biographische Belustigungen unter der Gehirnschale einer Riesin* (1796), *Leben des Quintus Fixlein* (1796), *Blumen- Frucht- und Dornenstücke, oder Ehestand, Tod und Hochzeit des Armenadvokaten Siebenkäs* (1796–97), *Der Jubelsenior* (1797), and *Das Kampaner Tal* (1797). This series of writings won for Richter an assured place in German literature.

In 1797 he went to Leipzig, and in the following year to Weimar, where he had much pleasant intercourse with Herder, by whom he

was warmly appreciated. He did not become intimate with Goethe and Schiller, to both of whom his literary methods were repugnant; but in Weimar, as elsewhere, his good talk and genial manners made him a favourite in general society. In 1801 he married Caroline Meyer, whom he met in Berlin in 1800. They lived first at Meiningen, then at Coburg; and finally, in 1804, they settled at Bayreuth. Here Richter spent a quiet, simple and happy life, constantly occupied with his work as a writer. In 1808 he was delivered from anxiety as to outward necessities by the prince-primate, K. T. von Dalberg, who gave him a pension of a thousand florins. Before settling at Bayreuth, Richter had published his most ambitious novel, *Titan* (1800–3); and this was followed by *Flegeljahre* (1804–5), two works which he himself regarded as his masterpieces. His later imaginative works were *Dr. Katzenbergers Badereise* (1809), *Des Feldpredigers Schmelzle Reise nach Flätz* (1809), *Leben Fibels* (1812), and *Der Komet, oder Nikolaus Marggraf* (1820–22). In *Vorschule der Aesthetik* (1804) he expounded his ideas on art; he discussed the principles of education in *Levana, oder Erziehungslehre* (1807); and the opinions suggested by current events in *Friedenspredigt* (1808), *Dämmerungen für Deutschland* (1809), *Mars und Phöbus Thronwechsel im Jahre 1814* (1814), and *Politische Fastenpredigten* (1817). In his last years he began *Wahrheit aus Jean Pauls Leben,* to which additions from his papers and other sources were made after his death by C. Otto and E. Förster. In 1821 Richter lost his only son, and never quite recovered from the shock. He died of dropsy, at Bayreuth, on Nov. 14, 1825.

Schiller said of Richter that he would have been worthy of admiration "if he had made as good use of his riches as other men made of their poverty." And it is true that in the form of his writings he never did full justice to his great powers. In working out his conceptions he found it impossible to restrain the expression of any powerful feeling by which he might happen to be moved. He was equally unable to resist the temptation to bring in strange facts or notions which occurred to him. Hence every one of his works is irregular in structure, and his style lacks directness, precision and grace. But he had an amazingly fertile imagination and a surprising power of suggesting great thoughts by means of the simplest incidents and relations. Richter was a great nature-lover and deeply religious in spirit; to him visible things were but the symbols of the invisible, and in the unseen realities alone he found elements which seemed to him to give significance and dignity to human life. His humour, the most distinctive of his qualities, cannot be dissociated from the other characteristics of his writings. It determined to some extent the form in which he embodied even his most serious reflections. It is sometimes extravagant and grotesque but never harsh or vulgar, and generally it springs naturally from the perception of the incongruity between ordinary facts and ideal laws. With all his wilfulness and eccentricity Richter was a man of a pure and sensitive spirit, with a passionate scorn for pretence and an ardent enthusiasm for truth and goodness.

Richter's *Sämtliche Werke* appeared in 1826–28 in 60 vols., to which were added 5 vols. of *Literarischer Nachlass* in 1836–38. Editions of selected works appeared in 16 vols. (1865), in Kürschner's Deutsche Nationalliteratur (edited by P. Nerrlich, 6 vols., 1884–87). The chief collections of Richter's correspondence are: *Jean Pauls Briefe an F. H. Jacobi* (1828); *Briefwechsel Jean Pauls mit seinem Freunde C. Otto* (1829–33); *Briefwechsel zwischen H. Voss und Jean Paul* (1833); *Briefe an eine Jugendfreundin* (1858); P. Nerrlich, *Jean Pauls Briefwechsel mit seiner Frau und seinem Freunde Otto* (1902). *See* further the continuation of Richter's autobiography by C. Otto and E. Förster (1826–33); R. O. Spazier, *J. P. F. Richter: ein biographischer Kommentar zu dessen Werken* (5 vols., 1833); F. J. Schneider, *Jean Pauls Altersdichtung* (1901), and *Jean Pauls Jugend und erstes Auftreten in der Literatur* (1906). All Richter's more important works have been translated into English, *Quintus Fixlein* and *Schmelzles Reise,* by Carlyle; *see* also Carlyle's two admirable essays on Richter.

RICHTHOFEN, FERDINAND, BARON VON (1833–1905), German geographer and traveller, was born near Karlsruhe, Silesia, on May 5, 1833. He was educated at Breslau and Berlin, and in 1856 carried out geological investigations in the Tirol, subsequently extending them to Transylvania. In 1859 he accompanied as geologist the Prussian diplomatic mission to the Far East under Count von Eulenburg, and visited Ceylon, Japan, Formosa, the Philippines and Java, subsequently making an overland journey from Bangkok to Moulmein and reaching Calcutta in 1862. No important work resulted from these travels, for much of Richthofen's records and collections was lost. China was at the time inaccessible owing to the Taiping rebellion, but Richthofen was impressed with the desirability of exploring it, and after a visit to California, where he remained till 1868, he returned to the East. In a remarkable series of seven journeys he penetrated into almost every part of the Chinese Empire. He returned home in 1872, and a work comprising three large volumes and an atlas, which, however, did not cover the entire field or complete the author's plan, appeared at Berlin in 1877–85 under the title of *China; Ergebnisse eigner Reisen und darauf gegründeter Studien.* In this standard work the author deals not only with geology but with every subject necessary to a general geographical treatise. Notably he paid close attention to the economic resources of the country he traversed; he wrote a valuable series of letters to the Shanghai Chamber of Commerce, and first drew attention to the importance of the coalfields of Shantung, and of Kiaochow as a port. In 1875 Richthofen was elected professor of geology at Bonn, but being fully occupied with his work in China he did not take up professorial duties till 1879; in 1883 he became professor of geography at Leipzig, and in 1886 was chosen to the same office at Berlin, and held it till his death. He died Oct. 16, 1905.

Among his other works are: *Natural System of Volcanic Rocks* (San Francisco, 1867); *Aufgaben und Methoden der heutigen Geographie* (an address delivered at Leipzig, 1883); *Führer für Forschungsreisende* (Berlin, 1886); *Triebkräfte und Richtungen der Erdkunde in neunzehnten Jahrhundert* (address on his election as rector, Berlin, 1903).

RICHWOOD, a city of Nicholas county, West Virginia, U.S.A., 60 m. E. of Charleston, on the Baltimore and Ohio railroad. Pop. 4,331 in 1920, 92% native white; estimated locally at 8,000 in 1928. It is in a farming and timber region in the foot-hills of the Alleghenies, and has lumber and paper mills, a tannery, coal mines and several wood-working factories. The town was founded and incorporated in 1901, and in 1921 was chartered as a city.

RICIMER (d. 472), master of the Roman Empire in the West during part of the 5th century, was the son of a prince of the Suebi and the daughter of Wallia, king of the Visigoths. His youth was spent at the court of Valentinian III., and he won distinction under Aetius. In 456 he defeated the Vandals in a sea-fight near Corsica, and on land near Agrigentum in Sicily. He then gained the consent of the Roman senate to an expedition against the emperor Avitus, whom he defeated at Piacenza on Oct. 16, 456. Ricimer then obtained from Leo I., emperor at Constantinople, the title patrician, but in 457 set up Majorianus as his own emperor in the West. When, however, Majorianus tried to rule by himself, Ricimer forced him to abdicate and caused his assassination on Aug. 7, 461. The successor whom Ricimer placed upon the throne was Libius Severus, who proved to be more docile than Majorianus. Upon his death in 465—said to be due to the poison of Ricimer—this emperor-maker ruled the West for eighteen months without an emperor, and then accepted Leo's candidate Anthemius. Before long, however, Ricimer moved to Milan, ready to declare war upon Anthemius. St. Epiphanius, bishop of Milan, patched up a truce, but in 472 Ricimer proclaimed as emperor Olybrius, whom Leo had sent to pacify the two enemies, and after three months' siege captured Rome, on July 1, 472. Anthemius was massacred and Rome was a prey to Ricimer's soldiers. He himself, however, died on Aug. 18, 472, of malignant fever.

The main authorities for this period are collected in Mommsen's *Chron. Minora* (3 vols., 1892–98). *See* also Gibbon ed. Bury (London, 1907) p. 15–49. L. M. Hartmann, *Geschichte Italiens im Mittelalter,* vol. i. (1897).

RICINA, an ancient town of Picenum, Italy, 3 m. N.W. of the modern Macerata, on the banks of the river Potenza, in a fertile valley. After it was refounded by Pertinax and Septimius Severus, it bore the name Colonia Helvia Ricina Pertinax. Considerable ruins of an amphitheatre and remains of baths and other buildings (all of the imperial period) still exist; also the

fragments of an ancient bridge over the Potenza.

RICKETS, a disease of children and young animals characterized by deficient calcification of the bones and teeth and by other evidences of perverted nutrition (*see* METABOLIC DISEASES). Rickets most commonly attracts attention about the end of the first year of life but the bony changes are preceded by digestive disorder. The child's appetite is poor, and there is frequent vomiting, with diarrhoea and wasting. A common early symptom is profuse sweating of the head, particularly during sleep, with a tendency in the child to kick off all coverings and expose the limbs. There is great tenderness of the bones, as shown by the pain produced on moving or handling the child. Gradually changes in the shape of the bones become obvious about the epiphyseal lines at the ends of the long bones. Thus in the arm there is enlargement at the wrists, and in the ribs a knobbed appearance at the junction of their ends with the costal cartilages. The bones from their lack of calcium salts become misshapen, by the action of the muscles and the superincumbent weight of the body. Those of the limbs are bent outwards and forwards, and the child becomes "bow-legged" or "in-kneed." The trunk shows alterations and deformities owing to curvature of the spine, flattening of the lateral curves of the ribs, and projection forwards of the sternum ("pigeon breast"). The pelvis undergoes distortion, which may reduce its diameters to a degree that in the female may afterwards lead to difficulties in parturition. The head of the rickety child is large-looking in its upper part, the individual bones of the cranium sometimes remaining long ununited, while the face is small and ill-developed, and the teeth appear late and fall out or decay early. The spleen often is enlarged.

Commonly, the disease terminates in recovery, with more or less deformity and dwarfing, the bones although altered in shape becoming firmly ossified. But during the progress of the disease, various intercurrent ailments may cause death, such as the infectious fevers, bronchitis and other pulmonary affections, chronic hydrocephalus, convulsions, laryngismus stridulus, etc.

Rickets is now recognized to be largely if not entirely due to deficiency of vitamin D in the food (*see* VITAMINS). The treatment is directed towards the supply of this deficiency, *e.g.*, by cod liver oil, exposure to sunlight or in its absence to ultra-violet light. Recently ergosterol which has been exposed to ultra-violet radiation, has been introduced to replace cod-liver oil. In addition general hygienic and nutritive measures must be adopted. Unduly prolonged suckling and artificial—especially starchy-foods given before the infant is able to digest them, are often noted in the histories of rickety children.

An acute form of rickets of rare occurrence (really a form of scurvy, *q.v.*) has been described, in which all the symptoms develop rapidly, the result in many instances being fatal.

The condition formerly known as foetal rickets (achondroplasia or chondrodystrophia foetalis) is now classed as a separate disease. Its chief characteristics are dwarfism with shortening of the limbs and enormous enlargement of the articulations.

RICKETTS, CHARLES (1866–), English artist, was born at Geneva on Oct. 2, 1866, and educated in France. In 1889 he became joint editor with Charles Shannon of the *Dial*. In 1896 he founded the Vale press, the output of which was a series of beautifully designed and printed books. Of his pictures, "The Plague" (1911) is in the Luxembourg at Paris, and "Don Juan" (1916) in the National Gallery. He published *The Prado and its Masterpieces* (1903); *A Bibliography of the Books issued by Hacon and Ricketts* (1904); *Titian* (1906); and *Pages on Art* (1913).

RICKMAN, THOMAS (1776–1841), English architect, was born on June 8, 1776, at Maidenhead, Berkshire, and died at Birmingham on Jan. 4, 1841. He designed many churches, the new court of St. John's College, Cambridge and a palace for the bishop of Carlisle. These are all in the Gothic style, but show more knowledge of its outward form than real acquaintance with its spirit. Rickman nevertheless played a part in the revival of mediaevalism perhaps second only to Pugin. His *Attempt to discriminate the Styles of Architecture in England* ran through many editions.

RICKMANSWORTH, an urban district in Hertfordshire, England; 17½ m. W.N.W. of London by the Met. and G.C. Jt. railway; served also by a branch of the L.M.S. railway from Watford. Pop. (1921) 7,515.

RICOCHET, a military term expressing the rebound of a projectile that strikes on a hard surface. The origin of the French word *ricochet* is unknown. Its earliest known use (14th and 15th centuries) was in the sense of "repetition," e.g. *chanson du ricochet*, "an oft-told tale." Hence it came to be applied to the rebound of a flat stone skimmed along the surface of water, known familiarly in English as "ducks and drakes," and so finally in the military sense defined above, which found its way into the English language.

The use of the now obsolete "ricochet fire" in war is well illustrated by "ducks and drakes." The shot, striking the ground at a small angle, described for the remainder of its course a succession of leaps and falls. The discovery of this species of fire, usually attributed to Vauban (siege of Ath in 1697), had the greatest influence both on sieges and on operations in the field. In siege warfare, ricochet, especially when combined with enfilade, *i.e.* when directed along the enemy's line of defence, soon became the principal weapon of the besieger, and with the system of parallels (*q.v.*) gave the attack a superiority so complete that a siege came to be considered as the most certain operation of war. Enfilade fire by itself was neutralized by traverses in the defences, but by the new method a shot could be so aimed as to skip over each successive traverse and thus to search ground that was immune from direct fire. The application of ricochet fire to operations in the field came somewhat later. In the 18th century field artillery, which was not, before Napoleon's time, sufficiently mobile to close with the enemy, relied principally upon the ricochet of round shot, which, sweeping a considerable depth of ground, took effect upon several successive lines of hostile troops. But once artillery was able to gallop up to the enemy and to use its far more terrible close-range projectile, case-shot, ricochet fire came to be used less and less, until finally, with the general adoption of shell (which, of course, burst at the first contact with the ground), the round shot disappeared altogether from the battlefield. Similarly in siege warfare, as soon as high-angle fire with shells became sufficiently accurate, there was no further need of round shot and ricochet.

The term "ricochet" is now only applied, in modern rifle shooting, to the graze of a bullet that has struck short. A modern bullet that has ricochetted inflicts a very severe wound, as its nickel or other hard envelope is torn and jagged by its contact with the ground. With its high remaining velocity it is dangerous even after more than one ricochet, except at extreme ranges.

RICOLD OF MONTE CROCE (1242–1320), Italian Dominican missionary, was born at Monte Croce, near Florence. In 1267 he entered the Dominican house of Santa Maria Novella in Florence, and in 1272 that of St. Catherine in Pisa. He started for Acre with a papal commission to preach in 1286 or 1287: in 1288 or 1289 he began to keep a record of his experiences in the Levant; this record he probably reduced to final book form in Baghdad. He travelled extensively in Syria, Asia Minor and Persia. In Baghdad he stayed several years, studying the Koran and other works of Moslem theology, for controversial purposes, arguing with Nestorian Christians, and writing. In 1301 Ricold again appeared in Florence: some time after this he proposed to submit his *Confutatio Alcorani* to the pope, but did not. He died on Oct. 31, 1320.

The best edition of the *Itinerary* is by J. C. M. Laurent, in *Peregrinatores Medii Aevi Quatuor*, pp. 105 (101)–41 (Leipzig, 1864 and 1873). The *Epistles* have been edited by R. Röhricht in *Archives de l'orient latin*, vol. ii. part ii. (Documents) pp. 258–96 (Paris, 1884). The *Confutatio Alcorani*, printed at Seville in 1500, at Venice in 1607, adds hardly anything to the sections of the *Itinerary* devoted to Moslem belief, etc. Ricold's *Libellus contra Nationes Orientales* and *Contra errores Judaeorum* have never been printed. *See* also C. Raymond Beazley, *Dawn of Modern Geography*, iii. 190–202, 218, 390–391, 547, 554, 564.

RICOTTI-MAGNANI, CESARE (1822–1905), Italian general and knight of the Annunziata, was born at Borgo Lavezzaro on June 30, 1822. After serving from 1856 to 1859 as

director of the artillery school, he became general of division in 1864, commanding the 5th division at the battle of San Martino. In the war of 1866 he stormed Borgoforte, to open a passage for Cialdini's army. Upon the death of General Govone in 1872 he was appointed minister of war, and after the occupation of Rome bent all his efforts to army reform, in accordance with the lessons of the Franco-German War. He shortened the period of military service; extended conscription to all able-bodied men; created a permanent army, a mobile militia and a reserve; commenced the renewal of armaments; and placed Italy in a position to put 1,800,000 men on a war footing. Ricotti fell from power with the Right in 1876, but returned to office with Depretis in 1884, and amended his previous scheme of reform. Resigning in April 1887, he became a member of the senate in 1890, but took little part in public life until 1896, when, after the battle of Adowa, he formed a ministry; he made over the premiership to the marquis di Rudini, retaining for himself the portfolio of war, and sought to consolidate the tactical structure of the army without weakening its fighting power. Ricotti's ideas were not acceptable at court, and he had to resign. Nevertheless, his prestige as creator of the modern Italian army remained unimpaired.

RIDDELL, GEORGE ALLARDICE RIDDELL, 1ST BARON (1865–), British newspaper proprietor, was born in London on May 25, 1865, and educated privately. He became a solicitor in 1888 and settled in practice at Cardiff. There he acquired an interest in *The Western Mail*, and he eventually turned his energies mainly to newspaper management. He went to London and obtained control over the Sunday paper *The News of the World*, which he developed on popular lines, so that it obtained a huge circulation during the first decade of the 20th century and made its proprietor a wealthy man. He gradually extended his newspaper connections, becoming a director also of George Newnes Ltd., Country Life Ltd. and C. Arthur Pearson Ltd., etc. In 1909 he received a knighthood. He was a prominent member of the Newspaper Proprietors' Association at the outbreak of the World War, and, owing to his intimate relations with Mr. Lloyd George, he gradually became the principal liaison between the Press and the Government so far as all matters of publicity were concerned. In this capacity he represented the British Press at the Peace Conference in 1919 and at all the important Allied conferences subsequently. He was created a baronet in 1918 and raised to the peerage as Baron Riddell of Walton Heath in 1920. His publications include *Some Things That Matter* (1922) and *More Things That Matter* (1925). (*See* CENSORSHIP.)

RIDGEFIELD PARK, a village of Bergen county, New Jersey, U.S.A., on the Hudson river, opposite New York city (about 125th street). It is served by the New York, Susquehanna and Western and the West Shore railways and motor-bus lines. Pop. (1920) 8,575. It is a residential suburb.

RIDGEWOOD, a village of Bergen county, New Jersey, U.S.A., 22 m. N.W. of New York city and 5 m. N.E. of Paterson on the Erie railroad. Pop. (1920) 7,580 (86% native white); 1928 local estimate 13,500. It is a park-like residential suburb, in the foot-hills of the Watchung and the Ramapo mountains. The village, originally called Godwinville, was incorporated in 1894 and in 1911 a commission form of government was established.

RIDGWAY, a borough of northern Pennsylvania, U.S.A., the county seat of Elk county; midway between Buffalo and Pittsburgh, on the Clarion river at the mouth of Elk creek. It is on Federal highways 120 and 219, and is served by the Buffalo, Rochester and Pittsburgh and the Pennsylvania railways. Pop. (1920) 6,037 (82% native white). The borough has an altitude of 1,380 ft. and covers nearly 3 square miles. It is in a natural gas field which has supplied many cities and towns within a radius of 150 m. since 1914, and is headquarters of the electric power company serving a large territory. Ridgway was founded in 1824 by Jacob Ridgway of Philadelphia and incorporated in 1880.

RIDING, THRITHING or **THRIDING,** a Scandinavian term for the third part of a shire or county, *e.g.*, the ridings of Yorkshire and of Lindsey in Lincolnshire. In Iceland the third part of a *thing* which corresponds roughly to an English county was called *thrithjungr;* in Norway, however, the *thrithjungr* seems to have been an ecclesiastical division. To the riding causes were brought which could not be determined in the wapentake, and a matter which could not be determined in the riding was brought into the court of the shire. There is abundant evidence that riding courts were held after the Norman Conquest.

Each of the ridings of Yorkshire has its own lord lieutenant and commission of the peace, and under the Local Government Act of 1888 forms a separate administrative county. They are distinguished as the north, east and west ridings, but the ancient divisions of Lindsey were known as the north, south and west ridings respectively.

See Dugdale, *Monasticon Anglicanum*, vol. vi. ed. by John Caley and others (1846); F. Liebermann, *Die Gesetze der Angelsachsen* (Halle, 1888–89); Stubbs, *Constitutional History of England.*

RIDING: *see* HORSEMANSHIP.

RIDLEY, NICHOLAS (*c.* 1500–1555), English bishop and martyr, was the second son of Christopher Ridley of Unthank Hall, near Willemoteswick, Northumberland. He was sent about 1518 to Pembroke Hall, Cambridge. Having graduated M.A. in 1526 he went to study at the Sorbonne in Paris and at Louvain, and on his return to Cambridge was appointed junior treasurer of his college. In 1534 he was one of the university proctors, and signed the decree of the university against the jurisdiction of the pope in England. Ridley was now chaplain to the university and began to show leanings to the reformed faith. In 1537 he became chaplain to Thomas Cranmer, archbishop of Canterbury, and in April 1538 vicar of Herne, Kent. In 1540 he was chosen master of Pembroke Hall; in 1541 he became chaplain to Henry VIII. and canon of Canterbury. In 1543 he was accused of heretical teaching and practices but acquitted, although just after his exculpation he finally abandoned the doctrine of transubstantiation.

In September 1547 Ridley was nominated bishop of Rochester. He was one of the visitors who were appointed to establish protestantism in the University of Cambridge; in 1548 helped to compile the English prayer book, and in 1549 was one of the commissioners who examined Bishops Gardiner and Bonner. He concurred in their deprivation, and succeeded Bonner in the see of London. Having signed the letters patent settling the English crown on Lady Jane Grey, Ridley, in a sermon preached at St. Paul's cross on July 9th, 1553, affirmed that the princesses Mary and Elizabeth were illegitimate, and that the succession of the former would be disastrous to the religious interests of England. When Lady Jane's cause was lost, however, he went to Framlingham to ask Queen Mary's pardon, but was at once arrested and sent to the Tower of London. From his prison he wrote in defence of his religious opinions, and early in 1554 he, with Cranmer and Latimer, was sent to Oxford to be examined. He defended himself against a number of divines, but was declared a heretic, and excommunicated. He refused to recant, and in Oct. 1555 he was tried for heresy under the new penal laws, being degraded and sentenced to death. With Cranmer and Latimer he met his end at the stake in Oxford on Oct. 16, 1555.

See *Works of Nicholas Ridley D.D.* (ed. H. Christmas, Parker Soc., 1841). His *Life* was written by Dr. Gloucester Ridley in 1763, and there is a memoir of him in Moule's edition of the bishops' *Declaration of the Lord's Supper* (1895).

RIDOLFI or RIDOLFO, **ROBERTO DI** (1531–1612), Italian conspirator, born at Florence on Nov. 18, 1531, settled in London about 1555. In 1570 he set to work on the plot against Elizabeth which is usually associated with his name. His intention was to marry Mary, queen of Scots, to the duke of Norfolk and to place her on the English throne. In 1571 he visited the duke of Alva at Brussels, Pius V. at Rome, and Philip II. at Madrid to explain to them his scheme and to gain their active assistance thereto. His messenger, by name Charles Baillie (1542–1625), was, however, seized at Dover; Norfolk and Lesley were arrested, the former being condemned to death in January 1572. Ridolfi, who was then in Paris, died at Florence on Feb. 18, 1612.

RIEGER, PHILIPP FRIEDRICH VON (1818–1903), Bohemian politician and publicist, was born on Dec. 18, 1818, at

Semil, Bohemia. He first came into prominence as one of the Czech leaders in the revolution of 1848. In 1853 he married a daughter of the historian Palacky. In 1858 he started the *Slovník naučny*, the Czech national encyclopaedia and also helped to found the first Czech political daily newspaper published in Prague (1861), of which he was for a while the editor. After the issue of the "October diploma" of 1860, Rieger, with Palacky, undertook the leadership of the reconstituted Czech party. In 1871 he conducted the negotiations with the Hohenenwarth ministry for a federal constitution of the empire, which broke down owing to his extreme attitude in the matter of Bohemian independence. On the reappearance of the Czechs in the Bohemian diet (1878) and the Austrian *Reichsrath* (1879) Rieger, as chief of the so-called "Old Czechs," supported Count Taaffe's government. In 1891, together with the other "Old Czechs," he was defeated at the poll. In March 1897 he was created a baron (*Freiherr*) and given a seat in the Upper House, but his influence was now at an end. He died on March 3, 1903.

RIEL, LOUIS (1844–1885), Canadian agitator, son of Louis Riel and Julie de Lagemaundière, was born at St. Boniface, on Oct. 23, 1844, according to his own account, though others place his birth in 1847. Though known as a half-breed, or Métis, and though with both Indian and Irish ancestors, his blood was mainly French. From July 1866 he worked for two years at various occupations in Minnesota, returning in July 1868 to St. Vital, near St. Boniface. In 1869 the transfer of the territorial rights of the Hudson's Bay Company to the dominion of Canada gave great uneasiness to the Métis, and in October 1869 a party led by Riel turned back at the American frontier the newly appointed Canadian governor; in November they captured Fort Garry (Winnipeg), the headquarters of the Company, and called a convention which passed a bill of rights.

In December a provisional government was set up, of which on Dec. 29, Riel was made president, and which defeated two attacks made on it by the English-speaking settlers of the vicinity. So far the Métis had been within their rights, but Riel was flighty, vain and mystical, and his judicial murder on March 4, 1870, of Thomas Scott, an Orangeman from Ontario, roused against him the whole of English-speaking Canada. An expedition was equipped and sent out under Colonel Garnet, later Lord Wolseley, which captured Fort Garry on Aug. 24, 1870, Riel decamping. (*See* STRATHCONA, LORD.) He was not arrested, and on Aug. 4, 1871, urged his countrymen to combine with the Canadians against a threatened attack from American Fenians, for which he was publicly thanked by the lieutenant-governor. In 1872 for religious reasons he changed his name to Louis David Riel. In October 1873 he became member of the Dominion parliament for Provencher, came to Ottawa and took the oath, but did not sit. On April 16, 1874, he was expelled from the House, but in September was again elected for Provencher; on Feb. 10, 1875, he was outlawed, and the seat thereby again vacated. In 1877–78 he was for over a year a patient in the Beauport asylum for the insane, but from 1879 to 1884 he lived quietly in Montana.

In 1884 in response to a deputation from the Métis, who had moved west to the forks of the Saskatchewan river, he returned to Canada to win redress for their wrongs. His own rashness and the ineptitude of Canadian politicians and officials brought on a rising, which was crushed after some hard fighting, and on May 15, 1885, Riel surrendered. He was imprisoned at Regina, was tried and on Aug. 1 found guilty of treason, and on Nov. 16 was hanged at Regina, meeting his fate with courage. His death was the signal for a fierce outburst of racialism in Quebec and Ontario, which nearly overthrew the Conservative government.

See J. S. Willison, *Sir Wilfrid Laurier*, vol. i.; George Bryce, *History of the Hudson's Bay Company* (1900); and the Canadian daily press for 1885.

RIEMANN, GEORG FRIEDRICH BERNHARD (1826–1866), German mathematician, was born on Sept. 17, 1826, at Breselenz, near Dannenberg in Hanover.

In 1840 he went to Hanover, where he attended the lyceum and two years later he entered the Johanneum at Lüneburg. The director, Schmalfuss, encouraged him in his mathematical studies by lending him books (among them Euler's works and Legendre's *Theory of Numbers*). In 1846 Riemann entered the university of Göttingen, where, although supposed to be studying theology, he attended lectures on the numerical solution of equations and on definite integrals by M. A. Stern, on terrestrial magnetism by Goldschmidt, and on the method of least squares by K. F. Gauss. In 1847 he went to Berlin, where P. G. L. Dirichlet, C. G. J. Jacobi, J. Steiner and F. G. M. Eisenstein were professors. During this period he formed those ideas on the theory of functions of a complex variable which led to his great discoveries.

In 1850 he returned to Göttingen and in 1851 obtained his doctorate with his celebrated thesis "Grundlagen für eine allgemeine Theorie der Functionen einer veränderlichen complexen Grösse."

In his Habilitationsschrift on the "Representation of a Function by Means of a Trigonometrical Series," Riemann shows his usual originality and refined style. The subject of his trial lecture, chosen by Gauss, was "On the Hypotheses which form the Foundation of Geometry." (*See* GEOMETRY: *Non-Euclidian.*) This wonderful work was published in the *Göttinger Abhandlungen* (1868) and a translation by Clifford in *Nature* (vol. 8).

Riemann's health had never been strong and now under the strain of work he broke down, and retired to the Harz with his friends Ritter and R. Dedekind, where he gave himself up to excursions and "Naturphilosophie." After his return to Göttingen (Nov. 1857) he was made extraordinary professor, and his salary raised to 300 thalers. Before this he had been in very straitened circumstances, and in 1855 was granted a government stipend of 200 thalers. On Dirichlet's death in 1859, Riemann was appointed his successor in Göttingen. He died at Selasca, on Lake Maggiore, on July 20, 1866. Most of his memoirs are masterpieces—full of original methods, profound ideas and far-reaching imagination. *See* RIEMANNIAN GEOMETRY below.

The collected works of Riemann were published by H. Weber, assisted by R. Dedekind (8vo, Leipzig, 1876; 2nd ed., 1892).

RIEMANNIAN GEOMETRY. Any n independent variables x_i where i takes the values 1 to n, may be thought of as the coordinates of an n-dimensional space, or variety V_n, in the sense that each set of values of the x's defines a point of V_n. In a space as thus defined there is not an *a priori* basis for the determination of magnitude nor for the comparison of directions at two different points. Riemann proposed the study of the metric properties of a general V_n by introducing as the basis for measurement a quadratic differential form

$$\sum_{i,j}^{1,\ldots,n} g_{ij}dx_i dx_j,$$

where the g's are functions of the x's, subject to the restrictions that the determinant of the g's is not zero and that for all values of the differentials the above sum is positive. By definition the distance ds between the points of coordinates x_i and x_i+dx_i is given by

$$ds^2 = \sum_{i,j}^{1,\ldots,n} g_{ij}dx_i dx_j. \qquad (1)$$

This is a generalization of the first fundamental form of a surface in ordinary space when the surface is defined in terms of two parameters, as proposed by Gauss (*see* DIFFERENTIAL GEOMETRY). In this case the metric on the surface is induced by the Euclidean metric of the enveloping space, whereas in a general Riemannian space the metric is assigned.

From the hypotheses concerning (1) it can be shown that at any point

$$\sum_{i,j}^{1,\ldots,n} g_{ij}\frac{dx_i}{ds}\frac{\delta x_j}{\delta s}$$

is less than unity for two different sets of differentials dx_i and δx_i. Consequently a real angle θ is determined by the equation

$$\cos\theta = \sum_{i,j}^{1,\ldots,n} g_{ij}\frac{dx_i}{ds}\frac{\delta x_j}{\delta s}; \qquad (2)$$

by definition it is the *angle* between the directions at the point determined by the two sets of differentials. This is in keeping with the fact that the cosine of the angle between two tangents, at a point, to a surface in ordinary space when expressed in terms of the induced metric, is given by an equation of the form (2).

When we have n independent functions ϕ_i of the x's the equations

$$x'_i=\phi_i(x_1, \cdots, x_n) \qquad (i=1, \cdots, n)$$

define a transformation of coordinates of the space. If the g's in (1) are such, which is rarely the case, that by a suitable transformation the form (1) is reducible to

$$ds^2=\sum_{i}^{1,\cdots,n}(dx'_i)^2, \tag{3}$$

which is a generalization of the metric of ordinary space in cartesian coordinates, we say that the space is flat, or *plane;* otherwise it is *curved.* The locus of points defined by

$$x_1=f_1(t), \quad \cdots, x_n=f_n(t)$$

for all values of the parameter t is called a *curve.* When these expressions are substituted in (1), we obtain an expression of the form $ds=F(t)dt$, and then the length of arc of the curve is given by integration. If the result of the integration is $s=\phi(t)$, by means of this equation the coordinates at points of the curve are expressible as functions of the arc s as parameter. The theory of curves involves $n-1$ principal curvatures, which are generalizations of the curvature and torsion of a curve in ordinary space.

Using the terminology of the calculus of variations, we say that the extremals of the integral

$$\int\Big(\sum_{i,j}^{1,\cdots,n} g_{ij}\frac{dx_i}{ds}\frac{dx_j}{ds}\Big)^{\frac{1}{2}}ds$$

are the shortest lines, or *geodesics,* of the space. The geodesics are found to be the integral curves of a system of differential equations

$$\frac{d^2x_i}{ds^2}+\sum_{j,k}^{1,\cdots,n}\Gamma^i_{jk}\frac{dx_j}{ds}\frac{dx_k}{ds}=0 \qquad (i=1, \cdots, n), \tag{4}$$

where the Γ's are certain functions of the g's and their first derivatives. When the space is flat and the coordinates are those for which the fundamental form is (3), all the functions Γ vanish identically. Consequently in the coordinate system the equations of the geodesics of the flat space are

$$x_i=a_is+b_i, \qquad (i=1, \cdots, n), \tag{5}$$

where the a's and b's are constants. Thus the geodesics of a Riemannian space are the analogues of straight lines of a Euclidean space. Riemann showed that in a general space a coordinate system exists such that all the geodesics through a given point are defined by a_is $(i=1,\ldots n)=1$, but those through other points are not given by (5). In such a coordinate system the Γ's vanish at the given point, but not their derivatives.

Two sets of differentials dx_i and δx_i determine two directions at a point, and $adx_i+b\delta x_i$, where a and b are parameters, a linear pencil of directions at the point. The geodesics issuing from a point P in a linear pencil of directions constitute a surface; the Gaussian curvature (*see* DIFFERENTIAL GEOMETRY) of this surface at P was taken by Riemann as the measure of curvature of the space for the given pencil. It is expressed in terms of the directions, and the components of a tensor of the fourth order, which involves the functions Γ^i_{jk} and their first derivatives; it is now known as the *Riemannian curvature tensor* (*see* TENSOR). Ordinarily the curvature varies with the choice of the pencil. Schur showed that, if it is the same for all pencils at each point of the space, then it has the same value at every point; these are the spaces of constant Riemannian curvature; when, and only when, the constant is zero, the space is flat.

From time to time important contributions to Riemannian geometry were made by Bianchi, Beltrami, Christoffel, Voss and others, and Ricci co-ordinated and extended the theory simultaneously with the development of tensor calculus. These contributions include the study of a sub-space of a Riemannian space analogous to that of a surface in ordinary space. Such a sub-space of order r is the locus of points defined by the equations

$$x_i=\psi_i(u_1, \cdots, u_r) \qquad (i=1, \cdots, n), \tag{6}$$

where the u's are independent parameters. When these expressions are substituted in (1), we obtain an induced metric for the sub-space—a generalization of the first fundamental differential form of a surface (*see* DIFFERENTIAL GEOMETRY). There is also a generalized second fundamental form, whose coefficients enter in the relations between the curvatures of a curve in the sub-space relative to the latter and the curvatures of the curve as of the enveloping space. Among the curves of the sub-space there are geodesics, lines of curvature, asymptotic lines and conjugate systems of curves, which are generalizations of these types of curves on a surface in ordinary space. Einstein based his theory of gravitation upon the assumptions that physical space and time constitute a four-dimensional continuum whose metrical character is determined by the presence of matter, and that these spaces are of a particular kind defined in invariantive form by means of the curvature tensor; in this theory the fundamental form (1) is not positive for every choice of the differentials. This and other physical interpretations of differential geometry of spaces have stimulated the development of the theory.

Notable among the recent contributions is the concept of parallelism of vectors in a general Riemannian space as introduced by Levi-Civita. In such a space parallelism is not absolute, as it is in Euclidean space, but is relative to the curve joining the points of application of the vectors. Thus for a curve $x_i=f_i(s)$ each set of solutions of the equations

$$\frac{d\xi^c}{ds}+\sum_{j,k}^{1,\cdots,n}\Gamma^c_{jk}\xi\frac{jdx_k}{ds} \qquad (i=1, \cdots, n) \tag{7}$$

are the components of a family of vectors at the points of the curve which are parallel to one another with respect to the curves. Certain Riemannian spaces admit one or more fields of vectors, such that any two of them are parallel with respect to any curve joining their points of application. When there are n independent fields of this kind, the space is flat. In particular, the tangents to a geodesic are parallel with respect to the geodesic, as follows from (7) and (4), when we put $\xi^i=\frac{dx_i}{ds}$, geodesics are the straight lines of the space. This concept of parallelism is involved in many of the recent developments of Riemannian geometry and its generalizations have opened up new fields (*see* AFFINE GEOMETRY).

RIENZI, COLA DI (*c.* 1313–1354), tribune of the Roman people, was born in Rome, the son of a tavern-keeper named Lorenzo Gabrini. His father's Christian name was shortened to Rienzo, and his own, Nicholas, to Cola; hence the Cola di Rienzi, or Rienzo, by which he is generally known. His early years were passed at Anagni. The study of the Latin writers, historians, orators and poets filled his mind with stories of the glories and the power of ancient Rome, and he dreamed of restoring his native city to its pristine greatness. His zeal was quickened by the desire to avenge his brother, who had been killed by a noble. Rienzi became a notary and a person of some importance in the city, and was sent in 1343 on a public errand to Pope Clement VI. at Avignon. He won the favour and esteem of the pope, who gave him an official position at his court. Returning to Rome about April 1344 he gathered a band of supporters, plans were drawn up, and at length all was ready for the rising. On May 19, 1347, heralds invited the people to a parliament on the Capitol, and on the 20th, Whit-Sunday, the meeting took place. Dressed in full armour and attended by the papal vicar, Cola headed a procession to the Capitol; here he addressed the assembled crowd on

"the servitude and redemption of Rome." A new series of laws were adopted by acclamation, and unlimited authority was given to the author of the revolution. The nobles left the city or went into hiding, and a few days later Rienzi took the title of tribune (*Nicholaus, severus et clemens, libertatis, pacis justiciaeque tribunus, et sacre Romane Reipublice liberator*).

The new ruler governed the city with a stern justice, in marked contrast to the recent reign of licence. The tribune moved through the streets of Rome in state, being received at St. Peter's with the hymn *Veni Creator spiritus*. Petrarch wrote to him, urging him to continue his great and noble work, and called him the new Camillus, Brutus and Romulus. In July in a sonorous decree he proclaimed the sovereignty of the Roman people over the empire, but before this he had set to work to restore the authority of Rome over the cities and provinces of Italy, to make the city again *caput mundi*. He invited the cities of Italy to send representatives to an assembly to meet on Aug. 1, when the formation of a great federation under the headship of Rome would be considered. On the appointed day representatives appeared, and after elaborate and fantastic ceremonial Rienzi, as dictator, issued an edict citing the emperor Charles IV., and also the imperial electors and all others concerned in the dispute, to appear before him in order that he might pronounce judgment in the case. On the following day the festival of the unity of Italy was celebrated.

Rienzi's power was recognized in Naples, whence both Queen Joanna and her bitter foe, King Louis of Hungary, appealed to him for protection. On Aug. 15 he was installed tribune with great pomp, wreaths of flowers being placed on his head. Gregorovius says this ceremony "was the fantastic caricature in which ended the imperium of Charles the Great. A world where political action was represented in such guise was ripe for overthrow, or could only be saved by a great mental reformation." Rienzi then seized, but soon released, Stephen Colonna and other barons who had spoken disparagingly of him. But his power was waning. His extravagant pretensions excited ridicule. His government was costly, and he was obliged to lay heavy taxes upon the people. He offended both pope and emperor by his proposal to set up a new Roman empire, resting directly upon the will of the people. In October Clement gave power to a legate to depose him and bring him to trial. The exiled barons gathered some troops, and war began. Rienzi obtained aid from Louis of Hungary and others, and on Nov. 20 his forces defeated the nobles in a battle outside the gates of Rome, where Rienzi's most distinguished foe, Stephen Colonna, was killed. But this victory did not save him. He passed his time in feasts and pageants, while in a bull the pope denounced him as a criminal, a pagan and a heretic, until, terrified by a slight disturbance on Dec. 15, he abdicated and fled from Rome. He sought refuge in Naples, but soon left that city and spent over two years in a mountain monastery.

Emerging from his solitude Rienzi journeyed to Prague, which he reached in July 1350, and threw himself upon the protection of the emperor Charles IV. Denouncing the temporal power of the pope he implored the emperor to deliver Italy, and especially Rome, from their oppressors; but Charles kept him in prison for more than a year in the fortress of Raudnitz, and then handed him over to Clement. At Avignon, where he appeared in August 1352, Rienzi was tried by three cardinals, and was sentenced to death, but this judgment was not carried out, and he remained in prison. In December 1352 Clement died, and his successor, Innocent VI., anxious to strike a blow at the baronial rulers of Rome, pardoned and released his prisoner. Giving him the title of senator, he sent him to Italy with the legate, Cardinal Albornoz, and Rienzi, with a few mercenaries, entered Rome in August 1354. He was received with great rejoicing, and regained his former position. A tumult broke out on Oct. 8. Rienzi attempted to address the mob, but the building in which he stood was fired, and while trying to escape in disguise he was murdered. In 1887 a statue of the tribune was erected at the foot of the Capitoline hill in Rome.

Rienzi's life and fate have formed the subject of a famous novel by Bulwer Lytton, of an opera by Wagner and of a tragedy by Julius Mosen. His letters, edited by A. Gabrielli, are published in vol. vi. of the *Fonti per la storia d'Italia* (Rome, 1890). *See* also Papencordt, *Cola di Rienzo und seine Zeit* (Hamburg, 1841); Auriac, *Étude historique sur N. Rienzi* (Amiens, 1885); E. Rodocanachi, *Cola di Rienzi* (Paris, 1888); Kühn, *Die Entwickelung der Bündnispläne Cola di Rienzos im Jahre 1347* (Berlin, 1905); A. von Reumont, *Geschichte der Stadt Rom* (1867–70); and F. Gregorovius, *Geschichte der Stadt Rom im Mittelalter*, vol. vi. (Eng. trans., by A. Hamilton, 1898).

RIESA, a town in the republic of Saxony, on the Elbe, 30 m. N.W. of Dresden, on the main line of railway to Leipzig, and at the junction of lines to Chemnitz, Elsterwerda and Nossen. Pop. (1925) 24,218. Riesa received municipal rights in 1632, and after a period of decay was again raised to the rank of a town in 1859. The town contains a castle, which is now used as a town hall. There are rolling-mills and saw-mills and ironworks. Other industries are the manufacture of furniture, beer, soap, carriages, marble wares, and bricks. The most important shipping station on the Elbe in Saxony, Riesa is the lading-place for goods to and from Bavaria, and a mart for herrings, petroleum, wood and grain. A passenger steamboat service is maintained with Meissen and Dresden.

RIESENER, JEAN HENRI (1734–1806), French cabinet-maker of the Louis XVI. period, was born at Gladbach near Cologne on July 4, 1734, and died in Paris on Jan. 6, 1806. At an early age he went to Paris, where he entered the workshop in the Arsenal of Jean François Oeben (*q.v.*). When his master died, Riesener became foreman of the works; two years later he married Mme. Oeben. By 1782 he had accumulated a fortune of about £40,000 and had received the title, formerly Oebens's, of "Ébéniste du Roi." Riesener was unquestionably the greatest of the Louis Seize cabinet-makers. His work is generally bold and graceful. His marquetry presents an extraordinary finish; his chiselled bronzes are of the first excellence. He was especially distinguished for his cabinets, in which he employed many European as well as exotic woods. Wreaths and bunches of flowers form the centres of the panels; on the sides are often diaper patterns in quiet colours. His high-water mark was reached in the Bureau du Roi, conceived by Oeben, finished in 1769 and consequently belonging rather to the Louis Quinze than the Louis Seize period, and a similar cylinder bureau believed to have been made for Stanislas Leszczynski, king of Poland, now in the Wallace Collection. At Buckingham Palace there is a third bureau on the same lines. These pieces are triumphs of marquetry. For long Riesener followed Oeben, but there was a gradual transition to a style more individual, more delicately conceived, with finer but hardly less vigorous lines. By the time he had been working alone for ten years he had completely embraced the Louis Seize manner —he had, perhaps, some responsibility for it. One of the most distinguished of his achievements for the court was the famous flat writing-table now at the Petit Trianon. Some of his creations are vitiated by being mounted with panels of Sèvres, Wedgwood and other china. Such is the beautiful little secretaire in the Jones collection in the Victoria and Albert Museum.

See F. de Salverte, *Les Ébénistes du XVIII. Siècle* (Paris, 1927).

RIESENGEBIRGE or **GIANT MOUNTAINS,** a lofty and rugged group on the boundary between Prussian Silesia and Bohemia, between the upper courses of the Elbe and the Oder. They are continued towards the north-west in the Erzgebirge, the Thuringian Forest and the Harz Mountains. Adjoining the Isergebirge and the Lausitzergebirge on the west, and the Eulengebirge and the Adlergebirge on the east and south-east, the Riesengebirge proper trend south-east and north-west between the sources of the Zacken and the Bober, for a distance of 23 m., with a breadth of 14 miles. They cover an area of about 425 sq.m., three-quarters of which is in Czecho-Slovakia, the rest in Germany. The boundary line follows the crest of the principal ridge (Riesenkamm, average height 4,000 ft.), which stretches along the northern side of the group. The principal peaks are the Reifträger (4,430 ft.), the Hohes Rad (4,950 ft.), the Great Sturmhaube (4,862 ft.), the Little Sturmhaube (4,646 ft.), and, near the east extremity, the Schneekoppe (5,258 ft.), the loftiest mountain in northern or central Germany. Roughly parallel to this northern ridge, and separated from it by a long narrow valley of the Siebengründe, there extends on the south a lower chain, of broad massive "saddles," with comparatively few peaks. The chief

heights here are Kesselkoppe (4,708 ft.), the Krkonose (4,849 ft.), the Ziegenrücken and the Brunnenberg (5,072 ft.). From both ridges spurs are sent off, whence a magnificent view is obtained from Breslau to Prague; the lowlands of Silesia, watered by the Oder, and those of Bohemia, intersected by the Elbe and the Moldau, appear to lie mapped in relief (*see* SCHNEEKOPPE). A group of isolated columnar rocks known as the *Adersbacher Felsen* occur in a valley on the Bohemian side of the Riesengebirge, 9 m. from Braunau.

On its northern side this mountain group has a rugged and precipitous slope from the Hirschberg valley; but on its southern slope, towards Bohemia, a more gradual one. The Bohemian ridge is cleft about the middle by a deep gorge through which pour the headwaters of the river Elbe, which finds its source in the Siebengründe. A great number of small streams also rise among these mountains and small lakes and tarns are not unfrequent. The Great and Little Schneegruben—two deep rocky gorge-like valleys in which snow remains all the year round—lie to the north of the Hohes Rad.

A wide range of rock formations occurs in the Riesengebirge. Archaean gneisses and schists form an important part, but Palaeozoic and Mesozoic rocks (especially Jurassic and Cretaceous) are also important. Variscan and Tertiary folding affected the region and north-easterly faults run along the foot of the Isergebirge and Riesengebirge. Extensive peat moors occupy many of the mountain slopes and valleys. The lower parts of the mountains are clad with forests of oak, beech, pine and fir; above 1,600 ft. only the last two kinds of trees are found, and beyond about 3,950 ft. only the dwarf pine (*Pinus Pumilio*). Various alpine plants are found, some of them having been artificially introduced on the Schneekoppe. Wheat is grown to an elevation of 1,800 ft. above the sea and oats as high as 2,700 feet.

The Riesengebirge is easily accessible by railway, several branches from the main lines on both sides, penetrating the valleys, and thus many spots are a good deal frequented in the summer. The Schneekoppe and other summits are annually visited by numbers of travellers, notably the spas of Warmbrunn (near Hirschberg) and Flinsberg on the Gneis, and Görbersdorf, with its sanatorium. The Riesengebirge is the legendary home of Number Nip (Rübezahl), a goblin of German folklore.

RIETI (anc. *Reate*), a city and episcopal see of Italy, the capital of the province of Rieti, 25½ m. by rail and 15 m. direct S.S.E. of Terni, which is 70 m. by rail from Rome. Pop. (1921) 11,810 (town), 18,975 (commune). It occupies a fine position 1,318 ft. above sea-level on the right bank of the Velino (a torrent subtributary to the Tiber), which at this point issues from the limestone plateau; the old town occupies the declivity and the new town spreads out on the level. While with its quaint red-roofed houses, its old town walls (some Roman fragments, restored about 1250), its cathedral (13th and 15th centuries), its episcopal palace (1283), and its various churches and convents Rieti has much mediaeval picturesqueness; it also displays a good deal of modern activity in corn, vine and olive growing and cattle-breeding. The fertility of the neighbourhood is celebrated both by Virgil and by Cicero.

For the disputes of Reate with the people of Interamna *see* TERNI. In 1149 the town was besieged and captured by Roger I. of Sicily. In the struggle between church and empire, it always held with the former; and it defied the forces of Frederick II. and Otho IV. Pope Nicholas IV. long resided at Rieti, and it was there he crowned Charles II. of Anjou king of the Two Sicilies. In the 14th century Robert, and afterwards Joanna of Naples managed to keep possession of Rieti for many years, but it returned to the States of the Church under Gregory IX. About the year 1500, the liberties of the town, long defended against the encroachments of the popes, were entirely abolished. An earthquake in 1785 was in 1799 followed by the pillage of Rieti by the Neapolitans.

See G. Colasanti, *Rieti* (Perugia, 1911).

RIEVAULX (rē-ę-vō), a village, North Riding, Yorkshire, England, three miles west by north of Helmsley, which is served by the L.N.E. railway. Pop. (1921) 191. It is situated on the River Rye before it emerges from the York moors into the Vale of Pickering. The name is probably a corruption of Rye Vale. Rievaulx abbey, one of the most beautiful ruins in Yorkshire, was founded by the Cistercians in 1131. The principal remains are those of a cruciform church which is mainly Early English in style and is of very fine workmanship. Considerable fragments of the refectory remain and the domestic buildings may be traced.

RIF CAMPAIGNS: *see* MOROCCO, FRANCO-SPANISH CAMPAIGNS IN.

RIFIS, the name given to the Berbers of the Rîf district of Morocco, the mountain region bordering the north coast from Ceuta eastward nearly to the borders of Algeria and forming part of the Atlas range. The Rîf dialect changes the Arabic "l" to "r," and this supports the derivation of "Rifi" from "Libi," "b" and "f" being interchangeable. *See* MOROCCO.

RIFLE: *see* SMALL ARMS.

RIFLE-BIRD or **RIFLEMAN-BIRD,** the name applied to birds of paradise (*q.v.*) of the genera *Ptilorrhis* and *Craspidornis*, probably because their plumage bears some resemblances to the full-dress uniform (green and black) of the British rifle regiments. There are five species, of which one inhabits New Guinea and the others the Australian continent. The best known is *P. paradisea*. *See* R. B. Sharpe, *Monograph of the Paradiseidae*.

RIGA, a seaport of Latvia, of which it is the capital, in 57° 3′ N., 24° 1′ E. Pop. (1923) 285,000. It is situated at the southern extremity of the Gulf of Riga, 8 m. above the mouth of the western Dwina, which is connected by means of inland canals with the basins of the Dnieper and Volga. The Gulf of Riga is 100 m. long and 60 m. wide, with shallow waters of slight salinity and a greatest depth of 22 fathoms. It is frozen for an average of 127 days in the year. The sea entrance has a depth of 24½ ft. which is being dredged to 26 ft. The channel up to the town is 24 ft. deep and the depth at the quays varies from 18 to 26 ft. There are vast warehouses and a large grain elevator. The port has two electric cranes (10 tons and 25 tons), a 25 ton floating crane and there are on order (1928) for the town 8 electrical portable cranes and one 130 ton crane as there is a growing transit trade with Soviet Russia. The Riga Exchange Committee's slip dock at Bolderaja is capable of taking ships up to 1,000 tons. Large ships unload at Ust-Dvinsk (formerly Dunamünde). The imports are herrings, foodstuffs, clothing, sugar, tobacco, industrial and agricultural machinery, mechanical tools, railway equipment, coal, coke and fertilisers, and the exports flax, timber, wooden goods, dairy produce, meat, pork and ham. The town manufactures paper, wood-pulp, cellulose, matches, veneered goods, paints and varnish, textiles, especially cotton and linen goods, boots and shoes, rubber goods, cement, vegetable oils, tobacco and alcoholic drinks. Manufactures were seriously hampered by the destruction of factories and plant during the World War, when Riga was occupied by German troops from 1917 to 1919. Trade in 1926 was about 10% of that in 1913.

Riga consists of four parts—the old town and suburbs on the right bank of the Dwina (Latvian, *Daugava*), and the Mitau suburb on the left bank, the two sides being connected by a floating bridge, which is removed in winter, and by a viaduct, 820 ft. long. The old town still preserves its Hanseatic features—high storehouses, with spacious granaries and cellars, flanking the narrow, winding streets. The only open spaces are the market-place and two other squares. The suburbs, with their broad and quiet boulevards on the site of the fortifications, are steadily growing.

Few antiquities of the mediaeval town remain. The oldest church, the Dom (St. Mary's), founded in 1215, was burned in 1547, and the present building dates from the second half of the 16th century, but has been thoroughly restored since 1883. Its organ, dating from 1883, is one of the largest in the world. St. Peter's church, with a beautiful tower 412 ft. high, was erected in 1406–9. The castle was built in 1494–1515 by the master of the Knights of the Sword, Walter von Plettenberg, a spacious building often rebuilt. The "House of the Black Heads," a corporation, or club, of foreign merchants, was founded in 1330, and subsequently became the meeting-place of the wealthier youth.

The Livlandische Ritterhaus, the former place of meeting of the Livonian nobility, still stands. Near the city are extensive

summer bathing beaches, with mile after mile of little wooden chalets nestling among pine trees. The Riga Polytechnic Institute became a university in 1919, Dorpat (Tartu) university, which previously served all the Russian Baltic provinces, having become Estonian property.

History.—Riga was founded in 1158, as a storehouse at the mouth of the river, by a few Bremen merchants. About 1190 the Augustinian monk Meinhard erected a monastery there, and in 1199–1201 Bishop Albert I. of Livonia obtained from Pope Innocent III. permission for German merchants to land at the new settlement, and chose it for his seat, exercising his power over the neighbouring district in connexion with the Teutonic Knights. As early as the first half of the 13th century the young city obtained the right of electing its own magistracy, and enlarged the walls erected during Albert I.'s time. It joined the Hanseatic League, and from 1253 refused to recognize the rights of the bishop and the knights. In 1420 it fell once more under the rule of the bishop, who maintained his authority until 1566, when it was abolished in consequence of the Reformation. Sigismund II., king of Poland, took Riga in 1547, and in 1558 the Russians burned its suburbs and many ships in the river. In 1561 Gotthard Ketteler publicly abdicated his mastership of the order of the Teutonic Knights, and Riga, together with southern Livonia, became a Polish possession. After some unsuccessful attempts to reintroduce Roman Catholicism, Stephen Bathory, king of Poland, recognized the religious freedom of the Protestant population. Throughout the 17th century Riga was a bone of contention between Sweden, Poland and Russia. In 1621 Gustavus Adolphus, king of Sweden, took it from Poland, and held it against the Poles and the Russians, who besieged it in 1656. During the Northern War between Sweden and Russia, it was courageously defended (1700), but after the battle of Poltava it succumbed, and was finally taken in July 1710 by the Russians.

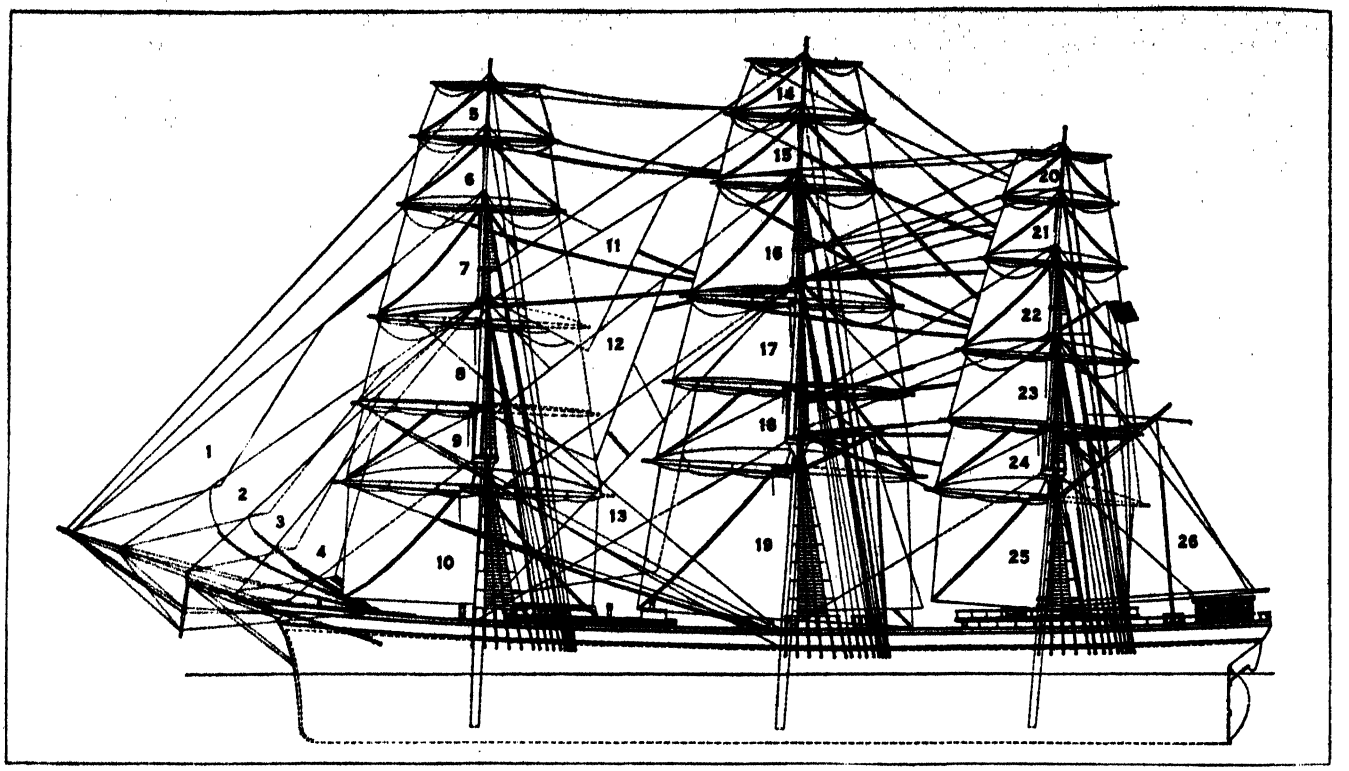
RIGAUD, HYACINTHE (1659–1743), French painter, born at Perpignan on July 20, 1659, was the descendant of a line of artists. He was sent to Montpellier to study under Pezet, and afterwards went to Lyons, and in 1681 to Paris. There he obtained the grand prix de Rome, but on the advice of Le Brun he allowed it to lapse and devoted himself to painting portraits. For sixty-two years he did as many as thirty to forty portraits a year. But Rigaud, although purely a portrait painter, set his heart on gaining admission to the Academy as a historical painter, and succeeded in Jan. 1700. He died on Dec. 27, 1743.

His principal portraits at the Louvre are those of himself and his mother (Marie Serre), of the sculptor Desjardins, of Mignard and Le Brun, of Bossuet and of Louis XIV.

RIGBY, RICHARD (1722–1788), English politician, was the only son of Richard Rigby (d. 1730) of Mistley Hall, Essex, a merchant who made a fortune through his connection with the South Sea Company. Young Rigby became an associate of Frederick, prince of Wales, and entered parliament in 1745. He is chiefly known to fame through his connection with John Russell, 4th duke of Bedford, and the "Bloomsbury gang," his audacity earning for him the title of the "brazen boatswain" of the "crew." In 1758 he became secretary to Bedford, who was lord lieutenant of Ireland, and in the following year he was given the sinecure office of master of the rolls for Ireland. Following the political fortunes of the duke he became vice-treasurer of Ireland in 1765, and in 1768 he obtained the lucrative position of paymaster-general of the forces. Rigby often spoke in parliament, and in 1769 he shared in the opposition to Wilkes. In 1784 he was obliged to resign his position as paymaster-general, and he was somewhat surprised and embarrassed when he was requested to pay over the large sum of public money which was in his possession. He left a great fortune when he died at Bath on April 8, 1788. Wraxall says that Rigby "possessed talents for addressing a popular assembly which were sustained by a confidence that nothing could abash."

RIGEL, the bright star at the heel of the constellation (*q.v.*) Orion (*q.v.*). It is of magnitude 0.34, being one of the brightest stars in the sky. Its equivalent in the alphabetical series is β Orionis. (*See* STAR.)

RIGG, JAMES HARRISON (1821–1909), English Nonconformist divine, was born at Newcastle-on-Tyne on Jan. 16, 1821. In 1845 he entered the Wesleyan ministry, and during the agitation of 1849–52 wrote successfully in exposition and defence of the polity of Methodism. In 1857 he published *Modern Anglican Theology*, an acute criticism of the writings of Coleridge, Hare, Maurice, Kingsley and Jowett. In 1868 Rigg was appointed Principal of the Westminster Wesleyan Training College for day-school teachers, a post which he held for 35 years. In 1870 he was elected on the first School Board for London. In 1886 he sat on the Royal Commission of Education. In 1878 he was elected president of conference—and again in 1892. He resigned his principalship in 1903 and died at Brixton on April 17, 1909.



See *Life* by John Telford (1909). His other works include: *National Education in its Social Conditions and Aspects* (1873); *The Living Wesley* (1875, reissued as *The Centennial Life of Wesley* in 1891); *Character and Life-work of Dr. Pusey* (1893); *Oxford High Anglicanism and its chief Leaders* (1895).

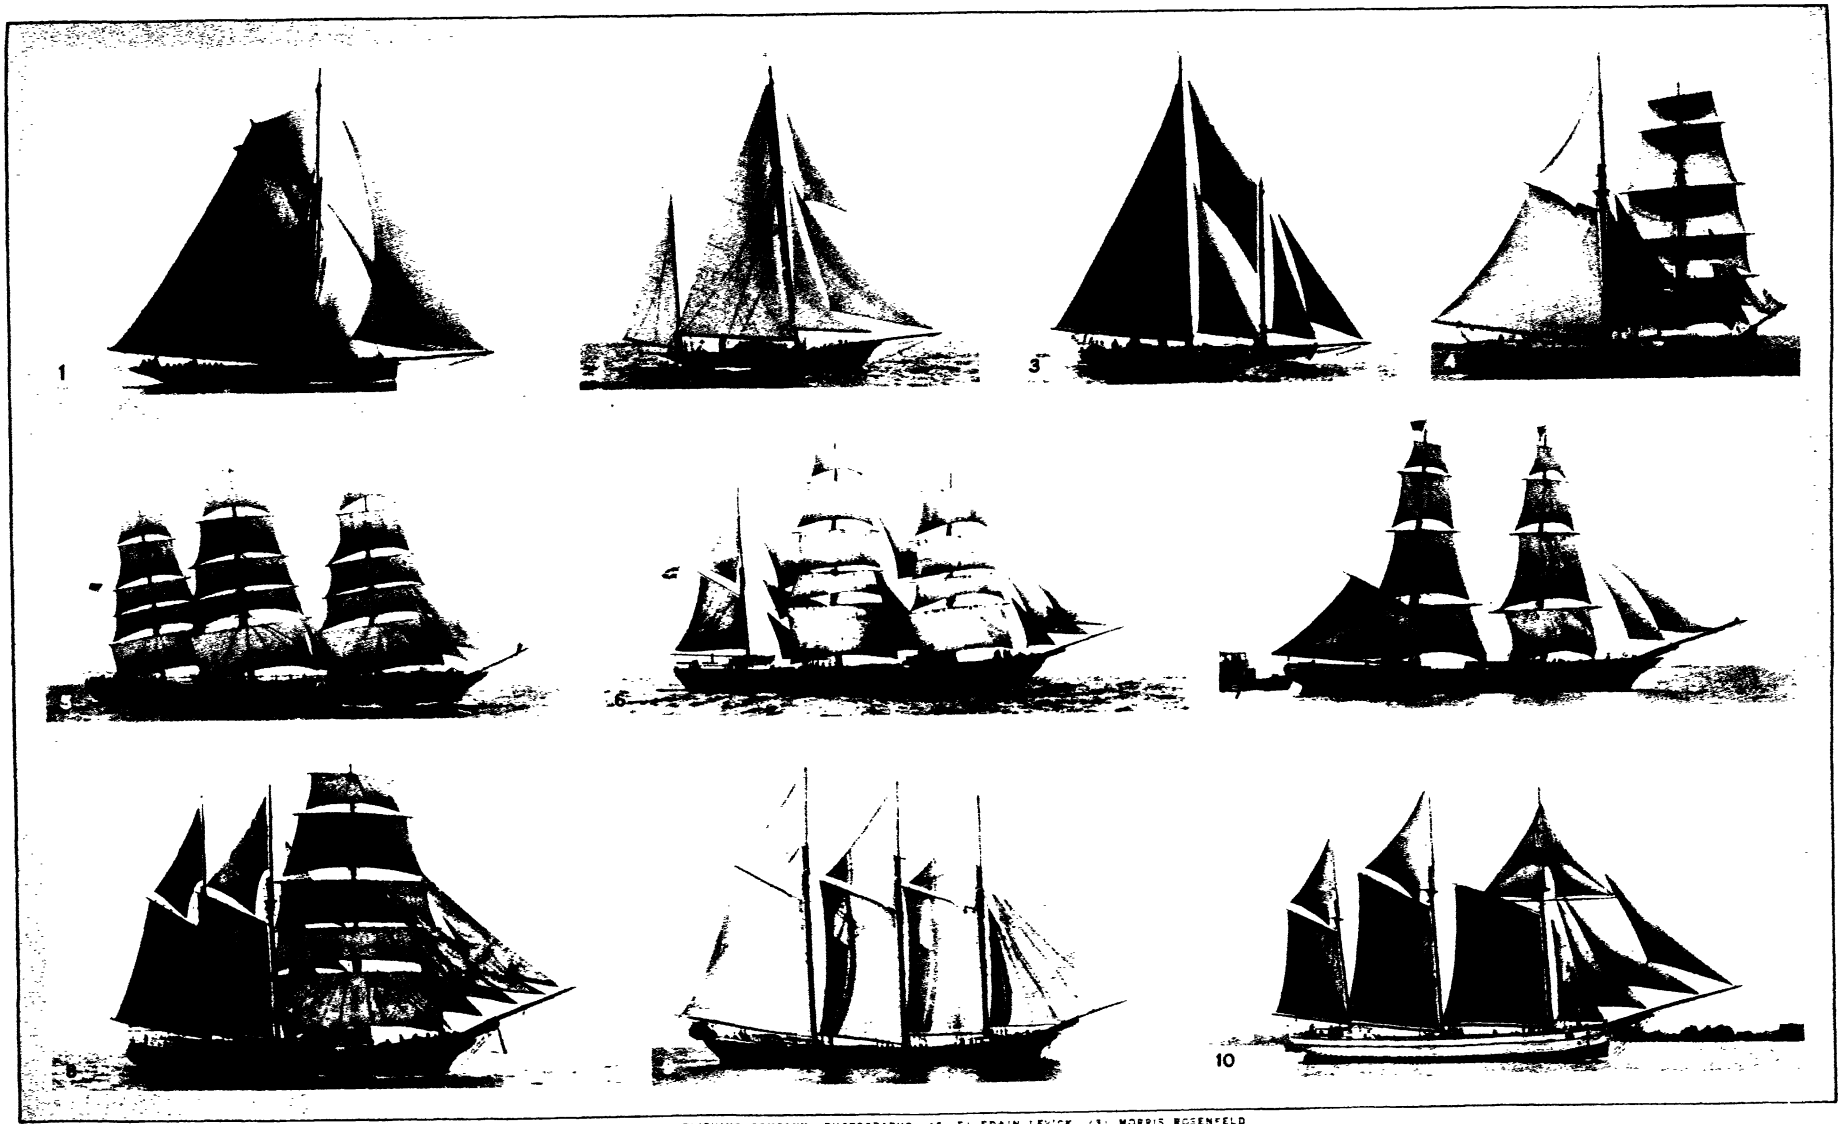
RIGGING (A.S. *wrigan* or *wrihan*, to clothe), the general term, in connection with ships, for the whole apparatus of masts, yards, sails and cordage. (*See* also SHIP, YACHT and NAUTICAL TERMS.) The word is also used as meaning the cordage only.

SAILING SHIPS

Sailing vessels of all classes are classed according to their "rig," *i.e.*, the particular combination of spars, sails and cordage. "Cutter," "brig," or "ship," are really convenient abbreviations for "cutter-rigged," "brig-rigged," or "ship-rigged."

The basis of all rigging is the mast whether it be composed of one or of many pieces of wood or of steel. The mast is supported against fore and aft or athwartship strains by fore and back stays and by shrouds, known as the "standing rigging," because they are made fast, and not hauled upon. In the case of a mast composed of several parts, including topmast and topgallant mast, the stays, and other ropes which keep the top and topgallant masts in place, are however only comparative fixtures as they may be cast off when these masts are lowered down. The bowsprit, though it does not rise from the deck but projects from the bow, is in the nature of a mast. The masts and bowsprit support all the sails, whether they hang from yards, slung across the mast, or from gaffs, projecting from the mast, or, as in the case of the jibs, or other triangular sails, travelling on the ropes called "stays," which go from the mast to the bowsprit or deck. The bowsprit is subdivided like the masts. The bowsprit proper corresponds to the lower fore-, main- or mizzen-mast. The jib-boom, which is movable and projects beyond the bowsprit, corresponds to a topmast; the flying jib-boom, which also is movable and projects beyond the jib-boom, answers to a topgallant mast. The ropes by which the yards, booms and sails are manipulated for trimming to the wind or for making or shortening sail, are known as the "running rigging." The rigging also provides the crew with the means of going aloft, and for laying out on the yards to let fall or to furl the sail. Therefore the shrouds (*see* below) are utilized to form ladders, the steps of which are called ratlines. Near the heads of the lower masts are the tops—platforms on which men can stand—and in the same place on the topmasts are the "cross-trees," of which the main function is to extend the topgallant shrouds. The yards are provided with ropes, extending from the middle to the extremities or yard-arms, called foot-ropes, which hang down about 2 or 3 ft., and on which men can stand. The material of which the cordage is made differs greatly. Leather has been used but the prevailing materials have been hemp or grass rope, and, in recent days, chain and wire. As the whole of the rigging is divided into standing and running, so a rope forming part of the rigging is divided into the "standing part" and the "fall." The standing part is that which is made fast to the mast, deck or block. The fall is the loose end or part on which the crew haul. The block is the pulley through which the rope runs. A "tackle" (pronounced "taikel") is a combination of ropes and blocks which gives increased power at the lifting or moving end, as distinct from the end which is being "manned." If fig. 1 is followed from the bow to the mizzenmast, it will be seen that a succession

THE SPARS, SAILS AND RIGGING OF A FULL-RIGGED SHIP



1. Flying jib; 2. Outer jib; 3. Inner jib; 4. Jib; 5. Fore skysail; 6. Fore royal; 7. Fore topgallant sail; 8. Fore upper topsail; 9. Fore lower topsail; 10. Foresail; 11. Main royal staysail; 12. Main topgallant staysail; 13. Main topmast staysail; 14. Main skysail; 15. Main royal; 16. Main topgallant sail; 17. Main upper topsail; 18. Main lower topsail; 19. Mainsail; 20. Mizzen skysail; 21. Mizzen royal; 22. Mizzen topgallant sail; 23. Mizzen upper topsail; 24. Mizzen lower topsail; 25. Crossjack; 26. Spanker

of stays connect the masts with the hull of the ship or with one another. All pull together to resist pressure from in front. Pressure from behind is met by the backstays, which connect the topmasts and topgallant masts with the sides of the vessel. Lateral pressure is met by the shrouds and breast-backstays. A temporary or "preventer" backstay is used when great pressure is to be met. The bobstays hold down the bowsprit, which is liable to be lifted by the tug of the jibs and of the stays connecting it with the fore-topmast. If the bowsprit is lifted the fore-topmast loses part of its support.

The running rigging by which all spars are hoisted or lowered and sails spread or taken in may be divided into those which lift and lower—the lifts, jeers, halliards (haulyards)—and those which hold down the lower corners of the sails—the tacks and sheets. A long technical treatise would be required to name the many parts of standing and running rigging and their uses. All that is attempted here is to give the main lines and general principles or divisions.

The vessel dealt with here is the fully rigged ship with three masts. But the principles of others are the same. The simplest of all forms of rigging is the dipping lug, a quadrangular sail hanging from a yard and always hoisted on the side of the mast opposite to that on which the wind is blowing (the lee side). When the boat is to be tacked so as to bring the wind on the other side, the sail is lowered and rehoisted. One rope can serve as halliard to hoist the sail and as a stay when it is made fast on the weather side on which the wind is blowing. The difference between such a craft and the fully rigged ship is that between a simple organism and a very complex one; but it is one of degree, not of kind. The steps in the scale are innumerable. Every sea has its own type. (*See* Pl. I., figs. 1, 2, 3, 4, 5, 6, 7.) Some in eastern waters are of extreme antiquity, and even in Europe vessels are still to be met with which differ very little if at all from ships of the Norsemen of the 9th and 10th centuries. For a full account of these varieties of rigging the reader may be referred to *Mast and Sail in Europe and Asia* (London, 1906), by H. Warington Smyth.

When the finer degrees of variation are neglected the types of rigging may be reduced to comparatively few, which can be classed by the shape of their sail and the number of their masts. At the bottom of the scale is such a craft as the Norse herring boat. This boat has one quadrangular sail suspended from a yard which is hung (or slung) by the middle to a single mast which is placed (or stepped) in the middle of the boat. She is the direct representative of the ships of the Norsemen. Her one sail is a "course" such as is still used on the fore and mainmasts of a fully developed ship; a topsail may be added (above the course) and then we have the beginning of a fully clothed mast. A very similar craft called a Humber keel is used in the north of England. The lug sail is an advance on the course, since it is better adapted for sailing on the wind, with the wind on the side. When the lug is not meant to be lowered, and rehoisted on the lee side, as in the dipping lug mentioned above, it is slung at a third from the end of the yard, and is called a standing lug. A good example of the lug is the junk (Pl. I., figs. 4, 6). The lug is a "lifting sail," and does not tend to press the vessel down as the fore and aft sail does. Therefore it is much used by fishing vessels in the North Sea. The type of the fore and aft rig is the schooner (Pl. II., fig. 9). The sails on the masts have a gaff above and a boom below. These spars have a prong called "the jaws," which fit to the mast, and are held in place by a "jaw rope" on which are threaded beads called trucks. Sails of this shape are carried by fully rigged ships on the mizzenmast, and can be spread on the fore and main. They are then called trysails and are used only in bad weather when little sail can be carried, and are hoisted on the trysail mast, a small mast above the great one. The lateen sail (Pl. I., fig. 2) is a triangular sail akin to the lug, and is the prevailing type of the Mediterranean. These original types, even when unmodified by mixture with any other, permit of large variations. The number of masts of a lugger may vary from one to five, and of a schooner from two to five or even seven. A small lug may be carried above the large one, and a gaff topsail added to the sails of a schooner. A one-masted fore-and-aft-rigged vessel may be a cutter (Pl. II., fig. 1) or sloop. But the pure types may be combined, in topsail schooners, brigantines, barquentines and barques, when the topsail, a

VARIOUS TYPES OF SAILING VESSELS AND THEIR RIGGING

1. A cutter-rigged yacht, with gaff-mainsail and topsail
2. A yawl, with Bermuda or jib-headed rig
3. A staysail schooner, so-called because of the staysails between the masts instead of the regular foresail
4. A brigantine, or hermaphrodite brig
5. A full-rigged ship, square-rigged on all three masts
6. Barque rig, square-rigged on fore and main masts
7. A full-rigged brig, a rare type to-day
8. A barquentine, square-rigged on foremast only
9. A three-masted schooner, fore-and-aft-rigged on all three masts
10. A Great Lakes schooner, with a raffee or triangular sail on the foremast

SAILING BOATS OF DIFFERENT NATIONS

1. Arab dhow with long overhang forward, an open waist and high poop
2. Native trading boat of the type frequently found on the River Nile
3. Small fishing boat on Lake Como, one of Italy's beautiful inland lakes
4. A Chinese junk with the characteristic bluff lines, overhanging stem and lug sails with battens running across them
5. Japanese sampans taking advantage of a favourable breeze to start down river
6. Chinese junk
7. A broad beamed Venetian trading boat crossing the lagoon from Malamocco to Venice
8. Trim Dutch fishing boat of Volendam on the Zuider Zee going to windward
9. English fishing smacks running before the wind in the Brawleys Race during Southbend Yachting week

quadrangular sail hanging from and fastened to a yard, slung by the middle, is combined with fore and aft sails. The lateen rig has been combined with the square rig to make such a rigging as the xebec—a three-masted vessel square rigged on the main, and lateen on the fore and mizzen. Triangular sails of the same type as the jibs can be set on the stays between the masts of a fully rigged ship, and are then known as staysails. But it can only be repeated that the variations are innumerable. Studding-sails (pronounced "stun-sails") are lateral extensions to the courses, topsails, etc., of a square-rigged ship to increase the spread of sails, that require the support of special yards, booms and tackle.

The development of the rigging of ships is a very obscure subject. It was the work of centuries, and of practical men who wrote no treatises. It has never been universal. A comparison of the four-masted junk given above with the figures of ships on mediaeval seals shows at least much similarity. Yet by selecting a few leading types of successive periods it is possible to follow the growth of the fully rigged ship, at least in its main lines, in modern times.

For a time, and after the use of spritsails had been given up, the spritsail yard continued to be used to discharge the function now given to the gaffs. (*See* Smyth, *Sailor's Word-Book*.) The changes in the mizzen have an obscure history. About the middle of the 18th century it ceased to be a pure lateen. The yard was retained, but no sail was set on the fore part of the yard. Then the yard was given up and replaced by a gaff. The resulting new sail was called the spanker. It was, however, comparatively narrow, and when a greater spread of sail was required, a studding-sail (at first called a "driver") was added, with a boom at its foot. At a later date "spanker" and "driver" were used as synonymous terms, and the studding-sail was called a "ringtail." The studding-sails are the representatives of a class of sail once more generally used. In modern times a sail is cut of the extreme size which is capable of being carried in fine weather, and when the wind increases in strength it is reefed—*i.e.*, part is gathered up and fastened by reef points, small cords attached to the sail. Till the 17th century at least the method was often to cut the courses small, so that they could be carried in rough weather. When a greater spread of sail was required, a piece called a bonnet was added to the foot of the sail, and a further piece called a drabbler could be added to that. It is an example of the tenacious conservatism of the sea that this practice is still retained by the Swedish small craft called "lodjor" in the Baltic and White Sea. It will be easily understood that no innovation was universally accepted at once. Jib and sprit topsail, lateen-mizzen and spanker, and so forth, would be found for long on the sea together.

The history of the development of rigging is one of adjustment. The size of the masts had to be adapted to the ship, and it was necessary to find the due proportion between yards and masts. As the size of the mediaeval ship increased, the natural course was to increase the height of the mast and of the sail it carried. Even when the mast was subdivided into lower, top and topgallant, the lower mast was too long, and the strain of the sail racked the hull. Hence the constant tendency of the ships to leak. Sir Henry Manwayring, when giving the proper proportions of the masts, says that the Flemings (*i.e.*, the Dutch) made them taller than the English, which again forced them to make the sails less wide.

A few words may be added concerning the tops. In the earlier form of ships the top was a species of crow's nest placed at the head of the mast to hold a look-out, or in military operations to give a place of advantage to archers and slingers. They appear occasionally as mere bags attached to one side of the mast. As a general rule they are round. In the 16th century there were frequently two tops on the fore- and main-masts, one at the head of the lower, another at the head of the topmast, where in later times there have only been the two traverse beams which make the crosstrees. The upper top dropped out by the 17th century. The form was round, and so continued to be till the 18th century when the quadrangular form was introduced.

Rigging in Power Ships.—The steam and motor ship still carries one or more masts for supporting derricks, for lifting heavy weights in and out of the ship, for carrying wireless aerials, for providing a platform for look out aloft, for mounting the steaming lights and for visual signalling. In the bigger ships the masts are usually hollow steel structures, occasionally with an internal ladderway, while in some merchant ships they also act as uptake ventilators. Stays are usually provided on the same principle as in sailing days, but dead eyes have given way to bottle screws as rope has to wire. Where masts are provided with ladderways, either internally or externally on the iron structure itself, ratlines on the rigging are dispensed with. Modern battleships, battle cruisers and light cruisers in the British navy usually have a tripod foremast in which the lower mast is supported by two inclined steel struts instead of rigging. This is to give the necessary rigidity for mounting the gun director, (*see* GUNNERY, NAVAL) control top and rangefinder.

The main mast usually carries the main derrick and is stayed on the old lines. Wooden topmasts and sometimes topgallant masts are fitted for wireless and signalling, while one or more signal yards are always carried on the foremast. In light cruisers the main mast is usually a small wooden pole. Destroyers and other light craft are fitted with a light wooden foremast and usually a short main or mizzen mast.

The upper end of the standing rigging is shackled to steel bands round the lower masthead and their lower ends are secured to the deck by bottle screws and slips, the screw being locked by a check piece which prevents it easing back, and together with its slip it is covered with painted canvas.

The topmast rigging, consisting of the usual shrouds, stays and back stays is fitted with insulators so as to avoid interference with wireless and danger from lightning. In the case of ships with a tripod foremast it is set up to projections on a level with the base of the control top instead of being brought right down to deck level. A Jacob's ladder gives access to the masthead, whilst above all is a lightning conductor connected by a copper strap running down the mast to the hull of the ship. Where a masthead flashing lamp is fitted, a gallows is provided for its reception. In flagships a pole 16 feet long is clamped to the fore topmast or fore topgallant mast head to carry the Admiral's flag.

Modern Running Rigging.—The only semblance to running rigging in a modern power ship is as follows:

Gantlines, which can be rove through a sheave in the topmast for tricing weights aloft and general purposes.

Clothes lines and hammock gantlines, used for drying clothes or hammocks, which in warships are of thin flexible steel rope which lead through blocks on a shroud near the fore or main lower mast heads and are set up well forward or well aft.

Dressing lines, leading from the foremast awning stantion over both topmasts and down to the after awning stantion. To these are attached flags for "dressing ship."

Signal halyards, made of light white line led through blocks on the yards and trucks for hoisting signal flags.

RIGHI, AUGUSTO (1850–1920), Italian physicist, was born at Bologna on Aug. 27, 1850. He studied at Bologna, where he afterwards held several posts for the teaching of physics. In 1880 he was appointed professor of physics at Palermo university, and in 1889 to a similar post at Bologna, which he retained until he died, on June 8, 1920.

Righi's researches were on electricity, magnetism and light. He discovered the variation in the resistance of bismuth in a magnetic field, and applied this to the measurement of magnetic fields. Righi extended Kerr's observations on the Kerr effect, and found the variation in the rotation of the plane of polarization with the wave length of the light. He examined the phenomena in

a discharge tube and investigated the potential in the neighbourhood of the cathode. Righi observed the discharge of negative electricity from a zinc plate when illuminated by ultra violet light, and this led him to work on photo-electricity. He worked with electromagnetic waves and designed a Hertzian oscillator known by his name. Righi also wrote papers on the changes of length due to magnetization, change of size of insulators under electric stress, and on the phenomena of radioactivity.

Righi received many academic and other honours, and in 1905 was elected a senator.

His principal works are: *Ricerche di elettro-statica* (1873), *La telegrafia senza filo* (with B. Dessau, 1902, etc.), *L'Ottica della oscillazioni eletriche* (1897), *La moderna teoria dei fenomeni fisici* (1907), *Le nuove vedute sulla struttura della materia* (1907), *I fenomeni elettro-atomici sotto l'azione del magnetismo* (1918).

RIGHT ASCENSION, in astronomy, that co-ordinate of a heavenly body defined by the angle which the meridian passing through it makes with the prime meridian through the vernal equinox (*see* ASTRONOMY).

RIGHT-HANDEDNESS: *see* HANDEDNESS.

RIGHTS OF MAN AND OF THE CITIZEN, DECLARATION OF, a sort of manifesto issued in 1789, by the Constituent Assembly in the French Revolution, to be inscribed at the head of the constitution when it should be completed. It stated the fundamental principles which inspired the revolution. The Declaration was first drafted and proposed by the marquis de Lafayette, who had returned from America full of enthusiasm for the principles proclaimed in the Declaration of Independence. The final text voted by the Assembly and accepted by the king on Oct. 5, 1789, is much fuller than the American prototype. It contains a preamble and 17 articles. They proclaim and define political equality and liberty in its various manifestations, determine the character of the law and the conditions of its application, and state at the same time the restrictions upon the individual will which are necessary for the benefit of society. Similar declarations were attached to the constitution of 1793 and to that of the year III.

See E. Blum, *La Déclaration des droits de l'homme et du citoyen*, text with commentary (1902); G. Jellinck, *Die Erklärung der Menschen und Bürgerrechte* (Leipzig, 1895). This study has been translated into English by Rudolf Tombo (New York), and aroused considerable controversy; *see* E. Boutmy, "La Déclaration des droits de l'homme et du citoyen et M. Jellinck," in *Annales des sciences politiques*, July 15, 1902; also E. Walsh, *La Déclaration des droits de l'homme et du citoyen et l'assemblée constituant, Travaux préparatoires* (Paris, 1903).

RIGHT WHALE (*Balaena mysticetus*), also called the Greenland whale, attaining a length of 60 ft. to 70 ft., the largest and most valuable of the whalebone whales, a single specimen sometimes furnishing 3,500 lb. of whalebone. It was formerly the mainstay of the whaling trade, but now almost extinct. An allied species exists in the southern hemisphere, but is also very rare. (*See* CETACEA; WHALE FISHERIES.)

RIGORD (*c.* 1150–*c.* 1209), French chronicler, was probably born near Alais in Languedoc, and became a physician. He entered the monastery of Argenteuil, and then that of St. Denis, and described himself as *regis Francorum chronographus*. Rigord wrote the *Gesta Philippi Augusti*, covering the period 1179–1206. It was abridged and continued by William the Breton (*q.v.*).

See Dom Bouquet's *Recueil des historiens des Gaules et de la France* (Paris, 1738–1876); another ed. by H. F. Delaborde (Paris, 1882–85); French trans. in tome xi. of Guizot's *Collection des mémoires relatifs à l'histoire de France* (Paris, 1825).

RIGORISM, a philosophical term applied by Kant specially to those moralists who take up an anti-hedonist or ascetic standpoint (Lat. *Rigor*, stiffness, firmness). In general the term is opposed to "latitudinarianism" or "indifferentism,"—respectively a morality of compromise and a morality of pure indifference,—and signifies insistence upon the strictest interpretation of a principle, rule or criterion. Thus, in Roman Catholic theology, a rigorist holds that in cases of conscience the proper course is to adhere to the strict wording of the law in question.

RILA (Bulg. RILSKOE SELO), a village of Bulgaria, 51 m. S.S.W. of Sofia, which can be reached by rail to Radomir and Decauville. Ten miles further, up a gorge of the magnificent Rila mountains, stands the monastery of Rila, the largest and richest in Bulgaria. It was founded in the 10th century, but the present church and most of the courtyard date from the 19th.

RILEY, JAMES WHITCOMB (1849–1916), American poet, was born, of pioneer stock, in Greenfield (Ind.), Oct. 7, 1849. "The poet of the common people," Riley was elected to the American Academy of Arts and Letters, received the gold medal of the National Institute of Arts and Letters, was given several honorary degrees and in 1915 had his birthday declared an official holiday throughout his home State in honour of "Indiana's most beloved citizen." After a happy boyhood, which he records in his poems, he found his father's profession of lawyer distasteful and spent several years as an itinerant sign-painter, entertainer, and assistant to patent-medicine venders, all valuable experience, for it gave him the opportunity to compose songs and dramatic skits, to gain skill as an actor and to come into intimate touch with the rural folk of Indiana. His first reputation came through his poems contributed to newspapers—*Leonainie*, which purported to be a poem written by Poe, and the series in Hoosier dialect ostensibly written by a farmer, "Benjamin F. Johnson of Boone," which he contributed to the Indianapolis *Daily Journal* and later published in book form as *The Old Swimmin' Hole and 'Leven More Poems* (1883). Riley was for a short time local editor of the Anderson (Ind.) *Democrat*, but his later life was spent in Indianapolis, where he died, July 22, 1916. His verse is sentimental and although he used, sometimes to excess, the conventional devices of the humorist, the best of his verse has a singing quality and a simple charm which make it live.

Of Riley's numerous volumes, among the most outstanding are: *The Boss Girl* (1886; republished 1891 as *Sketches in Prose*), *Pipes o' Pan at Zekesbury* (1889), *Old Fashioned Roses* (1888), *The Flying Islands of the Night* (1892), *A Child-World* (1896), *Home Folks* (1900). Because of reprints under varying titles, it is most satisfactory to read him in one of the collected editions: *Poems and Prose Sketches* (Homestead ed., 16 vol., 1897–1914); the biographical edition prepared by his nephew and secretary E. H. Eitel (6 vol., 1913); and the Memorial edition of his *Complete Works* (10 vol., 1916). Hewitt Howland collected Riley's conventional English verse in *The Lockerbie Book* (1911) and his dialect poems in *The Hoosier Book* (1916).

See Clara E. Laughlin, *Reminiscences of James Whitcomb Riley* (1916); also *The Youth of James Whitcomb Riley* (1919) and *The Maturity of James Whitcomb Riley* (1922), both by Marcus Dickey, and "James Whitcomb Riley" by Edgar Lee Masters in the *Century Mag.* (Oct., 1927).

RILKE, RAINER MARIA (1875–1926), German author, was born at Prague, Dec. 4, 1875. Originally intended for an officer, he studied in Prague, Munich and Berlin, travelled in Russia, Italy and France, and frequented chiefly artistic circles, acting at one time as Rodin's secretary. He afterwards lived in Vienna, Munich and Switzerland, where he died in Dec. 1926. Rilke's work includes both prose and verse; but the latter is the better known, and from 1900–10 he, with Stefan George (*q.v.*), was Germany's foremost lyric poet. His writing is deeply artistic and deeply musical at once; a religious mysticism colours an extraordinarily rich and melodious style, which absorbed the best influences of most of the important European literatures. Its unique delicacy fully compensates for a certain lack of breadth and grandeur.

Rilke's works include: *Traumgekrönt* (1897); *Zwei Prager Geschichten* (1899); *Vom lieben Gott* (1900); *Das Buch der Bilder* (1902); *Stundenbuch* (1908); *Neue Gedichte* (1907); *Sonette an Orpheus* (1923); *Vergers* (poems in French, 1925).

RIMBAUD, JEAN ARTHUR (1854–1891), French poet and adventurer, born at Charleville, in the Ardennes, on Oct. 20, 1854. He was the second son of a captain in the French army, who in 1860 abandoned his wife and family. From early childhood Arthur Rimbaud, who was severely brought up by his mother, displayed rich intellectual gifts and a sullen, violent temperament. He began to write when he was ten, and some of

the poems which now appear in his works belong to his fifteenth year. Before he was sixteen, in consequence of a violent quarrel with his mother, the boy escaped from Charleville with a packet of his verse, was arrested as a vagabond, and for a fortnight was locked up in the Mazas prison, Paris. A few days after being taken home Rimbaud escaped again, into Belgium, where he lived for some time as a tramp, almost starved, but writing verses with feverish assiduity. In February 1871 he left his mother for a third time, and made his way to Paris, where he knew no one, and whence, after very nearly dying of hunger and exposure, he begged his way back to Charleville. There he wrote in the same year the extraordinary poem of *Le Bateau ivre,* which is now hailed as the pioneer of the entire "symbolist" or "decadent" movement in French literature in all its forms. He sent it to Verlaine, who encouraged the boy of seventeen (whom he supposed to be a man of thirty) to return to Paris. Rimbaud spent from October 1871 to July 1872 in the capital, partly with Verlaine, partly as the guest of Théodore de Banville, and served in the army of the Commune. With Verlaine he travelled for thirteen months, after the fall of the Commune, through England and Belgium, where in 1873 he published the only work which he ever printed, *Une Saison en Enfer,* in prose; in this he gives an allegorical account of his extravagant relations with Verlaine, which ended at Brussels by a double attempt of the latter to murder his young companion. On the second occasion Rimbaud was dangerously wounded by Verlaine's revolver, and the elder poet was imprisoned at Mons for two years.

Meanwhile Rimbaud, deeply disillusioned, determined to abandon Europe and literature, and he ceased at the age of nineteen to write poetry. He settled for a while at Stuttgart, studying German, and in 1875 he disappeared. He set out on foot for Italy, and after extraordinary adventures found employment as a day-labourer in the docks at Leghorn. Returning to Paris, he obtained a little money from his mother, and then definitely vanished. For sixteen years nothing whatever was heard of him, but it is now known that he embarked as a Dutch soldier for the Sunda Isles, and, presently deserting, fled to Sumatra and then to Java, where he lived for some time in the forest. Returning to Europe, after a vagabond life in every capital, he obtained in 1880 some menial employment in the quarries of Cyprus, and then worked his way to Aden and up into Abyssinia, where he was one of the pioneers of European commercial adventure. Here he settled, at Harrar, as a trader in coffee and perfumes, to which he afterwards added gold and ivory; for the next eleven years, during which he led many commercial expeditions into unknown parts of northern Africa, Shoa and Harrar were his headquarters, and he lived almost entirely with the natives, and as one of themselves. From 1888 to 1891, having prospered greatly as a merchant, he became a sort of semi-independent chieftain, intriguing for France, just outside the borders of civilization. From documents which were first produced in 1902 it appears that from 1883 to 1889 Rimbaud was in close relations with the Ras Makonnen and with Menelek, then only king of Shoa. At the death of the Negus John, in 1888, he was concerned in the formation of the empire of Ethiopia. From this time Rimbaud had a palace in the town of Harrar, and intrigued with the French government in favour of Menelek and against Italy.

Meanwhile, in 1886, believing Rimbaud to be dead, Verlaine had published his poems, under the title of *Les Illuminations,* and they had created a great sensation in Paris. In this collection appeared the sonnet on the vowels, attributing a different colour to each: "A noir, E blanc, I rouge, U vert, O bleu voyelles." But the author, in his Abyssinian hut of palm-leaves, was, and remained, quite unconscious of the fact. In March 1891 a tumour in his knee obliged Rimbaud to leave Harrar and go to Europe for surgical advice. He reached Marseilles, but the case was hopeless; the leg had to be amputated, and Rimbaud died there in hospital on Nov. 10, 1891. The poems of Rimbaud all belong to his earliest youth. Their violent originality, the influence which they have exercised upon younger writers, the tumultuous existence of their author, and the strange veil of mystery which still hangs over his character and adventures, have given to Rimbaud a remarkable fascination. His life has been written by M. Paterne Berrichon (1897), and valuable reminiscences by his sister, Mlle. Isabella Rimbaud. His *Oeuvres* were collected in 1898 by MM. Berrichon and Delahaye, and in 1901 his statue was unveiled at Charleville.

His Oeuvres complètes were published by the *Mercure de France.* For the great significance of Rimbaud and his influence on post-war French writers *see* P. Claudel.

RIME ROYAL, the name given to a strophe or stanza-form, which is of Italian extraction, but is almost exclusively identified with English poetry from the 14th to the early 17th century. It appears to be formed out of the stanza called ottava rima (*q.v.*), by the omission of the fifth line, which reduces it to seven lines of three rhymes, arranged ababbcc. It was earliest employed with skill, if not invented, by Chaucer, who composed his long romantic poem of *Troilus and Cressida* in rime royal, of which the following is an example:—

"And as the new-abashéd nightingale,
That stinteth first when she beginneth sing,
When that she heareth any herdë tale,
Or in the hedges any wight stirring,
And, after, siker doth her voice out-ring,—
Right so Cresseyda, when her dredë stint,
Opened her heart, and told all her intent."

In the 15th century this stanza was habitually used, in preference to heroic verse, by Hoccleve and Lydgate, and, with more melody and grace, by the unknown writer of *The Flower and the Leaf.* In the 16th century, it was regarded as the almost exclusive classical form for heroic poetry in England, and it had long been so accepted in Scotland, where *The King's Quair* of King James I., the *Fables* of Henryson and *The Thistle and the Rose* of Dunbar had closely followed the pattern of Chaucer. After the first decade of the 17th century rime royal went out of fashion. Since then it has been occasionally revived, but not in poems of great length or particular importance. Rime royal should always be written in iambic metre, and be formed of seven lines of equal length, each containing ten syllables.

RIMINI, a town and bishop's see of Italy (anc. *Ariminum, q.v.*), in the province of Forlì, Emilia, on the Adriatic coast, 69 m. S.E. of Bologna by rail. Pop. (1921): town, 19,996; commune, 57,672. The city is bounded on three sides by water. It faces the Adriatic to the north, has the torrent Aprusa, now called Ausa, on the east, and the river Marecchia, which has been canalized to serve as a harbour for small boats, on the west. It stands in a fertile plain, which on the southern side soon swells into pleasant slopes backed by the jagged peaks of the Umbrian Apennines. The foremost foothill of the range is the steep crag of Monte Titano, crowned by the towers of the republic of San Marino. Rimini attracts numerous visitors for the sea-bathing, and has now extended as far as the coast, from which the old town is nearly a mile distant. Apart from its ancient buildings, Rimini has some interesting churches, notably S. Agostino in the Romanesque style (1247) with a lofty campanile; the Palazzi del Podestà (1304) and dell'Aréngo (1204) are good mediaeval buildings; there is a municipal picture gallery and an archaeological museum. The ancient castle of Sigismondo Malatesta is now dilapidated. For the church of S. Francis *see* p. 310.

HISTORY

Rimini is the ancient Ariminum (*q.v.* for its early history and remains). Alternately captured by Byzantines and Goths, it was rigorously besieged by the latter in A.D. 538. They were, however, compelled to retreat before the reinforcements sent by Belisarius and Narses; thus the Byzantines, after various vicissitudes, became masters of the town, appointed a duke as its governor, and included it in the exarchate of Ravenna. It afterwards fell into the power of the Longobards, and then of the Franks, who yielded

it to the pope, for whom it was governed by counts to the end of the 10th century. Soon after this period the imperial power became dominant in Rimini. In 1157 Frederick I. gave it, by imperial patent, the privilege of coining money and the right of self-government; and in the 13th century we find Rimini an independent commune waging war on the neighbouring cities.

Rise of the Malatesta.—In the year 1216 Rimini, being worsted by Cesena, granted citizenship to two members of the powerful Malatesta family, Giovanni and Malatesta, for the sake of their aid and that of their vassals in the defence of the state and the conduct of the war. This family quickly struck root in the town; and in 1237 Giovanni was named podestà.

Giovanni Malatesta died in 1247 and was succeeded by his son Malatesta, born in 1212 and surnamed Malatesta da Verrucchio. This chieftain, who lived to be 100 years old, was the real founder of his house. Being repeatedly elected podestà for lengthy terms of office, he at last became the virtual master of Rimini. Pope Boniface VIII. not only left Malatesta, as a Guelph champion, unmolested but in 1299 conferred on him fresh honours and estates, so that his power went on increasing to the day of his death in 1312.

Giovanni the Lame (*Sciancato*), his successor, served under Giovanni da Polenta of Ravenna and won the hand of that potentate's beautiful daughter, known to history as Francesca da Rimini. But her heart had been won by the handsome Paolo, her brother-in-law; and the two lovers, being surprised by Giovanni, were murdered by him (1285). This episode has been immortalized in Dante's *Inferno*. Giovanni died in 1304. Thus in 1312 Malatestino became lord of Rimini, and on his decease in 1317 bequeathed the power to his brother Pandolfo.

Pandolfo died in 1326, leaving two heirs, Malatesta and Galeotto. In 1355 the Malatesta were reduced to submission by Pope Innocent VI. The two brothers divided their lands. Galeotto retained the lordship of Rimini, ruling tranquilly and on good terms with the popes, who allowed him to add Cervia, Cesena, and Bertinoro to his states. Dying in 1385 at the age of 80, he left two sons—Carlo (1364–1429) and Pandolfo (1370–1427), who succeeded his brother. Of his sons, the eldest, Galeotto (1411–32), was an ascetic, gave little or no attention to public business, and, dying early, bequeathed the state to his brother Sigismondo Pandolfo. The third son, Novello (1418–65) ruled over Cesena.

Sigismondo Pandolfo.—Sigismondo (1417–68) is the personage to whom Rimini owes its renown during the Renaissance, of which indeed he was one of the strangest and most original representatives. He was born in Brescia, and when called to the succession, at the age of 15, had already given proofs of valour in the field. His knowledge of antiquity was so profound as to excite the admiration of all the learned men with whom he discoursed, even when, as in the case of Pius II., they chanced to be his personal enemies. To him is due the erection of the church of St. Francis, or temple of the Malatesta, the greatest of Rimini's treasures. On assuming power in 1432, Sigismondo was already affianced to the daughter of Count Carmagnola; but when that famous leader was arraigned as a traitor by the Venetians, and ignominiously put to death, he promptly withdrew from his engagement and espoused Ginevra d'Este, daughter of the duke of Ferrara in 1434. In 1440 his wife died. Two years afterwards he married Polissena, daughter of the famous condottiere, Francesco Sforza, who in 1443 bore him a son named Galeotto Roberto. But by this time he was already madly in love with Isotta degli Atti, and this was the passion which endured to his death. The lady succeeded in gaining an absolute ascendancy over him, which increased with time. She bore him several children, but this did not prevent his having others by different concubines. Such being the nature of the man, it is not astonishing that, as his ardour for Isotta increased, he should have little scruple in ridding himself of his second wife. On June 1, 1450, Polissena died by strangling, and on the 30th of the same month Isotta's offspring were legitimated by Nicholas V.

The Church of St. Francis.—Her marriage with Malatesta did not take place until 1456; but of the ardent affection that had long bound them together there are stronger proofs than the lover's juvenile verses, or than even the children Isotta had borne to him. For, more than all else, the temple of St. Francis has served to transmit to posterity the history of their loves. Malatesta decided to build this remarkable church as a thank-offering for his safety during a dangerous campaign undertaken for Pope Eugene IV. about the year 1445. The first stone was laid in 1446, and the work was carried on with such alacrity that mass was performed in it by the close of 1450. Sigismondo entrusted the execution of his plans to Leon Battista Alberti. The vault was never finished, and still shows its rough beams and rafters. The eight side chapels alone are complete, and their pointed arches spring from Renaissance pilasters planted on black marble elephants, the Malatesta emblem, or on baskets of fruit held by children. Everywhere—on the balustrades closing the chapels, round the base of the pilasters, along the walls, beneath the cornice of both the exterior and the interior of the church—there is one ornament that is perpetually repeated, the interwoven initials of Sigismondo and Isotta. This monogram is alternated with the portrait and arms of Malatesta; and these designs are enwreathed by festoons linked together by the tyrant's second emblem, the rose. The most singular and characteristic feature of this edifice is the almost total absence of every sacred emblem. Rather than to St. Francis and the God of the Christians it was dedicated to the glorification of an unhallowed attachment. Nature, science, and antiquity were summoned to celebrate the tyrant's love for Isotta.

Sigismondo understood the science of fortification. He was also the first to discard the use of wooden bomb-shells and substitute others cast in bronze. As a soldier his numerous campaigns had shown him to be possessed of all the best qualities and worst defects of the free captains of his time. He took part in many hazardous campaigns against adversaries such as the duke of Urbino, Sforza of Milan, Piccinino, and, worst of all, the Sienese pope, Pius II., his declared and mortal foe. This time Sigismondo had blundered, and he was driven to make his submission to the pope, but, again rebelling, was summoned to trial in Rome (1460) before a tribunal of hostile cardinals. All the old charges against him were now revived and eagerly confirmed. He was pronounced guilty of rapine, incendiarism, incest, assassination, and heresy. Consequently he was sentenced to the deprivation of his state (which was probably the main object of the trial), and to be burnt alive as a heretic. This sentence, however, could not easily be executed, and Sigismondo was only burnt in effigy. He could afford to laugh at this farce; nevertheless he prepared in great haste for a desperate defence (1462). He knew that the bishop Vitelleschi, together with the duke of Urbino, and his own brother, Novello Malatesta, lord of Cesena, were advancing against him in force; and, being defeated at Pian di Marotta, he was forced to go to Rome in 1463, again to make submission to the pope. This time he was stripped of all his possessions excepting the city of Rimini and a neighbouring castle, but the sentence of excommunication was withdrawn. In 1464 he took service with the Venetians, and had the command of an expedition to the Morea. In 1466 he was able to return to Rimini, for Pius II. was dead, and the new pope, Paul II., was less hostile to him. Indeed, the latter offered to give him Spoleto and Foligno, taking Rimini in exchange; but Malatesta was so enraged by the proposal that he went to Rome with a dagger concealed on his person, to kill the pope. But, being forewarned, Paul received him with great ceremony and surrounded by cardinals prepared for defence; whereupon Sigismondo changed his mind, fell on his knees, and implored forgiveness. His star had now set forever. For sheer subsistence he had to hire his sword to the pope and quell petty rebellions with a handful of men. At last, his health failing, he returned to his family, and died in Rimini on Oct. 7, 1468, aged 51 years.

Roberto Malatesta.—He was succeeded, according to his desire, by Isotta and his son Sallustio (who were ousted by an illegitimate elder son by another mother, named Roberto Malatesta), and died in 1470 in suspicious circumstances. Roberto died in 1482; his son Pandolfo fled before Cesare Borgia in 1500. Rimini was captured by Pope Julius II. after his victory at Ravenna over the Venetians in 1512. Malatesta made more than one attempt to

win back his city, but always in vain, for his subjects preferred papal rule; and in 1528 Pope Clement VII. became definite master of the town. The history of Rimini practically ends with its independence.

(P. V.; L. V.)

RIMSKY-KORSAKOV, NICOLAS ANDREIEVICH (1844–1908), Russian composer, was born at Tikhvin, Novgorod, on March 18, 1844. He spent six years (1856–62) in the Naval college at St. Petersburg, and at the end of that time received a commission and spent three years afloat. But as a cadet he had been one of the musical amateurs who, with Borodin, Cui and Moussorgsky, gathered round Balakirev in St. Petersburg in the days when Wagner was still unknown. During his cruise he had written a symphony (in E minor) which in that year was performed—the first by a Russian composer—under Balakirev's direction, and in 1873 he definitely retired from the navy, having been appointed a professor in the St. Petersburg Conservatoire. The same year witnessed his marriage to a talented pianist, Nadejda Pourgold, and the production of his first opera, *Pskovitianka*. This was followed by *May Night* (1878), *The Snow Maiden* (1880), *Mlada* (1892), *Christmas Eve* (1894), *Sadko* (1895), *Mozart and Salieri* (1898), *The Tsar's Bride* (1899), *Tsar Saltana* (1900), *Servilia* (1902), *Kostchei the Immortal* (1902), *The Tale of the Invisible City of Kitezh* (1905), and *Le Coq d'Or* (1910). For all of these, with the exception of *Mozart and Salieri*, he chose Russian national subjects. But his operas attracted less attention abroad than his symphonic compositions, which show a mastery of orchestral effect combined with a fine utilization of Russian folk-melody. Notable among these works are his first symphony, his second (op. 9) *Antar*, his third (op. 32), and his orchestral suites including the well known *Scheherazade* and overtures. He also wrote a number of beautiful songs, pianoforte pieces, etc., and he eventually took Balakirev's place as the leading conductor in St. Petersburg, where he died on June 20, 1908.

The influence of Rimsky-Korsakov on the Russian composers of his day was very great. His instrumentation was fresh and original; he was direct and clear, with something of a painter's vision, and he brought a wealth of learning and study to bear on his subject. Many came directly under his influence as his pupils at the Conservatoire, while many more studied his great treatise of *The Foundations of Instrumentation*. He did much also to promote the better appreciation of Moussorgsky and others of his fellow Russians, although during recent years he has been severely criticized for his alleged tampering with Moussorgsky's original text in his edition of *Boris Godounov*.

See his own *History of My Musical Life* (which has been translated into English); Stassov, *Rimsky-Korsakov* (1890); Rosa Newmarch, *The Russian Opera* (1914) and Montagu Nathan, *History of Russian Music* (1915).

RINCEAU, in architecture and the decorative arts, an ornament consisting of a continuous wavy line, from the sides of which there branch at intervals lines or forms that twist into spirals; sometimes known as a branching scroll.

RINDERPEST (German for "cattle-plague," which is the English synonym), one of the most contagious, infectious and fatal diseases of oxen; transmissible to sheep, goats, and other ruminants, both domesticated and wild; swine are doubtfully affected; horses, etc., carnivora and man are immune. Rinderpest is a virulent eruptive fever which runs its course so rapidly and attacks such a large percentage of ruminants, when it is introduced into a country, that from the earliest times it has excited terror and dismay. Endemic throughout Asia it has prevailed extensively in south-eastern Russia and neighbouring countries. It appeared in Egypt in 1844 and 1865, Abyssinia in 1890, Japan in 1892, and the Philippines in 1898, and towards the end of the nineteenth century it was carried along the course of the Nile into South Africa involving many parts of the country. Outbreaks occurred in Belgium in 1920 and in Western Australia in 1923.

It has been noted that its irruptions into Europe in the earlier centuries of our era always coincided with invasions of barbarous tribes in eastern Europe. One of the earliest recorded irruptions of cattle-plague into western Europe occurred in the 5th century after the invasion of the Huns. Later invasions are recorded, and in several of these Britain was visited—as in 809–10, 986–87, 1223–25, 1513–14, and notably in 1713, 1745, 1774, 1799. In 1865 it was imported from Finland into the cattle markets of London and other large provincial towns; it raged for 1½ years, destroying 500,000 cattle. The last outbreak occurred in 1877.

The infective agent belongs to the group of filter passing viruses (*q.v.*). Under favourable conditions, as in bone marrow, the virus may long remain infective, but generally its virulence is lost after a few days on exposure to sunlight, putrefaction or disinfectants. It is known to exist in all the various secretions and excretions, in the flesh, blood and various organs of the body. Contagion may be direct or indirect, and the disease may be conveyed to healthy cattle by contaminated fodder, litter, water, clothing, pasture, sheds, railway wagons, hides, horns and hoofs. Attendants, cats, dogs, birds, vermin and flies may spread the infection. Definite symptoms of the disease may not be recognised until the expiration of three to nine days after exposure.

Symptoms.—An exact knowledge of the symptoms and microscopical appearances of the disease is of the utmost importance, as its extension and consequent ravages can only be arrested through its timely recognition and the immediate adoption of the necessary sanitary measures. Intense fever, diarrhoea or dysentery, croupous inflammation of the mucous membranes in general, sometimes a cutaneous papular eruption, and great prostration, mark the course of the disease. Its introduction and mode of propagation can, in many instances, be ascertained only at a late period, and when great loss may already have been sustained. In the majority of cases the examination of the carcass of an animal which has died or been purposely killed is the best way to arrive at a correct diagnosis. Indeed, this is practically the only certain means of definitely deciding upon the presence of the malady.

Among cattle indigenous to the regions in which this malady may be said to be enzoötic the symptoms are often comparatively slight, and the mortality not great. So much is this the case that veterinary surgeons who can readily distinguish the disease when it affects the cattle of Western Europe, can only with difficulty diagnose it in animals from Hungary, Bessarabia, Moldavia, or other countries where it is always more or less prevalent. In these, fever is usually brief, and lassitude and debility are, in some instances, the only marks of the presence of this disorder in animals which may, nevertheless, communicate the disease in its most deadly form to the cattle of other countries.

In the more malignant form the fever runs high, 106° to 107° Fahr., and all the characteristic symptoms are well marked: dullness, sunken eyes, eruption on the skin, discharges from eyes, nose and mouth, shivering fits, difficult breathing, dry harsh cough, miliary eruptions on the gums, accumulation of bran-like exudate within the lips, fetid breath, with certain nervous phenomena, and dysenteric dejections. Death generally occurs in four or five days, the course of the disorder being more rapid with animals kept in sheds than with those living in the open, and in summer than in winter. The post-mortem appearances are most marked in the digestive canal, and comprise red spots and erosions on the palate, lips, tongue and pharynx; intense congestion of the lining of the fourth stomach, which in places is covered with a grey or reddish pultaceous deposit, under which the membrane is deeply ulcerated. Similar lesions are seen in the small intestine, caecum and rectum. The membrane lining the air passages is congested throughout, and the lungs are emphysematous.

Remedial Measures.—Various methods of preventive inoculation have been elaborated in countries where the disease is endemic. In South Africa the bile method (or the injection of bile obtained from cattle dead of rinderpest), discovered by

Koch, in 1896; bile with admixture of glycerine, recommended by Edington; the simultaneous injection of serum and rinderpest blood, introduced by Turner and Kolle in 1897, and repeated injection of fortified serum alone, have been employed, more or less successfully, in conferring immunity. The simultaneous method has been extensively used in many countries, such as in S. Africa, Egypt, India, Turkey, with a large measure of success. It consists in the injection of one c.c. of blood of an animal affected with rinderpest, but free from protozoan and other infection, into one side of the body and an appropriate amount of hyperimmune serum into the other side. Elsewhere, precautionary measures consist in legislation regarding importation of animals from infected countries. In Great Britain the disease is scheduled under the Diseases of Animals Act. (A. R. S.)

RING, a band of circular shape, made of any material and for various purposes, but, particularly, a circular band of gold, silver or other precious or decorative material used as an ornament, not only for the finger, but also for the ear (*see* EAR-RING), or even for the nose, as worn by certain races in India and Africa.

Egyptian Rings.—The earliest existing rings are those found in the tombs of ancient Egypt. The finest examples date from about the XVIII. to the XX. Dynasty; they are of pure gold, simple in design, very heavy and massive, and have usually the name and titles of the owner deeply sunk in hieroglyphic characters on an oblong gold bezel. Rings worn in Egypt by the poorer classes were made of less costly materials, such as silver, bronze, glass or pottery covered with a siliceous glaze and coloured brilliant blue or green with various copper oxides. Some of these had hieroglyphic inscriptions impressed while the clay was moist. Other examples have been found made of ivory, amber and hard stones, such as carnelian. Another form of ring used in the XII. and subsequent dynasties of Egypt had a scarab in place of the bezel, and was mounted on a gold hoop which passed through the hole in the scarab and allowed it to revolve.

Cylinders.—In ancient Babylonia and Assyria the signet took the form of a cone seal or of a cylinder cut in crystal or other hard stone and perforated from end to end. A cord was passed through the cylinder, and it was worn on the wrist like a bracelet.

Within the limits necessarily imposed by its purpose the finger ring assumed a considerable variety of form, according to its date and place of origin.

In the Cretan and Mycenaean periods a characteristic form of ring had a broad flat bezel, not organically connected with the hoop, and having an incised design in the gold. The use of inset stones hardly occurs, but rings from Enkomi and Aegina of the late Mycenaean period have inset paste decorations.

The Phoenician type of ring was primarily intended to carry a scarab or scarabaeoid, usually in a box setting on a swivel, called for by the fact that the flat base of the scarab would be wanted for sealing purposes, but in wear would be most conveniently turned inwards. Strength being necessary, the hoop became massive. A similar arrangement of the signet-scarab is found attached to a twisted ring, which, from its shape, must have been meant to be suspended, and which is shown thus worn on some of the Cypriote terra-cottas.

The Greek ring of an early period has a characteristic flattened bezel, for an intaglio design in the gold. An alternative form was a swivel ring for a scarab or scarabaeoid.

Etruscan Rings.—The Etruscans used very largely the gold swivel ring mounted with a scarab, a form of signet probably introduced from Egypt. Some found in Etruscan tombs have real Egyptian scarabs with legible hieroglyphs; others, probably the work of Phoenician or native engravers, have rude copies of hieroglyphs, either quite or partially illegible. A third and more numerous class of Etruscan signet rings have scarabs, cut usually in sard or carnelian. One from Etruria, now in the British Museum, is formed by two minutely modelled lions whose bodies form the hoop, while their paws hold the bezel, a scarab engraved with a lion of heraldic character. An alternative type of Etruscan ring has an incised design on the gold bezel, or a flat stone set in the rigid bezel.

Roman Rings.—The Romans appear to have imitated the simplicity of Lacedaemonia. Throughout the republic none but iron rings were worn by the bulk of the citizens, and even these were forbidden to slaves. Ambassadors were the first who were privileged to wear gold rings, and then only while performing some public duty. Next senators, consuls, equites and all the chief officers of state received the *ius annuli aurei*. In the Augustan age many valuable collections of antique rings were made, and were frequently offered as gifts in the temples of Rome. One of the largest and most valuable of the *dactyliothecae* was dedicated in the temple of Apollo Palatinus by Augustus's nephew Marcellus (Pliny, *H.N.* xxxvii. 5).

Different laws as to the wearing of rings existed during the empire: Tiberius made a large property qualification necessary for the wearing of gold rings in the case of those who were not of free descent; Severus conceded the right to all Roman soldiers; and later still all free citizens possessed the *ius annuli aurei*, silver rings being worn by freedmen and iron by slaves. Under Justinian even these restrictions passed away.

Early Christian Rings.—Most early Christian rings date from the 4th century onwards. Generally of bronze or gold they are often engraved with acclamations and invocations and occasionally with the owner's bust or with Christian symbols.

Celtic Rings.—Large numbers of gold rings have been found in many parts of Europe in the tombs of early Celtic races. They are usually of very pure gold, often penannular in form—with a slight break, that is, in the hoop so as to form a spring. They are often of gold wire formed into a sort of rope, or else a simple bar twisted in an ornamental way. Some of the quite plain penannular rings were used in the place of coined money.

Throughout the Middle Ages the signet ring was a thing of great importance in religious, legal, commercial and private matters.

Episcopal Rings.—The episcopal ring was solemnly conferred upon the newly made bishop together with his crozier, a special formula for this being inserted in the Pontifical. In the earliest references to rings worn by bishops, there is nothing to distinguish them from other signet rings. In A.D. 610 the first mention has been found of the episcopal ring as a well-understood symbol of dignity. It is clear that it was derived from the signet. It was only in the 12th century and onwards that it was brought into mystical connection with the marriage ring. In the time of Innocent III. (1194) the ring was ordered to be of pure gold mounted with a stone that was not engraved; but this rule appears not to have been strictly kept. It was the custom upon the death of a bishop for his ring to be handed over to the royal treasurer but many rings with all the appearance of consecration rings have been discovered in the coffins of bishops. Among the collection of rings formed by the naturalist Edmund Waterton, and now in the South Kensington museum, is a fine gold episcopal ring decorated with niello, and inscribed with the name of Alhstan, bishop of Sherborne from 824 to 867. In many cases an antique gem was mounted in the bishop's ring, and often an inscription was added in the gold setting of the gem to give a Christian name to the pagan figure. The monks of Durham, for example, made an intaglio of Jupiter Serapis into a portrait of St. Oswald by adding the legend CAPVT S. OSWALDI. In other cases the engraved gem appears to have been merely regarded as an ornament without meaning—as, for example, a magnificent gold ring found in the coffin of Seffrid, bishop of Chichester (1125–1151), in which is mounted a Gnostic intaglio.

Papal Rings.—The papal "Ring of the Fisherman" (*annulus piscatoris*) bears the device of St. Peter in a boat, drawing a net from the water. The first mention of it, as the well-understood personal signet ring of the pope, that has been found, occurs in a letter of Clement IV. in 1265. After the middle of the 15th century it was no longer used as the private seal of the popes, but was always attached to briefs. After the death of a pope the ring is broken. A new ring with the space for the name left blank is taken into the conclave, and placed on the finger of the newly elected pontiff, who thereupon declares what name he will assume, and gives back the ring to be engraved. (*See* Waterton, *Archaeologia*, 40, p. 138.)

The so-called papal rings, of which many exist dating from the

15th to the 17th centuries, are very large thumb rings, usually of gilt bronze coarsely worked, and set with a foiled piece of glass or crystal. On the hoop is usually engraved the name and arms of the reigning pope, the bezel being without a device. They are sometimes described as rings of investiture and according to another hypothesis they were carried as credentials by envoys. Such cumbrous ornaments cannot have been worn by the popes and cardinals themselves.

Other Varieties.—The giving of a ring to mark a betrothal was an old Roman custom. The ring was probably a mere pledge, *pignus*, that the contract would be fulfilled. In Pliny's time conservative custom still required a plain ring of iron, but the gold ring was introduced in the course of the 2nd century. This use of the ring, which was thus of purely secular origin, received ecclesiastical sanction, and formulae of benediction of the ring exist from the 11th century. The exact stages by which the wedding ring developed from the betrothal ring can no longer be traced. Gold marriage rings enriched with niello date from the 5th century though they may not have been used in the actual ceremony of marriage.

Posy rings, so called from the "poesy" or rhyme engraved on them, were specially common in the same centuries. The name "posy ring" does not occur earlier than the 16th century. A posy ring inscribed with "Love me and leave me not" is mentioned by Shakespeare (*Mer. of Ven.*, act v. sc. 1). The custom of inscribing rings with mottoes or words of good omen dates from a very early time. Greek and Roman rings exist with words such as ZHCAIC, XAIPE, KAAH, or *votis meis Claudia vivas*. In the middle ages many rings were inscribed with words of cabalistic power, such as *anam zapta*, or Caspar, Melchior and Balthasar, the supposed names of the Magi.

In the 17th century memorial rings with a name and date of death were frequently made of very elaborate form, enamelled in black and white; a not unusual design was two skeletons bent along the hoop, and holding a coffin which formed the bezel.

Cramp rings were much worn during the middle ages as a preservative against cramp. They derived their virtue from being blessed by the king; a special form of service was used for this, and a large number of rings were consecrated at one time, usually when the sovereign touched patients for the king's evil.

Decade rings were not uncommon, especially in the 15th century; these were so called from their having ten knobs along the hoop of the ring, and were used, after the manner of rosaries, to say nine aves and a paternoster.

In the 15th and 16th centuries signet rings engraved with a badge or trademark were much used by merchants and others; these were not only used to form seals, but the ring itself was often sent by a trusty bearer as the proof of the genuineness of a bill of demand. At the same time private gentlemen used massive rings wholly of gold with their initials cut on the bezel, and a graceful knot of flowers twining round the letters. Other fine gold rings of this period have coats of arms or crests with graceful lambrequins.

Poison rings with a hollow bezel were used in classical times; as, for example, that by which Hannibal killed himself, and the poison ring of Demosthenes. Pliny records that, after Crassus had stolen the gold treasure from under the throne of Capitoline Jupiter, the guardian of the shrine, to escape torture, "broke the gem of his ring in his mouth and died immediately." The mediaeval *anello della morte*, supposed to be a Venetian invention, was actually used as an easy method of murder. Among the elaborate ornaments of the bezel a hollow point made to work with a spring was concealed; it communicated with a receptacle for poison in a cavity behind, in such a way that the murderer could give the fatal scratch while shaking hands with his enemy. This device was probably suggested by the poison fang of a snake. (*See* also SEALS; JEWELLERY; GEMS.)

(J. H. MI.; A. H. SM.; X.)

RING-DOVE, a name applied to the European wood-pigeon, and also to the Barbary or collared dove. (*See* DOVE.)

RINGWOOD, a market town in Hampshire, England, 103½ m. S.W. by W. from London by the Southern railway. Pop. (1921) 5,131. It lies on the river Avon, which here divides into numerous branches, flowing through flat meadow land. The church of SS. Peter and Paul was almost entirely reconstructed in 1854. An agricultural trade and some manufactures are carried on.

RINGWORM or **TINEA TONSURANS,** a disease mainly affecting the scalp; it consists of bald patches, usually round, and half an inch up to several inches across, the surface showing the broken stumps of hairs and a fine whitish powdering of desquamated epidermic scales. The disease is due to a group of fungi distinguished, among other features, by the size of the spores they form. In London and Paris *Microsporon audovini* causes about three-quarters of all cases of ringworm. If one of the broken hairs be plucked out with forceps and pressed flat under a cover-glass in a drop of dilute caustic potash, the microscope will show it to be occupied by long rows of minute oval spores, very uniform in size.

Forms of ringworm are also met with in lower animals (*e.g.*, cat and dog) but according to J. G. Hare and P. Tate there is little evidence that these infect children. (*Journ. Hygiene*, 1927, xxvii., 32). Modern treatment is by X-rays (*see* X-RAY TREATMENT) and is very effective. Thallium acetate has also been recommended.

See also FAVUS.

RIOBAMBA or **ROYABAMBA,** a town of Ecuador, capital of the province of Chimborazo, on the railway between Guayaquil and Quito, about 85m. E.N.E. of the former. Pop. (1900, estimate) 12,000. It stands in a barren, sandy basin of the great central plateau, drained by the Chambo, a tributary of the Pastaza, on the old road running southward from Quito into Peru, 9,039ft. above sea-level, and in full view of the imposing heights of Chimborazo, Carahuairazo (Carguairazo), Tunguragua and Altar. Though 300ft. lower than Quito, its climate is considerably colder, owing, perhaps, to its more exposed situation and the vicinity of snow-clad peaks. The present town dates from 1797, when the great earthquake of that year destroyed the old town then situated 12m. W., near Cajabamba.

RÍO CUARTO, a town of Argentina in the province of Córdoba, 119 m. S. of the city of that name, and about 500 m. N.W. of Buenos Aires. Pop. (1926) 18,400. It stands 1,440 ft. above sea-level and about half-way across the great Argentine pampas, on the banks of a river of the same name which finds an outlet through the Carcarañal into the Paraná near Rosario. The town is built on the open plain and is surrounded with attractive suburbs. It is the commercial centre of a large district and has a large and lucrative trade. Its geographical position gives it great strategical importance, and the Government maintains here a large arsenal and a garrison of the regular army. Previous to the activities of General Ivanovski in 1872 this region was overrun by the Ranqueles, a warlike tribe of Indians. The surrounding country belongs to the partially arid pampa region and is devoted to stockraising. Irrigation is employed in its immediate vicinity. There are some manufacturing industries in the town. The Andine National railway passes through Rio Cuarto, and branch lines connect with the Buenos Aires and Pacific line—all of which give railway communication with Buenos Aires, Rosario, Tucumán, Córdoba, San Luis and Mendoza.

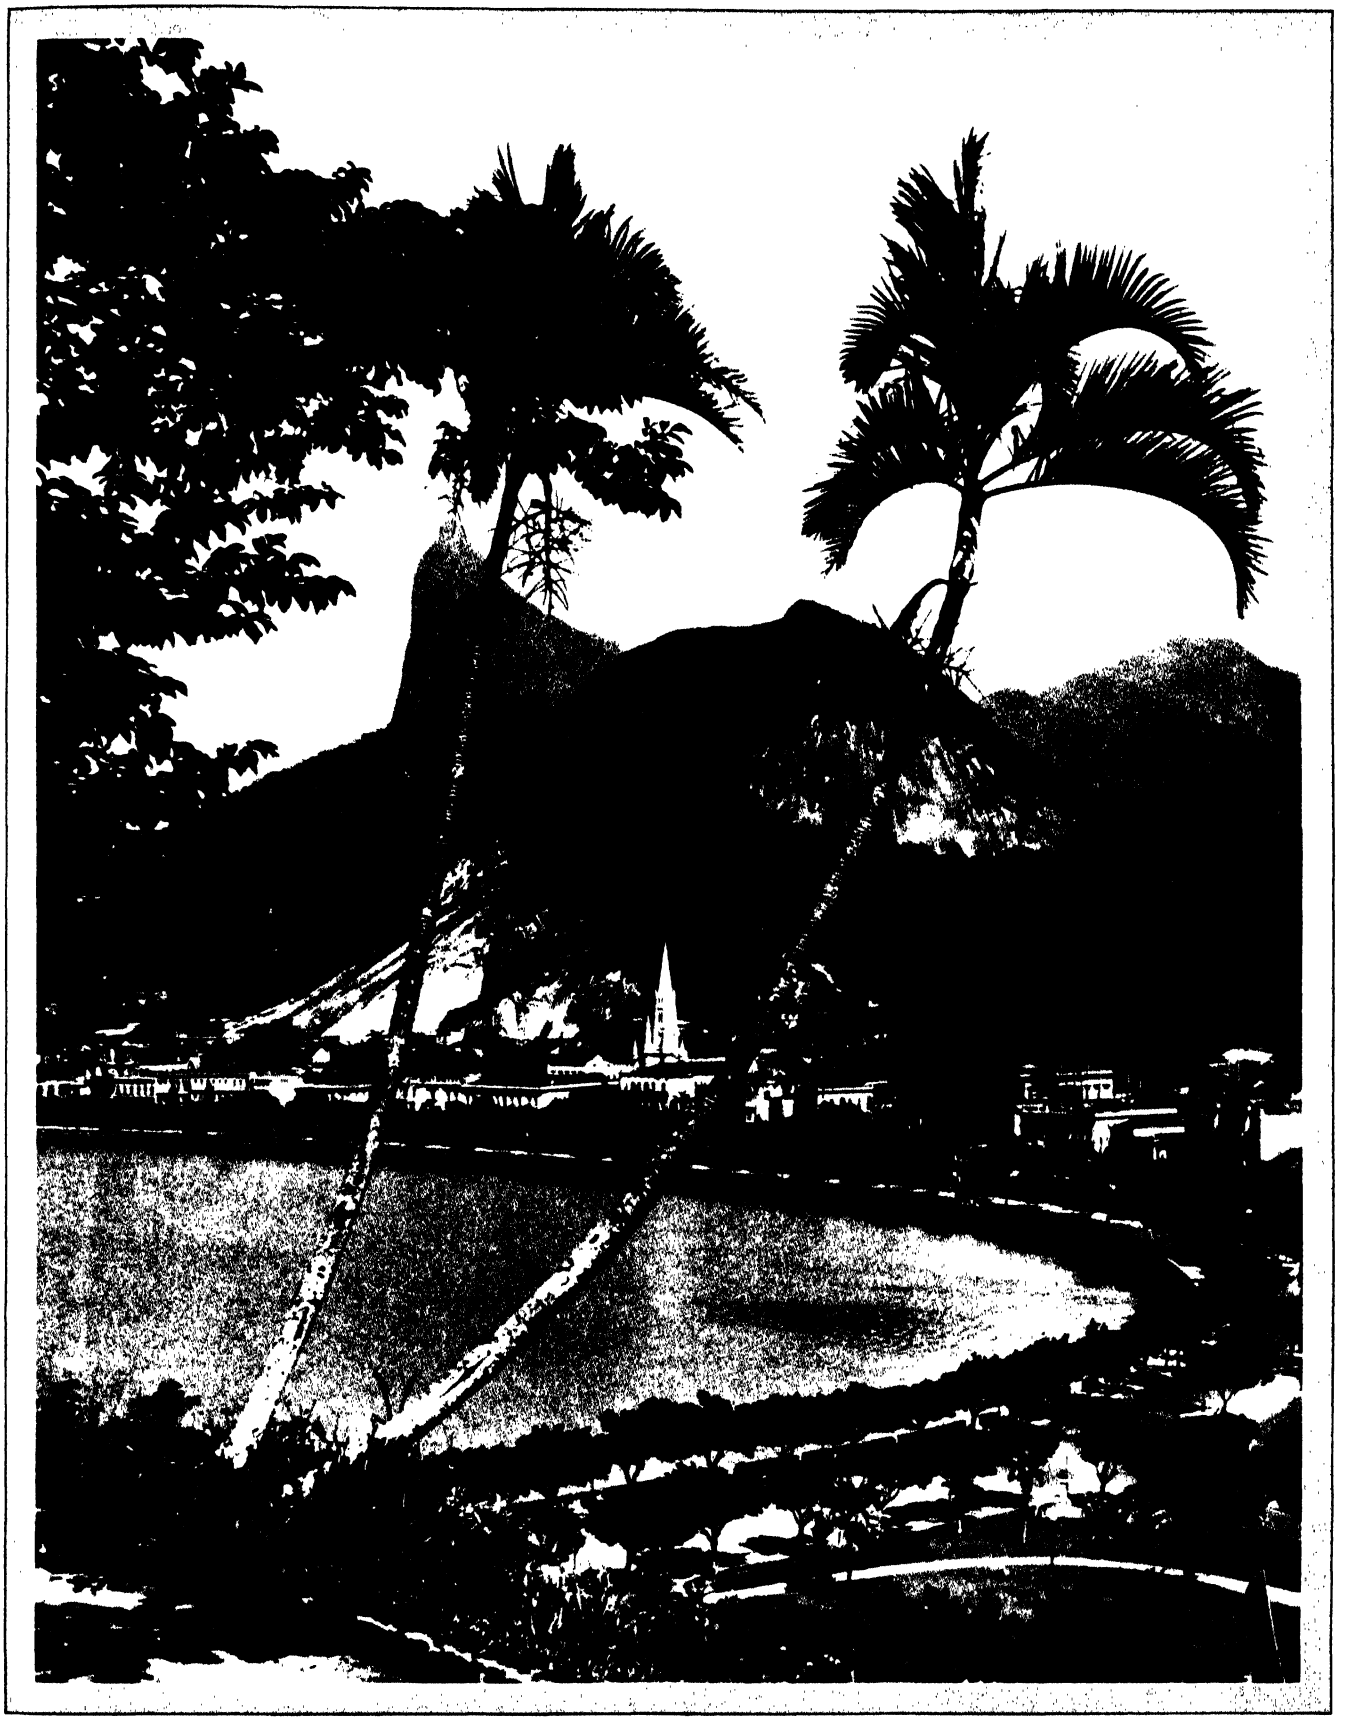
RIO DE CONTAS or **VILLA DE CONTAS,** a town of Brazil, in the State of Bahia, 230 m. S.W. from the city of Bahia, on the Brumado (Contas-Pequeño), a head stream of the Rio de Contas (Jussiape), which rises on the eastern slope of the neighbouring Serra das Almas, and flows south-east and east to the Atlantic coast at Barra do Rio de Contas. Pop. (1920), including rural districts, 24,350. Stock-raising was formerly an important industry here. The town was founded in 1715 by some "Paulistas" who discovered gold there in the sands of the river. It became a

"villa" in 1724, but was soon afterwards moved down the river 5 m. to a site on the high road between Bahia and Goyaz.

RIO DE JANEIRO, a maritime state of Brazil, bounded on the north by Minas Geraes, on the east by Espirito Santo and the Atlantic, on the south by the Atlantic, and on the west by São Paulo. It is one of the smaller states of the republic and has an area of 26,635sq.m.; pop. (1920) 1,505,601. The state is traversed longitudinally by the Serra do Mar, which divides it into a low, narrow, irregular coastal zone, and a broad elevated river valley through which the Parahyba flows eastward to the Atlantic. The eastern part of this valley widens out into a great alluvial plain on which are to be found some of the richest sugar estates of Brazil. The well watered Parahyba valley has long been celebrated for its fertility, and is the centre of the coffee-producing industry. Stock-raising has been slowly developing since the abolition of slavery (1888).

The state is watered by the Parahyba (*q.v.*) and its tributaries and by numerous short streams flowing from the Serra do Mar to the coast. Manufacturing has been developed largely because of the fine water power supplied by the mountain streams, and among the manufactures are cotton, woollen, silk and jute fabrics, brick, tile and rough pottery, sugar, rum, vehicles, furniture, beer and fruit conserves. The state is well provided with railways, which include the Central do Brazil, Leopoldina, Melhoramentos and Rio do Ouro. The Central line runs from the city of Rio de Janeiro north-north-westward across the Serra do Mar to the Parahyba valley, where it divides into two branches at the station of Barra do Pirahy, one running westward to São Paulo, and the other eastward and northward into Minas Geraes. Besides these there are a number of short railways called the Theresopolis, União Valenciana, Rio das Flores, Bananal, and Vassourense lines. The total extension of these railways in the state in 1925 was 2,100m. Other than Nictheroy, the ports of the state are São João da Barra, Macahé or Imbetiba, Cabo Frio and Paraty, visited only by the smaller coasting vessels.

The capital of the state is Nictheroy (Pop. 1920, 86,238) on the east side of the Bay of Rio de Janeiro, and other cities and towns, with their populations in 1920, are: Campos (48,108), on the lower Parahyba in the midst of a rich sugar-producing region; Rio Bonito (17,763); Itaborahy (22,228); Barra Mansa (13,585), on the upper Parahyba; Rezende (7,876), in a fertile district of the upper Parahyba; Petropolis (38,025); Cantagallo (6,963), in a rich coffee district of the Serra do Mar; Paraty (7,885), a small port on the west side of the bay of Angra dos Reis; Valença (13,020); Vassouras (12,510); São Fidelis (13,829), a river port on the lower Parahyba having steamboat communication with Campos; Macahé (8,635), an old port on the eastern coast of the state at the mouth of the Macahé river whose original anchorage has been filled with silt, and that of Imbetiba, in the vicinity, with which it is connected by tramway, is now used by vessels both for the town and the Macahé and Campos railway; Barra do Pirahy (13,086), an important station and junction of the Central do Brazil railway on the north side of the Serra do Mar, with large manufacturing and commercial interests; Parahyba do Sul (9,332), in a fertile, long-settled district in the north-east part of the state; Maricá (8,467); Cabo Frio (14,508); Pirahy (7,264); Saquarema (7,301); Nova Friburgo (23,261); and Araruama (10,374).



RIO DE JANEIRO (in full, SÃO SEBASTIÃO DO RIO DE JANEIRO, colloquially shortened to RIO), a city and port of Brazil, capital of the republic, and seat of an archbishopric, on the western side of the Bay of Rio de Janeiro, or Guanabara, in lat. 25° 54′ 23″ S., long. 43° 8′ 34″ W. (the position of the observatory). The city is situated in the south-east angle of the Federal District, an independent district or commune with an area of 538 sq.m., which was detached from the province of Rio de Janeiro in 1834. The city stands in great part on an alluvial plain formed by the filling in of the western shore of the bay, which extends inland from the shore-line in a north-westerly direction between a detached group of mountains on the south known as the Serra da Carioca, and the imposing wooded heights of the Serra do Mar on the north. The spurs of the Carioca range project into this plain, in some places close up to the margin of the bay, forming picturesque valleys within the limits of the city. Some of the residential quarters follow these valleys up into the mountains and extend up their slopes and over the lower spurs, which, with the hills covered with buildings rising in the midst of the city, give a picturesque appearance. At the entrance to the bay is the Sugar Loaf (*Pão de Assucar*), a conical rock rising 1,212 ft. above the water-level and forming the terminal point of a short range between the city and the Atlantic coast. The culminating point of that part of the Carioca range which projects into and partly divides the city is the Corcovado (Hunchback), a sharp rocky peak, 2,329 ft. high overlooking the Botafogo suburb and approachable only on the wooded north-west slope. Considerably beyond the limits of the city on its south-west side, but within the municipality, is the huge isolated flat-topped rock known as the Gavea, 2,575 ft. high, which received its name from its resemblance to the square sail used on certain Portuguese craft. The sky-line of this range of mountains, as seen by the approaching traveller some miles outside the entrance to the bay, forms the rough outline of a reclining figure called "the sleeping giant."

The entrance to the bay, between the Sugar Loaf on the west and the Pico on the east, with fortress of Santa Cruz on one side and the fort of São João on the other, is about a mile wide and free from obstructions. Almost midway in the channel is the little island and fort of Lage, so near the level of the sea that the spray is sometimes carried completely over it. On the west is the semicircular bay of Botafogo, round which are grouped the residences of one of the richest suburbs; on the east, the almost landlocked bay of Jurujuba. (*See* NICTHEROY.) The bay extends northward nearly 16½ nautical miles, with a maximum breadth of 11 m. The irregular shore-line has been modified by the construction of sea-walls and the filling in of shallow bays. Close to the shore are the islands of Villegaignon (occupied by a fort), Cobras (occupied by fortifications, naval storehouses, hospital and dry docks), Santa Barbara and Enxadas, the site of the naval school.

The oldest part of the city, which includes the commercial section, lies between Castle and Santo Antonio hills on the south and São Bento, Conceicão and Livramento hills on the north, and extends inland to the Praça da Republica, though the defensive works in colonial times followed a line much nearer the bay. This section during the 19th century extended southward along the bay shore in a string of suburbs known as the Cattete and Botafogo, with that of Larangeiras behind the Cattete in a pretty valley of the same name, and thence on or near the Atlantic coast as Largo dos Leoes, Copacabana and Gavea, the last including the botanical garden. The greatest development has been northward and westward, where are to be found the suburbs of Cidade Nova, São Christovão, Engenho Novo, Praia Formoso, Pedregulho, Villa Isabel, Tijuca, and a number of smaller places extending far out on the line of the Central railway. The extreme length of the city along lines of communication is little less than 20 m. The population (1920 census) was 1,157,873.

Climate.—The climate of Rio de Janeiro is warm and humid, the average temperature for the year being about 74° F, with little variation from month to month, and the rainfall (well distributed throughout the year) averages about 44 inches. The greater part of the city is only 2 or 3 ft. above sea-level, is surrounded by mountains, and has large areas of water, swamp and wet soil in its vicinity. But the unhealthiness of Rio de Janeiro in past years may be charged to insanitary conditions and not to the climate. Yellow fever, whose first recorded appearance was in Dec. 1849, was for many years almost a regular yearly visitant, and the mortality from it was terrible. This and other dangerous diseases disappeared as epidemics due to improved sanitary conditions following the notable work begun by Dr. Oswaldo Cruz under whose direction Rio de Janeiro was made one of the most healthy of tropical cities. The death rate has been reduced from about 50 to 20 per thousand.

Streets and Parks.—Some of the most modern streets have been laid out with Spanish-American regularity, but much the greater part seems to have sprung into existence without any plan. Most of the streets of the old city are parallel and cross at right

BOTAFOGO BAY

1. View of the harbour of Botafogo Bay and the Avenida Beira-Mar, the beautiful boulevard of Rio de Janiero which stretches for twenty miles around the harbour. The high pointed peak called Corcovado (Hunchback) may be seen in the background

angles, but they are narrow and enclose blocks of unequal size. Each suburb is laid out independently, with straight streets where the ground permits, and crooked ones where the shore-line or mountain contour compels. Since the beginning of the 20th century large sums have been borrowed and expended on new avenues, the widening and straightening of old streets, and the improvement of the water front between the Passeio Publico and the southern extremity of the Praia de Botafogo by the construction of a grand boulevard, partly on reclaimed land. One of these improvements consists of a central avenue (Avenida Rio Branco) cut across the old city from a point on the water front near the Passeio Publico northward to the Saúde water front. This is one of the handsomest thoroughfares in the Western Hemisphere. Over a mile long from north to south, it is lined with fine private and public buildings. The military, naval and jockey clubs are situated there, and also the offices of some of the principal newspapers, such as the *Jornal do Commercio* and *O Paiz*, besides fashionable shops, cafés and business places. The shore-line boulevard, called the Avenida Beira-Mar, is about 4½ m. long, the wider parts being filled in with gardens.

Another improvement was the completion and embellishment of the Mangue canal, originally designed as an entrance to a central market for the boats plying on the bay, but now destined for drainage purposes and as a public pleasure ground. This canal, as completed, is nearly 2 m. long, enclosed with stone walls, crossed by a number of iron bridges and bordered by lines of royal palms. The most famous street of the old city is the Rua do Ouvidor, running westward from the market-place to the Largo de São Francisco de Paula, and lined with retail shops, cafés and newspaper offices. It has long been a favourite promenade, and fills an important part in the social and political life of the city. The principal business street is the Rua Primeiro de Março, formerly called Rua Direita, which extends from the Praça 15 de Novembro northward to São Bento Hill. The streets and suburbs are served by tramway lines using electric traction. The streets are lighted with electricity and gas.

The public parks and gardens are numerous and include the botanical garden with its famous avenue of royal palms (*Oreodoxa regia*); the Passeio Publico (dating from 1783), a small garden on the water front facing the harbour entrance; the Jardim d'Acclamação, forming part of the Praça da Republica with its artistic walks and masses of shrubbery; the Praça Tiradentes with its magnificent equestrian statue of Dom Pedro I., executed by the French sculptor, Luiz Rochet; the Praça 15 de Novembro on the water front, facing the old city palace; and smaller squares.

Water Supply and Sewerage Drainage.—The water supply is derived from three sources: the small streams flowing down the mountain sides which serve small localities; the old Carioca aqueduct, dating from colonial times, which collects a considerable supply from the small streams of the Serra da Carioca and brings it into the city through a covered conduit which once crossed the gap between Santa Thereza and Santo Antonio hills on two ranges of stone arches (now used as a viaduct); and the modern Rio do Ouro waterworks, which brings in an abundant supply from the Serra do Tinquá, some 30 m. north-west of the city. An extensive system of sewers has been constructed and a separate system of rain-water drains.

Buildings.—There remain many public edifices and dwellings of the colonial period, severely plain in appearance, with heavy stone walls and tile roofs. The old city palace facing upon Praça 15 de Novembro, once the residence of the fugitive Portuguese sovereign Dom João VI., is a good example. The 19th century brought no important modifications until near its close, when French and Italian styles began to appear, both in exterior decoration and in architectural design. The Praça do Commercio (Merchants' Exchange) and post office on Rua 1° de Março, and the national printing office near the Largo da Carioca, are notable examples. Since then exterior ornamentation and architectural eccentricities have run riot, and the city is now a mixture of the plain one-storey and two-storey buildings of the Portuguese type and fanciful modern creations, embellished with stucco and overtopping the others by many storeys. At the southern end of the Avenida Rio Branco is a group of elegant State edifices: the Municipal theatre, the Monroe palace and the National library and Academy of Fine Arts. The Municipal theatre, designed in 1904, cost over £2,000,000, although it seats but 1,700 people. The building which houses the National library, opened in 1910 in commemoration of the centenary of its founding (1808), is also a notable addition to the city.

Rio has no cathedral, the old imperial chapel facing the Praça 15 de Novembro being used for that purpose. The most noteworthy church is the Candelaria church, in the commercial district, with twin towers and graceful dome.

Education.—Although much money is given to hospitals and asylums, Rio de Janeiro has no great educational institutions either public or private. The Medical school, the school of law and the Polytechnic school were consolidated (1920) into the University of Rio de Janeiro, a federal institution. The Gymnasio Nacional, formerly the Collegio D. Pedro II., is a boys' college of a high school grade, located on Rua Floriano Peixoto, with an *internato* or boarding-school in Rua de S. Francisco Xavier. One of the most noteworthy schools of the city is the Lyceo de Artes e Officios, located on Rua 13 de Maio, opposite the opera-house (1858). Another important school is the Instituto Benjamin Constant, a school for the blind, located in a fine new edifice on the Praia da Saudade, Botafogo. Primary instruction is provided by the municipality, which in 1920 maintained 320 day schools and 68 night schools, with a matriculation of 74,111 pupils in the former and 8,662 in the latter. The seminary on Castle Hill, called the Seminario Episcopal de São José, founded in 1739 and devoted exclusively to the education of priests, is the best classical school in the city.

There are a number of charitable institutions which are devoted to the education of orphans, the blind and the deaf and dumb. Among other educational institutions are a conservatory of music, school of fine arts, normal school, a military college, a naval academy, a rich national library, the Cabinete Portuguez da Leitura, the national observatory on Castle Hill, the national museum now domiciled in the São Christovão palace in the midst of a pretty park, a zoological garden in the suburb of Villa Isabel, and the famous botanical garden founded by Dom João VI. in 1808 and now a horticultural experiment station.

Hospitals, etc.—Rio de Janeiro is well provided with hospitals, asylums and benevolent institutions. Chief of these is Misericordia hospital, popularly known as the "Santa Casa," belonging to a religious brotherhood dating from 1591. In addition to a large income from rentals, the Santa Casa receives the product of certain port taxes in return for opening its wards on the crews of all vessels in port. Other public hospitals are the lepers' hospital in São Christovão, the military and naval hospitals, the São Sebastião hospital and the isolation and contagious diseases hospitals in Jurujuba. There are also a number of private hospitals maintained by church brotherhoods and charitable associations; among them are the Portuguese hospital in Rua de Santo Amaro and the Strangers' hospital (American and British) in Botafogo. Most prominent among the asylums is the Hospicio Nacional for the insane, on the Praia da Saudade, Botafogo, which was erected in 1842–52.

Harbour, Communications and Commerce.—The port and harbour of Rio de Janeiro are the largest and most important in the republic. The entrance is open to vessels of the largest draught, and there is sufficient deep-water anchorage inside for the navies of the world. The lower anchorage, where the health officers visit vessels, is below Ilha Fiscal, and the upper, or commercial anchorage, is in the broad part of the bay above Ilha das Cobras, the national coasting vessels occupying the shallower waters near the Saúde and Gambôa districts. The custom-house occupies a considerable part of the shore-line before the old city.

The new port works consist of a new water front for the Saúde, Gambôa and Sacco de Alferes districts, in which the shipping interests are centred, and a continuation of the sea-wall across the shallow São Christovão bay to the Ponta do Cajú, the large reclaimed area being filled in by the removal of some small hills. The commercial quays are built in deep water and

permit the mooring alongside of the largest vessels. The total length of the commercial quays is about 3,800 yards. Railway and tramway connections are provided and both electric and hydraulic power are available. Special surtaxes are levied on imports to meet the interest and redemption charges on the loans raised for the execution of these important works.

Railway communication with the interior is maintained by the Central do Brazil (formerly the Dom Pedro II.). Leopoldina and Melhoramentos lines, besides which there is a short passenger line up to the Corcovado about 2¼ m. long, an electric line to Tijuca, and a narrow-gauge line running out to the Rio do Ouro waterworks. There is communication with Petropolis by a branch line of the Leopoldina system, and also by a steamer to the head of the bay and thence by rail up the serra.

Rio de Janeiro is the seaport for a large area of the richest, most productive and most thickly settled parts of Brazil, including the States of Rio de Janeiro and Minas Geraes and a small part of eastern São Paulo. Its exports include coffee, sugar, hides, cabinet woods, tobacco and cigars, tapioca, gold, diamonds, manganese and sundry small products. Rio is also a distributing centre in the coasting trade, and many imported products, such as jerked beef (*carne secca*), hay, flour, wines, etc., appear among the coastwise exports, as well as domestic manufactures. The total exports for 1925 amounted to one-fifth the exportation of the whole country. Formerly Rio led all other ports in the export of coffee, but the enormous increase in production in the State of São Paulo has given Santos the lead. Rio handles about two-fifths the importation of the whole republic.

Manufactures.—The industrial activities of Rio de Janeiro have been largely increased since the organization of the republic through increased import duties on foreign products. There were a number of protected industries before this, but they made slight impression on imports. In 1920 there were 1,265 factories, with 46,953 operatives, representing a capital of nearly 270,000,000 paper milreis and an annual production valued at 5,000,000,000 milreis. Rio de Janeiro has manufactures of flour from imported wheat, cotton, woollen and silk textiles, boots and shoes, ready-made clothing, furniture, vehicles, cigars and cigarettes, chocolate, fruit conserves, refined sugar, biscuits, macaroni, ice, beer, artificial liquors, mineral waters, soap, stearine candles, perfumery, feather flowers, printing type, etc. There are numerous machine and repair shops, the most important of which are the shops of the Central railway. One of the most important industrial enterprises in the city is the electric plant belonging to the Rio de Janeiro Light and Power Company.

Government.—The Federal District including Rio de Janeiro is governed by a prefect, who represents the national Government, and a municipal council which represents the people. The prefect is appointed by the president of the republic for a term of four years, and the appointment must be confirmed by the Senate. There are seven *directorias*, or boards, under the prefect, each one assigned to a special field of work, chief among which are education, health and public assistance, public works and transportation, and finance. The municipal council is elected by direct suffrage for a term of two years, and is composed of 24 members. The consolidated debt of the municipality in 1920 was computed at 227,089,200 paper milreis, of which 129,225,450 milreis was an external debt, and 97,863,750 milreis internal. The revenue had grown from 29,070,883 paper milreis in 1910 to 51,182,357 paper milreis in 1919. There is some confusion in administration and accounts, however, and it is sometimes difficult to determine the exact situation. The Federal District is represented in Congress by three senators and ten deputies, and is credited with the rights and privileges of citizenship. On the other hand, the city is a garrison town and under the direct administration of the national executive, who controls its police force, and exercises part control over its streets, squares and water front. In the work of improving the city, the national Government assumed the expense of the commercial quays, the filling of the São Christovão bay, the opening of the Mangue canal and its embellishment, the opening of the Avenida Central, the extension of the sewage system and the addition of new sources to the water supply, while the city was responsible for the Avenida Beira-Mar, the opening of a new avenue from the Largo da Lapa westward to Rua Frei Caneca, the removal of the Morro do Senado, the widening of some streets crossing the Avenida Central and the opening and straightening of other streets.

History.—The discovery of the Bay of Rio de Janeiro is attributed by many Portuguese writers to André Gonçalves, who entered its waters on Jan. 1, 1502, and believed that it was the mouth of a great river, hence the name Rio de Janeiro (River of January). Another Portuguese navigator, Martim Affonso de Souza, visited it in 1531, but passed on to São Vicente, near Santos, where he established a colony. The first settlement in the bay was made by an expedition of French Huguenots under the command of Nicholas Durand Villegaignon, who established his colony on the small island that bears his name. In 1560 their fort was captured and destroyed by a Portuguese expedition from Bahia under Mem de Sá, and in 1567 another expedition under the same commander again destroyed the French settlements, which had spread to the mainland. The victory was won on Jan. 20, the feast-day of St. Sebastian the Martyr, who became the patron saint of the new settlement and gave it his name—São Sebastião do Rio de Janeiro. The French had named their colony La France Antarctique, and their island fort had been called Ft. Coligny. In 1710 a French expedition of five vessels and about 1,000 men under Duclerc attempted to regain possession, but was defeated; its commander was captured and later assassinated. This led to a second French expedition, under Duguay Trouin, who entered the bay on Sept. 12, 1711, and captured the town on the 22nd. Trouin released Duclerc's imprisoned followers, exacted a heavy ransom and then withdrew.

The discovery of gold in Minas Geraes at the end of the 17th century greatly increased the importance of the town. It had been made the capital of the southern captaincies in 1680, and in 1762 it became the capital of all Brazil. In 1808 the fugitive Portuguese court, under the regent Dom João VI., took refuge in Rio de Janeiro, and gave a new impulse to its growth. It was thrown open to foreign commerce, foreign mercantile houses were permitted to settle there, printing was introduced, industrial restrictions were removed, and a college of medicine, a military academy and a public library were founded. Dom João VI. returned to Portugal in 1821, and on Sept. 7, 1822, Brazil was declared independent with Dom Pedro I. as its first emperor and Rio de Janeiro as its capital. In 1839 a steamship service along the coast was opened, but direct communication with Europe was delayed until 1850, and with the United States until 1865. These services added largely to the prosperity of the port. The first section of the Dom Pedro II. railway was opened in 1858, and the second or mountain section in 1864, which brought the city into closer relations with the interior. In 1874 cable communication with Europe was opened, which was soon afterwards extended southward to the La Plata republics.

On Nov. 15, 1889, a military revolt in the city under the leadership of Gen. Deodoro da Fonseca led to the declaration of a republic and the expulsion of the imperial family, which was accomplished without resistance or loss of life. Disorders followed, a naval revolt in 1891 causing the resignation of President Deodoro da Fonseca, and another in 1893–94 causing a blockade of the port for about six months and the loss of many lives and much property from desultory bombardments. There have been since that time some trifling outbreaks on the part of agitators allied with the extreme republican element, but at no time was the security of the Government in danger.

BIBLIOGRAPHY.—Nearly all books relating to Brazil devote some attention to its capital city. *See* also M. D. Moreira de Azevedo, *O Rio de Janeiro* (Rio de Janeiro, 1877); A. J. Lamoureux, *Hand-Book of Rio de Janeiro* (Rio de Janeiro, 1887); W. E. Curtis, *Capitals of Spanish America* (New York, 1888); E. Albes, *Rio de Janeiro*, Pan-American Union (Washington, 1923); A. G. Bell, *The Beautiful Rio de Janeiro* (1914); F. B. Ford, *The Brazan Guide to Rio de Janeiro* (1922); P. Pessôa, *Guia da cidade do Rio de Janeiro* (1905); E. F. Vialoux, *Standard Guide and Handbook to Rio de Janeiro* (1914); F. F. do O. Freire, *Historia da Cidade do Rio de Janeiro* (1912–14).

RIO DE ORO, a Spanish possession on the north-west coast of Africa, extending north from Cape Blanco to Cape Bojador.

North of Cape Bojador are two zones, the southern, reaching to Cape Juby, being a Spanish protectorate, and the northern, from Cape Juby to the Wad Draa being "occupied territory." The three divisions are known collectively as Spanish Sahara. The frontier on the south traverses the middle of Cape Blanco promontory, thence it goes east and north in an irregular and arbitrary line till it meets the southern frontier of Morocco. East and south Spanish territory is bounded by the French Sahara. The area of Rio de Oro is about 65,000 sq.m., that of the whole of Spanish Sahara about 100,000 sq.m., mainly desert. The population, made up of nomad Arabs or Arabized Berbers, does not exceed 100,000 and four-fifths of the people live in the two northern zones. Here, in the basin of the Saqiyet el Hamra, a river (300 m. long) reaching the Atlantic midway between Capes Juby and Bojador, are fertile regions which might repay cultivation, including the oasis of Smara, where is a permanent native settlement and a Kasbah (stone fort). The Spanish headquarters are at Villa Cisneros, on the peninsula forming the Rio de Oro inlet. It has about 500 European inhabitants, and since 1925 has acquired some importance as an air station. The chief advantage Spain derives from possession of the country is its convenience to the Canary Islands fishermen.

The peninsula of Rio de Oro is 23 m. long and 1¼ to 2 m. broad and it is on an average about 20 ft. above sea-level. The estuary between peninsula and mainland is 22 m. long, 5 broad, navigable over two-thirds of its extent, with good anchorage.

History.—The estuary was taken by its Portuguese discoverers in the middle of the 15th century for a river, and, obtaining there a quantity of gold dust from the natives, they named it Rio d'Ouro (Gold River), Rio de Oro being the Spanish form. The activity of the Portuguese was before long transferred to the true auriferous regions of the Gulf of Guinea.

Spain's interest in the Saharan coast dates from the 13th century, but was particularly directed to that part nearest the Canary Islands. The site of the fort of Santa Cruz de Mar Pequeña, established in 1476, though not identified, was north of Cape Bojador. The protection of the Canary Islanders engaged in the fisheries south of that point occasioned, however, the presence of Spanish warships in these waters, and small trading stations were formed at Rio de Oro, Cape Blanco and elsewhere. To preserve the interests thus acquired, Spain in January 1885 took the territories on the coast between capes Blanco and Bojador under her protection. The extension inland of Spanish influence was opposed by France, which claimed a protectorate over the Sahara. A convention of 1900 fixed the limits of Rio de Oro proper; by subsequent agreements with France (in 1904 and 1912) the Spanish zone was extended first from Cape Bojador to Cape Juby, and secondly from Cape Juby to the Wad Draa, the inland frontier being fixed at 8° 40′ West. The 1912 agreement settled a matter long in dispute by fixing the southern frontier of Morocco, which had claimed the Cape Juby district, at the Wad Draa. By that agreement Spain bound herself not to cede or alienate in any form her rights in her zone of influence. In 1916 a small Spanish force was stationed at Cape Juby. It was at Cape Juby that in 1878 a British trading post had been established by Donald Mackenzie; it was eventually made over to the Sultan of Morocco (1895). Spanish Sahara is under the control of the Captain-General of the Canaries and a sub-governor lives at Villa Cisneros. Over the interior the authority of Spain remained almost nominal.

See *Spanish Sahara* (1920), a British Foreign Office handbook with bibliography; also the *Rivista* and the *Boletin* of the Madrid Royal Geog. Soc. (F. R. C.)

RIO GRANDE, a North American river, which rises in the San Juan mountains of southern Colorado, flows south-east and south in Colorado, south by west and south-east through New Mexico and south-east between Texas and Mexico to the Gulf of Mexico. Its length is approximately 2,200m. and for about 1,300m. it forms the international boundary between the United States and Mexico. It presents many features of a complex physiographic type, being first a river of the Rocky Mountains, then of the interior deserts and then of the gulf coastal plain. The Mexicans call it the Río del Norte in its upper course, the Río Bravo in the middle section and the Río Grande only in its course through the coastal plain. From its headwaters, 12,000ft. above the sea, it rushes rapidly down a mountain canyon to San Luis valley, in Colorado. It flows with moderate speed through this broad valley, enters a long canyon with a maximum depth of 400ft., about 4m. above the boundary between Colorado and New Mexico, and is hemmed in between canyon walls or the sides of narrow mountain valleys throughout its course in New Mexico. It passes through a series of picturesque canyons, some of them 1,750ft. in depth, in the "Big Bend," and becomes a silt-laden stream with a shifting channel in its passage through the coastal plain. In its course through the plain its channel is so much obstructed by sand bars that it is of no importance for navigation. As the increasing diversion of the water of the upper Rio Grande for irrigation in Colorado and New Mexico resulted in a scarcity of water for this purpose in Mexico, that country complained, and to remedy the evil the Reclamation Service of the United States proposed the construction by the United States of a storage dam across the river, near Engle, New Mexico. Mexico agreed to this proposal and a treaty covering the matter was proclaimed in Jan. 1907. Mexico receives 60,000 ac.ft. of water annually from the Elephant Butte reservoir in New Mexico. Since 1910 the delta of the Rio Grande, known as the Lower Rio Grande valley, has been developed by water diverted from the river. The irrigated districts, over 200,000ac. in area, extend from the town Rio Grande to the gulf, a distance of about 100 miles. The semi-tropical climate of the region makes it ideal for citrus fruit and vegetables for the winter market. The principal cities on the river are: Brownsville, Texas; Matamoras, Mexico; Laredo, Texas; Del Rio, Texas; El Paso, Texas; Ciudad Juárez, Mexico and Albuquerque, N.M.

RIO GRANDE DO SUL, a southern frontier state of Brazil, bounded on the north by the state of Santa Catharina, on the east by the Atlantic, on the south by Uruguay, and on the west by Uruguay and Argentina—the Uruguay river forming the boundary line with the latter. Area, 91,333sq.m. The northern part of the state lies on the southern slopes of the elevated plateau extending southward from São Paulo across the states of Paraná and Santa Catharina, and is much broken by low mountain ranges whose general direction across the trend of the slope gives them the appearance of escarpments. A range of low mountains extends southward from the Serra do Mar of Santa Catharina and crosses the state into Uruguay. West of this range is a vast grassy rolling upland devoted principally to stock-raising—the south-western part being suitable in pasturage and climate for sheep and cattle. East of it is a wide coastal zone only slightly elevated above the sea; within it are two great tide-water lakes—Lagôa dos Patos and Lagôa Mirim—which are separated from the ocean by two sandy, barren peninsulas. In addition to the Lagôa dos Patos and Lagôa Mirim there are a number of small lakes on the sandy, swampy peninsulas that lie between the coast and these two. The largest lake is the Lagôa dos Patos (Lake of the Patos—an Indian tribe inhabiting its shores at the time of the discovery). The lake is comparatively shallow and filled with sand banks, making its navigable channels tortuous and difficult. The Lagôa Mirim occupies a similar position farther south on the Uruguayan frontier.

Rio Grande lies within the South Temperate zone and has a mild, temperate climate, except in the coastal zone, where it is semi-tropical. There are only two well-marked seasons, though the transition periods between them (about two months each) are sometimes described as spring and autumn. The winter months, June to September, are characterized by heavy rains and by cold westerly winds, called *minuanos,* which sometimes lower the temperature to the freezing point, especially in the mountainous districts. Snow is unknown, but ice frequently forms on inland waters during cold winter nights, only to disappear with the first rays of the sun. In summer, which is nominally a dry season, light rains are common, northerly and easterly winds prevail, and the temperature rises to 95° in the shade.

The principal industry of the state is stock-raising, especially

on the southern plains, where large *estancias* (ranches) are to be found. This industry originated with the Jesuit missions on the Uruguay early in the 17th century, and its development here has been much the same as in Argentina and Uruguay. No general effort was made before the 20th century to improve the herds by the importation of better breeds, and the industry was practically in a state of decay until higher tariff rates were imposed on imported *carne secca* (jerked beef) toward the end of the 19th century. The export of live-stock is insignificant, the practice being to sell the cattle to the *xarqueadas* or *saladeros*, or modern packing plants, where they are slaughtered for *xarque*, *charqui* or *carne secca*, which is usually prepared by salting and drying in the sun, or for frozen meats for southern Europe. The jerked beef is largely exported to other Brazilian states for consumption, while the hides and other by-products are exported to Europe and the United States. Horses, sheep and swine are also raised, the raising of sheep being fostered by the building of woollen factories, and that of swine by the duties on imported pork and lard. In some parts of the state agriculture claims much attention, especially in the forested districts of the north, where colonies of foreign immigrants are established. The forest products include *herva matte* or Paraguay tea (*Ilex paraguayensis*), timbers and lumber and vegetable fibre (*crina vegetal*). Coal of an inferior quality is mined at São Jeronymo, on a small tributary (Arroio dos Ratos) of the Jacuhy river, and has been discovered in other localities. Lime is burned at Caçapava, and at some other places. Gold, copper and iron are said to exist, but are not mined. Considerable progress has been made in manufacturing industries.

The total length of railway lines in the state is nearly 2,000m. The main lines include the one from Rio Grande to Uruguayana, from Revara, near Uruguay, through the central part of the state to the northern border, and one from Porto Alegre to Santa Maria. The Quarahim to Itaquy line belongs to an English company and runs from the Uruguayan frontier, where it connects with the North-Western of Uruguay, northward to Uruguayana and the naval station of Itaquy.

The population in 1900 was 1,149,070; in 1920, 2,182,713. There is a large foreign element; in 1905 the total number of foreigners residing in the state was estimated at 400,000 (not including children born in the country), and of Germans at 250,000. The first German colony was founded in 1824 and settled in 1825 in the rich forested country north of Porto Alegre, and many large and prosperous communities have been established since then in spite of the wars and political agitations in the state. Several of these colonies, such as São Leopoldo, Novo Hamburgo and Conde d'Eu (now Garibaldi), have become important towns and are no longer under colonial administration. Italian colonies were subsequently established, also with good results, but an Irish colony founded at Monte Bonito, near Pelotas, about 1851, failed completely. The capital of Rio Grande do Sul is Porto Alegre (pop. 1920, 179,263) at the northern extremity of Lagôa dos Patos, and its two next most important cities are Rio Grande and Pelotas, both at the southern extremity of the same lake.

Among other important cities and towns with population returns for 1920 are Alegrete (18,372), prettily situated in the western part of the state on the Porto Alegre to Uruguayana railway; Bagé (24,424), about 173m. by rail north-west of Rio Grande in a picturesque mountainous region, 702ft. above sea-level; Jaguarao (11,079), on a river of the same name and opposite the Uruguayan town of Artigas, with steamboat communication with Rio Grande; Caçapava (7,834) in a fine grazing district in the central part of the state, 1,732ft. above sea-level; Quarahim or Quarahy (10,369), a town of much commercial importance on the Quarahim river opposite the Uruguayan town of Santo Eugenio.

History.—The territory was settled along the Uruguay by the Jesuits when they were compelled to abandon their missions on the upper Paraná. Between 1632 and 1707 they founded on the east side of the Uruguay seven missions—all under Spanish jurisdiction—which became highly prosperous, and at the time of their transfer from Spanish to Portuguese rule by a treaty of 1750 had an aggregate population of about 14,000, living in villages and possessing large herds of cattle and many horses. A joint effort of the two powers in 1753 to enforce the treaty, remove the Indians to Spanish territory, and mark the boundary line, led to resistance and a three years' war, which ended in the capture and partial destruction of the missions. On the coast the first recognized settlement—a military post at Estreito, near the present city of Rio Grande—was made in 1737. Before this, and as early as 1680, according to some chroniclers, the region south of Santa Catharina was occupied by settlements, or penal colonies of *degradados* (banished men) and immoral women from Santos, São Vicente and São Paulo, and was known as the "Continente de São Pedro." In 1738 the territory (which included the present state of Santa Catharina) became the Capitania d'El Rei and was made a dependency of Rio de Janeiro. Territorial disputes between Spain and Portugal led to the occupation by the Spanish of the town of Rio Grande (then the capital of the *capitania*) and neighbouring districts from 1763 to 1776, when they reverted to the Portuguese. The capture of Rio Grande in 1763 caused the removal of the seat of government to Viamão at the head of Lagôa dos Patos; in 1773 Porto dos Cazaes, renamed Porto Alegre, became the capital. In 1801 news of war between Spain and Portugal led the inhabitants of Rio Grande to attack and capture the seven missions and some frontier posts held by the Spaniards since 1763; since 1801 the boundary lines established by treaty in 1777 have remained unchanged. The districts of Santa Catharina and Rio Grande had been separated in 1760 for military convenience, and in 1807 the latter was elevated to the category of a *capitania-geral*, with the designation of "São Pedro do Rio Grande," independent of Rio de Janeiro, and with Santa Catharina as a dependency. In 1812 Rio Grande and Santa Catharina were organized into two distinct *comarcas*, the latter becoming an independent province in 1822 when the empire was organized. In 1835 a separatist revolution broke out in the province and lasted ten years. It was reduced more through the use of money and favours than by force of arms; but the province had suffered terribly in the struggle and did not recover its losses for many years. An incident in this contest was the enlistment of Garibaldi for a short time with the forces of the separatists. In 1865 a Paraguayan army invaded the state and on Aug. 5 occupied the town of Uruguayana. On Sept. 18 following, the Paraguayan general (Estigarribia) surrendered without a fight—an unusual occurrence in the remarkable war that followed. Political agitations have been frequent in Rio Grande do Sul, whose people have something of the temperament of their Spanish neighbours, but no important revolution occurred after the "ten years' war" (1835–45) until the presidency at Rio de Janeiro of Gen. Floriano Peixoto, whose ill-considered interference with the State governments led to the revolt of 1892–94, under Gumersindo Saraiva. In this struggle the revolutionists occupied Santa Catharina and Páraná, capturing Curityba, but were eventually overthrown through lack of munitions.

RIO GRANDE DO SUL or **SÃO PEDRO DO RIO GRANDE DO SUL** (sometimes São Pedro and commonly Rio Grande); a city and port of the state, on the western side of the Rio Grande (as the outlet of the Lagôa dos Patos is called), about 6m. from its mouth and nearly 780m. S.W. of Rio de Janeiro, in lat. 32° 7′ S., long. 52° 8′ W. Pop. (1920) of the city, 43,139; of the city and its suburbs, 53,607. The principal streets are served by tramways, and the Rio Grande to Bagé railway has an extension to its shipping wharf called "Estação Maritima" (1½m.), a branch to some points on the river (1½m.), and a branch to Costa do Mar, on the sea coast (11m.). The city is a port of call for several steamship lines, and has direct communication with European ports. Vessels of 24ft. draught can cross the bar, and those not exceeding 22ft. draught can safely enter the port.

The city is built on a low sandy peninsula, barely 5ft. above sea-level, formed by two arms of the Rio Grande projecting westward from the main channel, the peninsula being part of a large sandy plain extending southward along the coast to Lagôa Mirim. The level of the plain is broken by ranges of sand dunes, some of which rise not far from the city on the south and south-

east. The openness of the surrounding country and the proximity of the sea give to Rio Grande unusually healthy conditions, which, however, are largely counteracted by defective sanitary arrangements. In pleasing contrast to the drifting sands which surround the city is the fertile Ilha dos Marinheiros (Sailors' island) lying directly in front of the port; it is highly cultivated and supplies the market with fruit and vegetables. The waterfront has been improved by substantial stone walls, which permit the mooring of light-draught vessels alongside.

Rio Grande is wholly a commercial and industrial city. Its exports include salted jerked beef (*carne secca* or *xarque*), preserved meats, tongues, hides, horns, hoofs, woollen fabrics, Paraguay tea, beans, onions, fruit, flour, *farinha de mandioca* (cassava flour), candles and leather. The pioneer woollen factory in Brazil, and one of the largest in the country, is in Rio Grande.

Rio Grande was founded in 1737 by José da Silva Paes, who built a fort on the river near the site of the present city and called it Estreito. In 1745 the garrison and settlement was removed by Gomes Freire d'Andrade to its present site, which became a "villa," in 1751, with the name of São Pedro do Rio Grande, and a "cidade" (city) in 1807. It was the capital of the captaincy down to 1763, when it was captured by a Spanish force from Buenos Aires under the command of its governor, Don Pedro Zeballos, the seat of government being then removed to Viamão at the northern end of Lagôa dos Patos. The city was occupied by the national forces in the ten years' war which began in 1835, and in 1894 it was unsuccessfully besieged by a small insurgent force that had attempted to overthrow the government at Rio de Janeiro.

RIOJA, LA, an Andean province of Argentina, bounded north by Catamarca, east by Catamarca and Córdoba, south by San Luis and San Juan and west by San Juan and Chile. Area, 37,839 sq. miles. Pop. (1914) 79,754; (1927) 93,408. The province is traversed from north to south by eastern ranges of the Andes and is separated from Chile by the Cordillera itself. The western part of the province is drained by the Bermejo, which flows southward into the closed lacustrine basin of Mendoza. The eastern side of the province is arid. In the extreme north some small streams flow northward into Catamarca. The scanty waters of these streams are used for irrigation purposes. The principal industry of the province is that of mining, its mineral resources including gold, silver, copper, nickel, tin, cobalt, coal, alum and salt. Its best known mines are those of the Sierra de Famatina 16,400 ft. above sea-level, where an aerial wire line is used for transportation to Chilecito in the valley. Alfalfa is grown to a considerable extent and is used for feeding the herds of cattle driven across country to Chile. The capital of the province is La Rioja (pop., 1914, 12,536), on the eastern flank of the Sierra de Velasco, about 1,770 ft. above sea-level and near the gorge of Sanagasta, through which a small stream, also called Rioja, flows northward and affords water for the gardens, vineyards and orchards that surround it. The wines of Rioja are an important source of income for the district. The town is connected by rail with Córdoba and Catamarca. It was founded in 1591 by Velasco and in 1894 was destroyed by an earthquake. The most important town in the province is the mining centre of Chilecito, or Villa Argentina (pop., 1914, about 4,000), about 2,950 ft. above sea-level near the Famatina mines.

RIOM, a town of central France, capital of an arrondissement in the department of Puy-de-Dôme, 8 m. N. by E. of Clermont-Ferrand by rail. Pop. (1926) 8,835. Riom (*Ricomagus* or *Ricomum* of the Romans) was, along with Auvergne, seized for the crown by Philip Augustus, and was the capital of this province under the dukes of Berry and Bourbon. Riom stands on the left bank of the Ambène, on a height above the fertile plain of Limagne. The houses, some of the 15th and 16th centuries, being built of black lava, have a sombre appearance. The church of St. Amable, restored, of Romanesque and early Gothic architecture, dates from the 12th century. The church of Notre-Dame du Marthuret (15th century) has a well-known statue of the Virgin at its western entrance. The Sainte-Chapelle of the 14th and 15th centuries is a relic of the palace of Jean de Berry duke of Auvergne. The rest of the site of the palace is occupied by the law courts. The 16th century belfry and a mansion of the same period known as the Maison des Consuls are notable. Riom is the seat of a sub-prefect and tribunal of commerce.

RÍO NEGRO, a national territory of Argentina lying between 37° 35′ and 42° S. lat. and 62° 50′ and 72° 15′ W. long., within the geographical area formerly known as Patagonia. It is bounded north by the territories of Neuquen and La Pampa, east by the Province of Buenos Aires and the Atlantic, south by the territory of Chubut and west by Chile and Neuquen. Area, about 77,500 sq.m.; pop. (1914) 42,242 of whom approximately 15,000 were foreigners; 1925 estimate 49,372. That part of it lying between the Colorado and Negro rivers has much of the formation and characteristics of the "sterile pampas," but with irrigation the greater part of it can be utilized for agriculture and grazing. South of the Negro the country is arid, barren and lies in a series of sloping tablelands. Lake Nahuel-Huapi (200 sq.m. in area), lying partly in the territory of Neuquen (*q.v.*), is the principal lake of the region. However, there are several chains of lakes in the valleys of the Andes that are considered as rivals to Swiss scenery. The Atlantic coast-line of the territory has one deep indentation—the Gulf of San Matías—in the north bend of which is the port of San Antonio. Stock-breeding is the principal industry. According to an estimate made in 1925 there were over 3,200,000 sheep, 100,500 cattle and 180,000 horses within the territory. Agriculture is little developed, but irrigation, especially in the upper valley of the Río Negro, is transforming arid regions into valuable soil, where grapes are raised. The capital is Viedma (pop., 1926 estimate, 5,000), on the right bank of the Río Negro, 22 m. from its mouth and opposite Carmen de Patagones, a port of Buenos Aires. There are numerous small settlements along the Río Negro and the railway extending inland from San Antonio, but the only other town of importance is Bariloche on the shore of Lake Nahuel-Huapi, western terminal of the railway from San Antonio. Other transportation facilities are furnished by the Great Southern railway which crosses the northern part of the territory.

RIO PARDO (formerly Villa do Rio Pardo), a town of Brazil in the State of Rio Grande do Sul, on the left bank of the Jacuhy at its confluence with the Pardo. Pop. (1920) of the municipality, 34,861. The town is about 80 m. due west of Porto Alegre, with which it is connected by rail and steamer. The Jacuhy is navigable by small steamers. The town had its origin in a frontier fort built at this point by the Portuguese in 1751.

RÍO PIEDRAS, a city situated on the northern coast of Porto Rico. Pop. (1920) 5,820; now estimated at from 15,000 to 20,000. The population of the municipal district in 1920 was 23,025; in 1928 it probably exceeded 35,000.

The rapid growth of Rio Piedras is due to its proximity to the capital city, San Juan. Although the centres of the two cities are about 8 m. apart, they appear now to be one city. As a business centre also Rio Piedras has gained in importance considerably; almost every industry is represented. It has a good system of water-works, electric light, well-kept streets, a superior market, railroad and trolley connection and motor-bus service. It has good schools both public and private. It is the seat of the University of Porto Rico, whose beautiful buildings and grounds adorn the city. Over 2,000 students are in attendance, and the number is rapidly increasing. A municipal hospital and several privately supported hospitals are situated here. (H. M. T.)

RIOT, the gravest kind of breach of the peace, short of treason, known to the English law. It consists in a tumultuous disturbance of the peace by an assemblage of three or more persons who, with intent to help one another against any one who opposes them in the execution of some enterprise, actually execute that enterprise in a violent and turbulent manner, to the terror of the people. It is not necessary that violence should be used to any person or damage done to any property. Whether the enterprise itself is lawful or unlawful is not material, the gist of the offence lying in the mode in which the enterprise is carried out (*Reg.* v. *Cunningham, Grahame and Burns,* 1888, 16 Cox. C.C. 420). Nor is it material whether the enterprise is of a private or a public nature, though in the latter case the rioters may also be guilty

of sedition or treason. An assembly in its inception perfectly lawful may become a riot if the persons assembled proceed to form and execute a common purpose in the manner above stated, although they had no such purpose when they first assembled. Riot differs from "affray" in the number of persons necessary to constitute the offence, from an "unlawful assembly" in that actual tumult or violence is an essential element, and from "rout" which is an unlawful assembly that has moved towards the execution of a common purpose.

According to the decisions in *Field* v. *Receiver of Metropolitan Police* (1907 2. K.B. 853) and *Ford* v. *Receiver of Metropolitan Police* (1921 2 K.B. 344) five elements are necessary to constitute a riot:—(1) the presence of three persons at least; (2) a common purpose; (3) the execution or inception of the common purpose; (4) an intent to help one another by force if necessary against any person who may oppose them in the execution of their common purpose; (5) force or violence not merely used in demolishing, but displayed in such a manner as to alarm at least one person of reasonable firmness and courage.

It is an indictable misdemeanor at common law, but the Riot Act (1714), creates certain statutory offences for riot attended by circumstances of aggravation. That act makes it the duty of a justice, sheriff, mayor or other authority, wherever 12 persons or more are unlawfully, riotously and tumultuously assembled together, to the disturbance of the public peace, to resort to the place of such assembly and read the following proclamation: "Our Sovereign Lord the King chargeth and commandeth all persons being assembled immediately to disperse themselves, and peaceably to depart to their habitations or to their lawful business, upon the pains contained in the act made in the first year of King George for preventing tumultuous and riotous assemblies. God save the King." It is a felony to obstruct the reading of the proclamation or to remain or continue together unlawfully, riotously and tumultuously for one hour after the proclamation was made or for one hour after it would have been made but for being hindered. The act requires the justices to seize and apprehend all persons continuing after the hour, and indemnifies them and those who act under their authority from liability for injuries caused thereby. The punishment for the felony is penal servitude for life. Prosecutions for an offence against the act must be commenced within twelve months after the offence.

By s. 11 of the Malicious Damage Act 1801 (which is a re-enactment of a similar provision made in 1827 in consequence of the frame-breaking riots), it is a felony for persons riotously and tumultuously assembled together to the disturbance of the public peace to unlawfully and with force demolish or begin to demolish or pull down or destroy any building, public building, machinery or mining plant. The punishment is the same as for a felony under the Riot Act. By s. 12 it is a misdemeanour to injure or damage such building, etc. The punishment is penal servitude for seven years, or imprisonment as in the case of the two felonies above described. Under the Shipping Offences Act (1793) a riotous assemblage of three or more seamen, ship's carpenters and other persons, unlawfully and with force preventing and hindering or obstructing the loading or unloading or the sailing or navigation of any vessel, or unlawfully and with force boarding any vessel with intent to prevent, etc., is punishable on a first conviction as a misdemeanour by imprisonment for 12 months, and on a second conviction as a felony by penal servitude for 14 years.

A matter of interest is the extent of the protection afforded at common law and by the Riot Act to soldiers and others acting under the commands of their officers, and in this regard it must always be borne in mind that "a soldier for the purpose of establishing civil order is only a citizen armed in a particular manner." The question was dealt with by Lord Bowen and his fellow-commissioners in the report on the Featherstone riots (Parl. Paper, 1893–1894, *c.* 7234). The substance of their views is as follows:—

By the law of England every one is bound to aid in the suppression of riotous assemblages. The degree of force, however, which may be lawfully employed in their suppression depends on the nature of each riot, for the force used must always be moderated and proportioned to the circumstances of the case and to the end to be attained. The taking of life can only be justified by the necessity for protecting persons or property against various forms of violent crime, or by the necessity of dispersing a riotous crowd which is dangerous unless dispersed, or in the case of persons whose conduct has become felonious through disobedience to the provisions of the Riot Act, and who resist the attempt to disperse or apprehend them. The whole action of the military if once called in, ought from first to last to be based on the principle of doing, and doing without fear, only that which is absolutely necessary to prevent serious crime, and of exercising care and skill with regard to what is done. No set of rules exists which governs every instance or defines beforehand any contingency that may arise. The presence of a magistrate is not essential, but is usual, and of the highest value to aid the commander of the troops by local knowledge. But his presence or absence has no legal effect on the duties or responsibilities of the military to use their arms when it becomes necessary to do so, and without recklessness or negligence and with reasonable care and caution; and where they have so acted the killing of a rioter is justifiable homicide, and the killing of an innocent bystander is homicide by misadventure. It is not usual to resort to extremities with rioters until after reading the proclamation under the Riot Act (1714), but this preliminary is by no means a condition precedent to the exercise of the common-law powers of suppressing riots.

It was decided in *Reg.* v. *Glamorganshire County Council, ex parte Miller* (1899 2 Q.B. 536) that there is no duty upon the county council to pay out of the county funds the expenses of the maintenance of troops which have upon the application of the county justices been brought into the county for the purpose of preserving peace and order in the county.

Until 1886 persons whose property was damaged by riot had a civil remedy of an exceptional character by action against the hundred in which the riot took place. But the old statutes were repealed and replaced by the Riot Damage Act 1886. Under this act compensation is payable where rioters have injured or destroyed houses, shops, buildings, fixed or movable machinery and appliances prepared or used for or in connection with manufactures or agriculture, or for mines or quarries, or have injured, stolen, or destroyed property in houses, shops or buildings. The compensation is payable out of the police rate for the district in which the damage is done. The remedy is available in the case of stranded ships plundered by rioters (s. 515 of the Merchant Shipping Act 1894). (X.; W. DE B. H.)

United States.—Most States have enacted statutes which, though conforming generally to the outlines of the English law, have nevertheless common differences. *See* 94 Am. Dec. 36 *et seq.* In a few States only two people are required. Ga. Penal Code, 1926, sec. 360; Calif. Penal Code, 1923, sec. 404. Some States require that the acts committed be independently unlawful. Page, Ann. Ohio Code, 1926, sec. 12,809. In many others independent illegality is not essential. Cahill's Ill. Rev. Sta. 1927, ch. 38, sec. 518. There is a tendency to abolish the distinction between unlawful assembly, rout and riot by requiring merely threats of, or assembly with intent to do, such acts. Comp. Sts. Neb., 1922, sec. 9,744; Calif. Penal Code, *loc. cit. supra.* Reading of the riot act is still frequently a condition. Conn. Rev. Sts., 1918, sec. 6,336. As an additional deterrent, many statutes hold municipalities responsible to those injured by mobs or riots. Gen. Mun. Law, N.Y., Dec. 71. Diligence of municipal officers is no defence. *Arnold* v. *City of Centralia* (1915), 197 Ill. App. 73, 13 A.L.R. 765. The punishment for riot is generally comparatively mild. Burns Ann. Ind. Sts., 1926, sec. 2,529 (maximum fine of $500 and/or imprisonment for maximum of three months).

Although the courts, in interpreting these statutes, still require that there be "concert of action," a defendant, who was one of the crowd, may be convicted even though he committed none of the prohibited acts. The burden of proving no participation is on him. *Commonwealth* v. *Merrick* (1917), 65 Pa. Super. 482. Concert of action will be "implied" from the facts. *Commonwealth* v. *Frishman* (1920), 235 Mass. 449, 126 N.E. 838. Similarly, "common intent," also said to be essential, is not

necessarily lacking because of a failure to prove a previously existing specific agreement. It also will be "implied." *Grier* v. *State* (1912), 11 Ga. App. 767, 76 S.E. 70. To hold otherwise in any or all of these instances would make it extremely difficult to convict. The courts, for practical purposes, consider the objective realities, apply their own gauge of social desirability in a particular case, and then by the useful tool of "inference" find the elements previously said to be necessary. (L. A. Tu.)

RIOT AND CIVIL COMMOTION INSURANCE. These policies cover all that is provided for by explosion insurance (*q.v.*) and in addition protect against losses due to riot, insurrection, civil commotion and strike. The rates are low but in the case of strike, for example, they are trebled if the policy is taken out after the strike has been declared. Co-insurance of 50% is required and reductions in premium are granted for higher percentages.

RIO TINTO (Minas de Rio Tinto), a mining town of south-western Spain, in the province of Huelva; near the source of the river Tinto, and at the terminus of a light railway from the port of Huelva. Pop. (1920), 9,669. Rio Tinto is one of the greatest copper-mining centres in the world; and it is from the discoloration of its waters by copper ore that the river derives its name. Rio Tinto was probably exploited by the Carthaginians or others earlier; later Roman workings may still be seen. After the Moorish conquest, in 711, it was neglected until 1725, when the mines were leased to a Swede named Wolters. Their modern importance dates from 1872, when a syndicate of London and Bremen capitalists purchased them from the Spanish government.

RIOUW-LINGGA ARCHIPELAGO, five groups of islands lying off the east coast of Sumatra and extending from the Straits of Singapore in the north, to the Straits of Berhala in the south. They comprise the Karimon group, the Batam group, the Bintang group, the Lingga group, and the Singkep group, with territory on the mainland opposite known as Indragiri, and collectively they form a residency of the Dutch East Indies known as Riouw and Dependencies. The islands vary considerably in height and area, from rocky crags and small coral reefs, to Bintang, or Riouw, the largest island, area 440 sq.m., with a height of 1,235 ft.; Lingga and Singkep are almost as large, and the former attains a height of 4,400 ft. above sea-level and has the largest alluvial plain of the archipelago. Coral reefs and currents about the islands make navigation difficult. Really a granitic prolongation of the Malay peninsula, the alluvial deposits of the rivers of Sumatra are tending to unite the islands of the Riouw archipelago with the Sumatra mainland. The total area of the residency is 17,550 sq.m. and its population (1927) was 224,145, (468 Europeans and Eurasians and 27,797 Chinese). On the mainland territory of Indragiri, which consists of a long, triangular-shaped wedge of land between the government of Sumatra East Coast and Jambi residency, and is mainly the valley of the river Kuantan and its tributaries, the people are Malays; the people of the islands are Malays, Buginese and Chinese, with a few aboriginals, probably not more than 1,000, known as Benua. The chief products of the islands are gambir, rubber and pepper, although rice is grown very largely for food purposes, and trade in these, in fact the agriculture, shipping and finance of the islands, is very largely in Chinese hands, the Malays and Buginese selling their produce to the Chinese, who are cultivators, as well as traders. Exports from Riouw and dependencies (including Indragiri) in 1926 were 26,242,303 and imports 17,172,431 guilders. Tin mines are worked privately on the island of Singkep, the output in 1925 being 11,000 *piculs* (1 *picul* = 136 lb.). The capital of the residency is Tandjung Pinang, opposite Singapore and also known as Riouw, or Bintang, pop. 4,538, the seat of the resident, and a port of call for vessels of the Royal Packet Navigation company: it is the only free port in the archipelago. It is a roadstead, with a good anchorage. Bintang is mentioned by Marco Polo as Pentam, which resembles the Malay name for Bintang—Bentan. After the Portuguese conquest of Malacca (1511), the exiled Mohammedan dynasty occupied Bintang, and the island became notorious for its piracy. (E. E. L.)

RIPLEY, market town, urban district, Ilkeston parliamentary division, Derbyshire, England, 10 m. N. of Derby on the L.M.S. railway. Pop. (1921) 13,292. It lies high between the valleys of the Derwent and the Erewash. The charter for the market was granted by Henry III. To the west of Ripley lies the township of Heage. Pop. (1921) 3,740.

RIPON, GEORGE FREDERICK SAMUEL ROBINSON, 1st Marquess of (1827–1909), British statesman, only son of the 1st earl of Ripon and his wife Lady Sarah, daughter of Robert Hobart, 4th earl of Buckinghamshire, was born in London on Sept. 24, 1827.

Ripon began his political life as *attaché* to a special mission to Brussels in 1849. In 1851 he married Henrietta Vyner (d. 1907), and their eldest son, afterwards known as Earl de Grey, was born in 1852. Under his courtesy title of Viscount Goderich he was returned to the House of Commons for Hull in 1852 as an advanced Liberal. In 1853 he was elected for Huddersfield, and in 1857 for the West Riding of Yorkshire. In Jan. 1859 he succeeded to his father's title, and in November of the same year to that of his uncle, Earl de Grey. A few months after entering the Upper House he was appointed under-secretary for war, and in Feb. 1861 under-secretary for India. Upon the death of Sir George Cornewall Lewis in April 1863 he became secretary for war, with a seat in the cabinet. In 1866 he was appointed secretary of State for India. On the formation of the Gladstone administration in Dec. 1868, Lord Ripon was appointed lord president of the council, and held that office until within a few months of the fall of the Government in 1873, when he resigned on purely private grounds. In 1871 Lord Ripon was appointed chairman of the High Joint-Commission on the Alabama claims, which arranged the Treaty of Washington. In recognition of his services he was elevated to a marquessate (1871). In 1874 he became a convert to Roman Catholicism.

On the return of Gladstone to power in 1880 Lord Ripon was appointed viceroy of India, the appointment exciting a storm of controversy, the marquess being the first Roman Catholic to hold the viceregal office. He went out to reverse the Afghan policy of Lord Lytton, and Kandahar was given up, the whole of Afghanistan being secured to Abdur Rahman. The new viceroy extended the rights of the natives, and in certain directions curtailed the privileges of Europeans. For the Ilbert bill of 1883—so named after its author Sir Courtenay Ilbert, *see* India: *History*.

In 1886 he became first lord of the admiralty in the third Gladstone ministry; and on the return of the Liberals to power in 1892 he was appointed colonial secretary, which post he continued to hold until the resignation of the Government in 1895. He was included in Sir Henry Campbell-Bannerman's cabinet at the close of 1905 as lord privy seal, an office which he retained in 1908 when Asquith formed his new ministry, but which he resigned later in the same year. He died at his seat, Studley Royal, near Ripon, on July 9, 1909, when his only son, Earl de Grey, treasurer of the queen's household since 1901, became the 2nd marquess.

RIPON, a cathedral city, and municipal borough in the West Riding of Yorkshire, England, 214 m. N.N.W. from London, 30 m. N. of Leeds, on the L.N.E. railway. Pop. (1921) 8,391. It is a foot-hill town of the Pennines, situated at the confluence of the Ure with its tributaries the Laver and the Skell.

Ripon (*In Rhypum, Ad Ripam*) owed its origin to the monastery founded in 661, of which St. Wilfred became the first abbot. Tradition says that Ripon was made a royal borough by Alfred the Great and that King Aethelstan in 937 gave the borough to the Archbishop of York, and granted him privileges, as lord of the manor, of holding a market and fair. Henry I. certainly granted, or confirmed, these privileges to the Archbishops of York, who retained them until they were handed over to the Bishop of Ripon in 1837. In 1857, they were transferred to the ecclesiastical commissioners from whom they were purchased by the Corporation of Ripon in 1880. About the year 950 the monastery and town were destroyed by King Edred during an expedition against the Danes, but the monastery was rebuilt by the Archbishops of York and about the time of the Conquest it became a collegiate church. In 1318, when the Scots invaded

England, Ripon escaped being burnt a second time only by the payment of 1,000 marks.

The streets of Ripon are for the most part narrow and irregular, and although most of the houses are comparatively modern, some of them retain the picturesque gables characteristic of earlier times. The Cathedral, with a large square central tower and two western towers, is celebrated for its fine proportions and contains various styles of architecture. It was founded on the ruins of St. Wilfred's Abbey of the 7th century, but of this Saxon building nothing now remains except the crypt which is known as St. Wilfred's Needle. Apart from the crypt, the oldest part of the fabric is a portion of the chapter house and vestry adjoining the south side of the choir, and terminating eastward in an apse. This is pure Norman work and beneath is a crypt of that period. The present building was begun about 1154 and to this transitional period belong the transepts and parts of the choir. The west front and twin towers are fine specimens of Early English architecture and were completed about 1255. The eastern portion of the choir was rebuilt in Decorated style about the close of the 13th century. The nave and parts of the central tower and two bays of the choir are Perpendicular and were rebuilt towards the end of the 15th century.

The diocese of Ripon was created in 1836 and comprises most of the West Riding and part of the North Riding of Yorkshire and a small part of Lancashire. The episcopal palace, a modern building in Tudor style, is 1 m. N.W. of the city. To the south-west lies Studley Royal, a seat of the Marquess of Ripon, which contains the celebrated ruins of Fountains Abbey. Several old charities include the hospital of St. John the Baptist, founded in 1109, and the hospital of St. Mary Magdalene, founded by the Archbishop of York early in the 12th century as a secular community whose special duty was to administer to lepers. In the 13th century a master and chaplain took the place of the lay brethren and a chantry was founded in 1334. The chapel survives with interesting Norman work and a rare example of a pre-Reformation altar of stone.

From before the Conquest until the incorporation charter of 1604, Ripon was governed by a wakeman and 12 elders, but in 1604 the title of wakeman was changed to mayor, and 12 aldermen and 24 councillors were appointed. Ripon was summoned to send 2 members to parliament in 1295, and at intervals from that time until 1328–9. The privilege was revived in 1553, and continued until 1867, when only one was allowed. This latter privilege was removed by the Redistribution Bill of 1885 and Ripon gives its name to a parliamentary division of the county.

See *Victoria County History, Yorkshire.*

RISDON: *see* HOBART.

RISHANGER, WILLIAM (*c.* 1250–*c.* 1312), English chronicler, made his profession as a Benedictine at St. Alban's abbey in 1271, of which he perhaps became the official chronicler. The most important of his writings is the *Narratio de bellis apud Lewes et Evesham.* Though written many years afterwards and drawn from other sources, it is a spirited account of the barons' war. He is so great an admirer of Simon de Montfort that this work has been called a hagiography. He is credited with the authorship of a chronicle covering the period 1259–1306; this has been disputed, but the work is printed under his name by Riley.

See *Wilhelmi Rishanger chronica et annales,* Rolls Series, Introduction ed. H. T. Riley; the *Narratio de bellis apud Lewes et Evesham,* ed. J. O. Halliwell, Camden Society, 1840.

RISK, hazard, chance of danger or loss, especially the chance of loss to property or goods which an insurance company undertakes to make good to the insurer in return for the recurrent payment of a sum called the premium (*see* INSURANCE).

RISTIĆ, JOVAN (1831–1899), Serbian statesman, was born at Kragugevaz in 1831. He was educated at Belgrade, Heidelberg, Berlin and Paris. In 1861 he became Serbian diplomatic agent at Constantinople, and secured the withdrawal of the Turkish troops from the Serbian fortresses in 1867. On his return from Constantinople he became the recognized leader of the Liberal party. After the assassination of Prince Michael in 1868, he sat on the council of regency, and the first Serbian constitution (Jan. 2, 1869) was mainly his creation. When Prince Milan attained his majority in 1872, Ristić became foreign minister, and then prime minister, but resigned in the following autumn (1873). He again became prime minister in April 1876, and conducted the two wars against Turkey (July 1876–March 1877 and Dec. 1877–March 1878). Owing to the failure to realise Serb aspirations at the Congress of Berlin, the Ristić government became unpopular, and resigned in 1880. In 1887 Milan recalled Ristić; a new constitution was granted in 1888, and in 1889 Ristić became head of the council of regency for the young king Alexander. On April 13, 1893, King Alexander, by a successful stratagem, imprisoned the regents and ministers in the palace, and, declaring himself of age, recalled the Radicals to office. Ristić died at Belgrade on Sept. 4, 1899.

RISTORI (*rist'ō-rē*), **ADELAIDE** (1822–1906), Italian actress, born at Cividale del Friuli Jan. 30, 1822, daughter of strolling players. As a child she appeared upon the stage, and at 14 made her first success as Francesca da Rimini in Silvio Pellico's tragedy. She was 18 when for the first time she played Mary Stuart in an Italian version of Schiller's play. She had been a member of the Sardinian company and also of the ducal company at Parma for some years before her marriage (1846) to the marchese Giuliano Capranica del Grillo (d. 1861); and after a short retirement she returned to the stage and played regularly in Turin and the provinces. In 1855 she took Paris by storm in the rôle of Alfieri's *Myrrha.* Furious partisanship was aroused by the appearance of a rival to the great Rachel. In 1857 she visited Madrid, playing in Spanish to enthusiastic audiences, and in 1866 she paid the first of four visits to the United States, where she had great success in Giacometti's *Elizabeth,* an Italian study of the English sovereign. She retired from professional life in 1885, and died on Oct. 9, 1906, in Rome. Her *Studies and Memoirs* (1888) contain valuable studies in the psychological explanation of the characters of Mary Stuart, Elizabeth, Myrrha, Phaedra and Lady Macbeth, in her interpretation of which Ristori combined high dramatic instinct with the keenest intellectual study.

See also E. P. Hingston, *Adelaide Ristori: A Sketch of her Life* (1856); K. Field, *Adelaide Ristori: A Biography* (1867); Adelaide Ristori, *Studies and Memoirs* (1888), new rev. ed., trans. by G. Mantellini, *Memoirs and Artistic Studies* (1907).

RITCHIE, CHARLES THOMSON RITCHIE, 1ST BARON (1838–1906), English politician, was born at Dundee on Nov. 19, 1838, and educated at the City of London school. He went into business, and in 1874 was returned to parliament as Conservative member for the working-class constituency of Tower Hamlets. In 1885 he was made secretary to the Admiralty, and from 1886 to 1892 president of the Local Government Board, in Lord Salisbury's administration with a seat in the cabinet after 1887, sitting as member for St. George's in the East. He was responsible for the Local Government Act of 1888, instituting the county councils; and a large section of the Conservative party always owed him a grudge for having originated the London County Council. In Lord Salisbury's later ministries, as member for Croydon, he was president of the Board of Trade (1895–1900), and home secretary (1895–1900); and when Sir Michael Hicks-Beach retired in 1902, he became chancellor of the exchequer in Balfour's cabinet. Though in his earlier years he had been a "fair-trader," he was strongly opposed to Chamberlain's movement for a preferential tariff (*see* the articles on BALFOUR, A. J., and CHAMBERLAIN, J.), and he resigned office in Sept. 1903. In Dec. 1905 he was created a peer, but he was in ill-health, and he died at Biarritz on Jan. 9, 1906.

See the article in the *Dict. Nat. Biog.* Suppl. 1901–21.

RITSCHL, ALBRECHT (1822–1889), German theologian, was born in Berlin on March 25, 1822. His father, Benjamin Ritschl (1783–1858), was from 1827 to 1854 general superintendent and evangelical bishop of Pomerania. Albrecht studied at Bonn, Halle, Heidelberg and Tübingen. At Halle he came under Hegelian influences. In 1845 he was entirely captivated by the Tübingen school, and in *Das Evangelium Marcions und das kanonische Evangelium des Lukas* (1846) he appears as a disciple of F. C. Baur. But the second edition (1857) of his most im-

portant work, on the origin of the old Catholic Church (*Die Entstehung der alt-kathol. Kirche*), shows considerable divergence from the first edition (1850), and reveals an entire emancipation from Baur's method. Ritschl was professor of theology at Bonn (extraordinarius 1852; ordinarius 1859) and Göttingen (1864; *Consistorialrath* also in 1874), his addresses on religion delivered at the latter university showing the impression made upon his mind by his study of Kant and Schleiermacher. Finally, in 1864, came the influence of Rudolf Lotze. He wrote *Die Christliche Lehre von der Rechtfertigung und Versöhnung* (1870–74), and *Die Geschichte des Pietismus* (1880–86). He died at Göttingen on March 20, 1889.

Ritschl claims to carry on the work of Luther and Schleiermacher. He criticizes especially the use of Aristotelianism and speculative philosophy in scholastic and Protestant theology. He holds that such philosophy is too shallow for theology. Hegelianism attempts to squeeze all life into the categories of logic: Aristotelianism deals with "things in general" and ignores the radical distinction between nature and spirit. Neither Hegelianism nor Aristotelianism is "vital" enough to sound the depths of religious life. Neither conceives "God" as correlative to human "trust" (cf. *Theologie und Metaphysik*, esp. p. 8 *seq.*). But Ritschl's recoil carries him so far that he is left alone with merely "practical" experience. "Faith" knows God in His active relation to the "kingdom," but not at all as "self-existent."

Ritschl's school, in which J. G. W. Herrmann, Julius Kaftan and Adolf Harnack were the chief names, diverged from his teaching in many directions; *e.g.*, Kaftan appreciated the mystical side of religion and Harnack's criticism was very different from Ritschl's arbitrary exegesis. They were united on the value of faith-knowledge as opposed to "metaphysic."

See H. Schoen, *Les Origines historiques de la théologie de Ritschl* (1893); G. Ecke, *Die theologische Schule, A. Ritschl's und die evangelische Kirche der Gegenwart* (1897); J. Orr, *The Ritschlian Theology and the Evangelical Faith* (1898) and *Ritschlianism: expository and critical essays* (1903); A. E. Gavire, *The Ritschlian Theology* (1899); E. A. Edghill, *Faith and Fact, a study of Ritschlianism* (1910); R. Mackintosh, *Ritschl* (1915). The chief authority for his biography is *Albrecht Ritschls Leben* (2 vols., Leipzig, 1896) by his son Otto Ritschl.

RITSCHL, FRIEDRICH WILHELM (1806–1876), German scholar, was born in 1806 in Thuringia. He was well taught in youth by Spitzner, a pupil of Gottfried Hermann, spent a year at Leipzig, and in 1826 went to Halle. He went to Bonn in 1839, where he controlled a philological seminary. The names of Georg Curtius, Ihne, Schleicher, Bernays, Ribbeck, Lorenz, Vahlen, Hübner, Bücheler, Helbig, Benndorf, Riese, Windisch, who were his pupils either at Bonn or at Leipzig, attest his fame and power as a teacher. In 1865 a violent quarrel arose between him and Otto Jahn, now his colleague; he resigned, went to Leipzig, and died there in 1876. His great faculty for organization is shown by his administration of the university library at Bonn, and by the eight years of labour which carried to success a work of infinite complexity, the famous *Priscae Latinitatis Monumenta Epigraphica* (Bonn, 1862). This volume presents in admirable facsimile, with prefatory notices and indexes, the Latin inscriptions from the earliest times to the end of the republic.

To the world in general Ritschl was best known as a student of Plautus. Ritschl's examination of the Plautine mss. was both laborious and brilliant, and greatly extended the knowledge of Plautus: for example, by the aid of the Ambrosian palimpsest he recovered the name T. Maccius Plautus, for the vulgate M. Accius, and proved it correct by strong extraneous arguments.

In spite of the incompleteness, on many sides, of his work Ritschl must be assigned a place in the history of learning among a very select few. His studies are presented principally in his *Opuscula* collected partly before and partly since his death. The *Trinummus* (twice edited) was the only specimen of his contemplated edition of Plautus which he completed.

The facts of Ritschl's life may be best learned from the elaborate biography by Otto Ribbeck (Leipzig, 1879). An interesting estimate of Ritschl's work is that by Lucian Müller (1877).

RITTENHOUSE, DAVID (1732–1796), American astronomer, was born at Germantown, Pa., on April 8, 1732. First a watchmaker and mechanician, he afterwards became treasurer of Pennsylvania (1777–89), and from 1792 to 1795 director of the U.S. mint (Philadelphia). He was a fellow of the Royal Society of London, and a member, and in 1791 president, of the American Philosophical Society. As an astronomer, Rittenhouse's principal merit is that he introduced in 1786 the use of spider lines in the focus of a transit instrument. His researches were published in the *Transactions of the American Philosophical Society* (1785–1799). He died at Philadelphia June 26, 1796.

See *Memoir* (1813) by William Barton.

RITTER, HEINRICH (1791–1869), German historian of philosophy, was born at Zerbst on Nov. 21, 1791, and died on Feb. 3, 1869, at Göttingen, where he had been professor of philosophy for nearly 30 years. Of his numerous works the most important are the *Geschichte der Philosophie* (Hamburg, 12 vols., 1829–53), and, written with Preller, the *Historia philosophiae Graeco-Romanae* (1838, 7th ed. 1888).

RITTER, KARL (1779–1859), German geographer, born at Quedlinburg on Aug. 7, 1779, had already travelled much when in 1817–18 he wrote *Die Erdkunde im Verhältnis zur Natur und zur Geschichte des Menschen* (Berlin, 2 vols., 1817–1818). In 1819 he became professor of history at Frankfort, and in 1820 professor extraordinarius of history at Berlin, where he remained till his death. The second edition of his *Erdkunde* (1822–58) was on a much larger scale than the first, but he completed only the sections on Africa and the various countries of Asia. Ritter brought to his work a new conception of the subject. Geography was, to use his own expression, a kind of physiology and comparative anatomy of the earth: rivers, mountains, etc., were so many distinct organs, each with its own functions; and the structure of each country is a leading element in the historic progress of the nation. His death occurred in Berlin on Sept. 28, 1859.

See G. Kramer, *Karl Ritter, ein Lebensbild* (Halle, 1864 and 1870; 2nd ed., 1875); W. L. Gage, *The Life of Karl Ritter* (1867); F. Marthe, "Was bedeutet Karl Ritter für die Geographie," in *Zeitsch. der Ges. f. Erdk.* (Berlin, 1879).

RITUAL [Lat. *ritus*, a custom], a term of religion, which may be defined as the routine of worship. This is a "minimum definition"; "ritual" at least means so much, but may stand for more. Without some sort of ritual there could be no organized method in religious worship. Indeed, viewed in this aspect, ritual is to religion what habit is to life and its function is similar; namely, by bringing subordinate functions under an effortless rule, to permit undivided attention in regard to vital issues. The chief task of routine in religion is to organize the activities necessary to its stability and continuance as a social institution, in order that all available spontaneity and initiative may be directed into spiritual channels.

But, whilst ritual at least represents routine, it tends, historically speaking, to have a far deeper significance for the religious consciousness. A recurrent feature of religion, which many students of its phenomena would even consider constant and typical, is the attribution of a more or less self-contained and automatic efficacy to the ritual procedure as such. Before proceeding to considerations of genesis, it will be convenient briefly to analyse the notion as it appears in the higher religions.

Two constituent lines of thought may be distinguished. Firstly, there is the tendency to pass beyond the purely petitionary attitude which as such can imply no more than the desire, hope or expectation of divine favour, and to take for granted the consummation sought, a deity that answers, a grace and blessing that are communicated. When such accomplishment of its end is assumed, efficacy can readily be held to attach to the act of worship as such. Secondly, there is the tendency to identify such a self-accomplishing act of worship with its objective expression in the ritual that for purposes of mutual understanding makes the body of worshippers one.

The Formal Element in Ritual.—Exactly similar tendencies—to impute efficacy, and to treat the ritual procedure as the

source of that efficacy—are typically characteristic of black magic, and their reappearance in religion can hardly be treated as a coincidence, seeing that magic and religion would appear to have much in common, at any rate during the earlier stages of their development. In magic a suggestion is made orally, or by dramatic action, or most often in both ways together, that is held *ipso facto* to bring about its own accomplishment. A certain conditionality attaches to the magical operation, inasmuch as each magician is subject to interference on the part of other magicians who may neutralize his spell by a counter-spell of equal or greater power; nevertheless, the intrinsic tone is that of a categorical assertion of binding force and efficacy. Again, in magic the self-realizing force is apt to seem to reside in the suggestional machinery rather than in the spiritual qualifications of the magician, though this is by no means invariably the case. On the whole, however, spells and ceremonies are wont to be regarded as an inheritable and transferable property containing efficacy in themselves. What is true of magic is true of much primitive religion.

Sir J. G. Frazer has pronounced the following to be marks of a primitive ritual: negatively, that there are no priests, no temples and no gods (though he holds that departmental, non-individual "spirits" are recognized); positively, that the rites are magical rather than propitiatory (*The Golden Bough,* 2nd ed. ii. 191). If we leave it an open question whether, instead of "spirits," it would not be safer to speak of "powers" to which there is attributed not a soul-like nature, but simply a capacity for acting with *mana* (q.v.) (which roughly is what Frazer means by "magical"), this characterization may be accepted as applying to many, if not to all, the rites of primitive religion.

As Lang well puts it, "Ritual is preserved because it preserves luck." Given an intrinsic sacredness, it is but a step to associate definite gods with the origin or purpose of a rite, whose interest it thereupon becomes to punish omissions or innovations by the removal of their blessing (which is little more than to say that the rite loses its efficacy), or by the active infliction of disaster on the community. In the primitive society it is hard to point to any custom to which sacredness does not in some degree attach, but, naturally, the more important and solemn the usage, the more rigid the religious conservatism. Thus there are indications that in Australia, at the highly sacred ceremony of circumcision, the fire-stick was employed after stone implements were known; and we have an exact parallel at a higher level of culture, the stone implement serving for the same operation when iron is already in common use. (*See* B. Spencer and F. Gillen, *The Native Tribes of Australia*, 401; *cf.* E. B. Tylor, *Early History of Mankind,* 3rd ed. 217.)

The Interpretation of Ritual.—A valuable truth insisted on by the late W. Robertson Smith (*Religion of the Semites,* 17 et sqq.) is that in primitive religion it is ritual that generates and sustains myth, and not the other way about. Sacred lore of course cannot be dispensed with; even Australian aboriginal society, which has hardly reached the stage of having priests, needs its *Oknirabata* or "great instructor" (Spencer and Gillen, *ibid.,* 303). The function of such an expert, however, is chiefly to hand on mere rules for the performance of religious acts. If his lore include sacred histories, it is largely, we may suspect, because the description and dramatization of the doings of divine persons enter into ritual as a means of suggestional control. Similarly, the sacred books of the religions of middle grade teem with minute prescriptions as to ritual, but are almost destitute of doctrine. Even in the highest religions, where orthodoxy is the main requirement, and ritual is held merely to symbolize dogma, there is a remarkable rigidity about the dogma that is doubtless in large part due to its association with ritual forms, many of them bearing the most primeval stamp.

As regards the symbolic interpretation of ritual, this is usually held not to be primitive; and it is doubtless true that an unreflective age is hardly aware of the difference between "outward sign" and "inward meaning," and thinks as it were by means of its eyes. Nevertheless, it is easier to define fetishism (q.v.) (a fetish "differing from an idol in that it is worshipped in its own character, not as the symbol, image or occasional residence of a deity," *New Oxford Dictionary,* Oxford, 1901) than it is to bring such a fetishism home to any savage people, the West African negroes not excluded (*cf.* A. B. Ellis, *The Tshi-speaking Peoples of the Gold Coast of W. Africa,* 192). It is the intrinsic *mana,* virtue or grace residing in, and proceeding from, the material object—a power the communicability of which constitutes the whole working hypothesis of the magico-religious performance—that is valued in those cases where native opinion can be tested. Moreover, it must be remembered that in the act of magic a symbolic method is consciously pursued, as witness the very formulas employed: "As I burn this image, so may the man be consumed," or the even more explicit, "It is not wax I am scorching; it is the liver, heart and spleen of So-and-so that I scorch" (W. W. Skeat, *Malay Magic,* 570), where appearance and reality are distinguished in order to be mystically reunited.

Now it is important to observe that from the symbol as embodying an imperative to the symbol as expressing an optative is a transition of meaning that involves no change of form whatever; and, much as theorists love to contrast the suggestional and the petitionary attitudes, it is doubtful if the savage does not move quite indifferently to and fro across the supposed frontier-line between magic and religion, interspersing "bluff" with blandishment, spell with genuine prayer. Meanwhile the particular meanings of the detailed acts composing a complicated piece of ritual soon tend to lose themselves in a general sense of the efficacy of the rite, as a whole, to bring blessing and avert evil. Nay, unintelligibility is so far from invalidating a sacred practice that it positively supports it by deepening the characteristic atmosphere of mystery. Even the higher religions show a lingering predilection for cabalistic formulas.

Changes in Ritual.—Whilst ritual displays an extraordinary stability, its nature is of course not absolutely rigid; it grows, alters and decays. As regards its growth, there is hardly a known tribe without its elaborate body of magico-religious rites. In the exceptional instances where this feature is relatively absent (the Masai of East Africa offer a case in point), we may suspect a disturbance of tradition due to migration or some similar cause. Thus there is always a pre-existing pattern in accordance with which such evolution or invention as occurs proceeds. Unconscious evolution is perhaps the more active factor in primitive times; imitation is never exact, and small variations amount in time to considerable changes.

On the other hand, there is also deliberate innovation. In Australia councils of the older men are held day by day during the performance of their ceremonies, at which traditions are repeated and procedure determined, the effect being mainly to preserve custom but undoubtedly in part also to alter it. Moreover, the individual religious genius exercises no small influence. A man of a more original turn of mind than his fellows will claim to have had a new ceremony imparted to him in a vision, and such a ceremony will even be adopted by another tribe which has no notion of its meaning (Spencer and Gillen, *ibid.,* 272, 278, 281). Meanwhile, since little is dropped whilst so much is being added, the result is an endless complication and elaboration of ritual. Side by side with elaboration goes systematization, more especially when local cults come to be merged in a wider unity. Thereupon assimilation is likely to take place to one or another leading type of rite—for instance, sacrifice or prayer. At these higher stages there is more need than ever for the expert in the shape of the priest, in whose hands ritual procedure becomes more and more of a conscious and studied discipline, the naïve popular elements being steadily eliminated, or rather transformed. Not but what the transference of ritualistic duties to a professional class is often the signal for slack and mechanical performance, with consequent decay of ceremonial. The trouble and worry of having to comply with the endless rules of a too complex system is apt to operate more widely—namely, in the religious society at large—and to produce an endless crop of evasions.

Good examples of these on the part alike of priests and people are afforded by Toda religion, the degenerate condition of which is expressly attributed by Dr. W. H. R. Rivers to "the over-development of the ritual aspect of religion" (*The Todas,* 454–5).

It is interesting to observe that a religion thus atrophied tends to revert to purely magical practices, the use of the word of power, and so on (*ibid.*, ch. x.). It is to be noted, however, that what are known as ritual substitutions, though they lend themselves to purposes of evasion (as in the case of the Chinese use of paper money at funerals), rest ultimately on a principle that is absolutely fundamental in magico-religious theory; namely, that what suggests a thing because it is like it or a part of it becomes that thing when the mystic power is there to carry the suggestion through.

The Classification of Rites.—More than one basis of division has suggested itself. From the sociological point of view perhaps the most important distinction in use is that between public and private rites. Whilst the former essentially belong to religion as existing to further the common weal, the latter have from the earliest times an ambiguous character and tend to split into those which are licit—"sacraments," as they may be termed—and those which are considered anti-social in tendency, and are consequently put beyond the pale of religion and assigned to the "black art" of magic. Or the sociologist may prefer to correlate rites with the forms of social organization—the tribe, the phratry, the clan, the family and so on.

Another interesting contrast (seeing how primary a function of religion it is to establish a calendar of sacred seasons) is that between periodic and occasional rites—one that to a certain extent falls into line with the previous dichotomy. A less fruitful method of classing rites is that which arranges them according to their inner meaning. As we have seen, such meaning is usually acquired *ex post facto*, and typical forms of rite are used for many different purposes; so that attempts to differentiate are likely to beget more equivocations than they clear up. The fact is that comparative religion must be content to regard all its classifications alike as pieces of mere scaffolding serving temporary purposes of construction.

Negative Rites.—A word must be added on a subject dealt with elsewhere (*see* TABU), but strictly germane to the matter in hand. Ritual interdictions have the best, if not the sole, right to rank as taboos (*see* M. Mauss in *L'Année sociologique*, ix. 249). Taboo, as understood in Polynesia, the home of the word, is as wide as, and no wider than, religion, representing one side or aspect of the sacred (*see* RELIGION). The very power that can help can also blast if approached improperly and without due precautions. Taboos are such precautions, abstinences prompted, not by simple dread or dislike, but always by some sort of respect as felt towards that which in other circumstances or in other form has healing virtue. Thus the negative attitude of the observer of taboo involves a positive attitude of reverence from which it becomes in practice scarcely distinguishable. To keep a fast, for instance, is looked upon as a direct act of worship. It must be noted, too, that, whereas taboo as at first conceived belongs to the magico-religious circle of ideas, implying a quasi-physical transference of sacredness from that having it to one not fit to receive it, it is very easily reinterpreted as an obligation imposed by the deity on his worshippers.

The law observed by a primitive religious community abounds in negative precepts, and if early religion tends to be a religion of fear it is because the taboo-breaker provides the most palpable objective for human and divine sanctions. In the higher religions, to be pure remains amongst the most laudable of aspirations, and, even though the ceremonial aversion of a former age has become moralized, and a purity of heart set up as the ideal, it is on "virtues of omission" that stress is apt to be laid, so that a timorous propriety is too often preferred to a forceful grappling with the problems of life. There are signs, however, that the religious consciousness has at length come to appreciate the fact that the function of routine in religion as elsewhere is to clear the way for action.

RITUAL MURDER, a general term for human sacrifice in connection with religious ceremonies. False accusations as to the practice of ritual murder by various bodies have often been made. Justin Martyr in his second apology (cap. xii.) vigorously defends the Christian community against the charge: Octavius, Minutius Felix, Tertullian, Origen, and other Church Fathers all refer to the subject and indignantly repudiate the atrocious libel that the Eucharist involved human sacrifice. The myth was revived against the Montanists, and in the later middle ages against various dissenting sects of Christians. In modern times the accusation has been again levelled against "foreigners" during the disturbances in China. The chief sufferers from the libel were however the Jews. The earliest form of it (the first instance is the case of William of Norwich, 1144) was that they immolated a Christian child at Easter in mockery of the Passion. In the course of the next century there came about the elaboration that the blood was used in the manufacture of the unleavened bread for Passover (which generally coincided with Easter) or for other purposes. Ultimately, it was actually alleged that "the Jews of every province annually decide by lot" which congregation or town was to be the scene of the mythical murder. Almost invariably, the accusations were followed by spoliation and persecution. Among the classical instances are the "martyrdoms" of Hugh of Lincoln (1255) and Simon of Trent (1475), the Damascus affair (1840), and the Beilis case (1911–13). It is easy to understand how in ages when the Jews were everywhere regarded with suspicious awe such stories would find ready credence; but the revival of the myth by the anti-Semite in modern times is a deplorable instance of degeneration. That there is no foundation whatsoever for the belief is proved in the classical treatise on the subject by Hermann L. Strack, regius professor of theology at the University of Berlin. Many proselytes to Christianity have strenuously defended the Jews from the charge. Several of the popes have issued bulls exonerating them, and temporal princes have often taken a similar step. Many Christian scholars and ecclesiastics have felt it their duty to utter protests against the libel, including the most eminent Gentile students of Rabbinism of modern times. Indeed, the vast majority of the literature refuting the charge comes from non-Jewish pens. That on the other side is entirely anti-Semitic, and in no case has it survived the ordeal of criticism.

See G. A. Zaviziano, *Un Raggio di Luce* (Corfu, 1891); H. L. Strack, *Das Blut im Glauben und Aberglauben* (8th ed., Munich, 1900), Eng. trans., *The Jew and Human Sacrifice* (1909); D. Chwolson, *Blutanklage* (1901); F. Frank, *Der Ritualmord vor den Gerichtshöfen der Wahrheit und der Gerichtigkeit* (1901, 1902). A list of some of the most important cases is given by J. Jacobs in the *Jewish Encyclopaedia*, iii. 266–267.

RIVAROL, ANTOINE DE (1753–1801), French writer and epigrammatist, was born at Bagnols in Languedoc on June 26, 1753, and died at Berlin on April 11, 1801. It seems that his father was an innkeeper of cultivated tastes. The son assumed the title of comte de Rivarol, and asserted his connection with a noble Italian family. After various vicissitudes he appeared in Paris in 1777. In his *Petit Almanach de nos grands hommes pour 1788*, in which he had the assistance of Richebourg de Champcenetz, he ridiculed contemporary authors. Rivarol wrote in the Royalist press, in the *Journal politique* of Sabatier de Castres (1742–1817) and the *Actes des Apôtres* of Peltier (1770–1825). He emigrated in 1792, and established himself at Brus-

sels, whence he removed successively to London, Hamburg and Berlin. Rivarol has had no rival in France except Piron in brilliant epigrams. His works include *Isman, ou le fatalisme* (1795), a novel; *Le Véridique* (1827), comedy; *Essai sur les causes de la révolution française* (1827).

See the *Oeuvres* (2nd ed., 1880) ed. M. de Lescure; also M. de Lescure, *Rivarol et la société française pendant la révolution et l'émigration* (1882), and Le Breton, *Rivarol, sa vie, ses idées* (1895).

RIVAS, ANGEL DE SAAVEDRA, DUKE OF (1791–1865), Spanish poet and politician, born at Cordova, March 19, 1791. He fought in the War of Independence, was a prominent member of the advanced Liberal Party (1820–23) and in the latter year was condemned to death. He escaped to London and lived successively in Italy, Malta and France, until the amnesty of 1834, when he returned to Spain, shortly afterwards succeeding his brother as duke of Rivas. In 1835 he became minister of the interior under Istúriz, and along with his chief had again to leave the country. Returning in 1837, he joined the Moderate Party, became prime minister, and was subsequently ambassador at Paris and Naples. He died June 22, 1865. In 1813 he published *Ensayos poéticos*, and between that date and his first exile several of his tragedies (the most notable being *Alatar*, 1814, and *Lanuza*, 1822) were put upon the stage. Traces of foreign influence are observable in *El Moro Expósito* (1834), a narrative poem dedicated to John Hookham Frere; these are still more marked in *Don Alvaro ó La Fuerza del sino* (first played March 22, 1835), a drama of historical importance inasmuch as it established the new French romanticism in Spain.

RIVER AND RIVER ENGINEERING. A river is any natural stream of fresh water, larger than a brook or creek, which flows in a well-defined channel. Usually it discharges into another and larger body of water, the ocean, a lake, or another river. In rare instances in regions of porous soil it soaks into the ground, or, in excessively arid regions, evaporates, in which case it becomes a "lost river." In other regions of favourable rock conditions it may also run under ground for certain distances, disappearing and reappearing one or more times. A river with a well-cut channel and a graded bed, usually reaching base-level at its mouth, is an adolescent river. Rivers as they grow older usually widen their valleys accordingly unless prevented by certain geological formations or occurrences. A river whose upper waters sometime in the past suddenly found a new outlet, diminishing the volume and force of the original river and also its length, is known as a beheaded river. For other facts relating to the origin and subsequent development of rivers and their valleys *see* GEOGRAPHY and GEOLOGY.

The river works which the engineer may be called upon to execute vary widely in their character and object. The more important of these which are described in the present article may be grouped under the following heads:—(1) The prevention of river inundations and the mitigation of their effects; (2) the improvement for navigation of the non-tidal portions of rivers; and (3) works for the improvement of navigation in the tidal compartments of rivers, in their estuaries, and at the outlets of rivers flowing into tideless seas.

Other river engineering works are dealt with under separate headings, for instance, the utilization of river waters for power production (*see* ELECTRICAL POWER GENERATION; HYDROELECTRIC GENERATION, etc.); works for water storage and supply for various purposes including irrigation (*q.v.*); works connected with fisheries (*q.v.*); and reclamation of land (*see* COAST EROSION and RECLAMATION). *See* also the articles on HYDRAULICS, CANAL AND CANALISED RIVERS, WEIR, and particular rivers, *e.g.*, MISSISSIPPI and DANUBE.

PHYSICAL CHARACTERISTICS OF RIVERS

River Basins.—In general the size of rivers above any tidal limit and their average fresh-water discharge are proportionate to the extent of their basins, and the amount of rain over those basins. They vary in extent according to the configuration of the country, ranging from the insignificant drainage-areas of streams rising on high ground near the coast and flowing straight down to the sea, to immense parts of continents, where rivers rising on the slopes of mountain ranges far inland have to traverse vast stretches of valleys and plains before reaching the ocean.

The comparative size of the principal river systems of the world is shown in the following table:

River	Drainage basin, square miles	Length in miles
1. Amazon	7,050,000	5,500
2. Congo	3,700,000	4,640
3. Mississippi-Missouri	3,250,000	6,970
4. Rio de la Plata	3,100,000	3,880
5. Ob	2,915,000	3,640
6. Nile	2,800,000	5,920
7. Niger	2,800,000	4,160
8. Yenisei	2,570,000	4,750
9. Lena	2,320,000	4,600
10. Amur-Kerulen	2,080,000	4,480
11. Yangtze	1,775,000	5,300
12. Mackenzie	1,660,000	4,600
13. Volga	1,460,000	3,895
14. Zambesi	1,430,000	2,660
15. St. Lawrence	1,200,000	3,500
16. Hoang-Ho	980,000	4,150
17. Indus	965,000	3,200
18. Orinoco	944,000	3,000
19. Murray	910,000	2,870
20. Danube	817,000	2,900
21. Brahmaputra	670,000	2,900

Available Rainfall.—The rainfall varies considerably in different localities, both in its total yearly amount and in its distribution throughout the year; also its volume fluctuates from year to year. Even in small river basins the variations may be considerable according to differences in elevation or distance from the sea, ranging, for instance, in the Severn basin, with an area of only 4,350 sq.m., from an average of under 30 in. in the year to over 80 in. The proportion, moreover, of the rain falling on a river basin which actually reaches the river, or the available rainfall in respect to its flow, depends very largely on the nature of the surface strata, the slope of the ground and the extent to which it is covered with vegetation, and varies greatly with the season of the year. The available rainfall has, indeed, been found to vary from 75% of the actual rainfall on impermeable, bare, sloping, rocky strata, down to about 15% on flat, permeable soils.

Fall of Rivers.—The rate of flow of rivers depends mainly upon their fall, though where two rivers of different sizes have the same fall, the larger river has the quicker flow, as its retardation by friction against its bed and banks is less in proportion to its volume than that of the smaller river. The fall of a river corresponds approximately to the slope of the country it traverses. As rivers rise close to the highest part of their basins, generally in hilly regions, their fall is rapid near their source and gradually diminishes, with occasional irregularities, till, in traversing plains along the latter part of their course, their fall usually becomes quite gentle. Accordingly, in large basins, rivers in most cases begin as torrents with a very variable flow, and end as gently flowing rivers with a comparatively regular discharge.

Variations in the Discharge of Rivers.—In tropical countries, subject to periodical rains, the rivers are in flood during the rainy season and have hardly any flow during the rest of the year; whilst in temperate regions, where the rainfall is more evenly distributed throughout the year, evaporation causes the available rainfall to be much less in hot summer weather than in the winter months, so that the rivers fall to their low stage in the summer and are liable to be in flood in the winter. In fact, with a temperate climate, the year may be divided into a warm and a cold season, extending, in the northern hemisphere, from May to October and from November to April respectively. The rivers are low and moderate floods are of rare occurrence during the first period, and they are high and subject to occasional heavy floods after a considerable rainfall during the second period. The

only exceptions are rivers which have their sources amongst mountains clad with snow, and are fed by glaciers; their floods occur in the spring and summer from the melting of the snows and ice, as exemplified by the Rhone above the Lake of Geneva, and the Arve which joins it below. But even these rivers are liable to have their flow modified by the influx of tributaries subject to different conditions, so that the Rhone below Lyons has a more uniform discharge than most rivers, as the summer floods of the Arve are counteracted to a great extent by the low stage of the Saone flowing into the Rhone at Lyons, which has its floods in the winter when the Arve on the contrary is low.

Transportation of Materials by Rivers.—In flood-time rivers bring down a large quantity of detritus, derived mainly from the disintegration of the surface-layers of the hills and slopes in the upper parts of the valleys by glaciers, frost and rain. The power of a current to transport materials varies approximately as the square of its velocity, so that torrents with a rapid fall near the sources of rivers can carry down rocks, boulders and large stones. These are by degrees ground by attrition in their onward course into shingle, gravel, sand and silt which are carried forward by the main river towards the sea, or partially strewn over flat alluvial plains during floods. The size of the materials forming the bed of the river or borne along by the stream becomes less as the reduction of velocity diminishes the transporting power of the current. In the Po, for instance, pebbles and gravel are found for about 140 m. below Turin, sand along the next 100 m., and silt and mud in the last 110 m. When, however, the fall is largely and abruptly reduced, as in the case of rivers emerging straight from mountainous slopes upon flat plains, deposit necessarily occurs owing to the sudden reduction of velocity. If the impeded river is unable to spread its detritus over the plains, its bed becomes raised by deposit, causing the river in flood-time to rise to a higher level. The materials, moreover, which are carried in suspension or rolled along the bed of the river tend to deposit when the flow of the river slackens and is finally brought to rest on encountering the great inert mass of the sea. This is the cause of the formation of the bars and, especially in the absence of a tide and any littoral current, of the deltas with their shallow outlets which occur at the mouths of many rivers.

Influence of Lakes on Rivers.—A depression along part of a valley, with a rocky barrier at its lower end, causes the formation of a lake in the course of the river flowing down the valley. The intervention of a lake makes the river, on entering at the upper end, deposit all the materials with which it is charged in the still waters of the lake. The river issues at the lower end as a perfectly clear stream with a regular discharge, because the floods, in flowing into the lake, are spread over a large surface, and so produce only a very slight raising of the level. This effect is illustrated by the river Rhone, which enters the lake of Geneva as a turbid, torrential, glacier stream, and emerges at Geneva as a sparkling, limpid river with uniform flow, though in this particular case the improvement is not long maintained, owing to the confluence a short distance below Geneva of the large, rapid, glacial river, the Arve.

The influence of lakes on rivers is, indeed, wholly beneficial, in consequence of the removal of their burden of detritus and the regulation of their flow. Thus the Swine outlet channel of the Oder into the Baltic is freed from sediment by the river having to pass through the Stettiner Haff before reaching its mouth. The St. Lawrence, again, deriving most of its supply from the chain of the Great Lakes possesses a very uniform flow.

River Channels.—The discharge of the rainfall erodes the beds of rivers along the lowest parts of the valleys; but floods occur too intermittently to form and maintain a channel large enough to contain the augmented flow. A river channel, indeed, generally suffices to carry off the average flow of the river, which, whilst comprising considerable fluctuations in volume, furnishes a sufficiently constant erosive action to maintain a fairly regular channel. But rivers having soft beds and carrying down sediment erode their beds during floods and deposit alluvium in dry weather. As the velocity of a stream increases with its fall, the size of a channel conveying a definite average flow varies inversely with the fall, and the depth inversely with the width. A river channel, accordingly, often presents considerable irregularities in section, forming shallow rapids when the river flows over a rocky barrier with a considerable fall, and a succession of pools and shoals when the bed varies in compactness and there are differences in width, or when the river flows round a succession of bends along opposite banks alternately.

A river flowing through a flat alluvial plain has its current readily deflected by any chance obstruction or by any difference in hardness of the banks, and generally follows a winding course, which tends to be intensified by the erosion of the concave banks in the bends from the current impinging against them in altering its direction round the curves. (For Prof. James Thomson's theory of the concave banks of rivers *see* his *Collected Papers* [1912], also the article HYDRAULICS and Hunter's *Rivers and Estuaries*.) Large rivers bringing down a considerable amount of detritus shift their courses from time to time, owing to the obstructions produced by banks of deposit.

Floods of Rivers.—The rise of rivers in flood-time depends not merely on the amount of the rainfall, but also on its distribution and the nature of the strata on which it falls. The upper hilly part of a river basin often consists of impermeable strata, sometimes almost bare of vegetation. Consequently the rain flowing quickly down the impervious, sloping ground into the watercourses and tributaries feeding the main river produces rapidly rising and high floods in these streams, which soon pass down on the cessation of the rain. The river Marne, draining an impermeable part of the upper Seine basin, is subject to these sudden torrential floods in the cold season. On the contrary, rain falling on permeable strata takes longer in reaching the rivers, and the floods rise more gradually, are less high, continue longer and subside more slowly. A river fed by several tributaries, some from impermeable and others from permeable strata, experiences floods of a mixed character. An example is the Seine at Paris, below the confluence of the torrential Marne and Yonne, where the floods of the gently flowing Upper Seine and other tributaries with permeable basins also contribute to the rise of the river.

High floods are caused by a heavy rainfall on land already sodden by recent rains at a period of the year when evaporation is inactive, and especially by rain falling on melting snow. A fairly simultaneous rainfall over the greater part of a moderate-sized river basin is a tolerably common occurrence; and under such conditions, the floods coming from the torrential tributaries reach their maximum height and begin to subside before the floods from the gently flowing tributaries attain their greatest rise.

THE REGULATION OF NON-TIDAL RIVERS

Mitigation of Floods and Protection from Inundations.—As the size of the channel of a river is generally inadequate to carry down the discharge of floods, the river overflows its banks in flood-time and inundates adjacent low-lying lands. An enlargement of the river bed, principally by deepening it, in order to increase its discharging capacity, is precluded by the cost, and also, in rivers bringing down sediment, by the large deposit that would take place in the enlarged channel from the reduction in the velocity of the current when the flood begins to subside. Where, however, the depth of a tidal river has been considerably increased by dredging, the enlargement of its channel and the lowering of its low-water line facilitate the passage of the land water and consequently reduce the danger of flooding. The Glasgow quays, for instance, along the deepened Clyde are no longer subject to inundation, and the lands and quays bordering the Tyne have been relieved from flooding for 10 m. above Newcastle by the deepening of the river from Newburn to the sea. (*See* fig. 7.)

In certain cases it is important to restrict or to prevent the inundation of some riparian districts by embankments; and occasionally low-lying lands are so unfavourably situated that pumping has to be employed.

The flow of water off the slopes of a valley can be retarded by planting trees on mountain slopes, which have too often been denuded by the reckless clearing of forests.

Proposals have sometimes been made to reduce the height of floods in rivers and restrict the resulting inundations by impounding some of the flood discharge by the construction of one or more dams across the upper valley of a river, and letting it out when the flood has passed down. This arrangement, however, is open to the objection that in the event of a second flood following rapidly on the first, there might not be time to empty the reservoir for its reception. When this provision against floods can be combined with the storage of water for economic use it becomes financially practicable. Two masonry dams erected across the narrow valley of the river Furens, a torrential tributary of the Loire, form reservoirs for the supply of the town of St. Étienne. The most notable instance of the construction of a dam to form a regulating reservoir is the Gatun dam on the Panama canal (*q.v.*), one of the principal functions of which is the control of the flood waters of the river Chagres. The provision of flood-control reservoirs in the Mississippi basin has often been advocated and, since the 1927 inundation, it has received renewed consideration.

Methods of Increasing the Discharging Efficiency of River Channels.—The discharging efficiency of a river within the limits of its bed depends on the fall and the cross-section of the channel. The only way of increasing the fall is to reduce the length of the channel by substituting shorter cuts for a winding course. This involves some loss of capacity in the channel as a whole, and in the case of a large river with a considerable flow it is very difficult to maintain a straight cut, owing to the tendency of the current to erode the banks and form again a sinuous channel. Cuts therefore should be in the form of one or more flat curves. Nevertheless, where the available fall is exceptionally small, as in lands originally reclaimed from the sea, such as the English fen districts, and where, in consequence, the drainage is in a great measure artificial, straight channels have been formed for the rivers and "drains."

The removal of obstructions, whether natural or artificial, from the bed of a river furnishes a simple and efficient means of increasing the discharging capacity of its channel, and, consequently, of lowering the height of floods. Every impediment to the flow, in proportion to its extent, raises the level of the river above it so as to produce the additional fall necessary to convey the flow through the restricted channel, thereby reducing the total available fall. In the absence of legal enactments for the conservancy of rivers, numerous obstructions have in many cases been placed in their channel, such as mining refuse, sluice-gates for mills, fish-traps, unduly wide piers for bridges and solid weirs, which impede the flow and raise the flood-level.

Prediction of Floods.—The rise of floods in the tributaries of a river, and the periods they take in passing down to stations on the main river, are ascertained by means of gauges at suitable points. With the help of these records, and full information of the rainfall over the basin area, the time of arrival and height of the top of the flood at any station can be predicted with remarkable accuracy. By telegraphing warnings to places on the river, weir-keepers are enabled to open fully beforehand the movable weirs for the passage of the flood, and the riparian inhabitants receive timely warning. On some rivers, as for example the Mississippi, the Danube and the Po, the flood-prediction services serve also for the dissemination of information as to conditions of navigation, as for instance on the Danube. (*See* also FLOOD CONTROL.)

Embankments.—Where it is important to protect land from inundations, the overflow of the river must be confined within continuous embankments. By placing these embankments somewhat back from the margin of the river-bed, a wide flood-channel is provided for the discharge of the river directly it overflows its banks. Low embankments may be sufficient where only exceptional summer floods have to be excluded from meadows. Occasionally the embankments are raised high enough to retain the floods during most years, whilst provision is made for the escape of the rare exceptionally high floods at special places in the embankments, where the scour of the issuing current is guarded against, and the inundation of the neighbouring land is least injurious. Both the above methods afford the advantage of relieving the embanked channel of some of the sediment deposited in it by the confined flood-waters, when the surplus flow passes over the embankments.

When complete protection from inundations is required, the embankments have to be raised well above the highest flood-level, after allowing for the additional rise resulting from the confinement of the flood within the embankments. The system has been adopted where tracts of fertile alluvial land below flood-level stretch for long distances away from the river. Thus the fens of Lincolnshire, Cambridgeshire and Norfolk are protected from inundations by embankments along their rivers and drains; a great portion of Holland is similarly protected; and the plains of Lombardy are shut off from the floods of the Po by embankments along each side of the river for a distance of about 265 miles.

When towns like New Orleans on the Mississippi, and Szegedin on the Theiss in Hungary, have been established below the flood-level of an adjoining river, the channel of the river should be improved to facilitate the passage of floods past the town. The town also should be enclosed within embankments raised above the highest possible flood-level to obviate the contingency of an exceptional flood, or a gradually raised flood-level leading to a catastrophe such as overwhelmed the greater part of Szegedin in March 1879 and threatened New Orleans in 1927.

The Mississippi.—The system of embankments has been extensively developed along the alluvial valley of the Mississippi which lies below the highest flood-level of the river from Cape Girardeau, 45 m. above Cairo, to the gulf of Mexico, and has a length of 600 m. in a straight line with a width ranging between 20 and 80 m., and an area of 30,000 sq.m. These embankments, begun by the French settlers in Louisiana, are called levees, and had in 1928 a total length of over 1,815 m. The river is confined between a line of levees extending from Cairo to an outlet in the delta called the Jump (1,048 m.) on its western bank, and by levees and a line of hills above overflow-level for a distance of about 1,070 m. on its eastern bank. Below the levee lines are the several outlets through the delta of the river to the gulf of Mexico. The levees (fig. 1) are as a rule spaced apart with a width between them at least double that of the ordinary channel, thus providing a much enlarged sectional area for the river in times of flood. In some parts of the river the spacing is very much greater, as, for instance, where several sharp bends occur close together (fig. 1). The low-water discharge, measured at New Orleans, 109 m. from the mouth of the South Pass, has been as low as 135,000 cu.ft. per sec. At Vicksburg a discharge of 2,278,000 ft.sec. was recorded in 1927 which compares with the minimum of 97,000 ft.sec. at that place. The levees do not afford complete protection from inundations; they are not always strong enough to withstand the water pressure of high floods which had (before the record floods of 1927) a maximum rise at Vicksburg of 61½ ft. above the lowest stage of the river at that point. In 1927 the river at Vicksburg rose 3⅔ ft. higher or to 65 ft. above lowest water. The floods tend to increase in height owing to the improved drainage following on the extension of cultivation. Breaches, or crevasses as they are termed in the United States, are of not infrequent occurrence and produce a sudden rush of the flood waters through the opening which is much more damaging to the land in the neighbourhood of the breach than a gradual inundation. Moreover, the velocity of the out-flowing water is intensified by the sloping down of the land on the alluvial plains for some distance away from the river owing to the raising of the ground nearest the river by the gradual deposit of layers of sediment from the flood waters when they begin to overflow the banks. The levees on the Mississippi are breached in weak places almost every year during the spring floods, and they are liable to be overtopped by exceptional floods, and thereby rapidly eroded, as well as to be undermined by changes in the course of the river from the erosion of concave banks.

The great floods of the Mississippi and its tributary rivers in April–June 1927, were the most serious which had occurred since records of these rivers began to be kept. They were due to the extraordinary coincidence of flood conditions in all the chief tributaries of the river; whereas normally the eastern floods usually

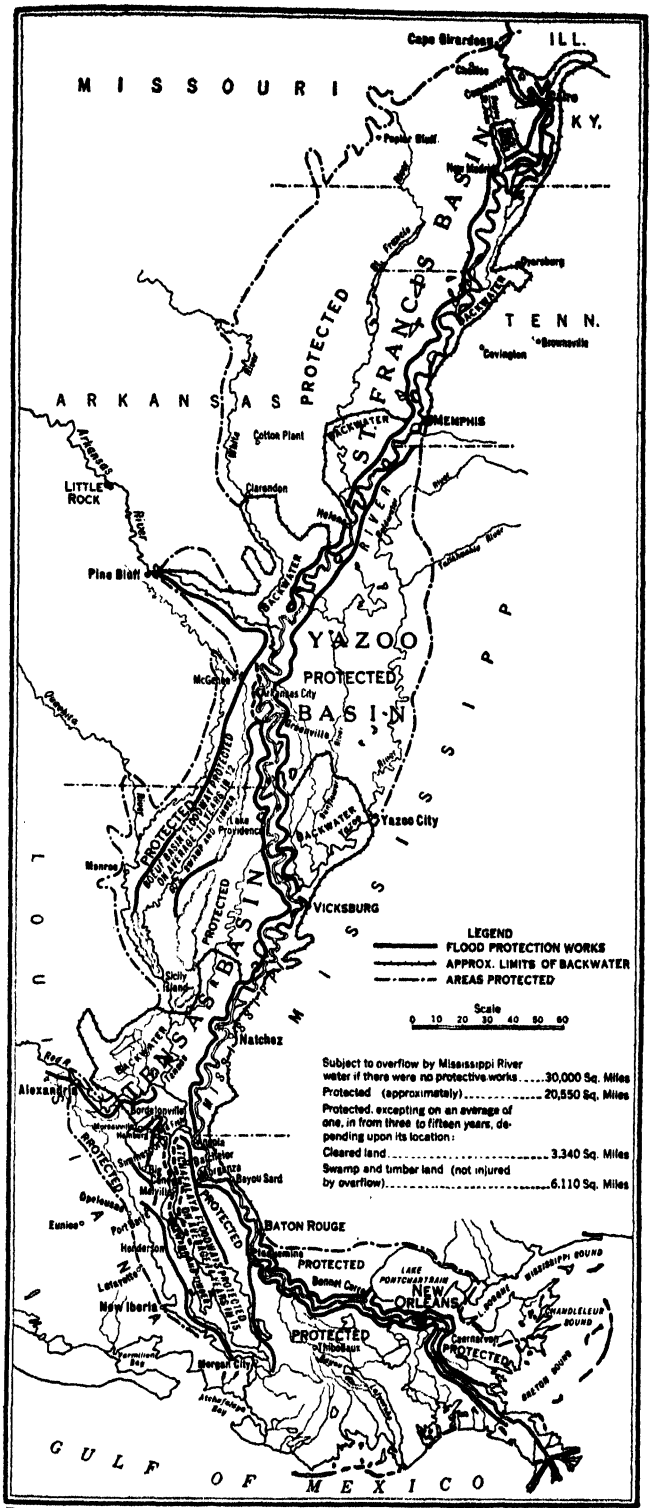

FIG. 1.—MAP OF MISSISSIPPI RIVER SHOWING AREAS SUBJECT TO OVERFLOW AND REQUIRING PROTECTIVE ENGINEERING

culminate between January and April, while the crests of the Missouri river floods usually enter the Mississippi in June. The levees were breached or the flood-waters overflowed them throughout the alluvial valley. An area of over 18,000 sq.m. was inundated and 700,000 people were driven from their homes. Further disaster was only averted at the city of New Orleans by cutting a wide gap in the levees at Poydras, a few miles below the city, thus permitting a part of the flood-waters to take a short course of about 5 m. to an arm of the sea instead of following the normal course of the river through the delta. (*See* MISSISSIPPI RIVER, *Engineering*.)

Effect of Embankments upon the River Levels and Bed.—The confinement of a river to a flood-channel of restricted width necessarily produces an increase in the elevation of the high-water surface. It has also been frequently asserted that this confinement by the construction of embankments is accompanied by a progressive and consequential rising of the river bed, but there does not appear to be sufficient evidence to bear out this contention. That river beds in those reaches where the steeper slope of hill valleys changes to the lesser slope in the plain become raised by deposit has already been mentioned. The river Po and the Hwang-Ho or Yellow river in China are frequently adduced as affording evidence of the raising of river beds in consequence of embanking; but where elevation, not attributable to the natural deposit, has taken place it seems to have been due to changes in the locus of the bed or to be local in character and accompanied by a corresponding deepening elsewhere. This question is discussed at length by Van Ornum, Townsend, Freeman (*Trans. Am. Soc. of C.E.* 1928) and other authorities who are unable to accept the theory of consequential raising of the river bed.

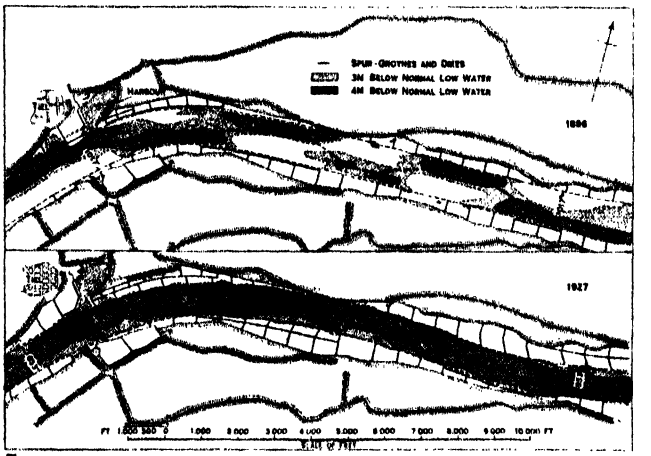

FIG. 2.—RIVER WAAL AT TIEL, HOLLAND; SHOWING THE CONDITION OF THE TIEL REACH IN 1896 AND 1927

The regulation works completed in this reach in 1911 have effected a permanent deepening of the channel and no dredging has been necessary since

REGULATION OF THE NON-TIDAL PORTIONS OF RIVERS FOR NAVIGATION

As rivers flow onward towards the sea, their current becomes more gentle and their discharge larger in volume and less subject to abrupt variations. Large rivers, therefore, often furnish important natural highways for inland navigation in the lower portion of their course, as, for instance, the Rhine, the Danube and the Mississippi. Works are, however, often required in such rivers for preventing changes in the course of the stream, for regulating its depth, and especially for fixing the low-water channel and concentrating the flow in it, so as to increase as far as practicable the navigable depth at the lowest stage of the water-level. Regulation works for increasing the navigable capabilities of rivers can only be advantageously undertaken in large rivers with a moderate fall and a fair discharge at their lowest stage; for with a large fall the current presents a great impediment to up-stream navigation, and there are generally great variations in water-level. Consequently, when the discharge becomes very small in the dry season it is impossible to maintain a sufficient depth of water in the low-water channel.

Removal of Shoals.—The possibility of securing uniformity of depth in a river by the lowering of the shoals obstructing the channel depends upon the nature of the shoals. A soft shoal in the bed of a river is due to deposit from a diminution in velocity of flow, produced by a reduction in fall and by a widening of the channel, or to a loss in concentration of the scour of the main current in passing over from one concave bank to the next on the opposite side. These changes from one side of the river to the other are called *crossings*. The lowering of such a shoal by dredging merely effects a temporary deepening, for it soon forms again. The removal, moreover, of the rocky obstructions at

rapids produces a lowering of the river above the rapids by facilitating the efflux, which may result in the appearance of fresh shoals at the low stage of the river. Where, however, narrow rocky reefs or other hard shoals stretch across the bottom of a river and present obstacles to the erosion by the current of the soft materials forming the bed of the river above and below, their removal may enable the river permanently to deepen its bed by natural scour.

The deepening of the bed of a non-tidal river along a considerable length by dredging merely lowers the water-level of the river during the low stage; and though this deepening facilitates the passage of floods in the first instance, it does not constitute a permanent improvement even in this respect, for the deposit of the detritus brought down by the river as the floods abate soon restores the river to its original condition. Nevertheless, where sand-banks obstruct and divert the channel of a river at its low stage, as in parts of the Mississippi below Cairo, it has been found possible before the river has fallen to its lowest level to form a channel through these sand-banks, with a depth of 9 or 10 ft. and 250 ft. wide, by suction dredgers, aided by revolving cutters or water-jets (*see* DREDGING). The dredged sand is discharged through floating pipe-lines into a part of the river away from the channel; and the navigation can thus be maintained through the low stage at a reasonable cost. Though, however, these channels across the shoals, connecting the deeper parts of the river, can be easily kept open on the Mississippi till the return of the floods, they are obliterated by the currents in flood-time, and have to be dredged out afresh every year on the abatement of the floods.

Low-water Channel.—The concentration and fixation of the low-water channel is effected by closing subsidiary low-water channels with dikes across them, and narrowing the channel at the low stage by low-dipping cross-dikes extended from the river banks down the slope, and sometimes pointing slightly up-stream so as to direct the water flowing over them into a central channel. The contraction of the channel can occasionally be more effectually accomplished, though at a greater cost, by low longitudinal dikes placed along either side of the low-water channel, some distance forward from the banks but connected with them generally at intervals by cross dikes at the back to prevent the current from scouring out a channel behind them during floods. By raising these dikes only slightly above the surface of the bed of the river, except where it is expedient to produce accretion for closing an old disused channel or rectifying the course of the river, the capacity of the channel for discharging floods is not affected; for the slight obstruction to the flow produced by the dikes at the sides is fully compensated by the deepening of the low-water channel in the central course of the river.

This system of obtaining a moderate increase in depth during the low stage of a river, whilst leaving the river quite open for navigation, has been adopted on the Rhône, the Rhine and the Mississippi. The improvement of the navigation of the river Po by extensive regulation works of this description has recently been begun. In the case of the Rhône below Lyons regulation works were preferred to canalization, in spite of the rapid fall of the river amounting in some places to 1 in 250, on account of the large quantities of sand and gravel carried down by it. The comparative regularity of the discharge, owing to the flow being derived from tributaries having their floods at different times of the year, has aided the effects of the works. Owing, however, to the unfavourable natural condition of the river, the depth does not exceed 5 ft. at lowest water level; and the rapid current forms a serious impediment to up-stream navigation.

The Rhine is much better adapted for improvement by regulation works of the Rhône, for it has a basin more than double the area of the Rhône basin, and its fall does not exceed 3·1 ft. per mile at Strasbourg and 2·5 ft. per mile through the rocky defile from Bingen to Kaub, and is much less along most of the length below Strasbourg. These works systematically carried out in wide shallow reaches between the Dutch frontier and Mainz, aided by dredging where necessary, have secured a navigable depth at the low stage of the river of 10 ft. from the frontier to Cologne, 8½ ft. from Cologne to Kaub, and 6½ ft. up to Bingen, beyond which the same depth is maintained up to Philippsburg, 22½ m. above Mannheim, and is being extended up to Strasbourg. (*See* also CANAL AND CANALIZED RIVERS.)

Soon after reaching the Dutch frontier in its seaward course the Rhine divides into three branches of which the most important is the Waal taking about ⅔ of the water of the undivided river. The Waal and its westward continuations under various names form the main navigable waterway between Germany and Rotterdam and the sea. Its importance to inland navigation may be gauged by the volume of river traffic passing Lobith at the frontier which increased from 28 million tons in 1903 to 73 million tons in 1927. The improvement of the Waal was commenced about the middle of the 19th century, but the works carried out in it between 1909–16 afford one of the most interesting and successful examples of river regulation effected in the present century (fig. 2). The channel at its low stage has been deepened, throughout its length of 53 m., from 7½ ft. to 11½ ft. almost entirely by training works, regulation of width, and its reformation in curved reaches, so that nowhere is there a straight section left in the river. Low spur-groynes or cross-dikes have been largely employed and very little dredging work was necessary. Since 1916 no dredging has been required to maintain the depths.

The Mississippi also, with its extensive basin and its moderate fall in most parts, is well suited for having its navigable depth increased by regulation works, which have been carried out below St. Paul in shallow and shifting reaches, with the object of obtaining a minimum navigable depth during the low stage along the upper river from St. Paul to St. Louis just above the confluence of the Missouri, thence 9 ft. to New Orleans.

On the Rhône below Lyons with its rapid current, the dikes are constructed of rubble, consolidated above low water with concrete. The dikes on the Rhine consist for the most part of earthwork mounds protected by a layer of rubble or pitching on the face, with a rubble mound forming the toe exposed to the current; but occasionally fascines are employed in conjunction with the stone or simple rubble mounds. On the Waal the newer cross-dikes have a core of sand protected by a mattress weighted with stone. The dams closing subsidiary channels on the Mississippi are almost always constructed of fascine-mattresses weighted with stone; but whereas the regulating dikes on the upper river are usually similar in construction, a common form for dikes in the United States consists of two parallel rows of piles filled in between with brushwood or other materials not affected by water, and protected at the sides from scour by an apron of fascines and stone.

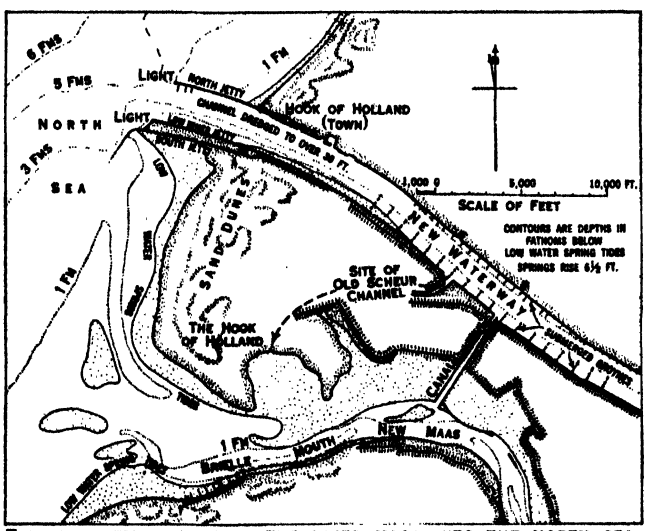

FIG. 3.—JETTY OUTLET OF THE RIVER MAAS INTO THE NORTH SEA. THE ARTIFICIAL CUT FOR THE RIVER MAAS THROUGH THE HOOK OF HOLLAND, BEGUN IN 1864

Protecting and Easing Bends.—Unless the concave banks of a river winding through wide, alluvial plains are protected from the scour of the current, the increasing curvature presents

serious impediments to navigation, sometimes eventually becoming so intensified that the river at last makes a short cut for itself across the narrow strip of land at the base of the loop it has formed. This, however, produces considerable changes in the channel below, and disturbances in the navigable depth. Protection, accordingly, of concave banks is necessary to prevent excessive curvature of the channel and changes in the course of a river. On the Mississippi the very easily eroded banks are protected along their upper, steeper part by stone pitching or a layer of concrete, and below low-water level by fascine-mattresses weighted with stone, extended a short distance out on the bed to prevent erosion at the toe. Dikes, also, projecting into the channel from the banks reduce the curvature of the navigable channel by pushing the main current into a more central course; whilst curved longitudinal dikes placed in the channel in front of concave banks are also effective in keeping the current away from the banks, which is sometimes still further promoted by dipping cross-dikes in front.

Regulation of Depth.—Regulation works at bends, besides arresting erosion, also reduce the differences in depth at the bends and the crossings. The excessive depth round the concave banks is diminished and the channel along the crossings deepened by giving a straighter course to the current and concentrating it by a reduction in width of the channel between the bends. Where there are deep pools at intervals in a river, shoals are always found above them, owing to the increased fall which occurs in the water line on approaching the pool, to compensate for its very slight inclination where it crosses the pool, whose ample cross-section serves for the discharge of the river through this part of the river bed. These variable depths can be regulated to some extent by submerged rubble-dikes or fascine-mattress *sills* deposited across the bed of the pool, so as to reduce its excessive depth, but not raised high enough to interfere at all with the navigable depth. These obstructions in the pool raise the water-line towards its upper end, in order to provide the additional fall needed to effect the discharge through the pool with its diminished cross-section.

Protection of Vessels During Floods.—On large rivers, where vessels during high floods are exposed to injury from floating débris and ice-floes, shelter can be provided for them in refuge ports, formed in a recess at the side under the protection of a solid jetty or embankment constructed in the river parallel to the bank. These ports are closed against floods at their upper end and have their entrance at the lower end facing down-stream. There are numerous examples of such river harbours on the Danube, the Rhine and other European rivers and in the rivers of North America. Many of them, made in the vicinity of towns, as at Düsseldorf, are inland ports of considerable size.

Many rivers have been improved, for the purpose of navigation, by canalization; and in some cases lateral canals have been constructed alongside portions of rivers to avoid rapids, falls or other serious obstructions. (*See* CANALS AND CANALIZED RIVERS.)

SMALL RIVER OUTLETS EXPOSED TO LITTORAL DRIFT

Rivers with a small discharge flowing into the sea on an exposed coast are more or less obstructed at their outlet by drift of shingle or sand along the coast. When the flow falls very low in dry weather, the outlet of a river is sometimes completely closed by a continuous line of beach, any inland or tidal waters merely trickling through the obstruction; and it is only on the descent of floods that the outlet is opened out. In rivers which always have a fair fresh-water discharge, or a small fresh-water flow combined with a tidal flow and ebb, the channel sometimes has its direct outlet closed, and is deflected parallel to the shore till it reaches a weak place in the line of beach, through which a new outlet is formed; or, where the current keeps the outlet open, a bar is formed across the entrance by the littoral drift, reducing the navigable depth. (*See* HARBOURS and JETTY.)

Jetties at River Outlets.—The bar formed across the outlet of a river not heavily charged with sediment and flowing into a tideless sea can be lowered by carrying out solid jetties on each side of the outlet across the foreshore, so as to scour the bar by concentrating the issuing current over it. Thus by means of jetties slightly curved in plan, aided by dredging, the depth at the entrance to the Swine mouth of the Oder has been increased from 7 ft. to 27 ft.; the approach channels to the river Pernau and other rivers flowing into the Baltic have been deepened by jetties, and the outlet channels of some of the rivers flowing into the Great Lakes of North America have been improved by cribwork jetties and dredging.

Where the littoral drift is powerful enough to divert the outlet of a river, as in the case of the river Yare, which at one time was driven to an outlet 4 m. south of its direct course into the sea at Yarmouth, and the river Adour in France, whose outlet, owing to the violent storms of the Bay of Biscay, was liable to be shifted 18 m. from its proper position, it has proved practicable to fix as well as to deepen the outlet by means of jetties. In such cases, however, where the rivers flow into tidal seas, it is important to place the jetties sufficiently apart to avoid any loss of tidal influx, since the tidal flow assists the fresh-water discharge in keeping the outlet open; whereas, with rivers flowing into tideless seas, a moderate restriction of the width between the jetties increases the scour. The tortuous and somewhat shifting outlet channel of the Scheur branch of the river Maas emerging on to a sandy coast where the rise of tide is small, and obstructed at its mouth by a bar, has been replaced by a straight cut across the Hook of Holland. The outlet across the foreshore is fixed in position by fascine-mattress jetties (*see* JETTY), the maintenance of the depth at the mouth by the tidal and fresh waters being aided by frequent dredging (fig. 3).

DELTAIC OUTLETS OF TIDELESS RIVERS

Large rivers heavily charged with sand and silt, when their current is gradually arrested on entering a tideless, or nearly tideless, sea, deposit these materials as a constantly advancing fan-shaped shoal through which comparatively shallow diverging channels, almost devoid of fall, have to force their way in order to convey the fresh-water discharge into the sea. These deltaic channels deposit their burden of sediment in front of their outlets, forming bars which advance with the delta and whose rate

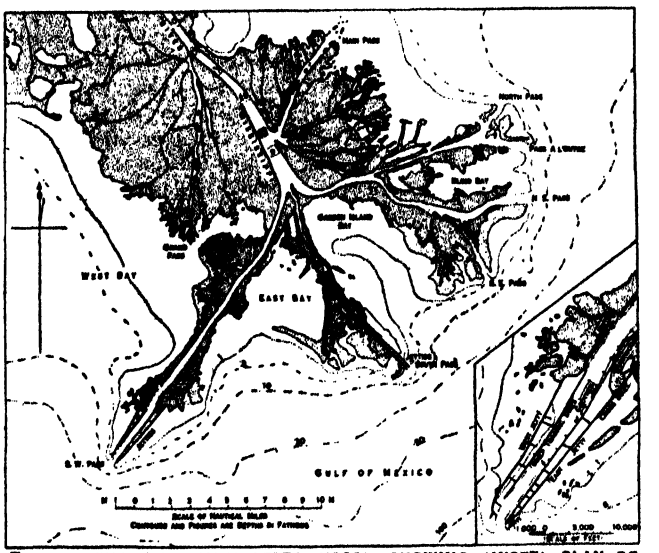

FIG. 4.—THE MISSISSIPPI DELTA (1928), SHOWING (INSET) PLAN OF S. W. PASS JETTIES

of progress seawards and distance in front of each outlet are proportionate to the discharge of the several channels. A channel dredged on the bar in front of one of the outlets of a deltaic river retains its depth only for a moderate period on account of the deposit continually accumulating at the outlet.

Parallel Jetties at Delta Outlets.—The construction of parallel jetties prolonging seaward the banks of the channel, concentrates the scour of the issuing current on the bar at the outlet and under favourable conditions will procure and maintain for some time an adequate depth for navigation. The requisite

conditions for the success of this system of improvement are (1) a sufficient depth in the sea beyond the bar, to allow of a considerable deposit of alluvium before the increased depth is interfered with, and (2) a littoral current carrying a portion of the alluvium away from the outlet. Both of these conditions retard the progression of the delta in front of the outlet and the inevitable eventual formation of a new bar farther out. The rate of advance of a delta depends also on the proportion of solid matter carried in suspension by the river and on the specific gravity and size of the particles of alluvium discharged into the sea; for the heavier and coarser materials, and especially those which are rolled along the bed of the channels, come first to rest. Moreover, the larger channels of a delta bring down a larger volume of alluvium on account of their larger discharge, and their bars form farther seawards from their outlets owing to the issuing current being less rapidly arrested in proportion to the volume discharged. Thus the rate of advance of the delta in front of an outlet is proportionate to the size of the channel, and the length of the jetties required is proportionate to the discharge of the channel. Consequently, the conditions are more unfavourable for the improvement of the outlets of the larger delta channels than of the smaller ones; though, on the other hand, the larger channels crossing the delta are generally more suitable for navigation on account of their size, and the natural depth over their bars is greater owing to the larger discharge.

The Rhône Outlets.—The discharge of the main branch of the Rhône, which formerly flowed into the Mediterranean at the gulf of Foz through six mouths, was in 1852–57 concentrated in the direct eastern channel by embankments along its sides, which closed all the lateral channels. The entire flow of the river, being thus discharged through the eastern outlet, increased for a time the depth over its bar from 4½ to 9½ ft.; but as the great volume of alluvium brought down, including an unusually large proportion of sand rolled along the bed of the river, was also all discharged through the one outlet, the bar soon formed again farther out, and naturally advanced with the delta in front of the outlet more rapidly than formerly when the deposit was distributed through six divergent mouths. Accordingly, the very moderate deepening produced by the embankments was not long maintained, and the average depth over the bar has not exceeded 5 ft. for many years past. The St. Louis lateral canal, an artificial waterway between the gulf of Foz and the river 4 m. above its bar, was constructed in 1864–73 to afford a deeper navigable outlet, the entrance being 2½ m. north of the river outlet. The want of success of the Rhône outlet jetties was due to the selection for training of a channel opening on a sheltered, somewhat shallow bay, instead of a southern outlet discharging into deep water in the open Mediterranean and having a deep littoral current flowing across it. The closing of all the other outlets whereby the whole of the deposit, as well as all the discharge, was concentrated in front of the badly situated eastern outlet likewise contributed to the failure. The southern Roustan branch was reopened in 1893 to prevent the silting up of the outlet of the St. Louis canal.

The Delta of the Danube.—The Danube traverses its delta in three branches, the northern one of which, though conveying nearly two-thirds of the discharge of the river, is unsuitable for improvement owing to its splitting up along portions of its course into several channels, and eventually flowing into the sea through twelve mouths of a small independent delta advancing about 250 ft. annually across a shallow foreshore. The central Sulina branch was selected for improvement in 1858 in preference to the southern St. George's branch, which had a more favourable outlet and a better channel through the delta. The distance of the Sulina bar from the shore was only half that of the St. George's bar owing to the much smaller discharge of the Sulina branch. The jetties, begun provisionally in 1858 and subsequently consolidated and somewhat extended, were completed in 1877. They increased the depth over the bar from an average of about 9 ft. previously to 1858 up to 20½ ft. in 1873, which was maintained for many years. In 1894, however, the increasing draught of vessels rendered a greater depth necessary; the wide inshore portion of the jetty channel was therefore narrowed by inner parallel jetties, and a powerful suction dredger was set to work in the jetty channel and outside, whereby the depth was increased to 24 ft. in 1897, and was fairly maintained up to 1907, when a second dredger became necessary to cope with the shoaling. The depth contours gradually advanced seawards whilst the deepest channel was deflected northwards by the action of current and waves. During the World War the decrease in depth, accelerated by the interference with dredging which occurred, was so rapid that the navigable depth was reduced at one time to 18 feet. In 1922 the seaward extension of the jetties was commenced leaving temporary gaps, between the old heads and the new works, which were closed after the new channel had been opened for traffic (fig. 5). This extension of the jetties for about 6,000 ft. and dredging operations restored for the time being the ruling depth of 24 ft. in the direct channel. A further extension of 2,000 ft. is proposed. The new jetties, like the original ones, are formed of fascine-mattresses covered with stone-rubble.

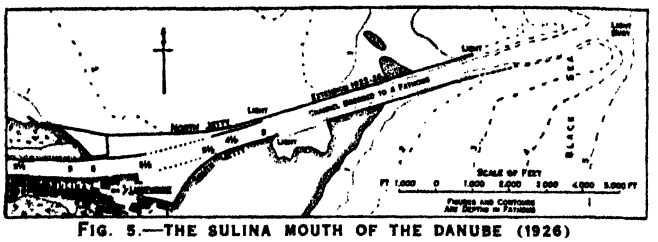

FIG. 5.—THE SULINA MOUTH OF THE DANUBE (1926)
The full lines show the water levels in the river during the flood tide, the ebb tide levels are shown by dotted lines. Khisjiri is near the mouth of the river and Nadia is about 84 miles above Calcutta

The Mississippi Delta.—The selection of the outlet of the south pass of the Mississippi delta for improvement by parallel jetties in 1876–79, in spite of the south-west pass possessing a larger channel and a better depth over its bar, was due, as at the Danube, to motives of economy, as the bar of the south-west pass was twice as far off from the shore as that of the south pass (fig. 4). Fascine-mattress jetties, 2¼ and 1½ m. long, weighted with limestone, and with large concrete blocks at their exposed ends, were constructed. The jetties, which were curved slightly southwards at their outer ends to direct the sediment-bearing current more directly at right angles to the westerly littoral current, increased the depth of 8 ft. over the bar in 1875 up to 31 ft. between the jetties and out to deep water. The prolonged flow of the river produced by the jetties has, as at the Sulina outlet, carried the main portion of the heavier sediment into fairly deep water, so that the greatest advance of the foreshore in front of the south pass has occurred in the 70-ft. line of soundings, though the shallower soundings have also advanced. The shoaling, however, in the jetty channel necessitated its reduction in width by mattresses and spurs from 1,000 ft. to 600 ft., and eventually the jetties were rebuilt on lines reducing the channel width to about 650 ft. Dredging was also required to maintain the stipulated central depth of 30 ft., and 26 ft. depth for a width of 200 ft. out to deep water; whilst the outer channel was deflected to the east and narrowed by the alluvium carried westwards by the littoral current and also deposited in front of the jetty outlet. Since 1901 suction dredging, the construction of additional sills, and the increased discharge at the south pass (due to the works carried out in the south-west pass) have widened the channel across the bar to over 600 ft., and given it a minimum depth of 32 feet.

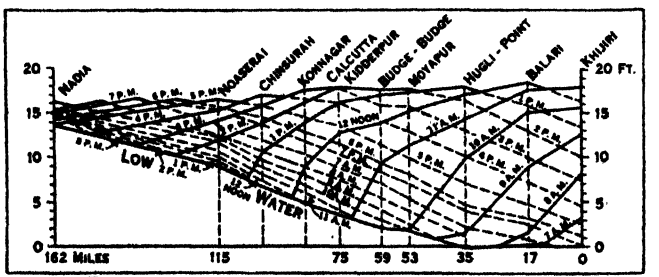

FIG. 6.—SIMULTANEOUS TIDAL LINES: RIVER HUGLI

In order to provide for the increasing requirements of sea-going vessels, the formation of a channel 35 ft. deep and 1,000 ft. wide through the larger south-west pass and its 9 ft. bar to deep water in the gulf was begun at the end of 1903. The discharge through this pass is rather more than three times that through the south pass and the bar was double the distance seaward of the outlet. Converging jetties, about 5,600 ft. apart at their land ends, and about 3,000 ft. apart at the seaward outlet, were substituted for the parallel jetties constructed at the south pass, and suction dredging was relied upon to maintain the channel between the jetties. The channel dredging was soon found to be excessive in quantity and in 1916 the project was modified by limiting the channel to a width of 2,400 ft. between two parallel interior jetties, and the extension of the latter to the 30 ft. contour beyond the bar. In 1923 the width was still further restricted to 1,750 ft. by building spur-dikes or groynes, and by 1924 a depth of 35 ft. was secured by dredging aided by the scour of the current. The jetties are formed of fascine-mattresses weighted with stone and capped with rubble and concrete (*see* JETTY.) They have been extended seawards from time to time and in 1927 the east jetty was about 4¾ m. in length from the shore. The west jetty has a length of about 3¾ m. The amount of dredging required to maintain the 35 ft. deep channel through the pass and over the bar has been much reduced since the contraction of the width has been effected. The artificial improvement and simultaneous maintenance of two mouths of a river is an unique experiment. (See *Reports* of the Chief of Engineers, U.S. Army [annually]; also Townsend, XIVth Int. Con. of Navigation, 1926, paper 33.)

IMPROVEMENT OF TIDAL RIVERS FOR NAVIGATION

Whereas the size of tideless rivers depends wholly on their fresh-water discharge, the condition of tidal rivers is due to the configuration of their outlet, the rise of tide at their mouth, the distance the tide can penetrate inland, and the space available for its reception. Accordingly, tidal rivers sometimes, even when possessing a comparatively small fresh-water discharge, have a much better natural navigable channel at high tide than the largest deltaic rivers, as shown by a comparison of the Thames, the Humber and the Elbe with the Danube, the Nile and the Mississippi. Tidal water is, indeed, unlimited in volume; but, unlike the drainage waters, which must be discharged into the sea, it only flows up rivers where there is a channel and space available for its reception. Consequently, works which exclude the tide from a river may have injurious effects on the channel, as did the sluices which were erected long ago across the fen rivers of eastern Anglia to secure the low-lying lands from the inroads of the sea. The tidal influx is also liable to be reduced by the accretion which may result in an estuary from the construction of training works. The aims of all tidal river improvement should

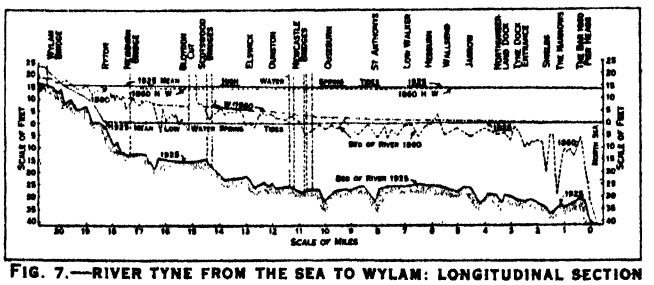

FIG. 7.—RIVER TYNE FROM THE SEA TO WYLAM: LONGITUDINAL SECTION ON THE CENTRE LINE OF THE RIVER SHOWING THE DEEPENING OF THE CHANNEL AND ALTERATION IN WATER LEVELS BETWEEN 1860 AND 1925

be to facilitate to the utmost the flow of the flood-tide up a river, to remove all obstructions from the channel so as to increase the scouring efficiency of the flood and ebb tides, and to reduce to a minimum the period of slack tide when deposit takes place.

Tidal Flow in a River.—The progress of the flood-tide up a river and the corresponding ebb are clearly shown by a diagram giving a series of tidal lines obtained from simultaneous observations of the height of the river Hugli during a high spring-tide in the dry season. The observations were taken at intervals at several stations along the river and the lines exhibit on a very distorted scale the actual water-levels of the river at these periods (fig. 6). The steep form assumed by the foremost part of the flood-tide lines from the entrance to beyond Chinsura, attaining a maximum in the neighbourhood of Konnagar and Chinsura, indicates the existence of a *bore*. This is caused by the sand-banks in the channel obstructing the advance of the flood-tide, till it has risen sufficiently in height to rush up the river as a steep, break-

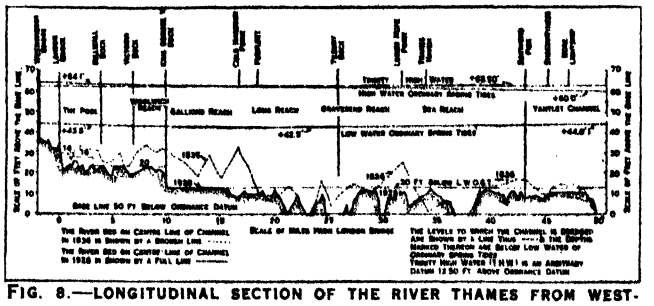

FIG. 8.—LONGITUDINAL SECTION OF THE RIVER THAMES FROM WESTMINSTER BRIDGE TO THE NORE

ing wave, overcoming all obstacles and producing a sudden reversal of the flow and abrupt rise of the water-level. Such phenomena are observed on the Severn, the Seine, the Amazon and other rivers. A bore indicates defects in the tidal channel, which can only be reduced by lowering the obstructions and by the regulation of the river. No tidal river of even moderate length is ever completely filled by tidal water; for the tide begins to fall at its mouth before the flood-tide has produced high-water at the tidal limit. This is clearly shown in the case of a long tidal river by the Hugli tidal diagram. Every improvement of the channel, however, expedites and increases the filling of the river, whilst the volume of water admitted at each tide is further augmented by the additional capacity provided by the greater efflux of the ebb, as indicated by the lowering of the low-water line.

Deepening Tidal Rivers by Dredging.—The improvement of tidal rivers mainly by dredging is specially applicable to small rivers which possess a width sufficient for navigation like the Clyde and the Tyne; for such rivers can be considerably deepened by an amount of dredging which would be quite inadequate for producing a similar increase in depth in a large, wide river, with shifting channels. Both the Clyde below Glasgow and the Tyne below Newcastle were originally insignificant rivers, almost dry in places at low-water of spring-tides; and the earliest works on both rivers consisted mainly in regulating their flow and increasing their scour by jetties and training works. They have been improved, since 1840 on the Clyde and 1861 on the Tyne, by continuous systematic dredging. The Clyde has been given a minimum depth of 27 ft. in the channel at low-water of spring-tides up to Port Glasgow; 25 ft. up to Rothesay Dock, and 24 ft. up to Glasgow Harbour. A depth of 32 ft. at low-water has been provided alongside some of the quays. The Tyne has been progressively deepened (fig. 7) until in 1929 the channel from the sea to the Northumberland dock (3½ m.) has a minimum depth at low-water spring-tides of 30 ft.; from thence to Derwenthaugh, above Newcastle, 25 ft.; and about 12 ft. on to Newburn, the rise of tide at springs increasing these depths by 15 feet.

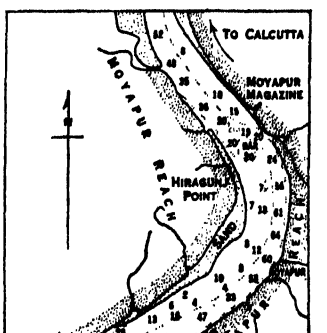

FIG. 9.—RIVER HUGLI SHOWING THE MOYAPUR AND ROYAPUR BAR CROSSINGS, 1923

The minimum low-water depth in the river Thames below Thames Haven in its natural state was about 27 ft. (*see* HARBOURS). A channel at least 30 ft. deep at low-water spring-tides

now extends from the sea to the King George V. dock, 37 m. above the Nore and Shoeburyness (fig. 8). Shallow portions of the channel between Shoeburyness and Purfleet have been dredged and above Purfleet the river has been considerably deepened in recent years throughout its course to secure this depth. Above the King George V. dock the river has been dredged to lesser depths at low water, decreasing to 14 ft. at London Bridge.

Regulation and Dredging of Tidal Rivers.—Considerable improvements in the navigable condition of tidal rivers above their outlet or estuary can often be effected by regulation works aided by dredging, which ease sharp bends, straighten their course and render their channel depth and flow more uniform. Examples are the Nervion between Bilbao and its mouth, the Weser from Bremen to Bremerhaven at the head of its estuary, and the Whangpoo from Shanghai to Woosung where it enters the Yangtse estuary. These works resemble in principle the regulation works on large rivers with only a fresh-water discharge, previously described; but on tidal rivers the main low-water channel should alone be trained with an enlarging width seawards to facilitate the tidal influx, and the tidal capacity of the river above low water should be maintained unimpaired.

To secure a good and fairly uniform depth on a tidal river, it is essential that the flood and ebb tides should follow the same course in order to combine their scouring efficiency and form a single, continuous deep channel. In wide, winding reaches, however, the flood tide in ascending a river follows as direct a course as practicable; and on reaching a bend, the main flood-tide current, in being deflected from its straight course, hugs the concave bank, and, keeping close alongside the same bank beyond the bend, cuts into the shoal projecting from the convex bend of the bank higher up, forming a blind shoaling channel as clearly indicated near Brul point in fig. 9. This effect is due to the flood-tide losing its guidance and consequently its concentration, at the change of curvature beyond the termination of the concave bank, where it spreads out and passes gradually over, in its direct course, to the next concave bend above along the opposite bank. The ebb tide, on the contrary, descending the river, follows the general course of the fresh-water discharge in all rivers, its main current keeping close along the concave bank and crossing over opposite Brul point to the next concave bank below. The main currents, accordingly, of the flood and ebb tides in such reaches act quite independently between the bends, forming channels on opposite sides of the river and leaving a central intervening shoal or bar crossing.

In tidal rivers the main ebb-current, being reinforced by the fresh-water discharge, generally forms the navigable channel, which is scoured out during floods. Narrowing the river between the bends to bring the two channels together would in certain cases unduly restrict the tidal flow; and, in a river like the Hugli

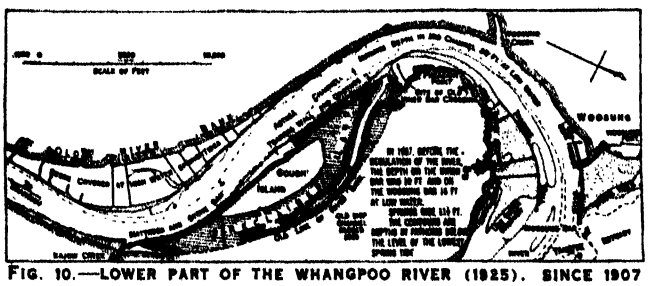

FIG. 10.—LOWER PART OF THE WHANGPOO RIVER (1925). SINCE 1907 THE CHANNEL OF THE RIVER HAS BEEN REGULATED BY BUILDING TRAINING WALLS AND GROYNES INDICATED BY HEAVY BLACK LINES

dependent on the tidal flow for the maintenance of its depth for two-thirds of the year, with channels changing with the wet and dry seasons and even shifting their position from day to day, deepening by dredging can never be permanent. Hitherto frequent re-dredging has been relied on for maintaining the requisite depths at the bar crossings in the Hugli.

The training and dredging works carried out in the Whangpoo since 1906[1] have been successful in deepening the alluvial channel of the river to about 30 ft. at low-water up to Shanghai including the bar crossing in a wide reach between Gough island and Woosung where formerly the low-water depth was no more than 13 to 15 ft. The problem which had to be faced differed from that of the Hugli in that the volume of the land-water run-off is relatively small. Moreover the concave bank of the river above the crossing was being rapidly eroded, accentuating a sharp bend below it. The condition of the lower part of the river before and after the improvement works were effected is shown in fig. 10.

The erosion of the Taylor's bank, forming the concave side of the main sea-channel of the river Mersey, which threatened to

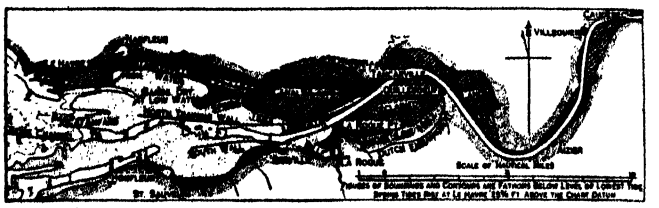

FIG. 11.—TRAINING WORKS IN THE SEINE ESTUARY (1924)

intensify the bend to a dangerous degree, has been countered by the revetting with stone of the concave face of the bank below low-water (*see* HARBOURS).

The average rate of enlargement (of width) adopted for the trained channel of the Nervion, in proportion to its length, is 1 in 75 between Bilbao and its mouth; 1 in 71 for the Weser from Bremen to Bremerhaven; and about 1 in 73 for the Whangpoo from Shanghai to its outlet; and these ratios correspond very nearly to the enlargement of the regulated channel of the Clyde from Glasgow to Dumbarton of 1 in 83, and of the Tyne from Newcastle to its mouth of 1 in 75. Accordingly a divergence comprised between 1 in 70 and 1 in 80 for the regulated or trained channel of the lower portion of a tidal river with a fairly level bed may be expected to give satisfactory results. The divergence as originally laid down for the Seine training works, 1 in 200, was found to be too small. (*See* fig. 11.) In rivers in which the channels are more or less in natural condition, such as the Thames, the Humber and the Scheldt the divergence is nearly 1 in 50.

Effect of River Deepening on Tidal Levels.—The general effect of deepening and regulating the tidal compartment of a river by dredging and the removal of obstructions is to facilitate the propagation of the flood-tide up the channel and the efflux of the ebb. Consequently such works often result in the lowering of the low-water lines and the raising of the high-water levels in the upper part of the improved channel and sometimes above it. Thus the deepening of the river Tyne raised the level of mean high-water spring tides at Newcastle by about 1 ft. between 1860 and 1904, and lowered the low-water level by 2 ft. at Newcastle quay. Low-water level at Glasgow has fallen nearly 2 ft. since 1873 and the rise of spring tides has been increased by 1′ 8″.

The average high-water level in the Thames at Chelsea increased 8 in. between 1890 and 1927, a period which corresponds with the dredging carried out on a large scale in the lower reaches of the river. The maximum flood-levels have also steadily increased since 1874 when a tide rose 16′ 10″ above O.D. at Westminster, considerably higher than any previous record. This height has been exceeded on several occasions since, the highest recorded at Westminster (up to the end of 1927) being 17′ 6″ in 1881, the same level being reached again in 1882. These high levels were, however, far surpassed by the disastrous tidal-flood of Jan. 6–7, 1928 (see *Report: Floods from the River Thames*, Cmd. 3045; 1928) when 18′ 3″ above O.D. was reached at London Bridge (equivalent to about 18′ 5″ at Westminster). It is difficult to estimate how far the increase in average and maximum tidal levels in the upper part of the tidal Thames is accounted for by the deepening of the river, for the problem is complicated by the extensive building of embankments and the rebuilding (with enlarged waterways) of several of the bridges which span the river. There is little doubt that the deepening of the channel has resulted in raising the high-water levels in the Thames as in other rivers where similar improvements have been effected.

Works at the Outlet of Tidal Rivers.—Tidal rivers flowing straight into the sea, without expanding into an estuary, are sub-

[1] H. von Heidenstam, *Int. Nav. Congress Papers*, 1919, and 1923.

ject to the obstruction of a bar formed by the heaping-up action of the waves and drift along the coast, especially when the fresh-water discharge is small. The scour of the currents is often in such cases concentrated and extended across the beach by parallel jetties for lowering the bar, as at the outlets of the Maas and the Nervion rivers. Except in the case of large rivers, the jetties have to be placed too close together, if the scour is to be adequate, to form an easily accessible entrance on an exposed coast. Accordingly, in the small bay into which the Nervion flows, a harbour has been formed by two converging breakwaters, which provide a sheltered approach to the river and protect the outlet from drift. Similar provision has been made at Sunderland for the mouth of the Wear; whilst the Tynemouth piers formed part of the original design for the improvement of the Tyne, under shelter of which the bar has been removed by dredging (*See* HARBOURS and JETTIES.)

Training Works Through Estuaries.—Many tidal rivers flow through bays, estuaries or arms of the sea before reaching the open sea, as, for instance, the Mersey through Liverpool bay, the Tees through its enclosed bay, the Liffey through Dublin bay, the Thames, the Ribble, the Dee, the Shannon, the Seine, the Scheldt, the Weser, the Elbe and the Yangtse, through their respective estuaries, the Yorkshire Ouse and Trent through the Humber estuary, the Garonne and Dordogne through the Gironde estuary, and the Clyde, the Tay, the Severn and the St. Lawrence through friths or arms of the sea. These estuaries vary greatly in their tidal range, the distance inland of the ports to which they give access, and the facilities they offer for navigation. Some possess a very ample depth in their outer portion, though they generally become shallow towards their upper end; but dredging often suffices to remedy their deficiencies and to extend their deep-water channel. Thus the St. Lawrence, which possesses an ample depth from the Atlantic up to Quebec, has been rendered accessible for large sea-going vessels up to Montreal by a moderate amount of dredging; whilst dredging has been resorted to in parts of the Thames and Humber estuaries, and on the Elbe below Hamburg, to provide for the increasing draught of vessels; and the Mersey bar in Liverpool bay, about 11 m. seawards of the actual mouth of the river, has been lowered by suction dredging from a depth of about 9 ft. down to about 26 ft. below low-water of equinoctial spring-tides.

The Weser from Bremen down to Bremerhaven, a distance of over 40 m., has been regulated by constructing longitudinal training walls, cross dikes and groynes, while in the estuary between Bremerhaven and the Hoheweg light, a distance of about 18 m., there are occasional low training-walls and dikes and minor channels have been closed. These operations have secured a minimum low-water depth in the channel up to Bremerhaven of about 25 ft. and to Bremen of about 17 feet.

A remarkable improvement has been effected in the navigable condition of the upper portion of the Seine estuary by training works, begun in 1848; for in place of a shallow, intricate channel through shifting sand banks, whose dangers were at times intensified by a *bore*, a stable channel has been provided down to St. Sauveur, rendering access easy as far up the river as Rouen for vessels drawing up to 23 ft. at high-water neaps and up to 27 ft. at high water of spring tides. The channel itself, however, was originally made too narrow between Aizier and Berville and was subsequently enlarged, and large tracts of land were reclaimed in the upper estuary. The reduction in tidal capacity due to the reclamations, together with the fixing and undue restriction in width of the channel, occasioned large accretions at the back of the lower portions of the training walls and at the sides of the estuary beyond them, and an extension of the sand banks seawards.

Experience has proved that training works through sandy estuaries, by stopping the wanderings of the navigable channel, produce an increase in its depth, and, consequently, in the tidal scour for maintaining it. This scour, however, being concentrated in the trained channel, is withdrawn from the sides of the estuary, which in its natural condition is stirred up periodically by the wandering channel; and, therefore, accretion takes place in the parts of the estuary from which the tidal scour and fresh-water discharge have been permanently diverted, especially where an abundance of sand from outside, put in suspension by the action of the prevalent winds blowing into the estuary, is brought in by the flood-tide, as in the cases of the estuaries of the Dee, the Ribble and the Seine. This accretion reduces the tidal capacity of the estuary, and, producing a diminution in the tidal volume passing through the outlet, promotes the extension of the sand banks seawards. To prevent as far as possible the reduction in tidal capacity, the training walls should not be raised more above low-water level than absolutely necessary to fix the channel; and the rate of enlargement of their width apart should not be less than 1 in 80 at the upper end, and increase towards the mouth of the estuary. Training works carried partially out through an estuary have the advantage of reducing the length of the shallow channel to be traversed between deep water and the entrance to the deepened river; but as the influence of these works on the channel terminates close to their seaward end, a shallow, shifting channel is always found between the end of the trained channel and deep water. Accordingly, when training works are started at the head of a sandy estuary, provision should always be made in their design for their eventual prolongation to deep water at the mouth of the estuary, to ensure the formation of a stable, continuous, navigable channel. Experiments with a model, moulded to the configuration of the estuary under consideration and reproducing in miniature the tidal ebb and flow and fresh-water discharge over a bed of very fine sand, in which various lines of training walls can be successively inserted, are capable in some cases of furnishing valuable indications of the respective effects and comparative merits of the different schemes proposed for works which have often evoked very conflicting opinions.

BIBLIOGRAPHY.—*See* list at end of article CANALS AND CANALIZED RIVERS. The works by Vernon-Harcourt, D. Stevenson and Thomas & Watt (vol. 1, Free Rivers, vol. 2, Canalised Rivers) mentioned therein are important. *See* also W. H. Hunter, *Rivers & Estuaries* (1913); J. L. Van Ornum, *The Regulation of Rivers* (1914 an excellent and comprehensive work dealing mainly with non-tidal rivers); C. McD. Townsend, *Hydraulic Principles of River and Harbour Construction* (1922 contains bibliography); *Encyclopédie de Génie Civil* (2 vols. by Vidal deal with rivers, 1921–22); and L. Fargue, *La Forme du Lit des Rivières* (1908). The *Annual Reports* of Chief of Engineers, U.S. Army, should be consulted for the waterways of the United States. The *Proceedings* Inst. Civ. Eng.; *Transactions* American Soc. C. E. and the International Navigation Congress publications contain valuable papers. The Bibliographies issued by the I.N.C. bureau (Brussels) are exhaustive. (L. F. V-H.; N. G. G.)

RIVER BRETHREN: *see* BRETHREN IN CHRIST.

RIVER-HOG, a name for the African wild pig. It constitutes a genus, *Potamochoerus*, allied to the typical pigs of the genus *Sus* (*see* SWINE), from which they are distinguishable by the presence in the males of a long horny ridge below the eye, by their thick coat of bristly and often brightly coloured hair, and by tufts at the tips of the elongated ears. *P. choeropotamus*, of southern and eastern Africa, is typically a greyish-brown animal, but one of its eastern representatives is orange-red. *P. johnstoni* and *P. hassama* occur in north-east Africa. The most remarkable member of the group is the red river-hog, *P. porcus*, which is a heavy, short-legged species remarkable for its bright red colour, the great length of the ear-tufts and the white rings round the eyes. It is a native of the great equatorial forest-tracts. A small yellow-haired representative of the group (*P. larvatus*) occurs in Madagascar, and must have reached its present habitat from the mainland.

THE RIVER-HOG, A WILD HOG NATIVE OF AFRICA

RIVERINA, an important district occupying the central south portion of New South Wales, Australia, bounded on the south by the River Murray, on the north by the Lachlan–Murrumbidgee from about Hillston down to the Murray confluence. The eastern boundary is less easy to draw. That of the administrative district runs from the Lachlan (30 miles above Hillston)

in a sinuous line curving eastwards and then westwards to the Murray at Corowa, but the lower slopes of the southern tableland—the administrative "South Western Slopes"—is perhaps to be included in the natural Riverina region. Except for these eastern and north-eastern parts, where lie the fairly open upper-middle basins of the Murrumbidgee and Murray systems, the whole area is flat. The fall of the rivers varies from 10 in. per mile in the east to 4–5 in. in the west of the area, and they meander across vast alluvial plains, periodically flooding and forming distributaries and lagoons (anabranches, billabongs) and sometimes even flowing up-stream. Higher up they are stronger, more definite, and more constant in flow and their valleys offer also sites for dams. The soil is prevailingly rich; the climate is generally mild and warm but the summers are hot and dusty and the rain, which falls in winter, is variable. (Av. ann. temps.: 75°–49° F, with extremes: 117°–20° F; av. ann. rainfall: from 12 in. in the north-west to 25 in. in the south-east.) The eastern valleys have yielded considerable quantities of gold, both alluvial and reef, and some alluvial dredging still continues (Adelong and Gundagai districts). In 1915 a deposit of soft black (Permian) sub-bituminous coal was discovered near Oaklands (area: 5 miles by 3 miles, with seams 8 ft. 6 in. to 36 ft.). It is important because of its position near the overland (Sydney–Melbourne) railway line in an otherwise fuelless area of growing population and because of the valuable kaolin deposits which overlie it.

The greater part of the western plains, which normally provide good natural fodder (including salt-bush), is used for sheep grazing, and these are still the home of the large "squatter." But improvements in wheat-growing (seed-selection, dry-farming) have enabled considerable areas to be put to the plough and by 1922 wheat was being grown as far north-west as Hillston, and, in the south, as far west as Balranald (9·12 in. and 7·89 in. winter, April–Oct., rainfall respectively). The Riverina, indeed, ranks second amongst the wheat-growing districts of New South Wales and has also a relatively high average yield (12·3–17·8 bu. per ac.). Along the south-eastern slopes, with their cooler temperatures and more reliable rain, a good deal of arable farming and dairying is carried on, and fruits, including vines, are grown, the wines of the Albury district having an established reputation. Further west mixed wheat and sheep farming is increasingly practised. But perhaps the greatest potential wealth of the Riverina lies in its irrigation agriculture. The development of this branch is in its infancy but it is already important. Of the total 83,800 ac. under irrigated crops in New South Wales in 1925–26, *c.* 61,200 were included in the Murrumbidgee and Hay (Riverina) areas. The Murrumbidgee Irrigation area, supplied from the Burrinjuck reservoir below Yass, had (1926) nearly 2,000 occupied holdings (1–250 ac. each, average 15–25 ac.) occupying 112,000 ac. or ⅓ of the total projected area (561 sq. miles). The principal settlements are Leeton, Yanco and Griffith. Fruit (sub-tropical and temperate climate types) is grown, dairying and pig-raising, with butter and cheese making, bacon-curing and fruit-canning carried on largely by cooperative methods. Electricity and water-supplies are provided and education and experimental research are well cared for. In Hay the area is smaller (1926, *c.* 1,000 ac. occupied for irrigation and 2,900 ac. non-irrigated) and is devoted mainly to dairying and pig-raising. The Murray River development scheme, with the great Hume dam above Albury as head-works, will provide further facilities. The economic and financial aspects of the irrigation projects have presented difficulties and these may still be regarded as expensive if promising experiments. A recent development is rice-growing, the hope being that Australia's needs can be satisfied from this source. Of similar importance is the great Wyangala Dam project, on the upper Lachlan river near Corowa, now (1929) being inaugurated. One million acres will be made available along the Lachlan for wheat growing and mixed (wheat and sheep) farming for 700 families at a cost of about £2,000,000. Though not an irrigation project some irrigation blocks will be provided for fodder (lucerne, etc.) growing, and the railway from Hillston will be extended to Roto.

The area of the Riverina Administrative Division (*see* above) is 26,600 sq. miles, its population 70,920 (2·7 per sq. mile). (Murrumbidgee Irrigation area alone: 561 sq. miles; pop. 12,360 = 22·0 per sq. mile). The chief towns are: Albury (*q.v.*, pop. 8,200), Wagga Wagga (8,400), Junee (3,650) and Narrandera in the east, important as business centres for wheat-farming, fruit-growing, and grazing districts and also as railway junctions and river-crossing (bridge) towns with small industries; Leeton, and other irrigation centres with butter, cheese and bacon factories, electricity-supply and machine-repairing works; Jerilderie, Deniliquin, pastoral and agricultural centres with good road or rail connections; Hay, Hillston, Balranald, also pastoral centres (Hay has irrigation settlement also) and both river and rail-head importance. The rivers are still used, when seasons permit, mainly for wool transport, but railway and motor transport are increasingly opening up and serving the "back blocks." Interesting and significant is the way in which the southern borderlands—by agreement between the Victorian and New South Wales Governments—are increasingly tapped by Victorian lines, and, yielding to geographical necessity, are being drawn within the economic sphere (hinterland) of Melbourne.

Production: (1925–26): Riverina (administrative division): wool: 58,500,000 lb.; wheat: 9,800,000 bu.; butter: 1,850,000 lb.; minerals: £46,000; manufactures: £392,000.

RIVER PLATE: *see* PLATA, RIO DE LA.

RIVER ROUGE, a city of Wayne county, Michigan, U.S.A., on the Detroit and the Rouge rivers, 6 m. S.W. of Detroit; served by the New York Central railroad and for freight also by the Michigan Central and by lake steamers. The population was 9,822 in 1920 (24% foreign-born white) and was estimated locally at 25,000 in 1928. Since 1915 it has been one of the manufacturing centres of the Ford Motor company. The village was incorporated in 1899, and in 1922 it was chartered as a city.

RIVERS, ANTHONY WOODVILLE, or WYDEVILLE, 2ND EARL (*c.* 1442–1483), statesman and patron of literature, and author of the first book printed on English soil, was born probably in 1442. He was the son of Richard de Wydeville and his wife, Jacquetta de Luxemburg, duchess of Bedford. His father was raised to the peerage in his son's infancy, and was made earl of Rivers in 1466. Anthony, who was knighted before he became of age, and fought at Towton in 1461, married the daughter of Lord Scales, and became a peer *jure uxoris* in 1462, two years after the death of that nobleman. Being lord of the Isle of Wight at the time, he was in 1467 appointed one of the ambassadors to treat with the duke of Burgundy, and he exalted his office by challenging Anthony, comte de la Roche, the bastard of Burgundy, to single fight in what was one of the most famous tournaments of the age. (*See* Bentley's *Excerpta Historica*, 176–182.) In 1469 Anthony was promoted to be lieutenant of Calais and captain of the king's armada, while holding other honorary posts. His father and brother were beheaded after the battle of Edgecot, and he succeeded in August of that year to the earldom. He accompanied Edward in his temporary flight to the Continent, and on his return to England had a share in the victory of Barnet and Tewkesbury and defended London from the Lancastrians. In 1473 he became guardian and governor to the young prince of Wales. In 1475 and 1476 he went on pilgrimage to the holy places of Italy.

Caxton had in 1476 rented a shop in the Sanctuary at Westminster, and here had set up a printing-press. The first book which he undertook in London was one sent to him by "the noble and puissant lord, Lord Antone, Erle of Ryvyers," consisting of a translation "into right good and fayr Englyssh" of Jean de Teonville's French version of a Latin work, "a glorious fair mirror to all good Christian people." In 1477 Caxton brought out this book, as *Dictes and Sayengis of the Philosophers.* (*See* CAXTON.) To this succeeded the *Moral Proverbs* of Christine de Pisan, in verse, in 1478, and a *Cordial*, in prose, in 1479. The original productions of Lord Rivers, and, in particular, his *Balades against the Seven Deadly Sins*, are lost.

In 1478 a marriage was arranged between him and Margaret, sister of King James III. of Scotland, but it was mysteriously broken off. He was beheaded by order of Richard III. at Pontefract on June 25, 1483. His protection and encouragement of Caxton were of inestimable value to English literature, and in

the preface to the *Dictes* the printer gives an account of his own relations with the statesman which illustrates the dignity and modesty of Lord Rivers in a very agreeable way. Rivers was one of the purest writers of English prose of his time.

"Memoirs of Anthony, Earl Rivers" are comprised in the *Historical Illustrations of the Reign of Edward the Fourth* (ed. W. H. B[lack]).

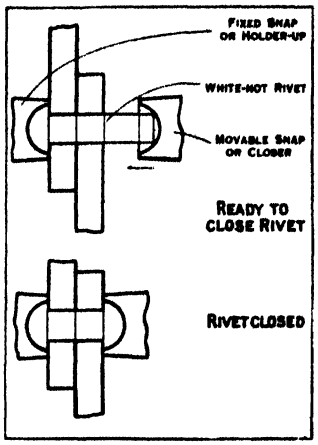
RIVERS, RICHARD SAVAGE, 4TH EARL (*c.* 1660–1712), the son of Thomas, 3rd earl, was styled Viscount Colchester after the death of his elder brother Thomas (*c.* 1680), until he succeeded to the peerage. Richard Savage was one of the most conspicuous rakes in the society of the period. In 1694 he succeeded his father as 4th Earl Rivers. On the fall of the Whigs, Rivers went over to the Tories, and in 1711 was appointed master-general of the ordnance, a post hitherto held by Marlborough. In June 1712 Rivers was promoted to the rank of general, and became commander-in-chief in England; he died a few weeks later, on Aug. 18, 1712. Rivers' intrigue with Lady Macclesfield was the cause of that lady's divorce from her husband in 1701. Richard Savage (*q.v.*) the poet, claimed identity with Lady Macclesfield's son by Lord Rivers, but the evidence in its support is insufficient.

See William Coxe, *Memoirs of Marlborough* (3 vols., 1818); *Letters and Despatches of Marlborough, 1702–1712*, vol. v., edited by Sir G. Murray (5 vols., 1845); Gilbert Burnet, *History of his Own Time* (6 vols., Oxford, 1833); F. W. Wyon, *History of Great Britain during the Reign of Queen Anne* (2 vols., 1876); G.E.C., *Complete Peerage*, vol. vi. (1895).

RIVERS, RICHARD WOODVILLE or **WYDEVILLE,** EARL (d. 1469), served under the duke of Bedford in France, and after his master's death married his widow Jacquetta of Luxemburg. Henry VI. created him Baron Rivers in 1448. His associations made him a strong Lancastrian. For some years he was lieutenant of Calais in Henry's interests. In 1459 he was taken prisoner, and was sent with his son Anthony to the earl of Warwick at Calais. He was, however, released in time to fight for Henry VI. at Towton. Early in the reign of Edward IV. Rivers recognized that the Lancastrian cause was lost and made his peace with the new king. The marriage of his eldest daughter, Elizabeth, widow of Sir John Grey of Groby, to Edward on May 1, 1464, secured the fortunes of his family.

Rivers was appointed treasurer in 1466, and a little later created earl. Elizabeth found great alliances for her younger brothers and sisters, and the Woodville influence became all-powerful at court. The power of this new family was very distasteful to the old baronial party, and especially so to Warwick. Early in 1468 Rivers's estates were plundered by Warwick's partisans, and the open war of the following year was aimed to destroy the Woodvilles. After the king's defeat at Edgecot, Rivers and his second son, John, were taken prisoners at Chepstow and executed at Kenilworth on Aug. 12, 1469. Rivers had a large family. His third son, Lionel (d. 1484), was bishop of Salisbury. All his daughters made great marriages: Catherine, the sixth, was wife of Henry Stafford, 2nd duke of Buckingham (*q.v.*).

For Earl Anthony's connection with Caxton consult William Blades's *Life of Caxton* (1861–63).



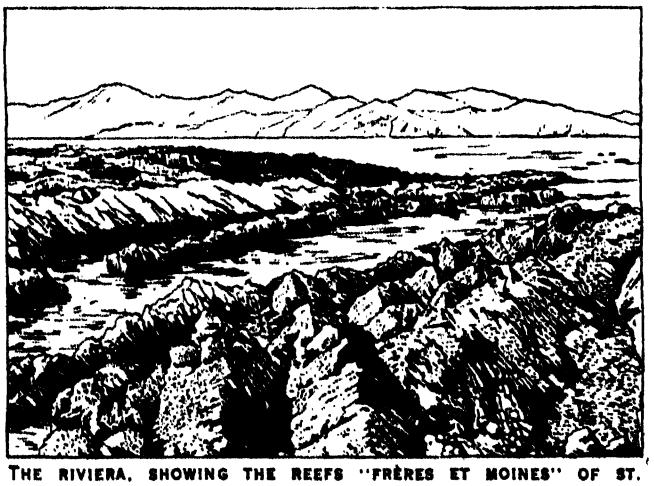
RIVERS, WILLIAM HALSE RIVERS (1864–1922), British psychopathologist, was educated at Tonbridge and St. Bartholomew's hospital, London. He was made university lecturer at Cambridge in physiological and experimental psychology in Dec. 1867, and in 1907, when the two subjects were separated, lecturer in the physiology of the senses. He founded during this period the Cambridge school of experimental psychology, and was made fellow of St. John's college. In 1898, with his pupils C. S. Myers and William MacDougall, he joined the anthropological expedition to Torres Straits led by A. C. Haddon, and had charge of the psychological work. By the genealogical method of social investigation he obtained such valuable results that whereas he joined the expedition as a pure psychologist he returned an enthusiastic ethnologist. *The Todas* (1906) records his investigation on these lines among the Todas in Southern India in 1902. His first expedition to Melanesia was in 1908. He revisited that area later, and in the *History of Melanesian Society* (2 vol., 1914) abandoned the evolutionary theory of society in favour of that of cultural migration. During the World War he obtained many valuable results as a psychopathologist (see *Instinct and the Unconscious*, 1920) and while critically interested in Freudian methods of psycho-analysis he came to very different conclusions on matters of principle and practice, holding that "though dreams are the attempted solutions of conflicts, the nature of the solution is largely determined by the affective attitude dominant before going to sleep." His *Psychology and Politics* (1923), *Medicine, Magic and Religion* (1924), *Social Organisation* (1924), were published after his death. He died at Cambridge on June 4, 1922.

RIVERSIDE, a city of southern California, U.S.A., on the Santa Ana river, at the base of the San Bernardino range, 56 m. E. by S. of Los Angeles; the county seat of Riverside county. It has a commercial aviation field, and is served by the Santa Fe, the Southern Pacific, the Union Pacific and electric railways, and by motor coach and truck lines. Pop. (1920), 19,341; was estimated locally in 1928 at over 33,000. Riverside is a beautiful city, at an altitude of 800–1,000 ft., situated in the centre of the finest orange-growing district in the State. It has an area of 40 sq.m. The climate is dry and warm, tempered by breezes from the ocean (60 m. W.). The mean annual temperature is 63° F. and the mean annual rainfall is 10·6 inches. The prevailing style of architecture is the modified Spanish type of the early missions, and the avenues are lined with pepper and other sub-tropical trees. On the rock-crowned summit of Mt. Rubidoux, just outside the city, religious services attended by thousands are held at sunrise on Easter morning. Riverside is the seat of Sherman Institute, the largest of the Government non-reservation schools for Indians, with an attendance of over 1,000; and of the citrus experiment station of the University of California. Over 6,000 car-loads of oranges, lemons and grapefruit are packed and shipped annually, and the annual revenue from the poultry business is estimated at $4,000,000. Much of the machinery used in handling citrus crops has been invented and perfected in Riverside and is manufactured there. The total factory output in 1925 was valued at $3,166,522. Bank clearings in 1927 amounted to $57,371,000, and the assessed valuation of property for 1927–28 was $16,505,290. In 1870 the site of Riverside (called Jurupa Rancho, the name of the old Spanish grant) was bought by the Southern California Colony Association, and in 1873 the cultivation of navel oranges was introduced from Brazil, laying the foundation of one of the leading industries of the State. One of the parent trees (at the head of Magnolia avenue, protected by an iron grill) is still bearing (1928). The city was chartered in 1883.

RIVES, WILLIAM CABELL (1793–1868), American political leader and diplomat, was born in Nelson county, Va., on May 4, 1793. He attended Hampden-Sidney and William and Mary colleges, was admitted to the bar, and practised in Nelson and Albemarle counties. A Democrat, he served in the State Constitutional convention, in the Virginia house of delegates and in the Federal House of Representatives. From 1820 to 1832 he was minister to France; in 1833 he entered the United States Senate, but resigned in the following year. From 1836 to 1845 he again served in the Senate, and in 1849–53 was again minister to France. In Feb., 1861, he was a delegate to the Peace Conference in Washington; he opposed secession, but was loyal to his State when it seceded, and was a representative in the Confederate Congress during the Civil War. He died at the country estate of Castle Hill, Albemarle county, Va., on April 25, 1868. Rives was the author of *Life and Times of James Madison* (3 vols., Boston, 1859–68), the completion of which was prevented by his death. He was the father of ALFRED LANDON RIVES (1830–1903), an engineer of some prominence, whose daughter, AMÉLIE RIVES (Princess Troubetzkoy) (1863–), became well known as a novelist.

RIVET is a headed pin or bolt used as a permanent fastening in metal work by beating out the headless end. Cold riveting is practicable for small sizes in copper, brass, aluminium, iron and steel, but the larger sizes have to be heated in the cases of iron and steel, in order to secure rapid and easy closing.

Machine riveting in small sizes is done either in a power-press, the ram of which works a snap and closes the tail with a blow, or with a rotary rivet spinning machine, with hard steel rollers which spin the tail quickly and noiselessly into shape. In engineering structures, machine riveting is employed whenever practicable, portable pneumatic hammers, or fixed or portable hydraulic riveters being used.



METHOD OF MACHINE RIVETING, IN A PRESS, OR BY PNEUMATIC OR HYDRAULIC RIVETER

The various shapes of rivet heads or tails include the *countersunk*, beaten flush into a conical recess in the plate, the *cup* or *round* head (as illustrated) the *pan* head, which has sloping sides and flat top, the *conical* with sloped sides ending in a point, and the thin *flat head* coopers' or tinmen's rivets. *Bifurcated* rivets for belting and harness have thin heads, but the tails are split, and opened like a paper fastener. A great deal of gas or electric welding is now substituted for riveting in the case of hollowware and other sorts of sheet metal product.

(*See* also BOILER-MAKING and PNEUMATIC TOOLS.)

RIVIERA, the narrow coast-land between the mountains and the sea around the Gulf of Genoa in the north of Italy and in France from Nice on the west to Spezia on the east. The name is derived from *riva* (Lat. *ripa*) meaning bank. It is usually spoken of as Riviera di Ponente ("the coast of the setting sun," the portion between Nice and Genoa), and as Riviera di Levante ("the coast of the rising sun," the portion from Genoa to Spezia). All this district, being open to the south and sheltered from the north and east winds, enjoys a remarkably mild climate (winter mean, about 49° F); the vegetation in many places partakes of a subtropical character (*e.g.*, the pomegranate, agave, prickly pear, date, palm and banana). Large numbers of flowers, especially roses, violets, hyacinths, etc., are grown near Nice, Mentone, Bordighera and other towns, for the London and Paris markets. The uncommon mildness of the climate, conjoined with the natural beauty of the coast scenery,—the steep sea-crags, the ruined towers and the range of the Maritime alps,—attracts thousands of invalids and convalescents to spend the winter there, and these resorts are frequented for sea-bathing in summer. Proceeding from west to east, the following are the places to which visitors principally resort: Nice, Monaco (an independent principality), Monte Carlo, Mentone (the last town on the French Riviera), Bordighera, Ospedaletti, San Remo, Alassio, Nervi, Santa Margherita, Rapallo, Sestri Levante, Levanto. The railway which runs close through the Riviera burrows through the many projecting headlands by means of more than 80 tunnels.

THE RIVIERA, SHOWING THE REEFS "FRÈRES ET MOINES" OF ST. HONORAT

RIVIERE, BRITON (1840–1920), English artist, was born in London on Aug. 14, 1840. He was educated at Cheltenham and Oxford, and received his art training from his father, an art master. His first pictures appeared at the British Institution, and in 1857 he sent three works to the Royal Academy, becoming from 1863 a regular exhibitor. He contributed illustrations to *Punch* and other journals. In 1878 he became associate, and in 1881 full member, of the Royal Academy, and in 1891 received the degree of D.C.L. at Oxford. He died on April 20, 1920.

See Sir Walter Armstrong, "Briton Riviere, R.A.; His Life and Work," *Art Annual* (1891).

RIVINGTON, CHARLES (1688–1742), British publisher, was born at Chesterfield, Derbyshire, in 1688. He was apprenticed to a bookseller in London, and in 1711 took over the business of Richard Chiswell (1639–1711), at the sign of the Bible and the Crown in Paternoster row. His business was almost entirely theological and educational; he published one of Whitefield's earliest works, and brought out an edition of the *Imitation of Christ*. In 1736 Rivington founded the company of booksellers called the "New Conger," in rivalry with the "Conger" which dated from about 1700. The business was handed down through the family until 1890, when it was sold to Messrs. Longmans. A business of the same character was carried on by Septimus Rivington (b. 1846) and J. G. Percival, as Percival and Co. (1889–93), and in 1897 the title of Rivington and Co. was revived.

See S. Rivington, *The House of Rivington* (1894); also *The Publishers' Circular* (Jan. 15, 1885 and June 2, 1890).

RIVINGTON, CHARLES ROBERT (1846–1928), English solicitor, was born on Dec. 7, 1846, and educated at King's college, London. He entered the old family firm of Rivington and Sons in 1869, and for 47 years held the post of clerk to the Stationers' company. His most important work was the publication of the *Records of the Stationers' Company*. He died at Appleby, on Aug. 22, 1928.

RIVOLI VERONESE, a village of Venetia, Italy, in Verona, on the Adige, 13 m. N.W. of Verona. Pop. (1921) 1,710. It was the scene of the battle in which, on Jan. 15, 1797, Napoleon defeated the Austrians commanded by Josef Alvintzi, Baron von Barberek (1735–1810). (*See* FRENCH REVOLUTIONARY WARS.) A famous street in Paris (rue de Rivoli) commemorates the victory, and under the empire Marshal Masséna received the title of duke of Rivoli.

The Battle of Rivoli.—This battle, fought on Jan. 14, 1797, was the climax of the repeated Austrian efforts to relieve the vital fortress of Mantua, which blocked Napoleon's advance towards Vienna. Napoleon's victory cleared the way for his advance into Austria. *See* FRENCH REVOLUTIONARY WARS.

RIXDORF, a suburb of Berlin, Germany. Rixdorf was a foundation of Moravian Brethren from Bohemia, who settled here in 1737. German Rixdorf was a much more ancient place, and appears as Richardsdorf in 1630 and as Riegenstorp in 1435. Before 1435 it belonged to the order of the Knights of St. John.

RIYADH, a city of the Nejd (*q.v.*) in the heart of Arabia with a population of from 10,000 to 20,000. It is the capital of the region and the headquarters from which Ibn Sa'ud (*q.v.*) rules over most of Desert Arabia.

The city is situated on an oasis in a hollow of the great plateau and is surrounded on all sides, except the north-east, by palm groves. The actual site is on limestone rock, forming a well marked mound on the crest of which is the royal palace. The settlement is encircled by a thick wall some 25 ft. high, pierced by many gates. The Thamairi gate on the east is the entry from the desert tracks to the north and east and south, while the Dhuhairi gate gives access to the north-western route to Washm

and the roads to Mecca. Other gates lead to roads or desert trackways making for the south or south-west. Riyadh is thus a great desert focus.

Within the walls irregular streets converge upon a central square. In the open space north of the royal palace is the market place. The great Mosque of Jami'da is a rectangular building some 60 yards by 50 yards. Architecturally it reflects the severity of the puritan Wahhabi. Besides the great Mosques there are between 15 and 20 smaller ones. To the north of the main thoroughfare, about half way between the palace and the Thamairi gate, is the great fort built in the form of a square, but it is the royal palace of Ibn Sa'ud that commands the whole city, and in its simplicity represents "all that is best in modern Arabian architecture."

The water supply of the city is obtained from numerous wells among the palm groves without the city, and beneath the shades of these groves there tend to grow up suburban residential quarters.

See H. St. J. B. Philby, *The Heart of Arabia,* vol. i.

RIZA PAHLAVI (1877–), shah of Persia, was born in Savad Kūh, the son of an army officer. He joined the army in early youth and eventually rose to be one of the senior officers of the Cossack Division. In 1917 he went to Tehrān from Hamadan with his regiment and compelled Col. Clergé, the then commander of the Cossack Division, to relinquish his command and replaced him by Col. Starosselsky. In 1921 with a force of about 4,000 men at his disposal he captured Tehrān, and as a result became commander-in-chief of the Persian army and minister for war. In 1923 he took over the premiership and instituted a series of reforms, rendering assistance to the American Financial Mission which was already in the employ of the Persian Government for the purpose of modernizing the various departments. In Oct. 1924 on the departure of the shah, Sultan Ahmad Kadjar, Riza Khan Pahlavi was appointed by the Majliss to be head of a temporary Government until the form of a new constitution was drawn up. On Dec. 13, 1925 Riza Khan Pahlavi was appointed shah of Persia and the sovereignty was vested in the Pahlavi dynasty. The coronation took place in the Gulistan Palace in Tehrān on April 25, 1926. The new shah proceeded to carry out reforms on western lines. He had married the daughter of Taimur Khan, an army officer of high rank under whom he had served earlier in his career. There was a son of this marriage, by name Mohammed Riza, who thus became vahliad or crown prince and henceforth known as Shahpur Mohammed Riza.

RIZAZKAT: *see* BAKKARA.

RIZZIO or **RICCIO, DAVID** (*c.* 1533–1566), secretary of Mary (*q.v.*), queen of Scots, was a native of Turin, and came to Scotland in 1561 in the train of the Piedmontese ambassador. The queen wanted a bass singer, and he entered her service as a musician, becoming also her *valet de chambre,* and in 1564 private foreign secretary. After her marriage to Darnley in 1565 his influence with Mary became paramount. His elevation aroused the active hostility of Darnley and the other nobles, and he was suspected of being the queen's lover. On the evening of March 9, 1566, the earls of Morton and Lindsay, with armed followers, entered Mary's supper chamber at Holyrood, seized Rizzio, hacked him to death with daggers, and threw his body into the courtyard.

See Ruthven's *Narrative of Riccio's Murder* (1836); and the articles on MARY, QUEEN OF SCOTS.

THE PEARL ROACH (SCARDINEUS ERYTHROPHTHALMUS)

ROACH (*Rutilus rutilus*), a cyprinid fish of England, Europe and Siberia. It is a moderately deep, silvery fish. Specimens of more than 3 lb. are rare.

ROAD ROLLER, a self-propelled machine primarily designed for compacting loose or granular material composing the surface or sub-base of a road. In conjunction with scarifying and scraping attachments it is used for breaking up or loosening the road surface or sub-base, preliminary to further treatment. It is also used for scraping, compacting or smoothing the road surface or its base. Two general types are in common use, the macadam roller and the tandem roller.

The Macadam Road Roller has three wheels or rolls, two being mounted on a common shaft for driving the machine and the third for steering purposes. The steam engine-driven macadam roller is customarily fitted with a boiler of the locomotive type the supporting structure of which forms the main frame, where the wheels, engine and other necessary parts are mounted. Some machines have been built fitted with boilers of the vertical fire-tube type. The steam engine has two high pressure cylinders and cranks at 90°. Engines of one cylinder are occasionally used. Two speeds are usually provided, the speed change being accomplished by means of sliding gears. Macadam rollers are also fitted with gasolene or kerosene internal combustion engines. The engine is usually mounted on a structure which constitutes the main frame of the roller. The engines in common use have one horizontal cylinder, two horizontal opposed cylinders or four vertical cylinders in line. A power-driven air compressor is commonly used for operating an attached scarifier.

The Tandem Road Roller has two wheels or rolls mounted one behind the other on a frame which carries the driving mechanism and accessory parts. One of the rolls is driven and is commonly called the driving roll. The steering roll is separated into three or four parts to facilitate steering and to prevent marking the road surface. The rolls are approximately the same length, but if there is any difference in length the steering roll is shorter. The steering roll is of smaller diameter than the driving roll.

The tandem roller is designed primarily to compact and smooth bituminous road surfaces, the work being done while the surface is readily compressible. It is used only to a limited extent to compact non-bituminous surfaces or sub-bases. It is not usually provided with attached road scarifiers or scrapers. Means are provided for wetting the face of the driving roll to prevent the bituminous matter adhering to it. For the same reason the work done by the roller is usually confined to that which will not indent the working surfaces of the rolls. In order to prevent the rolls from marking a soft bituminous surface it is necessary that the engine be provided with a quick acting reverse mechanism so that the stop will be momentary. Manual and mechanical steering devices are provided. The steam engine-driven tandem roller is fitted with a boiler of the vertical fire-tube type. The steam engine has two high pressure cylinders with cranks at 90° and may be either vertical or horizontal. No change speed gears are provided. The internal combustion engine-driven tandem roller is provided with a two-cylinder opposed or four-cylinder vertical engine using gasolene as fuel. Sliding gears are provided for speed changes and reversing. On account of the time element involved in changing gears the operation of the roller is not as uniform or flexible as with the steam engine, except with expert operation. Steam engine-driven road rollers are usually designed to use coal as fuel. Wood may be used without boiler change if the work to be done is not too exacting. Petroleum fuel oil may be used by providing a special fuel tank and oil burner and special brick work in the fire-box of the boiler. At the present time (1929) the Diesel or semi-Diesel type of internal combustion engine is not used for power because a suitable design of engine has not been commercially developed. (F. A. BR.)

THE ROAD-RUNNER (GEOCOCCYX CALIFORNIANUS)

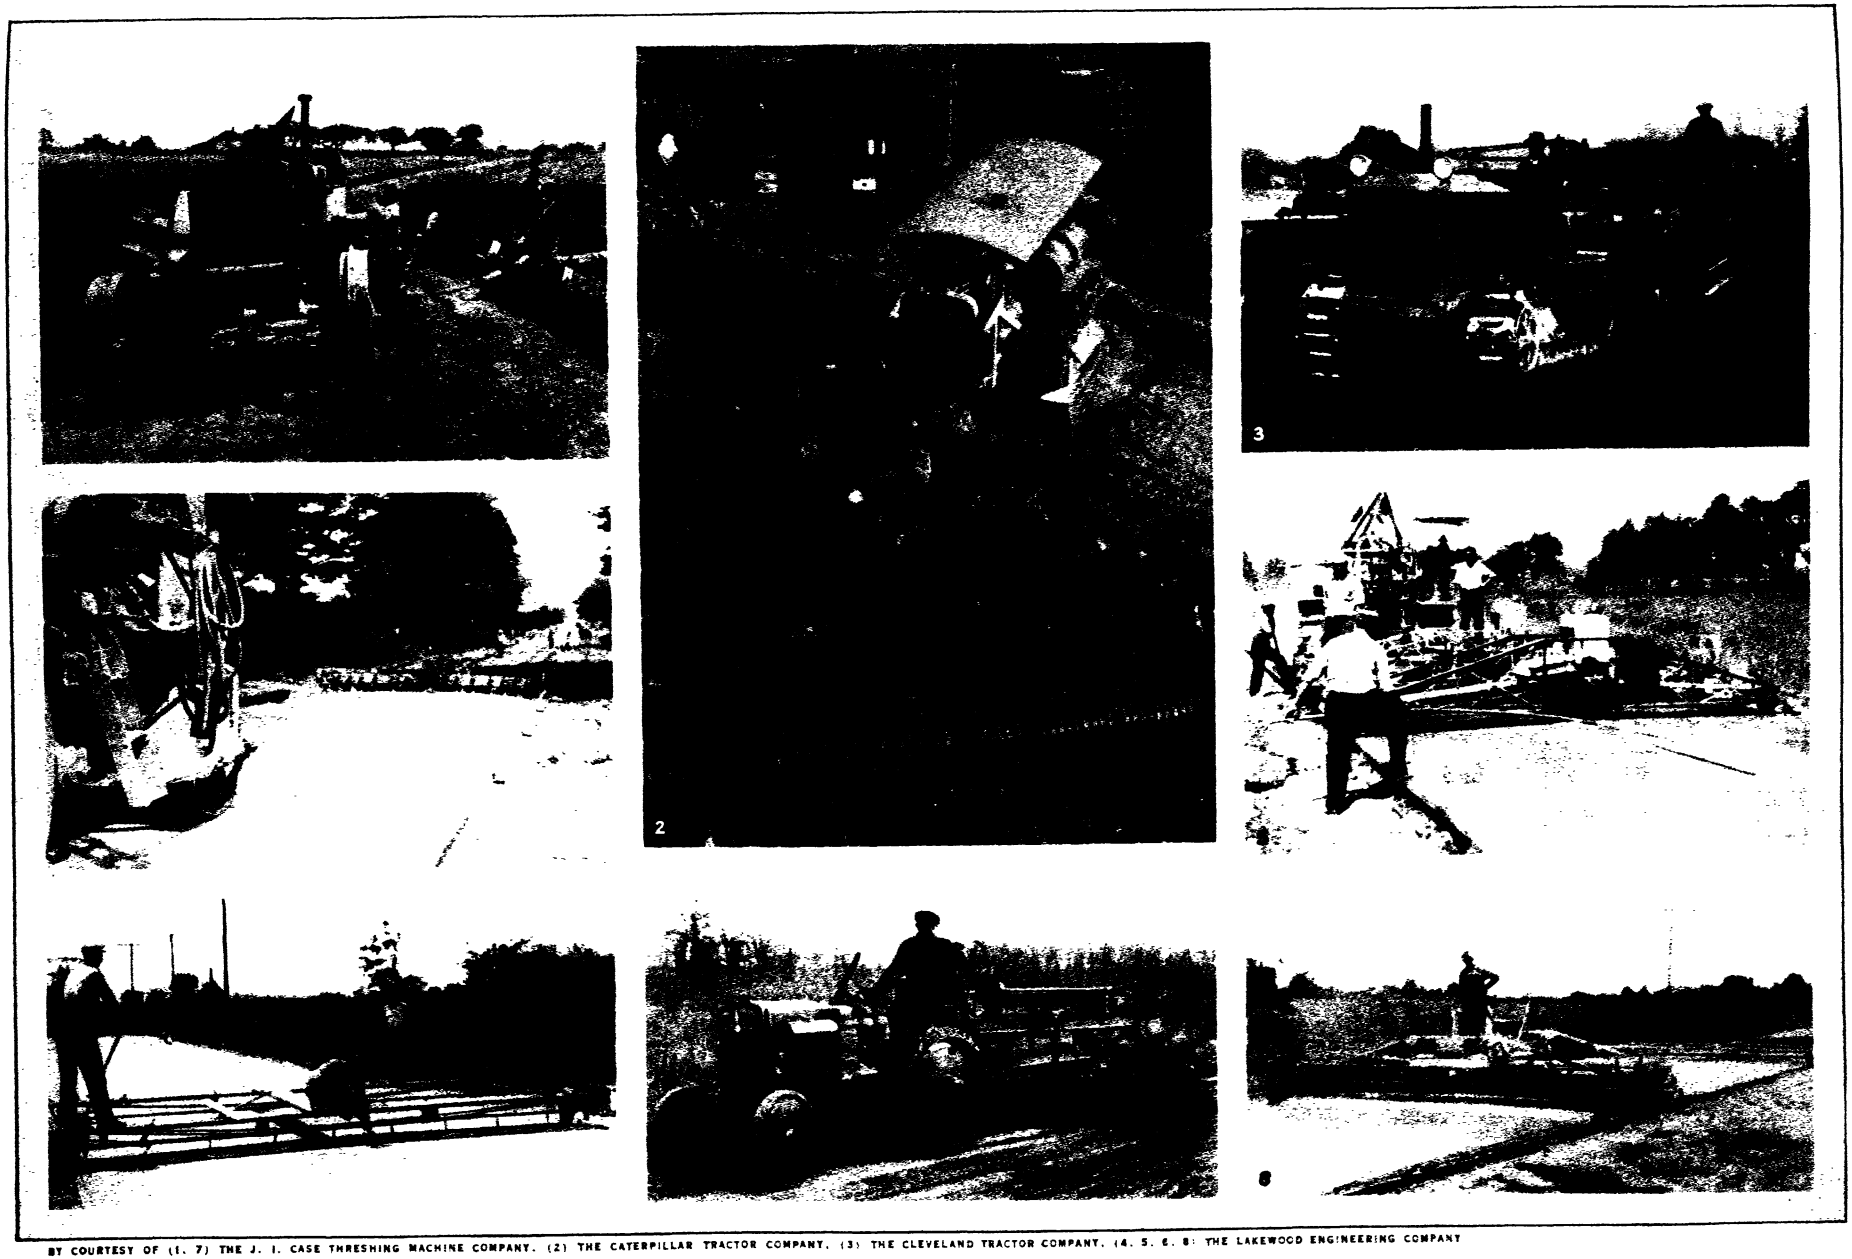
ROAD-RUNNER (*Geococcyx californianus*), a bird characteristic of the deserts of north-west South America, Mexico and southern U.S.A. It runs with head lowered and tail horizontal, stopping from time to time, when the tail assumes an almost vertical position. It belongs to the cuckoo family (*Cuculidae*).

ROADS AND STREETS. In current usage "road" is applied as a general term for all broad made ways from place to place, whether with separate side-paths for foot-passengers or not, while "street" is confined to the roads through towns, villages and other inhabited places, more or less lined by houses and other buildings on either side. The present article is confined to the methods adopted in making roads, from the first great road-makers, the Romans, down to modern times. The roadways of times anterior to the Romans, at least in Europe, were merely the tracks worn by the feet of pedestrians and animals, and the wheels of vehicular traffic.

Roman Roads.—The earliest roads about which anything definite is known, so far as construction is concerned, are those of ancient Rome, one of the oldest of which and the most celebrated for the grandeur of its works—the Appian Way—was commenced in 312 B.C. Roman roads are remarkable for preserving a straight course from point to point regardless of obstacles which might have been easily avoided. They appear to have been often laid out in a line with some prominent landmark, and their general straightness is perhaps due to convenience in setting them out. In solidity of construction they have never been excelled, and many of them still remain, often forming the foundation of a more modern road, and in some instances constituting the road surface now used. In England many lengths of Roman road which had fallen into disuse have been re-opened and modernized since 1920. It is possible, with the help of allusions of ancient writers, to follow the ideal mode of construction, though this was not always adopted. Two parallel trenches were first cut to mark the breadth of the road; loose earth was removed until a solid foundation was reached; and it was replaced by proper material consolidated by ramming, or other means were taken to form a solid foundation for the body of the road. This appears often to have been composed of four layers, generally of local materials, though sometimes they were brought from considerable distances. The lowest layer consisted of two or three courses of flat stones, or, when these were not obtainable, of other stones, generally laid in mortar; the second layer was composed of rubble masonry of smaller stones, or a coarse concrete; the third of a finer concrete, on which was laid a pavement of polygonal blocks of hard stone jointed with the greatest nicety. The four layers are found to be often 3 ft. or more in thickness, but the lower ones were dispensed with on rock, on which the paving stones were sometimes laid almost directly. The paved part of a great road appears to have been about 14 ft. wide, and on either side, and separated from it by raised stone edgings, were unpaved sideways, each of half the width of the paved road. Where, as on many roads, the surface was not paved, it was made of hard concrete, or pebbles or flints set in mortar. Sometimes clay and marl were used instead of mortar, and it would seem that where inferior materials were used the road was made higher above the ground and rounder in cross section. Streets were paved with large polygonal blocks laid as above described, and footways with rectangular slabs. Specimens are still to be seen in Rome and Pompeii, while in Britain many of the roads were of hard gravel or had a cobbled surface. There are no traces of Roman influence in the later roads in England, but in France the Roman method appears to have been followed to some extent when new roads were constructed about the beginning of the 18th century. A foundation of stones on the flat was laid, and over that two layers of considerable thickness, of larger and smaller stones, bordered by large stones on edge, which appeared on the surface of the road. A French *chaussée* with *accotements* still retains some resemblance to the old Roman roads.

English Roads, 18th Century.—The almost incredibly bad state of the roads in England towards the latter part of the 17th century appears from the accounts cited by Macaulay (*Hist.* c. iii.). It was due chiefly to the state of the law, which compelled each parish to maintain its own roads by statute labour, but the establishment of turnpike trusts and the maintenance of roads by tolls do not appear to have effected any great improvement. At the time of Arthur Young's six months' tour in 1770 the roads would seem to have been almost as bad as ever, and it is doubtful if there was much improvement up to the beginning of the 19th century. The turnpike roads were generally managed by ignorant and incompetent men until Telford and McAdam brought scientific principles and regular system to their construction and repair. The name of Telford is associated with a pitched foundation, which he did not always use, but which closely resembled that which had been long in use in France, and the name of McAdam often characterizes roads on which all his precepts are disregarded. Both insisted on thorough drainage and on the use of carefully prepared materials, and adopted a uniform cross section of moderate curvature instead of the exaggerated roundness given before; but, while Telford paid particular attention to a foundation for the broken stone, McAdam disregarded it, contending that the subsoil, however bad, would carry any weight if made dry by drainage and kept dry by an impervious covering. McAdam was engaged more with the repair of old roads than with the construction of new ones, and, though it is not possible to agree with all his doctrines, the improvement which he effected in road management and maintenance was great and lasting. When McAdam died in 1836 the turnpike system had attained its widest extension, no less than 1,100 trusts being then in existence. The dawn of the railway era brought disaster to the turnpike trusts, and roads suffered a long period of neglect at the hands of the parochial authorities who were mainly responsible for their upkeep.

The Public Health Acts of 1848 and 1875 and the Local Government Acts of 1888 and 1894 set up, stage by stage, the system of road-administration which now prevails in Great Britain,—the responsibility for main roads resting generally upon county councils, while less important roads are in the hands of urban district councils and rural district councils. The Development and Road Improvement Funds Act (1909) established the road board, now merged in the Ministry of Transport, which makes grants from the Government's road fund towards the expenses incurred by the highway authorities just named.



Construction of Roads.—The progressive transfer of traffic from railways to roads during the first quarter of the 20th century and the increase in the volume of road traffic and in the consequent strain upon the road surface impel the road engineer to seek more and more permanent and impervious materials which will avoid the vexatious process of frequent renewal.

Incidentally, an impervious surface will prevent the deterioration of the foundation and will enable the camber or crown of the carriage way to be reduced, thereby adding to the safety and convenience of drivers. Cambers of 1 in 24[1], and even steeper, used to be common. In modern practice this has been reduced to 1 in 48. In the design of new highways sufficient land is frequently acquired to enable all pipes, mains and conduits to be laid under the verges, shoulders or margins, so that the carriageway itself may not be subject to future disturbance. Dimensions of 100 ft. or 120 ft. between fences are becoming common in England, while in the United States even more generous figures are adopted. In England it has become common to adopt a 10 ft. factor for the width of carriageways, *e.g.*, for three streams of traffic a 30-ft. carriageway would be provided, for four streams 40 ft.

The wide road allows space for tree planting and keeps noise and vibration at a tolerable distance from the householder's windows. Spacious footways and verges on each side of a carriageway extend the motorist's view as he rounds a curve and promote the safety of vehicles entering from side roads. Drivers gain a wider range of vision on each side and secure an extra fraction of a second for deliberation before venturing into the main stream of traffic.

Sharp bends and abrupt changes of direction are now discountenanced in favour of easy curves of long radius. Where, owing to the configuration of the ground, curves of less radius than 1,000 ft. are unavoidable the outer edge of the carriageway is super-elevated or "banked," following the invariable practice

[1]The British refer to cambers in this way; in the United States they are referred to as ¼ in. to 1 ft. or ½ in. to 1 ft. (ED. E.B.)

ROAD BUILDING MACHINERY AT WORK ON GRADING AND SURFACING OF ROADS

1. Grader (right background) with tractor. 2. "Bulldozing" dirt over a metal culvert. 3. Crawler tractor grading a road. 4. Sub-grader drawn by steam roller. 5. "Straightedge," a machine used for surfacing a concrete road. 6. "Float bridge" in use where centre joint on concrete road-surface must be "edged." 7. Road planer with tractor. 8. Finishing machine on a concrete road

of railway engineers. The width of the carriageway should be increased at such points. Steep gradients which disfigure the rigidly straight Roman roads are avoided by moulding the line to the contours of the hillside. In laying out new arterial roads of which upwards of 200 miles have been built in the neighbourhood of London since the year 1920, it has almost invariably been found possible to limit the gradients to 1 in 30. Gradients of excessive flatness (less than 1 in 300) are to be avoided, owing to the difficulty of effectively draining the surface.

The elimination of level crossings over railways is an important item in the programme of modern road-improvements, and the time is fast approaching when, in the interest of public safety bridges may have to be provided at points where important highways cross one another.

Single and Duplicate Carriageways.—In designing new arterial roads, varying opinions prevail as to the relative advantages and disadvantages, on the one hand, of a single wide carriageway, or, on the other hand, of duplicate carriageways for up and down traffic respectively. While the single carriageway 50 ft. wide will probably carry a greater volume of traffic in the year than two 30 ft. carriageways each reserved for one-way traffic, the separate tracks will conduce to the safety of the driver and to that of the pedestrian who, in crossing each carriageway, knows from which direction the traffic will be approaching him.

Again the duplicate carriageway lends itself to progressive development. In the first instance, while the country alongside the road remains open, a single carriageway can be formed and will meet travellers' needs until such time as population and traffic increase, when the second carriageway can be constructed without interfering with the road which is already in use. The general tendency of road practice to assimilate railway methods, encourages the view that separate carriageways (up and down lines) are likely to prevail in the case of new arterial roads.

In the older and more settled countries where a tolerably complete network of old highways already exists, the road engineer's task is usually confined to the improvement of these, rather than to the construction of entirely new communications. Due to the steady increase in funds available through taxation it became possible to launch in Great Britain in 1925 the so-called "trunk road programme" for the systematic transformation of the most important through routes of the country. The expenditure incurred or approved for this purpose had reached by March 1928 a total of about £6,500,000. In their unimproved state these roads usually possess a carriageway varying from 14 ft. to 24 ft. in width, with little, if any, footway. Generally speaking, where improvement is now undertaken, sufficient land is being acquired to allow a dimension of 60 ft. between fences. This affords space for a carriageway 30 ft. wide, two 8 ft. footways and two 7 ft. verges. In more rural areas the carriageway is limited for the present to 20 ft., only one footway is constructed, and the verges are widened to absorb the additional space.

Plank and Log Roads.—In opening up a new country, roads, temporary or permanent, must be made with such materials as may happen to be at hand. The plank road often used in American forests makes an excellent track for all kinds of traffic. Upon that side of the space devoted to the road, which the heavy traffic leading to a town will use, two parallel rows of sills are laid longitudinally flatwise, the earth being well packed and rammed to the level of their faces. The joints are not opposite; a short piece of sill is put either under or by the side of each joint. Cross-boards are laid down loosely, so that groups of four boards together will project on alternate sides of the road forming a shoulder to enable vehicles to get on to the track at any point. The remainder of the road space is formed as an earthen track, for light vehicles. Its slope outwards may be 1 in 16, that of the plank road 1 in 32. If the soil is too bad for the earthen track, short lengths of plank road of double width are made at intervals to form passing places. The cross boards are spiked down on five sills, and are sprung so as to give a fall both ways.

The log road is formed across swamps by laying young trees of similar length close together. This is ridiculed as a "corduroy" road, but it is better than the swamp. Good temporary roads may be made by laying down half logs roughly squared upon the ground, close together or with spaces between of a couple of inches, into which earth is well rammed.

The mode of carrying a road across a bog upon a foundation of faggots or brushwood is well known. In India the native roads have been made equal to heavy traffic by laying branches of the mimosa across the track. And in the great plains, where the soil, when dry, would otherwise lie deep in dust, this is entirely prevented by laying across the track a coarse reed or grass like the pampas-grass, and covering it with 3 or 4 in. of loam.

THE MAKING OF CITY STREETS

In the principal streets of the world's great cities where highly durable paving materials on a concrete foundation have long been in use—mastic asphalt, compressed asphalt, wood blocks, granite setts, etc.—recent changes of method are mainly confined to the strengthening of the concrete foundation by an increase in thickness or the introduction of metal reinforcement. In some areas in London it is now the practice to lay as a foundation for wood blocks a bed of cement-concrete as much as 12 in. thick, containing a steel reinforcing fabric. Intolerance of traffic interruptions encourages the introduction of time-saving devices. Growing use is made in the busiest thoroughfares of quick-setting cements, such as *ciment fondu* and ferrocrete, which reduce by a fortnight or more the period which must elapse before the road can be opened to traffic. Various experiments have been tried in the use of rubber as a paving material; in some instances it has taken the form of a wearing cap applied to a block of wood or other material; in other instances the entire block is composed of rubber. The elasticity of the material renders it somewhat liable to displacement under the stress of traffic.

Foundations.—The choice of materials for foundations is usually dictated by considerations of transport, though in certain favoured districts the hard, compact subsoil of chalk or rock needs but little improvement. On a firm stratum of chalk a well-compressed layer of clinker will often serve to carry the surfacing coat. Equally serviceable as a natural foundation is a well-drained bed of coarse gravel; finer gravels, and even so fine a material as sand, are not to be despised, provided that the latter has no opportunity of escaping laterally under pressure. In France a thick bed of river sand is not infrequently used as the foundation for sett paving. The bearing capacity of clay, loam and other similar subsoils is so diminished by the presence of water that great care must be taken to ensure adequate drainage before road-making operations are begun. The want of uniformity and reliability in the chance supplies of materials formerly used as "hardcore" foundation for new roads in areas devoid of quarries has led to a notable extension in the use of cement concrete as a road foundation. Hardcore derived from demolished buildings consists of ingredients possessing every degree of durability from broken fragments of plaster to the hardest vitrified bricks. These heterogeneous materials thrown down pell-mell in a layer 12 in. thick and subsequently crushed under a 10-ton steam roller form the foundation of most of the roads on outskirts of great cities, and it is not surprising that carriageways so constructed show obvious signs of weakness under the stress of modern traffic.

Surfacing Methods.—Water-bound macadam (composed of broken granite, trap or hard limestone) still remains in use on lightly trafficked roads, but as it does not possess impervious qualities it is usually treated with hot surface dressings such as tar or various bituminous mixtures, applied in warm, sunny weather to a thoroughly swept, dry carriageway, the surface of which is then "gritted" with chippings or shingle. As surface dressings, various asphaltic or bituminous emulsions are applied cold, regardless of weather. Tar is used as a surface dressing and as a "binder" for mixing with materials prior to their application so as to give cohesive qualities to the entire thickness of the road crust. By this means such materials as limestone and slag can be utilised, which are not so well adapted to waterbound methods.

Natural asphalts after a 70 years' test still remain in high favour for the paving of streets in wealthy cities. During the twelve years 1916–1928, however, much research has been devoted

to the problem of utilising the valuable properties of asphalts and bitumens in some cheaper form of pavement suitable for wider adoption. Asphaltic and bituminous mixtures are now utilised as a matrix to bind together an aggregate of broken stone or clinker, applied in one or two coats as a road-surfacing material.

In this category fall the processes known as bituminous macadam, grouted macadam, single-coat bituminous carpet, bituminous sand-carpet on a bituminous sub-crust, bituminous clinker carpet on a bituminous sub-crust. In many cases these surfacing materials are laid upon the old macadam road-crust suitably regulated, but where this does not afford sufficient strength a concrete foundation is formed. In all these bituminous surfacing methods, the need for securing the greatest possible compactness by the elimination of voids is achieved by elaborate precautions in grading the materials. It is necessary to determine experimentally the exact proportions of ingredients of varying grades needed to attain the highest degree of density in the resultant mixture.

Cement-concrete, after gaining a wide vogue in Canada and the United States, is now extending its sphere of use in Great Britain as a running surface for carriageways. Its use as a foundation for asphalt or wood blocks has long been an established practice. Special interest attaches to the application of concrete in view of the wide range of materials utilisable as aggregate, as compared with the very uneven geographical distribution of good road-stone supplies. On the other hand, concrete is somewhat handicapped by the lengthy period of setting and "curing," which is requisite before the new surface can be subjected to the strain of traffic. This difficulty may be mitigated in future by the use of quick-setting cements, several types of which (*ciment fondu,* ferrocrete and other aluminous cements) are now available.

Standardisation.—Standard specifications and practice have not yet been evolved for concrete road construction. There is considerable variety of method. The construction may take the form of one-course work or two-course work, the former consisting of one grade of concrete for the full thickness, while the latter provides two layers of concrete mixed in varying proportions. One-course work is simpler, and avoids the risk of cleavage between two layers of differing consistency. For two-course work a poorer concrete can be used for the lower layer.

Methods of Laying.—In the actual process of laying the concrete, there is much variety of practice, some engineers preferring to proceed continuously, while others adopt the "alternate bay" system, in which the carriageway is divided into slabs of uniform length, each extending the full width of the carriageway. The odd numbers would be laid first, separated by gaps representing the even numbers; these gaps would not be filled until the odd numbers had completely set, thus counteracting the effects of expansion and contraction. The transverse joints separating the slabs are sometimes disposed at right angles across the road; in other instances they lie at an angle of 60° or so to the kerb-line, so that the impact of the wheels of the vehicle does not strike any slab simultaneously.

The aggregate, consisting of crushed stone or gravel, should be clean and well graded in size, so as to reduce the percentage of voids to a minimum. Risks of failure in the concrete are greatly reduced by washing the aggregate. The proportions commonly adopted vary from 1 cement, 1½ sand and 3 gravel to 1 cement, 2 sand and 4 gravel. Only a bare sufficiency of water should be added—a very wet mixture encourages voids. Mechanical mixing plant is generally adopted.

The precautions to be taken during the setting of the concrete depend largely on the climatic conditions. In moist weather no harm will arise from leaving the green concrete uncovered for a few hours, but in hot sunny weather exposure will lead to the formation of hair cracks. Heavy canvas is often used for protecting the concrete during the first 24 hours of setting. The canvas is then removed, and a layer of earth spread over the surface about 2 in. thick and left there for a fortnight or so. For the purpose of indurating the surface of the cement concrete, recourse is sometimes had to two or three applications of a weak solution of silicate of soda.

In London several interesting experiments are being tried (1929) in the use of rubber as a paving material for carriageways, but the high cost appears likely to hinder any general adoption of this method.

Reinforcement.—Where anxiety is felt as to the soundness of the subsoil on which concrete is laid, and it is accordingly desired to form a slab qualified to serve as a raft or bridge, one or two layers of metal reinforcement are often introduced into the concrete. In other cases reinforcement is adopted owing to the fact that the thickness of the concrete has had for various reasons to be reduced.

There are large numbers of fabrics in use, expanded metal of 6 in. and other meshes, woven wire, mesh fabrics in which the main tension wires of drawn mild steel run longitudinally with cross-wires welded thereto at regular intervals; other systems make use of twisted or vertical bars; double reinforcement is frequently used in "mattress" form, the upper and lower layers being connected by diagonal members. The weight of reinforcement varies in ordinary practice from 5 lb. to 25 lb. per yard superficial of concrete foundation.

Traffic problems (*see* Traffic and Traffic Regulations and various articles under the heading of Transport) have created many new problems in road construction. These developments have necessitated the elimination to a great extent of narrow bridges and under passes, sharp curves, blind intersections and crossings.

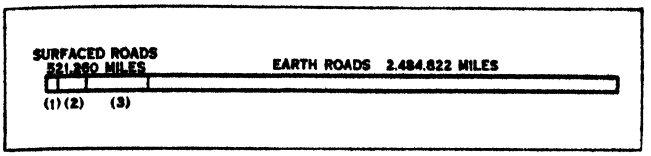
(C. H. Br.)

ROADS AND ROAD CONSTRUCTION IN THE UNITED STATES

There are approximately 3,000,000 m. of public rural roads in the United States. Of these 550,064 m. are surfaced and 627,259 m. are graded and drained according to engineering standards. Of the surfaced mileage, 81,107 m. are improved with sand-clay, 324,810 m. with gravel, 61,160 m. with waterbound macadam, 24,578 m. with bituminous macadam, 8,422 m. with bituminous concrete, 2,438 m. with sheet asphalt, 42,341 m. with Portland cement concrete, 5,207 m. with brick and other block pavements. These figures are as of Jan. 1927.

Highway construction is progressing at the rate of 55,000 m. of surfaced road a year. This figure includes new surfaced roads and reconstructed roads. Between 30,000 and 40,000 m. of newly surfaced roads are built yearly. Approximately 60,000 m. of highways are graded and drained annually. The net increase in graded and surfaced roads is between 90,000 and 100,000 m. a year.

The 3,000,000 m. of roads are divided into three main classes —Federal-aid roads, constructed with Federal-aid funds and State funds under supervision of the State highway departments and the Federal Bureau of Public Roads; State roads, built with State and local funds under the supervision of the State highway departments; county and local roads constructed with county and local funds by county and local authorities.



In the Federal-aid system there are 187,000 m. of road, of which, on July 1, 1928, 71,074 m. had been improved with Federal aid. All roads in the Federal-aid system are free of toll and are maintained by the State highway departments.

The Federal-aid Highway System.—The Federal-aid highway system was designated co-operatively by the Secretary of Agriculture, acting through the Bureau of Public Roads, and the officials of the several State highway departments, in accordance with the Federal highway act passed by Congress, 1921. The system thus designated comprises the main interstate roads, and reaches directly nearly every city of 5,000 population or greater, and the roads are so chosen that if a zone 10 m. wide were marked off on each side of them, these zones would include the homes of 90% of the population. (*See* Highways.)

The Federal-aid system is improved with funds appropriated by acts of Congress from funds available in the U.S. Treasury. No Federal tax is levied for road construction. The original Federal-aid road act authorized the Secretary of Agriculture to participate in the improvement of roads up to 50% of the cost of the improvement, provided that the aid granted to any particular project did not exceed $10,000 a mile, exclusive of the

cost of bridges more than 20 ft. long. Recent amendments permit the States to use 100% of Federal-aid funds upon certain roads in the public land States. The other 50% of the improvement is borne by the State highway departments. No Federal-aid funds are applied to county or local roads.

In addition to its contribution to Federal-aid roads, the Federal Government has also assumed as a rightful obligation the

RURAL ROAD MILEAGE IN THE UNITED STATES, UP TO DECEMBER 31, 1925
(1) PAVED, (2) MACADAM, (3) GRAVEL, SANDY CLAY, ETC.

duty of building those sections of the major national system which lie in the national forests and parks and other parts of the public domain. In the forest highway system are 13,842 m. of road, of which 3,775 m. have been improved. The system is divided into three classes. In class 1 are 1,079 m. of roads. These are the more important highways which are necessary sections or extensions of the Federal-aid highway system wholly within forest areas. In class 2 are 7,060 m., which also extend the Federal-aid system. Class 3 comprises 5,703 m., which serve the communities within the forests.

Of the 71,074 m. of road improved with Federal aid, 10,611 are graded and drained; 6,471 m. are sand-clay; 27,698 m. are gravel; 1,427 m. are waterbound macadam; 4,317 m. are bituminous macadam; 1,993 m. are bituminous concrete; 17,516 m. are Portland cement concrete; and 818 m. are brick. The completed mileage also includes 223 m. of Federal-aid bridges and approaches.

Of the 3,775 m. of improved forest roads, 2,123 m. are graded and drained; 79 m. are of sand-clay; 685 m. are of gravel; and 884 m. of waterbound macadam. There are also 4 m. of bridges.

State Highway Systems.—There are approximately 300,000 m. of roads in the 48 State highway systems. These systems include, in most States, all the roads of the Federal-aid system and a number of others of important State significance. In some States the Federal-aid system is larger than the designated State system. In some States the selected roads have been designated by name and description in the laws of the State, in others the designation has been left to the State highway departments.

State highway systems are constructed with State funds only and with State and county or other local funds.

Of the total State highway mileage, on Jan. 1, 1927, 163,059 m. were surfaced. Of the surfaced mileage, 11,396 m. are of sand-clay and top soil, 79,286 m. are of gravel, chert and shale (treated and untreated), 18,428 m. are waterbound macadam (treated and untreated), 12,927 m. are of bituminous macadam by penetration, 890 m. are of sheet asphalt, 4,815 m. are of bituminous concrete, 31,936 m. are Portland cement concrete, 3,216 m. are of vitrified brick, 88 m. are of asphalt block, 34 m. are of wood block and 43 m. are of stone block.

Of the unsurfaced mileage, amounting to 124,869 m., 96,413 m. are unimproved or only partly graded, and 28,456 m. are improved to established grade and drained.

County and Local Roads.—There are approximately 2,712,000 m. of county and local rural roads in the county and local road systems. All roads not included in the Federal-aid and State highway systems are classified as county and local rural roads. They are built by local officials with local funds.

By far the larger part of the unimproved mileage of the country is in the county and local road system. There are hundreds of thousands of miles on which the traffic is so small that improvement is not justified. Of the local road mileage, 598,803 m. of earth roads have been built to established grade and drained; and 387,005 m. have been surfaced. Of the surfaced mileage, 69,711 m. are of sand-clay, 245,524 m. are of gravel (treated and untreated), 42,732 m. are of waterbound macadam, 11,651 m. are of bituminous macadam by penetration, 1,548 m. are of sheet asphalt, 3,607 m. are of bituminous concrete, 10,405 m. are of Portland cement concrete, 1,384 m. are of brick, 87 m. of stone block, 37 m. of wood block, and 319 m. of asphalt block.

Administration of Federal-aid Road Construction.—Federal-aid roads are constructed under the immediate supervision of the several State highway departments subject to the approval of the Secretary of Agriculture, who has delegated the details of administration to the Bureau of Public Roads. The bureau has established 11 districts, each in charge of a district engineer who co-operates directly with the State highway engineers of the States included in his district. The four western districts are under the general supervision of a deputy chief engineer, with headquarters at San Francisco, who is responsible to the chief engineer at Washington. All other districts are directly under the supervision of the chief engineer.

When a State highway department desires Federal aid in financing a road on the Federal-aid system, it notifies the district engineer, who, if he has not already done so, immediately makes an examination of the road and the plans proposed for its improvement. If he approves the State's proposals he submits the project either to the deputy chief engineer at San Francisco or to the chief engineer at Washington with appropriate recommendations. However, he may at once authorize the State highway department to proceed with the construction subject to subsequent agreement or any modifications of plans which may be required by his superior authorities. A formal agreement is made between the State and the Federal Government. Construction then proceeds with full authority of the Government under the immediate supervision of State highway engineers and subject to frequent inspection by Federal engineers.

The Federal Government has no official relations with county and local officials.

Administration of State Highways.—Control over the State roads is vested in the State highway departments. In more advanced States the highway department determines the order in which the roads of the State system are to be improved, prepares the plans for the improvement, supervises the construction, and pays for it with State funds entirely under its own control, and, after completion, maintains the roads also with State funds under its own control. In less advanced States control is divided between the State highway department and the county or local governing bodies. In some States initiation of improvement rests with the counties; in others, a part of the money to pay for the improvement is raised by the counties; in others, the actual construction work may be carried on by the counties subject to the approval of the State highway department. In some States the maintenance of the roads is left to the county officials. When the State and county share in the cost of construction the road is generally called a State-aid road.

STATE PARTICIPATION

The Development of State Highway Departments.—In 1891 New Jersey passed a law providing for a certain measure of State participation in road building. With one exception, it was the first instance in which any State had undertaken to participate directly in the construction of roads. The exception is Kentucky, which had a State highway department and a well defined State road policy from 1821 to 1837, and had completed some 340 m. of roads.

Following New Jersey's example, laws providing for establishment of State highway departments and for granting of State aid were passed in Massachusetts in 1892, in California and Connecticut in 1895, and in Maryland, New York and Vermont in 1898.

Between 1900 and 1915, 38 other States had established highway departments and empowered them with some degree of authority. Several of these previously established departments were materially strengthened and similar agencies were created in the three remaining States when, in 1916, the Federal-aid road act required the establishment of adequate State agencies as a condition of the granting of Federal aid. The establishment of adequate State highway departments by the 48 States was the most important immediate effect of the Federal-aid law. The first administrative act of the Bureau of Public Roads under the Federal-aid law was to request all States to submit a five-year programme

map showing the system of roads upon which the State highway departments would request Federal aid. The rapid and consistent improvement of the main highways of the United States is due to concentration of authority in the State highway departments, to the engineering control thus established and especially to the correlating influence of the Federal Government. The several State systems were substantially welded into a national network by the designation in 1921 of the Federal-aid highway system.

The purpose of the New Jersey law was to establish a State department, employing skilled engineers, which would act in an advisory capacity to county officials, for improvement of road construction. The highway department developed plans and specifications, inspected and supervised the construction, but contracts were let by the counties and the roads were to remain county roads subject to maintenance by the county. As an inducement for counties to seek State aid, funds were appropriated by the State legislature to pay one-third the cost of road construction.

With minor modifications, the New Jersey principle of State aid was subsequently adopted by many other States. In some States joint participation of the State and county in construction of the most important roads was made mandatory. Other variations differentiated the systems as adopted by the several States.

Organization of State Highway Departments.—In 33 of the 48 States, the highway departments are called State highway commissions, consisting of three to five members, appointed by the Governor, with the consent of the Senate in some States, for a period of from two to six years. The commission of one State—Mississippi—is elected by popular vote. In the majority of States, the executive officer of the commission is the State highway engineer, appointed by the commission. In two States—Michigan and Arkansas—he is elected by popular vote. In some States the Governor serves as chairman of the commission. In eight States, highway departments are bureaux or divisions of highways which are part of the Department of Public Works. The executive officer may have the title of State Highway Engineer, Director of Highways or Commissioner of Highways. In six States the chief executive of the highway department is a State highway commissioner, appointed by the governor, except in one State—Michigan—where he is elected by popular vote.

Construction of practically all roads of the Federal-aid and State highway systems is by contract let by the State highway departments, to the lowest bidder. All work is advertised. Each State highway department makes its own tests of materials either in its own laboratory or in a nearby commercial laboratory. It likewise conducts its own inspections of construction work. Federal-aid highways are subject also to Federal inspection.

FINANCE

Administration of Local Roads.—County roads, in general, are built and maintained by county officials with funds raised, as a rule, by taxation of real and personal property within the county. The more advanced counties employ a county engineer or an engineering organization to supervise the technical details of construction, the county governing body acting only as an administrative body. In some States the lesser roads in each county are administered, constructed and maintained by a host of township and district officials, each of whom may have charge of only a few miles of road. In other States, special road-improvement districts are created upon petition, by the State legislature, and the construction of the road or roads included in the district is supervised by special appointed commissioners. In general, the roads thus built revert to the county authorities for maintenance.

Sources of Highway Revenue.—For many years, the property tax and poll tax were the only sources of road revenues. They were collected and expended by the local Governments. Commutation of the poll tax was permitted. As an indirect source of revenue, prison labour, while not a large factor, has been used, mainly to give employment to prisoners.

The first motor vehicle fees levied by the States were nominal and were designed merely to cover cost of registration. The rapid growth in motor vehicle registration increased the demand for improved roads with the resulting issuance of State and county bonds to secure funds to speed the improvements beyond the rate possible with limited current revenues. With improved roads, special benefits resulted to operators of motor vehicles and the motor vehicle taxes have been increased in recognition of this fact.

In recent years the States have levied a gasolene tax as a source of additional revenue. The tax was first levied in 1919 by four States: Colorado, a 1 cent tax per gallon; New Mexico, 2 cents per gallon; North Dakota, ¼ cent per gallon; and Oregon, 1 cent per gallon. In 1920 Kentucky joined the four and levied a gas tax of 1 cent per gallon. In 1921, 15 States levied taxes from ¼ cent to 2 cents per gallon. In 1922, four additional States levied taxes. In 1923, 35 States levied a gasolene tax. This year marked an increase in the amount per gallon for some of the States. The lowest tax was 1 cent, the highest 3 cents, and the total revenue collected was $38,566,338. In 1925, 44 States and the District of Columbia collected $148,358,087 in gasolene taxes. In 1927, all but two States levied a tax from 1 cent to 5 cents a gallon and collected $258,966,851.

In the majority of States, the total gasolene tax, less collection and other costs, is used by the State highway department in construction of State roads. In some States a division of the funds is made, a portion going to the State highway department and a portion to the county and local roads. In some States the money is divided half and half, but in most cases the greater amount goes to State roads; in one State the local roads get a greater portion than the State roads. Distribution of gasolene funds is according to State law. In a few States a portion of the gasolene taxation is applied to the State and county bond payments and the balance divided between the State and county roads or applied only to State construction. In some States, the gasolene tax revenue is used largely for maintenance on the theory that motor vehicles should be directly assessed with this cost. In most of the States all revenues from motor vehicle fees and gasolene taxation are applied to State and county and local road construction, after certain sums for collection fees and for miscellaneous purposes have been deducted.

With the increase in fees from motor vehicles and gasolene, appropriations are decreasing. Revenues from motor vehicle fees pay about 28% of the annual State road bill; revenues from gasolene taxation pay about 17% of the annual bill. These two sources contribute about 35% toward payment of the annual State bill.

There are no marked increases in bond revenues to the States. They remain approximately constant, and contribute about 12% to the States' available funds.

Since the passage of the Federal-aid road act, in 1916, a total of $990,000,000 has been authorized, including the sum for the fiscal year 1931. From 1925 to 1931, the annual appropriation authorized has been $75,000,000. Federal-aid appropriations contribute slightly less than 10% to the total annual available funds to the States.

Revenues for county and local road construction are still largely raised from property taxes.

MODERN ROAD PRACTICE

Types of Road.—Prior to 1904, the major types of surfacing were gravel and macadam, which gave entire satisfaction under the normal traffic of relatively light horse-drawn, steel-tired vehicles, with a bicycle traffic near the cities. The outpouring of motor vehicles from the cities which began about 1904 caused the macadam roads to "ravel," and maintenance under such traffic was impossible. Tars and asphalts were substituted for the weaker binders; first, as dust layers, as protective surface coatings, and then as binders introduced into roads of the macadam type by penetration, and finally as hot admixtures according to the bituminous concrete principle. These types were entirely satisfactory for automobile traffic.

From 1904 to 1914 is the period of bituminous construction. In 1904, there were in the entire country only 18 m. of bituminous rural roads, all in the two States of Massachusetts and Ohio. By 1914, there were 10,500 m., a mileage which was nearly three-quarters of the aggregate length of all roads of higher type than

macadam. The decline in the surface-treated and penetration types of macadam began when motor trucks in considerable numbers began to appear on the rural highways. They brought a demand for rigid pavements of concrete and brick and bituminous concrete on a concrete base.

Although the first concrete road had been built in 1893, in Bellefontaine, O., there were no more than five m. of that type on rural highways in the entire country in 1909. The first big increase occurred in 1912 when more than 250 m. of rural highways were paved, to be followed in 1913 with 500 m., and in 1914 with more than 1,500 miles. At the close of 1914, there were in the entire country 2,348 miles of concrete roads. Ten years later the mileage had increased to 31,186 and construction was proceeding at the rate of more than 6,000 miles a year, a rate approached by no other type better than gravel.

The increase of motor trucks on the highways also caused a more extensive use of brick, and the bituminous pavements of the mixed type on concrete bases. In 1914 there were approximately 1,600 m. of brick pavement; in 1924 there were 4,319 m. In 1914, the bituminous concrete or sheet asphalt mileage on rural highways was negligible; in 1924 there were more than 9,700 m. of these types.

Current Policies and Practices in Road Construction.—In recent years the realization has been growing that the cost of highway transportation is made up of the cost of the highways and the cost of operating the vehicles over the highways. It is agreed that the common purpose of the public highway officials, vehicle manufacturers and operators should be to reduce the total cost of transportation rather than one or the other of the elemental costs. It has been proved that the number of large-capacity trucks already using some of the highways, principally those radiating from and connecting the larger cities, has already grown to the point where the combined savings in operating costs would more than balance the greater cost of providing highway service for them. To build a type of surface adequate for the heavy truck traffic on such roads has been found to be a real economy.

Working on the theory that all roads should be improved to the degree justified by the operating savings that may be expected to accrue to traffic, and that no road should be improved to any greater degree, the stage-construction plan has been generally adopted. The plan takes into account the rapid growth of traffic, which is a characteristic especially of the main roads, by providing fully in the initial stage of improvement for the subsequent requirements. Grades and alignment are designed to meet ultimate requirements; drainage structures are built of durable materials; rights of way of ample width for the future are obtained; and the initial surfacing becomes the sub-base of the second-stage surfacing.

Eighteen ft. predominates as the width of pavement on highways, although pavements 20 ft. wide and wider are not uncommon. This is an increase of 4 ft. over the 14 to 16 ft. width of some ten years ago. There is a tendency to build highways from large commercial centres in multiples of 20 ft., and thus make them four or six way roads.

Nearly all States now require that hard-surfaced pavements shall meet a surface trueness test, and this has resulted in greater care in finishing and has permitted a reduction in crown until the pavement now appears to be almost flat. The crown on cement concrete, brick, sheet asphalt or any of the bituminous concrete pavements on rigid foundations is rarely more than $\frac{1}{4}$ in. per foot. The trend of practice is toward a $\frac{1}{10}$ in. per foot crown. On sand-clay, gravel and waterbound macadam roads the prevailing crown is $\frac{1}{2}$ in. per foot and on bituminous macadam roads $\frac{3}{8}$ in. per foot is quite general.

The trend toward easy horizontal curves and longer vertical curves is apparent. The length of vertical curves has increased with the volume and speed of traffic, which have made greater sight distances necessary.

There is a continual upward trend of standards of alignment. The alignment is becoming straighter. Relocation of crooked roads and the use of long, easy curves are becoming common. Super-elevation and widening curves are now universally practised, but there is no agreement in formula or method in the various States.

There is a decided trend toward wider shoulders on rural highways. At least 80% of the current plans provide for shoulders more than 4 ft. in width. Most of them provide for 5 ft. and a few require 6 ft. or more. Grade crossings are being eliminated by means of relocation or by overpass or underpass.

CO-OPERATION OF INTERESTS

The United States Highway System.—Through the co-operation of all States and the Federal Government, effected initially through the agency of the Joint Board on Interstate Highways, and continued by the American Association of State Highway Officials, a system of main transcontinental highways, known as the U.S. highway system, has been designated in recent years. This system, which is a portion of the Federal-aid system, includes approximately 96,000 m., composing 17 through routes, many of which extend from one border of the country to the other. The various routes are designated by the distinctive numbers which are displayed upon them, on standard, shield-shaped markers. Arrangements have also been made for the erection of standard danger and direction signs on these roads in all States. The standard signs adopted are of two general classes. One group, the danger and caution signs, are of four different shapes representing as many degrees of danger. These have a yellow background with black letters and symbols. The other group includes the standard route marker in the form of a U.S. shield and directional and informational signs, with white backgrounds and black letters.

The standard railroad crossing sign is round, 24 in. in diameter, with the letters R R in black in the upper quadrants on the yellow background. At danger points, the stop sign is octagonal, 24 in. in size, and has the word STOP in large black letters on a yellow background. At curves, narrow bridges, steep hills and other dangerous points, a diamond-shaped yellow sign, 24 in. on each side, is erected with the character of the danger described in black letters and symbols. At points of lesser or occasional danger, the 24 in. square yellow sign is used, with the caution explained in black letters in a single word, such as SCHOOL, HOSPITAL, CHURCH, etc.

The standard United States shield adopted as the route marker is 16 in. vertically. At the top on the white background is the name of the State in black letters, and below in the section of the shield in which the red and white stripes ordinarily appear are the initials U.S. and the route number in large numerals. At the approach to forks or junctions of the interstate routes with other roads, a smaller shield, 9 in. vertically, with the single letter R or L is erected below the numbered shield to indicate the direction the United States highway branches. Distances along the main routes to cities and towns are indicated on rectangular white signs with the names of the points and the distances to them, and an arrow pointing the proper direction in black. Distances to points not on the interstate roads are posted at the intersecting routes. The rectangular signs bear the names of the cities with their distances in black on the white background. No arrows are used on these signs. The side of the road on which they are posted indicates the direction. At creeks, rivers, lakes, etc., crossed or passed by interstate roads, rectangular white and black signs are erected. The change of speed limit is indicated by a standard black and white sign prescribing the limit.

Highway Research.—As a result of the co-operation of the Bureau of Public Roads with State highway departments and universities, in scientific research looking to the development of types of construction and methods of administration and finance adequate to meet the demands of the fast-growing traffic, there is being built up a new science of highway engineering.

The investigations conducted include studies of the characteristics of materials; determination of the forces applied to road surfaces by standing and moving vehicles; of stresses developed in the structure of roads and bridges by live loads, and by temperature and other natural causes; analyses of subgrade soils

and tests of methods designed for their improvement; studies of the flow of water through drainage structures, of the run-off from drainage areas, of the effect of moisture on soils and many others of fundamental importance and value.

The tests made on the Bates road in Illinois, the Pittsburg (Calif.) experiments, the impact tests at Arlington, Va., and the intensive studies of highway traffic conducted by the Bureau of Public Roads in co-operation with the authorities of Connecticut, Maine, New Hampshire, Vermont, Pennsylvania, Ohio, California, Tennessee and Cook County, Ill., were made in the interest of scientific research, and have yielded data of considerable value to the highway engineer.

Hunt, *Taxation of Motor Vehicles and its relation to Highway Finance* (1925). (T. H. MACD.; H. S. F.)

ROADSTER. The term is commonly applied to a small open type automobile body seating two people on one seat, and equipped with a folding top and removable curtains. Usually there is provided behind the seat a compartment to carry baggage.

ROAD TRANSPORT: *see* MOTOR TRANSPORT.

ROANNE, a town of east-central France, capital of an arrondissement in the department of Loire, on the left bank of the Loire, 54 m. N.W. of Lyons on the P.L.M. railway to Moulins. Pop. (1926) 36,091. Roanne (*Rodomna,* or *Roidomna*) was an ancient city of the Segusiani and a station on the great Roman road from Lyons to the sea. In 1447 the lordship of Roannais became the property of the celebrated banker Jacques Coeur, from whom it passed to the family of Gouffier. In their favour the title was raised to the rank of marquisate and in 1566 to the rank of duchy; it became extinct in the early 18th century. A fine bridge of seven arches connects Roanne with the industrial suburb of Le Côteau on the right bank of the river. The town is the seat of a sub-prefect, of a tribunal of commerce, of a chamber of commerce and a board of trade-arbitrators. It is the terminus of the Roanne-Digoin Canal and starting-point of Loire navigation.

ROANOKE, a river of the south Atlantic slope, U.S. With the Staunton, which rises in the Appalachian valley in south-western Virginia, it constitutes one river, and, flowing in a general south-easterly direction, crosses the boundary between Virginia and North Carolina just above the Fall line and discharges into Albemarle sound. It is nearly 400m. long, with a drainage area of 9,237 sq. miles. In 1820 the Weldon canal, 12m. long, was opened to afford a passage around the falls, but was abandoned in 1850.

ROANOKE, a city of south-western Virginia, U.S.A., on the Roanoke river, 175 m. W.S.W. of Richmond; in Roanoke county, but administratively independent. It is on Federal highways 11 and 311, and is served by the Norfolk and Western and the Virginian railways. Pop. 50,842 in 1920, 80% native white and 18% negroes; estimated locally at 71,500 in 1928, with an additional 10,000 in the immediate suburbs. The city occupies 10 sq.m. in a beautiful amphitheatre formed by the Blue Ridge and the Allegheny mountains, 940 ft. above sea-level. Most of it is of recent construction. There are commodious hotels and business buildings, a city auditorium seating 5,000, a municipal market, 17 public schools, 66 churches, a handsome municipal building, 6 parks and 7 playgrounds. The assessed valuation for 1927 was $55,017,241. The city has a commission-manager form of government. Six miles west is Salem, the county seat, and Roanoke college for men (1853); and 6 m. north is Hollins college for women (1842). Roanoke is an intersection point for railroads and highways, as formerly for Indian trails. It is headquarters of the Norfolk and Western railway. A village called Big Lick (from the salt marshes to which the cattle and wild game came) was founded here about 1852. In 1880 it had a population of 669. In 1882, when the Shenandoah Valley railroad (now part of the Norfolk and Western) made this its southern terminus and moved its general offices here, the name was changed to Roanoke; and in 1884, with a population of 5,000, was chartered as a city.

ROARING FORTIES, the belt between latitudes 40° and 50° south latitude characterized by boisterous westerly winds. In this belt the barometric gradients, both in summer and in winter, are steep, and the "planetary circulation" is but little interrupted by land; the "brave west winds" are very strong.

ROBBEN ISLAND, an island at the entrance of Table bay, 7 m. N.N.W. of Cape Town. It is some 4 m. long by 2 broad. At its southern end is a lighthouse with a fixed light visible for 20 m. It got its name (*robben,* Dutch for seal) from the seals which formerly frequented it, now only occasional visitants. The island when discovered was uninhabited. In 1614 ten criminals from London were landed on the island to form a settlement and supply fresh provisions to passing ships. The attempt, which ended in failure, is interesting as the first recorded settlement of English in South Africa. As early as 1657 criminals were banished to the island by the Dutch authorities at Cape Town; it has also served as the place of detention of several noted Kaffir chiefs. It is now noted for its leper asylum. The island has a lighthouse with an occulting (7 second) white light. It is visited by a boat from Cape Town four days a week.

See G. F. Gresley, "The Early History of Robben Island," in *The Cape Illustrated Magazine* (Oct. 1895).

ROBBER FLY, the name given to the large, powerful, predacious flies of the family Asilidae. (*See* DIPTERA.)

ROBBER SYNOD, the name given to an irregular ecclesiastical council held at Ephesus in A.D. 449. *See* EPHESUS, COUNCIL OF.

ROBBERY, a felony in English law, is the unlawful and forcible taking of goods or money from the person of another by violence or threatened violence. Robbery is larceny (*q.v.*) with violence. It is a specific offence under the Larceny Act, 1916, which provides by s. 23 that every person who (*a*) being armed with any offensive weapon or instrument, or being together with one other person or more, robs, or assaults with intent to rob, any person; (*b*) robs any person and, at the time of or immediately before or immediately after such robbery, uses any personal violence to any person; shall be guilty of felony and on conviction thereof liable to penal servitude for life, and, in addition, if a male, to be once privately whipped. Also every person who robs any person shall be guilty of felony and on conviction thereof liable to penal servitude for any term not exceeding 14 years, and every person who assaults any person with intent to rob shall be guilty of felony and on conviction thereof liable to penal servitude for any term not exceeding five years. To constitute the offence there must be violence or the placing of the prosecutor in bodily fear; the goods or money must be taken from the person or in the presence of the prosecutor; and in fact a larceny (*q.v.*) must be proved under the before mentioned circumstances. The elements of the offence are essentially the same under American law.

ROBERT I. (*c.* 865–923), king of France, or king of the Franks, was the younger son of Robert the Strong, count of Anjou, and the brother of Odo, or Eudes, who became king of the western Franks in 888. He did not claim the crown of France when his brother died in 898; but recognizing the supremacy of the Carolingian king, Charles III., the Simple, he continued to defend northern France from the attacks of the Normans as "duke of the Franks." About 921 Robert, supported by many of the clergy and by some of the most powerful of the Frankish nobles, took up arms, drove Charles into Lorraine, and was himself crowned king of the Franks at Reims on June 29, 922. Collecting an army, Charles marched against the usurper, and on June 15, 923, in a stubborn and sanguinary battle near Soissons, Robert was killed, according to one tradition in single combat with his rival.

Robert left a son, Hugh the Great, duke of the Franks, and his grandson was Hugh Capet, king of France.

See F. Lot, *Les Derniers Carolingiens* (1891); and E. Lavisse, *Histoire de France*, tome ii. (1903).

ROBERT II. (*c.* 970–1031), king of France, was a son of Hugh Capet, and was born at Orleans. He was educated at Reims under Gerbert, afterwards Pope Silvester II. As the ideal of mediaeval Christianity he won his surname of "Pious" by his humility and charity, but he also possessed some of the qualities of a soldier and a statesman. His father associated him with himself in the government of France, and he was crowned in December 987, becoming sole king on Hugh's death in October 996. In 988 he had married Rosala, or Susanna, widow of Arnold II., count of Flanders. He repudiated her in 989, fixing his affections upon Bertha, daughter of Conrad the Peaceful, king of Burgundy, or Arles, and wife of Eudes I., count of Blois; and although the pair were related, and the king had been godfather to one of Bertha's children, they were married in 996, a year after the death of Eudes. Pope Gregory V. excommunicated the king, and a council at Rome imposed a seven years' penance upon him. For five years the king braved all anathemas, but about 1002 he gave up Bertha and married Constance, daughter of a certain Count William. Still attached to Bertha, Robert took this lady with him to Rome in 1010, but the pope refused to recognize their marriage, and the king was forced to return to Constance. By this wife Robert had four sons, and in 1017, the eldest of these, Hugh, (1007–1025), was crowned as his father's colleague and successor. After Hugh's death Robert's concluding days were troubled by a rising on the part of his younger sons, and after a short war, in which he was worsted, the king died at Melun on July 20, 1031.

His life was written by his chaplain, Helgaud, and this panegyric, *Epitoma vitae Roberti regis*, is published by J. P. Migne in the *Patrologia Latina*, tome cxli. (Paris, 1844). *See* also C. Pfister, *Études sur le règne de Robert le Pieux* (1885); and E. Lavisse, *Histoire de France*, tome ii. (1901).

ROBERT (1275–1343), king of Naples, was the son of Charles II., duke of Anjou and king of Naples. On the death of Charles in 1309 Robert succeeded to the throne, although his nephew Caroberto (Carlo Roberto), son of his elder brother Charles Martel, who had died before his father, had a prior claim. He was crowned by Pope Clement V. at Avignon, and on the descent into Italy of the emperor Henry VII. was appointed papal vicar in Romagna to resist the imperialists; thenceforth he became the recognized leader of the Guelphs or papal faction in Italy and took part in all the wars against the Ghibellines. On various occasions he obtained for himself or his sons the suzerainty over Rome, Florence and other cities, and was regarded as the most powerful Italian prince of his day. Pope John XXII. created him papal vicar in Italy against the emperor Louis the Bavarian. In 1320 Robert summoned his kinsman Philip V. of France to Italy, and he waged war against Sicily once more from 1325 to 1341, but failed to drive out the Aragonese. He died in 1343, just as he was about to lead another expedition to the island. Robert was a man of learning, devoted to literature, and a generous patron of literary men; he befriended Petrarch. Dante described Robert as a *re da sermone* (word king).

See G. Villani, *Cronache;* M. Murena, *Vita di Roberto d'Angiò, re di Napoli* (Naples, 1770); and *Archivio storico Siciliano* (1884, viii. 511 *seq.*)

ROBERT I., "THE BRUCE" (1274–1329), king of Scotland, the son of Robert de Bruce VII., earl of Carrick by right of his wife Marjorie, was a direct descendant of a Norman baron who accompanied William I. to England. He was probably born at Turnberry, Ayrshire, on July 11, 1274, and is said to have spent his youth at the court of Edward I., where he must have watched the progress of the suit for the crown of Scotland. After the death of Margaret, the "maid of Norway," Bruce's grandfather claimed the crown by right of his descent from David I.; but John de Balliol, grandson of Margaret, being preferred by the commissioners of Edward I., he resigned his estates to Bruce's father, who assumed the title of Lord of Annandale (1295). In 1292, Bruce became earl of Carrick, by which title he is often known. Some four years later Bruce and his father swore fealty to Edward I., but when Sir William Wallace raised his standard, Bruce followed the popular leader and harried the forces of John de Warenne, Edward's general. In July, 1297, however, he was forced to sign the capitulation of Irvine, whereby the Scottish lords were pardoned in return for their allegiance.

Bruce thus took no part in the momentary triumph and final defeat of Wallace, who continued the struggle almost unaided. Soon after Bruce again appears to have sided with his countrymen, but he was not yet regarded as an open enemy of the English, for his estates were left intact, and in 1299 he was appointed co-regent of Scotland, together with William Lamberton, bishop of St. Andrews, and John Comyn the younger. For the next four years he remained passive, and in 1304 even supported Edward I. in the capture of Stirling, but secretly he entered into a bond with Lamberton which bound him to the patriotic cause.

The second period of his life, which was occupied by the contest for the kingdom, now began. After the execution of Wallace in 1305, Edward sought to conciliate the Scottish nobles by granting a liberal constitution to Scotland. Bruce is reputed to have been one of the advisers, but his fidelity was already suspected and in 1306 he returned to Scotland secretly. In the same year he murdered his old enemy Comyn, and was thenceforward definitely committed to the Scottish cause. Collecting his adherents, Bruce marched to Scone where he was crowned on March 27, 1306, and a few days later was placed on the throne according to an ancient Celtic ceremony, by the Macduffs, earls of Fife. He then set out to win his kingdom, but after being defeated at Methven and at Dalry in Strathfillan, he fled almost alone to the island of Rathlin. Proclaimed an outlaw, excommunicated by the pope, his wife and daughter in the hands of the English, and his brother executed, Bruce's cause seemed hopeless, but on July 7, 1307, Edward I. died, and Bruce was opposed only by his incompetent son Edward II. In the winter of 1307 and in 1308, hurrying to Aberdeenshire, he harried the lands of the earl of Buchan, whom he defeated near Inverurie on May 22, 1308, while his brother Edward reduced Galloway. He then crossed to Argyllshire, took the pass of Brander (1309), captured Dunstaffnage, and in March held his first parliament at St. Andrews.

A truce having been effected by Pope Clement V. in 1309, Bruce was recognized as king by the clergy of Scotland in Feb. 1310, in spite of his excommunication; and with this backing he set out to reduce the strongholds still held by the English. Linlithgow fell towards the end of 1310, Dumbarton in Oct. 1311, Perth in Jan. 1312, two raids into the north of England were also successful in March 1313, Roxburgh and Edinburgh were captured and in May the Isle of Man was subdued. By the end of 1313, Stirling, Bothwell and Berwick alone remained English and these Edward II. made a determined effort to save. He reached Falkirk on June 22, 1314, and two days later the battle of Bannockburn was fought, in which the defeat of the English determined the independence of Scotland and confirmed the title of Bruce. On April 26, 1315, at the parliament of Ayr, the succession was unanimously settled on Bruce and his heirs.

The last part of Bruce's life, from 1315 to 1329, began with the rising of the whole Celtic race against the English. Robert Bruce declined the offer of the Irish crown, but in 1315, Edward Bruce crossed to Ireland at the invitation of the natives, and in 1317 he was joined by Robert, who defeated the English at Slane in Louth. But although they enjoyed a temporary success, Edward was finally killed at Dundalk in Oct. 1318, having previously been proclaimed king of Ireland. In 1317, Robert Bruce had been obliged to return to protect his own borders, and in 1318 he laid siege to Berwick. Refusing all offers of mediation on the part of the pope, unless his title were recognized, Bruce continued his struggle and after the capitulation of Berwick, laid waste to the English border. In Dec. 1318, he held a parliament at Scone, where the succession was settled, and legislation for the defence and administration of the kingdom was initiated.

The king's position was now so strong that foreign countries began to recognize him, and in 1323 his title was confirmed by the pope. Hostilities against England continued, however, and

on May 30, 1323, Edward was forced to make a truce of 13 years. On the accession of Edward III., 1327, the treaty of York was signed, whereby "Scotland according to its ancient bounds in the days of Alexander III., should remain to Robert, king of Scots, and his heirs free and divided from England, without any subjection, servitude, claim or demand whatsoever." This was ratified by the marriage of Edward's sister, Joanna, to David, Bruce's infant son (July 12, 1328).

The chief author of Scottish independence barely survived his work. In 1327 he conducted an expedition into Ireland, but on his return, he spent his remaining years at Cardross, on the Clyde, where he died from leprosy on June 7, 1329. His body was buried at Dunfermline, his heart at Melrose.

BIBLIOGRAPHY.—The chief contemporary authorities for the life of Bruce are coloured to some extent by the nationality of the writers. On the Scottish side, *The Brus*, a poem by John Barbour, ed. by W. W. Skeat (Edinburgh, 1894), and the *Chronica gentis Scotorum* of John of Fordun, ed. by W. F. Skene (Edinburgh, 1871–72), are perhaps the most valuable. The *Chronicon de Lanercost*, ed. by J. Stevenson (Edinburgh, 1839), is also very important. The English chronicles which may be consulted with advantage are those of Walter of Hemingford, ed. by H. C. Hamilton (1848–49) and of Peter Langtoft, ed. by T. Wright (1866–68), and the *Scalacronica* of Thomas Gray, ed. by J. Stevenson (Edinburgh, 1836). For the documents of the time reference should be made to the *Calendar of Documents relating to Scotland*, ed. by J. Bain (Edinburgh, 1881–88), *Documents and Records Illustrating the History of Scotland*, vol. i., ed. by F. Palgrave (1837); the *Rotuli Scotiae* (1814–19), and the *Foedera* of T. Rymer, vol. i. (1704). *See* also Sir H. Maxwell, *Robert the Bruce* (1897).

ROBERT II. (1316–1390), called "the Steward," king of Scotland, a son of Walter, the steward of Scotland (d. 1326), and Marjorie (d. 1316), daughter of King Robert the Bruce, was born on March 2, 1316. In 1318 the Scottish parliament decreed that if King Robert died without sons the crown should pass to his grandson; but the birth of a son, afterwards King David II., to Bruce in 1324 postponed the accession of Robert for nearly 42 years. Soon after the infant David became king in 1329, the Steward began to take a prominent part in the affairs of Scotland. He was one of the leaders of the Scottish army at the battle of Halidon Hill in July 1333; and together with John Randolph, 3rd earl of Moray (d. 1346), was chosen co-regent of Scotland, while David sought safety in France. The colleagues soon quarrelled; Randolph fell into the hands of the English, and Robert became sole regent until the return of David in 1341. The Steward escaped from the battle of Neville's Cross in 1346, and was again regent while the king was a captive in England.

Soon after this event some friction arose between Robert and his royal uncle. Accused, probably without truth, of desertion at Neville's Cross, the Steward as heir-apparent was chagrined by David's recognition of Edward III. as his successor.

In 1363 he rose in rebellion, and after having made his submission was seized and imprisoned together with his three sons, being only released a short time before David's death in February 1371. By the terms of the decree of 1318 Robert now succeeded to the throne, and was crowned at Scone in March 1371. His reign was unimportant; for relations with England and France *see* SCOTLAND: *History*. The king died at Dundonald on May 13, 1390, and was buried at Scone.

See Andrew of Wyntoun, *The Orygynale Cronykil of Scotland*, edited by D. Laing (Edinburgh, 1872–79); John of Fordun, *Scotichronicon*, continued by Walter Bower, ed. T. Hearne (Oxford, 1722); John Major, *Historia maioris Britanniae* translated by A. Constable (Edinburgh, 1892); and P. F. Tytler, *History of Scotland* (Edinburgh, 1841–43).

ROBERT III. (*c.* 1340–1406), king of Scotland, was the eldest son of King Robert II. by his mistress, Elizabeth Mure, and was legitimatized when his parents were married about 1349. In 1368 he was created earl of Carrick, and he took some part in the government of the kingdom until about 1387, when he was disabled by the kick of a horse. It was probably in consequence of this accident that his brother Robert, earl of Fife, and not the crown prince himself, was made guardian of the kingdom in 1389; but the latter succeeded to the throne on his father's death in May 1390. At this time he changed his baptismal name of John, which was unpopular owing to its connection with John de Baliol, for that of Robert, being crowned at Scone in August 1390 as King Robert III. The new king was only the nominal ruler of Scotland, the real power being in the hands of his brother, the earl of Fife. In 1399, his elder son, David, duke of Rothesay, was appointed lieutenant of the kingdom; but this event was followed by an English invasion of Scotland, by serious differences between Rothesay and his uncle, Robert, now duke of Albany, and finally in March 1402 by Rothesay's mysterious death at Falkland. Early in 1406 the king's only surviving son, afterwards King James I., was captured by the English; and on April 4, 1406, Robert died, probably at Rothesay, and was buried at Paisley.

ROBERT, the name of two dukes of Normandy.

ROBERT I. (d. 1035), called Robert the Devil, was the younger son of Richard II., duke of Normandy (d. 1026), and father of William the Conqueror. In 1028 he succeeded his brother, Richard III., whom he was accused of poisoning, as duke of Normandy. Robert sheltered the exiled English princes, Edward, afterwards King Edward the Confessor, and his brother Alfred, and fitted out a fleet for the purpose of restoring them to their inheritance, but this was scattered by a storm. When returning from a pilgrimage to Jerusalem, he died at Nicaea on July 22, 1035. Robert is the subject of several poems and romances. (*See* ROBERT THE DEVIL below.)

ROBERT II. (*c.* 1054–1134), called Robert Curthose, was the eldest son of William the Conquerer. Although recognized in boyhood as his father's successor in Normandy, he twice revolted against his father. (*See* WILLIAM I.) When the Conqueror died in September 1087 Robert became duke of Normandy, but not king of England; although he received offers of help, he took no serious steps to displace his younger brother, King William II. In Normandy his rule was weak and irresolute. He lost the county of Maine, which for some years had been united with Normandy, and he was soon at variance with his brothers, the younger of whom, Henry, he seized and put into prison. In 1089 his duchy was invaded by William II., who soon made peace with Robert, the two agreeing to dispossess their brother Henry of his lands in Normandy. This peace lasted until 1094, when occasions of difference again arose and another struggle began, Robert being aided by King Philip I. of France.

This warfare ended in 1096, when Robert set out on the first crusade, having raised money for this purpose by pledging his duchy to William for 10,000 marks. He returned to Normandy in September 1100.

William Rufus died while Robert was on his homeward way, and in Italy the Norman duke was greeted as king of England; but when he reached Normandy he learned that the English throne was already in the possession of Henry I. In July 1101 he crossed over to England, intending to contest his brother's title, but Henry met him near Alton, in Hampshire, and an amicable arrangement was made between them. But there was no lasting peace. In 1106 the English king crossed over to Normandy, and at the battle of Tinchebrai (Sept. 28, 1106), Henry took his brother prisoner and carried him to England. For twenty-eight years Robert was a captive, first in the Tower of London, and later in the castles of Devizes and Cardiff. He died probably at Cardiff on Feb. 10, 1134.

The chief sources for the life of Robert II. are Ordericus Vitalis, William of Malmesbury and other chroniclers of the time. *See* E. A. Freeman, *History of the Norman Conquest* (1870–76), and *The Reign of Rufus* (1882).

ROBERT, HUBERT (1753–1808), French artist, born at Paris on May 22, 1753, deserves to be remembered not so much for his skill as a painter as for the liveliness and point with which he treated his subjects. His work has a scenic character, and it was this quality which led Voltaire to entrust him with the decorations of his theatre at Ferney. Robert died of apoplexy on April 15, 1808.

See C. Blanc, *Hist. des peintres;* Villot, *Notice des tableaux du Louvre;* Julius Meyer, *Gesch. mod. fr. Malerei.*

ROBERT GUISCARD [*i.e.*, "the resourceful] (*c.* 1015–1085), the most remarkable of the Norman adventurers who conquered southern Italy. From 1016 to 1030 the Normans served either Greeks or Lombards as mercenaries, and then Sergius of

Naples, by installing the leader Rainulf in the fortress of Aversa in 1030, gave them their first pied-à-terre and they began an organized conquest of the land. In 1030 William and Drogo, the two eldest sons of Tancred of Hauteville, a petty noble of Coutances in Normandy, joined in the attempt to wrest Apulia from the Greeks, who by 1040 had lost most of that province. In 1042 Melfi was chosen as the Norman capital, and in September of that year the Normans elected as their count William "Iron Arm," who was succeeded in turn by his brothers Drogo, "comes Normannorum totius Apuliae et Calabriae," and Humfrey, who arrived about 1044. In 1046 arrived Robert, the sixth son of Tancred of Hauteville.

Guiscard soon rose to distinction. The Lombards turned against their allies and Leo IX. determined to expel the Norman free-booters. The army which he led towards Apulia in 1053 was, however, overthrown at Civitate on the Fortore by the Normans united under Humfrey, Guiscard and Richard of Aversa. In 1057 Robert succeeded Humfrey as count of Apulia and, in company with Roger his youngest brother, carried on the conquest of Apulia and Calabria, while Richard conquered the principality of Capua. The Papacy, foreseeing the breach with the emperor over investitures, now resolved to recognize the Normans and secure them as allies. Therefore at Melfi, on Aug. 23, 1059, Nicholas II. invested Robert with Apulia, Calabria, and Sicily, and Richard with Capua. Guiscard "by Grace of God and St. Peter duke of Apulia and Calabria and future lord of Sicily" agreed to hold by annual rent of the Holy See and to maintain its cause.

In the next twenty years Guiscard made an amazing series of conquests. Invading Sicily with Roger, the brothers captured Messina (1061) and Palermo (1072). Bari was reduced (April 1071) and the Greeks finally ousted from southern Italy. The territory of Salerno was already Robert's; in December 1076 he took the city, expelling its Lombard prince Gisulf, whose sister Sikelgaita he had married. The Norman attacks on Benevento, a papal fief, alarmed Gregory VII., but pressed by the emperor, Henry IV., he turned again to the Normans, and at Ceprano (June 1080) reinvested Robert, securing him also in the southern Abruzzi, but reserving Salerno. Guiscard's last enterprise was his attack on the Greek Empire, a rallying ground for his rebel vassals. He contemplated seizing the throne of the Basileus and took up the cause of Michael VII., who had been deposed in 1078 and to whose son his daughter had been betrothed. He sailed against the empire in May 1081, and by February 1082 had occupied Corfu and Durazzo. He was, however, recalled to the aid of Gregory VII., besieged in San Angelo by Henry IV. (June 1083). Marching north he entered Rome and forced Henry to retire, but an émeute of the citizens led to a three days' sack of the city (May 1084), after which Guiscard escorted the pope to Rome. His son Bohemund, for a time master of Thessaly, had now lost the Greek conquests. Robert, returning to restore them, occupied Corfu and Kephalonia, but died of fever in the latter on July 15, 1085.

Guiscard was succeeded by Roger "Borsa," his son by Sikelgaita; Bohemund, his son by an earlier Norman wife Alberada, being set aside. At his death Robert was duke of Apulia and Calabria, prince of Salerno and suzerain of Sicily. His successes had been due not only to his great qualities but to the "entente" with the Papal See. He created and enforced a strong ducal power which, however, was met by many baronial revolts, one being in 1078, when he demanded from the Apulian vassals an "aid" on the betrothal of his daughter. In conquering such wide territories he had little time to organize them internally. In the history of the Norman kingdom of Italy Guiscard remains essentially the hero and founder, as his nephew Roger II. is the statesman and organizer.

The best modern authorities are F. Chalandon, *Histoire de la domination normande en Italie et en Sicile* (Paris, 1907), and L. von Heinemann, *Geschichte der Normannen in Unteritalien* (Leipzig, 1894). Contemporary authors: Amatus, *Ystoire de li Normant*, ed. Delarc (Rouen, 1892); Geoffrey Malaterra and William of Apulia, both in Muratori Rer. Ital. SS., vol. v., and Anna Comnena in *Corpus script. hist. Byz.* (Bonn, 1839). (E. Cu.)

ROBERT OF AUXERRE (*c.* 1156–1212), French chronicler, was an inmate of the monastery of St. Marien at Auxerre. At the request of Milo de Trainel (1155–1202), abbot of this house, he wrote a *Chronicon*, or universal history, which covers the period between the creation of the world and 1211. Robert is an original authority for the period from 1181 to 1211. Two continuators took the work down to 1228 and it was extensively used by later chroniclers. The original manuscript is now at Auxerre.

See A. Molinier, *Les Sources de l'histoire de France*, tomes iii. and iv. (1903–04).

ROBERT OF COURTENAY (d. 1228), emperor of Rumania, or Constantinople, was a younger son of the emperor Peter of Courtenay, and was descended from the French king, Louis VI., while his mother, Yolande, was a sister of Baldwin and Henry of Flanders, the first and second emperors of Constantinople. When it became known in France that Peter of Courtenay was dead, his eldest son, Philip, renounced the succession in favour of his brother Robert, who set out to take possession of his distracted inheritance. Crowned emperor on March 25, 1221, Robert appealed for help to the pope and to the king of France; but meanwhile his lands were falling into the hands of the Greeks. Some little aid was sent from western Europe, but soon Robert was compelled to make peace with his chief foe, John Ducas Vatatzes, emperor of Nicaea, who was confirmed in all his conquests. Robert repudiated his affianced bride Eudoxia, daughter of Theodore Lascaris I., and married a French lady, already the fiancée of a Burgundian, by whom Robert was driven from Constantinople, and early in 1228 he died in Achaia.

See Gibbon, *Decline and Fall of the Roman Empire*, ed. Bury (1912), vol. 6, p. 449.

ROBERT OF GLOUCESTER, English chronicler, is known only through his connection with the work which bears his name. This is a vernacular history of England, from the days of the legendary Brut to the year 1270, and is written in rhymed couplets. The lines are of 14 syllables, with a break after the eighth syllable. He probably wrote about the year 1300. The earlier part of his chronicle (up to 1135) may be from another hand, since it occurs in some manuscripts in a shorter form, and with an exceedingly brief continuation by an anonymous versifier. The authorities employed for the earlier part were Geoffrey of Monmouth, Henry of Huntingdon, William of Malmesbury, the English chronicles, and some minor sources; Robert, in making his recension of it, also used the *Brut* of Layamon. From 1135 to 1256 Robert is still a compiler, although references to oral tradition become more frequent as he approaches his own time. From 1256 to 1270 he has the value of a contemporary authority. But he is more important to the philologist than to the historian. His chronicle is one of the last works written in Old English.

Robert's chronicle was first edited by T. Hearne (2 vols., Oxford, 1724); but this text is now superseded by that of W. Aldis Wright (2 vols., Rolls Series, 1887). Minor works attributed to the author are: a *Life of St. Alban* in verse (ms. Ashmole 43); a *Life of St. Patrick*, also in verse (ms. Tanner 17); a *Life of St. Bridget* (ms. C.C.C. Cambridge, 145); and a *Life of St. Alphege* (ms. Cott., Julius D. ix.). A *Martyrdom of St. Thomas Becket* and a *Life of St. Brendan*, both attributed to Robert, were printed by the Percy Society in 1845.

See T. D. Hardy's *Descriptive Catalogue of mss.* i. 25, 68, iii. 181–9, 623; K. Brossman, *Über die Quellen der Chronik des R. von Gloucester* (Striegau, 1887); W. Ellmer in *Anglia* (1888), x. 1–37, 291–322; H. Strohmeyer, *Der Stil der Reimchronik R. von Gloucester* (1891).

ROBERT OF JUMIÈGES (d. *c.* 1070), archbishop of Canterbury, was a Norman who became prior of St. Ouen at Rouen and then abbot of Jumièges. A close friend of the future king of England, Edward the Confessor, he crossed over to England with Edward in 1042, and in 1044 became bishop of London. Robert was the most trusted and the most prominent of the king's foreign friends, and was the leader of the party hostile to the influence of Earl Godwine. In 1051, although the chapter had already made an election, Edward appointed him archbishop of Canterbury. He seems to have been sent by the king on an errand to Duke William of Normandy, and on the return of Godwine

from exile in 1052 he fled in great haste from England. He was outlawed and deposed, and he died at Jumièges about 1070.

See *Two Saxon Chronicles*, edited by J. Earle and C. Plummer (Oxford, 1892); and E. A. Freeman, *History of the Norman Conquest* (Oxford, 1870–76).

ROBERT OF TORIGNI (*c.* 1110–1186), mediaeval chronicler, was prior of Bec in 1149, and in 1154 became abbot of Mont St. Michel, whence he is also sometimes called Robertus de Monte. He died, according to Potthast, on May 29, 1186. He wrote additions and appendices to the chronicle of Sigebert of Gembloux, covering the period A.D. 385–1100, and a chronicle in continuation of Sigebert, extending from 1100 to 1186, of great value for Anglo-Norman history. It is for continental affairs between 1154 and 1170 that his information is valuable.

The best modern editions are the *Chronique de Robert de Torigni*, etc., edited by Léopold Delisle for the *Soc. de l'histoire de Normandie* (Rouen, 1872–1873), and *Chronicle of Robert of Torigni*, edited with an introduction, by Richard Howlett (Rolls Series, No. 82, iv. 1889).

ROBERTS, FREDERICK SLEIGH ROBERTS, EARL (1832–1914), British soldier, second son of General Sir Abraham Roberts, G.C.B., was born at Cawnpore, India, on Sept. 30, 1832. Educated at Eton, Sandhurst and Addiscombe, he obtained a commission in the Bengal Artillery on Dec. 12, 1851. In the following year he was posted to a field battery at Peshawar, where he also acted as aide-de-camp to his father, who commanded the Peshawar division. In 1856 Roberts was appointed to the quartermaster-general's department of the staff, in which he remained for 22 years, passing from one grade to another until he became quartermaster-general in India. On the outbreak of the Mutiny in 1857, Roberts, at first, was staff officer to the movable column operating against the mutineers in the Punjab, but, towards the end of June, he joined the Delhi Field Force, and was deputy assistant quartermaster-general with the artillery during the operations against Delhi. He served under Sir Colin Campbell at the second relief of Lucknow in November, at the battle of Cawnpore on Dec. 6 and the subsequent pursuit and defeat of the Gwalior contingent near Shinrajpur.

Roberts distinguished himself at the engagement of Khudaganj, on Jan. 2, 1858, and he was recommended for the Victoria Cross for acts of gallantry there. He was present at the reoccupation of Fatehgarh on Jan. 6, the storm of Mianganj in February, the siege and capture of Lucknow in March, and the action at Kursi on the 22nd of that month, after which he went home on sick leave. For his services in the Mutiny he was seven times mentioned in despatches, received the medal with three clasps, the Victoria Cross, and on his promotion to captain, in Oct. 1860, a brevet majority. On May 17, 1859 he married, at Waterford, Miss Nora Bews, and on his return to India was entrusted with the organization of the viceroy's camps during the progresses through Oudh, the North-West Provinces, the Punjab and Central India in 1860 and 1861. In Dec. 1863 he took part, under Major-General Garvock, in the Umbeyla campaign among the mountains to the north of Peshawar, and was present at the storm of Lalu, the capture of Umbeyla and the destruction of Mulka.

In 1867 Roberts was appointed assistant quartermaster-general to Sir Donald Stewart's Bengal Brigade for Abyssinia. He showed judgment in embarking each unit complete in every detail, instead of despatching camp equipage in one ship, transport in another, and so on, as was customary. He arrived at Zula, Annesley Bay, in the Red Sea, the base of the expedition, on Feb. 3, 1868, and remained there as senior base staff officer during the four months' campaign. At its close he superintended the re-embarkation of the whole army. He returned to India the following year as first assistant quartermaster-general. In the autumn of 1871 he made the arrangements for the expedition into Lushai, between south-east Bengal and Burma, fitted out two columns under Brigadier-Generals Bourchier and Brownlow, and himself accompanied the first. A road, over 100 m. long, was cut through dense gloomy forests in stifling heat, and the column was attacked by cholera; but the object of the expedition was successfully accomplished, and Roberts, who was present at the capture of the Kholel villages and the action in the Northlang range, and commanded the troops at the burning of Taikum, was mentioned in despatches and made a Companion of the Bath. On his return in March 1872, he became deputy quartermaster-general in Bengal, and in 1875 quartermaster-general and colonel. He settled the details of the great camp of exercise at Delhi on the occasion of the visit of the prince of Wales in January 1876, and attended H.R.H. at the manoeuvres. He also superintended the arrangements for the great durbar at Delhi on Jan. 1, 1877, when Queen Victoria was proclaimed empress of India.

In 1878 Roberts was appointed to the command of the Frontier Field Force at Abbottabad, in Hazara; but in the autumn, on the repulse of the Chamberlain Mission by the Afghans, and the formation of three columns to advance into Afghanistan by the Khyber, the Bolan and the Kurram passes, he was given the command of the Kurram Field Force, with the rank of major-general. Concentrating his column at Thal, he advanced to Kurram towards the end of November, and having formed an advanced base there, moved on to Habib Kila. Under cover of preparations for a front attack on the Peiwar Kotal, he reconnoitred that formidable position, and on the night of Dec. 1, moved part of his force to attack the Spingawi Kotal, in order to turn the Afghan left flank, leaving the remainder of the force to feign a front attack on the Peiwar, and to guard the camp. After a very difficult night march the Spingawi Kotal was carried at daybreak on the 2nd, and, later, the Afghans on the Peiwar Kotal, threatened in rear, abandoned the position. The next morning Roberts occupied the Peiwar, and on the 6th advanced to Ali Khel. He reconnoitred the Shutargardan and the Sapari passes, and made a strong reconnaissance through Khost, in which some fighting took place, and at the end of January returned to Hagir Pir, in Kurram, where his force remained in occupation. In July Major Cavagnari, the British envoy to the new amir, Yakub Khan, passed through Kurram on his way to Kabul, and, shortly afterwards, Roberts left his Kurram command and went to Simla to take his seat on the army commission, where he strongly advocated the abolition of the three Presidency armies, and the substitution for them of four army corps, a measure which was carried out sixteen years later.

While Roberts was at Simla, news arrived on Sept. 5 of the murder of Cavagnari and his companions at Kabul. The Peshawar Valley Force had been broken up; Sir Donald Stewart was still at Kandahar, but most of his troops had started for India; Roberts, therefore, had the only force ready to strike rapidly at Kabul. It was hastily reinforced, and he hurried back to Kurram to take command, as a lieutenant-general, of the Kabul Field Force (7,500 men and 22 guns). By Sept. 19, a brigade was entrenched on the Shutargardan, and as Roberts advanced, the Amir Yakub Khan came into his camp. An Afghan force of 8,000 men blocked the way in a strong position on the heights beyond Charasia, and on Oct. 6, Roberts repeated the tactics that had done him such good service at the Peiwar in the previous year, and sending Brigadier-General T. D. Baker with the greater part of his force to turn the Afghan right flank, threatened the pass in front with the remainder. By the afternoon Baker had seized the position, and the enemy, severely defeated, were in full retreat. Kabul was occupied without further opposition.

The city was spared, but punishment was meted out to those convicted of complicity in the murder of the British Mission. Yakub Khan abdicated on Oct. 12, and was eventually deported to India. The troops occupied the Sherpur cantonments; but in November a religious war was proclaimed by the Mullahs, and early in December, in order to prevent a threatening combination of Afghan tribes against him, Roberts moved out two columns to attack them in detail. After considerable fighting near Kabul, the numbers of the enemy became so great that he was forced to concentrate his troops again at Sherpur, the defences of which had been greatly improved and strengthened. Sherpur was invested by the enemy, and early on Dec. 23, was attacked by over 100,000 Afghans. They were driven off with great loss; and on making a second attempt to storm the place, were met by Roberts, who moved out, attacked them in flank, and defeated them.

Roberts now recommended the political dismemberment of Afghanistan, and negotiations were carried on with the northern

tribes for the appointment of an amir for the Kabul district only. On May 5, Sir Donald Stewart arrived with his column from Kandahar and assumed the supreme command in Afghanistan, Roberts retaining, under Stewart, the command of the two Kabul divisions, and organizing an efficient transport corps under Colonel R. Low, which was soon to be of inestimable value. On July 22, Abdur Rahman was proclaimed Amir of Kabul; and Roberts was preparing to withdraw his troops to India by the Kurram route, when news arrived that a British brigade had been totally defeated at Maiwand on July 27, and that Lieutenant-General Primrose was besieged in Kandahar. Roberts was ordered to proceed thither at once with a specially selected column of 10,000 troops and his new transport corps. He started on his famous march on Aug. 9, and arrived at Kandahar on the morning of the 31st, having covered 313 miles in twenty-two days. On the following day he fought the battle of Kandahar and gained a complete victory. Roberts was now created K.C.B., G.C.B. and a baronet, and was given the command of the Madras army.

Before proceeding to Madras, Roberts went home on furlough, and when the news of the disaster at Majuba Hill in South Africa arrived in London at the end of February 1881, he was appointed governor of Natal and commander-in-chief in South Africa. He arrived at Cape Town to find that peace had been made with the Boers, and that instructions were awaiting him to return home. The same year he attended the autumn manoeuvres in Hanover as the guest of the German emperor. He declined the post of quartermaster-general to the forces in succession to Sir Garnet Wolseley, and returned to India, arriving at Madras in November. The following year he visited Burma with the viceroy, and in 1885 attended the meeting between Abdur Rahman and Lord Dufferin at Rawalpindi at the time of the Panjdeh incident, in connection with which he had been nominated to the command of an army corps in case of hostilities. In July he succeeded Sir Donald Stewart as commander-in-chief in India, and during his seven years' tenure of this high position instituted many measures for the benefit of the army, and greatly assisted the development of frontier communications and defence. At the end of 1886, at the request of the viceroy, he took personal command for a time of the forces in Burma, and organized measures for the suppression of dacoity. In 1892 he was created Baron Roberts of Kandahar and Waterford. In 1893 he left India for good, and the G.C.S.I. was bestowed upon him. He was promoted to be field-marshal in 1895, and in the autumn of that year succeeded Lord Wolseley in the Irish command and was sworn a privy councillor.

After the disastrous actions in the Boer war in South Africa in December 1899 at Magersfontein, Stormberg and Colenso, where his only son was killed, Lord Roberts was sent out as commander-in-chief. He arrived at Cape Town on Jan. 10, 1900, and after organizing his force, advanced with sound strategy on Bloemfontein, the capital of the Orange Free State, and soon changed the aspect of affairs. The sieges of Kimberley and Ladysmith were raised, and the Boer general, Cronje, flying towards the capital, was overtaken at Paardeberg and, after a fine defence, compelled to surrender, with 5,000 men, on the anniversary of Majuba Day, Feb. 27, 1900. Roberts entered Bloemfontein on March 13, and after six weeks' preparation, advanced on Pretoria, the capital of the Transvaal. Mafeking was relieved on May 17, and Pretoria occupied on June 5. The two Boer states were annexed, and the war gradually assuming a guerrilla character, Roberts handed over the command to Lord Kitchener and returned to England to fill the office of commander-in-chief of the army in succession to Lord Wolseley.

On his return in 1901 he received an earldom, the thanks of both Houses of Parliament and a grant of £100,000 for his services in South Africa. In 1905 he resigned his post on the Committee of National Defence, and devoted himself to attempting to rouse his countrymen to the necessity of cultivating rifle-shooting and of adopting systematic general military training and service.

As head of the National Service League, he took part in the movement in favour of compulsory military service for home defence and published in 1911, *Fallacies and Facts*, in support of his views. On the outbreak of the World War he was a frequent visitor at the War Office, and shortly after the arrival of the two Indian divisions in France he crossed the Channel to visit them in the trenches. He was attacked by pneumonia while at the front, and he died at St. Omer on Nov. 14, 1914, the title going by special remainder to his elder daughter, Aileen Mary. He was buried in St. Paul's Cathedral, London.

Earl Roberts was the author of the following works: *The Rise of Wellington* (1895); *Forty-one years in India* (1897); *Letters written during the Indian Mutiny* (1924). *See* also H. Hensonan, *The Afghan War of 1879–1880* (1881); *The Anglo-Afghan War* (official account, 1881); Sir T. F. Maurice and M. H. Grant (Official), *History of the War in South Africa 1899–1902* (1906–1910); Sir S. W. Forrest, *The Life of Lord Roberts* (1914).

ROBERTSON, FREDERICK WILLIAM (1816–1853), English divine, known as Robertson of Brighton, was born in London on Feb. 3, 1816. He studied at Edinburgh university, and at Brasenose college, Oxford. He had intended to go into the army, but Oxford changed the bent of his mind, and he was ordained in 1840, and served in curacies at Winchester and Cheltenham. He entered in 1847 on his famous ministry at Trinity Chapel, Brighton, where his church was thronged with thoughtful men of all types. Robertson was not a scientific theologian; but his insight into the principles of the spiritual life was unrivalled. As his biographer says, thousands found in his sermons "a living source of impulse, a practical direction of thought, a key to many of the problems of theology, and above all a path to spiritual freedom." His closing years were full of suffering, arising mainly from the opposition aroused by his sympathy with the revolutionary ideas of the 1848 epoch. He died on Aug. 15, 1853.

Robertson's works include 5 vols. of sermons, 2 vols. of expository lectures, on Genesis and on the epistles to the Corinthians, a volume of miscellaneous addresses, and an *Analysis of "In Memoriam." See* Stopford A. Brooke, *Life and Letters* (1865).

ROBERTSON, THOMAS WILLIAM (1829–1871), English actor and dramatist, was born at Newark on Jan. 9, 1829. Robertson was familiar with the stage from his childhood; he was the eldest of a large family, the actress Margaret (Madge) Robertson (Mrs. Kendal) being the youngest. A farcical comedy by him, *A Night's Adventure*, was produced, without great success, at the Olympic, under Farren's management as early as 1851. He remained for some years longer in the provinces, varying his work as an actor with miscellaneous contributions to newspapers. In 1860 he went to London, and edited a mining journal. He was at one time prompter at the Olympic under the management of Charles Mathews. He wrote a farce entitled *A Cantab*, which was played at the Strand theatre in 1861. This brought him a reputation in a Bohemian clique, but so little practical assistance that he thought of abandoning the profession to become a tobacconist. Then, in 1864, came *David Garrick*, produced at the Haymarket with Edward Sothern in the principal character, which has kept the stage ever since.

But his name was made by the production of *Society* at the Prince of Wales Theatre in 1865, under the management of Miss Marie Wilton, afterwards Mrs. Bancroft. Play-writer and company were exactly suited one to another; the plays and the acting together—the small size of the playhouse being also in their favour—were at once recognized as a new thing. Although some critics sneered at the "cup-and-saucer comedy," voted it absurdly realistic, said there was nothing in it but commonplace life represented without a trace of Sheridanian wit and sparkle, all London flocked to the little house in Tottenham Street, and the stage was at once inundated with imitations of the new style of acting and the new kind of play. All Robertson's best known plays (except *David Garrick*) were written for the old Prince of Wales's under the Bancrofts, and that régime is now an historical incident in the progress of the English stage. *Ours* was produced in 1866, *Caste* in 1867, *Play* in 1868, *School* in 1869, *M.P.* in 1870. Robertson died in London on Feb. 3, 1871.

See *Principal Dramatic Works of Robertson; with Memoir by his son* (1889); and T. E. Pemberton, *Life and Writings of Robertson* (1893).

ROBERTSON, WILLIAM (1721–1793), Scottish historian, born at Borthwick, Midlothian, on Sept. 19, 1721, was the eldest

son of the Rev. William Robertson. He was educated at the school of Dalkeith and the University of Edinburgh. In 1743 he was presented to the living of Gladsmuir in East Lothian. His services in the '45 were rewarded by his election as a member of the General Assembly, where his influence as leader of the "moderate" party was for many years nearly supreme. (*See* PRESBYTERIANISM.)

Robertson's *History of Scotland during the Reigns of Queen Mary and of James VI. until his Accession to the Crown of England* begun in 1753, was published in two volumes in 1759 (19th ed. 1812). Before the end of the author's life the book had reached its 14th edition; and it soon brought him other rewards than literary fame. In 1759 he was appointed chaplain of Stirling castle, in 1761 one of His Majesty's chaplains in ordinary, and in 1762 he was chosen principal of the University of Edinburgh. In May 1763 he was elected Moderator of the General Assembly, and in August king's historiographer. His other works were: *History of the Reign of the Emperor Charles the Fifth* (3 vols., 1769) which had a European reputation and was translated into French in 1771, German, 1770–71, Italian, 1835, and Spanish, 1846; *History of America* (2 vols., 1777); *Disquisition concerning the Knowledge which the Ancients had of India* (1791).

There are lives of Robertson by Dugald Stewart (Edinburgh, 1801 and 1802), prefixed to most of the collective editions of his works; by George Gleig, bishop of Brechin (Edinburgh, 1812); and by Lord Brougham in *Lives of Men of Letters*, etc. (1845–1846). Robertson's works were edited with a life by D. Stewart (8 vols. 1817) and were translated into French in 12 vols. (1829) by J. B. Suard and others.

ROBERTSON, SIR WILLIAM ROBERT (1860–), British field marshal, was born at Welbourn, Lincs., on Sept. 14, 1860. He enlisted as a private in the 16th Lancers in 1877, and served in the ranks of that regiment until 1888, when he won a commission in the 3rd Dragoon Guards, then in India. He eagerly studied his profession in all its branches and he learned the native languages. He was railway staff officer in the Miranzai and Black Mountain operations of 1891, and in the following year joined the intelligence department at Simla; while on its staff he carried out a reconnaissance to the Pamirs, and in 1895 served with the Chitral Relief Force, being wounded and receiving the D.S.O. He passed through the Staff College in 1897–8—the first officer risen from the ranks to do so—and then, after a few months at the War Office, went out to South Africa on the Intelligence Staff; he accompanied Lord Roberts on his advance from Cape Colony into the Transvaal, and was promoted brevet lieutenant-colonel for his services. He spent the period from 1901 to 1907 at the War Office, being promoted colonel in 1903, and he then went to the staff at Aldershot, where he spent three years. In 1910 he was appointed commandant of the Staff College, was shortly afterwards promoted major-general and in 1913 became director of military training at the War Office.

On the mobilization of the army for the World War, Robertson became quartermaster-general of the Expeditionary Force, and in Jan. 1915 chief of the general staff to Sir John French. In the following December he was brought back to the War Office as chief of the imperial general staff and immediately introduced great improvements in the office organization. Convinced that the Western Front represented the decisive theatre of war, and fully aware how mischievous was dispersion of force in principle, he saw to it that, where operations in distant regions were unavoidable, the commanders on the spot were furnished with what was deemed essential to achieve success—with the result that the position of affairs in Mesopotamia, on the Suez frontier and in East Africa was completely transformed within a very few months. His services were recognized by promotion to general in 1916 and by the G.C.B. in 1917.

In the later months of 1917 he found it more and more difficult, in view of the disappointing results of Allied offensives in France and Flanders, to persuade the War Cabinet that diversion of fighting resources to other theatres of war endangered prospects of victory at the decisive point and might lead to disaster near home. His anxieties were increased by the manner in which the problem of man-power was treated. He moreover foresaw that the Supreme War Council, introduced towards the end of the year, would not provide effective means for combining the operations of the Allies. In Feb. 1918 he was transferred by the Government to the charge of the eastern command in England—just one month before the success that attended the great German offensive of March proved how correct had been his appreciation of the situation. Three months later he succeeded French as commander-in-chief in Great Britain. After the War he received a baronetcy, a grant of £10,000, and in 1919, the G.C.M.G. From April 1919 to March 1920 he commanded the British troops on the Rhine, and, after relinquishing that appointment on the force being reduced, was promoted field-marshal. Robertson received many English and foreign honours.

See his *From Private to Field-marshal* (1921); and *Soldiers and Statesmen 1914–1918* (1926).

ROBERT THE DEVIL, hero of romance. He was the son of a duke and duchess of Normandy, and by the time he was 20 was a prodigy of strength, which he used, however, only for outrage and crime. At last he learnt from his mother, in explanation of his wicked impulses, that he was born in answer to prayers addressed to the devil. He was directed by the pope to a hermit, who imposed on him by way of penance that he should maintain absolute silence, feign madness, take his food from the mouth of a dog, and provoke ill-treatment from the common people without retaliating. He became court fool to the emperor at Rome, and delivered the city from Saracen invasions in three successive years in the guise of an unknown knight, having each time been bidden to fight by a celestial messenger. The emperor's dumb daughter recovered speech to declare the identity of the court fool with the deliverer of the city, but Robert refused the hand of the princess and the imperial inheritance and ended his days in the hermitage of his old confessor. The French romance of *Robert le Diable* is one of the oldest versions of the legend. The story had undergone much change before it was used by E. Scribe and C. Delavigne in the libretto of Meyerbeer's opera of *Robert le Diable*.

See *Robert le Diable*, ed. E. Löseth (Soc. des anc. textes fr., 1903); *Sir Gowther*, ed. K. Breul (Oppeln, 1886); M. Tardel, *Die Sage v. Robert d. Teufel in neueren deutschen Dichtungen* (1900); L. A. Hibbard, *Medieval Romance in England* (1924).

ROBERT THE STRONG (le Fort) (d. 866), count of Anjou and of Blois, appears as rector of the abbey of Marmoutier in 852, and as one of Charles the Bald's *missi dominici*, in 853; but soon afterwards he was among those who rebelled against Charles, and invited the king's half-brother, Louis the German, to invade West Francia. In 860 Robert came to terms with Charles, who made him count of Anjou and of Blois, and entrusted him with the defence of that part of his kingdom which lay between the Seine and the Loire, a district which had suffered greatly from the ravages of the Normans and the Bretons. He was killed in battle at Brissarthe in October 866, leaving two sons, Odo, or Eudes, and Robert, both of whom became kings of the Franks. Robert was the ancestor of the Capetian kings of France.

See K. von Kalekstein, *Robert der Tapfere* (1871); and E. Favre, *Eudes, comte de Paris et roi de France* (1893).

ROBERVAL, GILLES PERSONNE (or PERSONIER) **DE** (1602–1675), French mathematician, was born at Roberval, near Beauvais, on Aug. 8, 1602. In 1632 he became professor of mathematics in the Collège de France. He died in Paris on Oct. 27, 1675. Roberval studied the quadrature of surfaces and the cubature of solids, which he accomplished, in some of the simpler cases, by an original method which he called the "Method of Indivisibles." He discovered a general method of drawing tangents, by considering a curve as described by a moving point whose motion is the resultant of several simpler motions. (*See* INFINITESIMAL CALCULUS.) He also discovered a method of deriving one curve from another, by means of which finite areas can be obtained equal to the areas between certain curves and their asymptotes. To these curves, which were also applied to effect some quadratures, Evangelista Torricelli gave the name of "Robervallian lines." Roberval invented the balance which goes

by his name.

His works were published in 1693 by the Abbé Gallois, in the *Recueil* of the *Mémoires de l'Académie des Sciences.*

ROBES, the name generally given to a class of official costume, especially as worn by certain persons or classes on occasions of particular solemnity. The word robe was earliest used, in the sense of a garment, of those given by popes and princes to the members of their household or their great officers. It would be going too far to assume that, *e.g.*, peers' robes were originally the king's livery, but in most early cases where robes are mentioned, if not of cloth of gold, etc., they are of scarlet, furred. A robe is properly a long garment, and the term "robes" is now applied only in those cases where a long garment forms part of the official costume, though in ordinary usage it is taken to include all the other articles of dress proper to the costume in question. The term "robes," moreover, connotes a certain degree of dignity or honour in the wearer. We speak of the king's robes of State, of peers' robes, of the robes of the clergy, of academic robes, judicial robes, municipal or civic robes; we should not speak of the robes of a cathedral verger, though he too wears a long gown of ceremony, and it is even only by somewhat stretching the term "robes" that we can include under it the ordinary academical dress of the universities. In the case of the official costume of the clergy, too, a distinction must be drawn. The sacerdotal vestments are not spoken of as "robes"; a priest is not "robed" but "vested" for Mass; yet the rochet and chimere of an English bishop, even in church, are more properly referred to as robes than as vestments, and while the cope he wears in church is a vestment rather than a robe, the scarlet cope which is part of his parliamentary full dress is a robe, not a vestment. The official, non-liturgical costume of the clergy is dealt with under the general heading VESTMENTS and the subsidiary articles.

The coronation robes of emperors and kings, representing as they do the sacerdotal significance of Christian kingship, are essentially vestments rather than robes. Apart from these, however, are the royal robes of State; in the case of the king of England a crimson velvet surcoat and long mantle, fastened in front of the neck, ermine lined, with a deep cape or tippet of ermine. The sovereign's coronation robes are described in "The King's Coronation Ornaments," by W. St. John Hope, in *The Ancestor,* vols. i. and ii., also by L. Wickham Legg, *English Coronation Records* (1901).

All countries, East and West, which boast an ancient civilization have some sort of official robes, and the tendency in modern times has been to multiply rather than to diminish their number. In the United States few save Federal judges wear robes. The scarlet judicial robes were discarded at the Revolution. Those of black silk now worn are slightly modified academic gowns. John Jay, first chief justice of the Supreme Court (1789), set the fashion by sitting in the LL.D. gown granted him by Columbia university. The present article does not attempt to deal with any but British robes, under the headings of (1) peers' robes, (2) robes in the House of Commons, (3) robes of the Orders of Knighthood, (4) judicial and forensic robes, (5) municipal and civic robes, (6) academic costume.

Peers' Robes.—As early as the end of the 14th century peers seem to have worn at their creation some kind of robe of honour. An illumination on the foundation charter of King's college, Cambridge, represents the peers in 1446 wearing gowns, mantles and hoods of scarlet, furred with miniver, the mantle opening on the right shoulder and guarded with two, three or four bars of miniver, in the form of short stripes high up on the shoulder. The origin of these is as yet unknown, and it is not certain precisely when the peers' velvet robe of estate was first used. During the reign of Henry VIII., references are found to the "parliament robes" of peers. By the time of James II.'s coronation, the baron and viscount had the velvet robes of estate. The colour of these seems to have been crimson at first, sometimes varying to purple. They consisted of a long gown or surcoat with girdle, a mantle lined with ermine, a hood and a tippet of ermine, the rows being as follows: for a duke 4, a marquess 3½, an earl 3, a viscount 2½ and a baron 2.

Till late in the 18th century peers continued to attend the House of Lords in parliamentary robes, with the stars and ribbons of their orders, but robes are now only worn in the House of Lords, *e.g.*, at the opening of parliament, on occasions when the sovereign gives his assent to bills by "royal commission" (when five or six peers on the Government side appear in robes, and the lord chancellor also wears his peer's robe of scarlet ermine), and at the introduction of a newly created peer, when the new peer and his two introducers wear their parliamentary robes (over morning dress) during the ceremony of introduction only. The mover and seconder of the Address no longer wear robes, but uniform. On all the above occasions, and when the peers as a body attend church or some other ceremony, the parliamentary robe of scarlet cloth is worn; in the present day it takes the form of a mantle opening on the right shoulder, with a collar of ermine, and guarded with rows of ermine and gold lace round the right shoulder, varying in number according to the rank of the wearer. The modern coronation robes consist of a crimson velvet surcoat and a mantle with a tippet of ermine and with rows of ermine as in the parliamentary robes. The surcoat is no longer a gown, but a short sleeveless garment.

As regards peeresses' robes, the order of the earl-marshal for the regulation of these at the coronation of James II. shows that by then all peeresses wore the robes of state of crimson velvet, and minutely regulates all details, such as shape, powderings, length of train and width of the fur edging of the mantle. They have changed very little up to the present day.

House of Commons.—The speaker of the House of Commons wears on state occasions a black damask robe with gold lace and a full-bottomed wig; in the House itself he wears a black silk robe with train and a full-bottomed wig. The clerks at the table wear barristers' gowns and wigs.

Robes of the Orders of Knighthood.—The robes of the Garter were originally of blue woollen stuff, the surcoat and hood being powdered with garters embroidered in silk and gold. The surcoat varied in colour from year to year; the hood was made of the same material as the surcoat and, when hats began to be worn, was carried hanging over the shoulder. Robes were sometimes granted to ladies in the early days. The last lady to receive the robes was Margaret, countess of Richmond, in 1488. At the present day the mantle is of dark blue velvet, of the same colour as the ribbon, lined with taffeta, and with the star embroidered on the left shoulder, the hood and surcoat of crimson velvet lined with white taffeta, and with these are worn a doublet and trunk-hose of white satin and a plumed hat.

The robes worn by the knights of the Bath created at the coronation of Henry IV. were green with furred hoods, and a white silk cord hanging from the left shoulder. The mantle in the present day is of crimson velvet lined with white over a white satin under-coat and trunk-hose, and a plumed hat and white boots with red tops are worn. The mantle of the Thistle is of dark green velvet over surcoat, etc., of cloth of silver; that of St. Patrick azure, with doublet and trunk-hose of white satin; that of St. Michael and St. George of Saxon blue satin lined with scarlet; and that of the Star of India of light blue satin lined with white.

Judicial and Forensic Robes.—It is frequently stated that judicial robes had their origin in the dress of ecclesiastics. But though ecclesiastics in early days frequently acted as judges, and though, as Fortescue says, the serjeant's long robe was "after the fashion of a priest," judicial robes more probably arose from the ordinary civilian dress of the early 14th century. The chief argument for the ecclesiastical origin has been found in the coif, a cap of white linen or silk, tied under the chin, and described by Fortescue as "the principal or chief insignment and habit wherewith serjeants-at-law at their creation are decked," which is said to have been used by ecclesiastics to hide the tonsure when in court. More probably the coif was a head-dress in common use in the 13th century, which survived as the distinguishing mark of men of law.

About the time of Queen Elizabeth the square cap, otherwise known as the cornered, black or sentence cap (the last from the

fact of its being put on by the judge when pronouncing sentence of death), began to appear. Sometimes it was worn over the coif only, sometimes over the coif and skull-cap. Sometimes it had ear-flaps, sometimes, as in its present form, it had not.

Towards the end of the 17th century the judges took to wearing wigs, and they have continued to wear them ever since. The wearing of wigs naturally concealed the coif and velvet skull-cap, so a device had to be invented by which they could still be displayed. The expedient was hit upon of putting a round patch of white stuff, with a black spot in the middle of it, on the crown of the wig of certain of the judges, to represent the coif and skull-cap. Serjeant being appointed no longer, this round patch has now disappeared, the only trace of it left being the circular depression on the crown of the wig.

Minute details of court and levée dress, judicial and legal, of the present day, will be found in *Dress worn at Court* (pp. 60–61), issued with the authority of the Lord Chamberlain—also details of mourning costume.

Municipal and Civic Robes.—The word "livery," the use of which is now practically confined to the costume of the "livery companies," the dress of men-servants, etc., originally meant an allowance of food or clothing granted to certain persons. It is still used of the allowances of food made to the fellows of certain colleges. As early as the 13th century, the citizens of London used to assume a uniform dress to do honour to some great occasion, as when 600 citizens rode out to meet Queen Margaret, wife of Edward I., "in one livery of red and white, with the cognizances of their misteries embroidered upon their sleeves." By the 14th century there is evidence of the adoption of liveries by the trades and fraternities; and when the livery companies were incorporated, they took care to have their liveries authorized by their charters.

As to the costume of the mayor, aldermen, sheriffs, etc., the scarlet, violet and black robes, still worn by them, were early in use. The provincial mayors and aldermen at quite an early date followed the fashion of London. An account of the robes of modern provincial mayors will be found in St. John Hope's *Corporation Plate and Insignia.*

At the present day the lord mayor has several sets of robes; a special coronation robe, a crimson velvet robe of State like that of an earl, worn with the chain and jewel, *e.g.*, in the presence of the sovereign when in the city; a black robe of State trimmed with gold, which is worn with the chain and jewel, *e.g.*, at the Guildhall on lord mayor's day; the scarlet robes, which are worn, with or without the chain, on most public occasions, such as the service at St. Paul's on the first day of the Easter law term, audiences of the sovereign, the election of the lord mayor, the opening of the central criminal court, etc.; a violet gown, which is worn, *e.g.*, when the lord mayor elect is presented to the king, when he is sworn in, at the election of sheriffs, etc., and a black gown worn in church on Good Friday, etc. The aldermen wear scarlet on most occasions of ceremony, ex-mayors "having the Cap of Dignity attached to their gown, and being entitled to introduce a sword and mace into their badges." Violet robes are also worn on certain occasions marked in the almanac of the *Alderman's Pocket-Book;* and black gowns when the lord mayor wears his. The sheriffs and recorders have scarlet, violet and black gowns, and the members of the common council have deep mazarine blue gowns, which seem to have been first prescribed in 1761.

Academic Costume, like judicial robes, has been considered to be of ecclesiastical origin, but though the mediaeval scholar was of course a clerk, and had to wear the clerkly gown and the tonsure, his robes probably developed out of the ordinary civilian costume. The statutes of certain colleges required of the scholars as early as the 14th century the tonsure and a "decent habit" suitable to a clerk, *i.e.*, a long gown, which it is stipulated in some cases must be closed in front. Some colleges had liveries, prescribed perhaps by the founder of the college and laid down by the statutes. The differences of colour and shape in the undergraduate gowns of most of the Cambridge colleges are supposed to be a survival of this.

The gown was worn by all degrees, as befitting clerks. It is hard to determine whether there was at first any difference between the gown of the higher degrees and that of the lower degrees, but it seems improbable. It was frequently fur-lined, but the use of the more costly furs was forbidden to all below the degree of master, except sons of noblemen, or those possessing a certain income, bachelors using budge. Students, and even doctors in theology were also restricted to budge, and to sad-coloured habits. The robes of masters had to be flowing and reach to the ankles.

The cope probably originated in the ordinary everyday mantle of the clergy. This kind of cope, closed in front, sometimes, for convenience's sake, had a slit in front to allow of the passage of the hands. By the 16th century all copes were scarlet. It has survived to the present day at Cambridge as the dress worn by the vice-chancellor and by regius professors of divinity, law and medicine when presenting for degrees.

The hood was originally worn by all scholars, as by everybody, and had evidently no academic significance. Sometimes a cap was also worn, the hood being thrown back. There were evidently hoods of two kinds for masters. At a later date, at Cambridge, a distinction was made between the hoods of non-regent masters, which were lined with silk, and those of regents, which were lined with miniver. Later again the regents wore their hoods in such a way as to show the white lining, while the non-regents wore theirs "squared," so that the white did not show. Hence the name "White Hoods" and "Black Hoods" given to the upper and lower houses of the old Senate respectively. It is not settled when the modern colourings of hoods arose; they probably followed those of the gowns of the faculties, but about these we are equally uncertain. The Oxford proctor still wears a miniver hood. The modern Cambridge hood has preserved the original shape more closely than the Oxford one, being a hood and tippet combined, the hood having square corners.

There seem to have been originally at least three varieties of academic head-dress, one of which, the round cap of velvet for doctors, survives as part of their full dress to the present day. The square cap was adopted at the universities, according to Robinson, after 1520, in imitation of the University of Paris. In this connection should be mentioned the term "tuft-hunting," *i.e.*, attempting to thrust oneself into the society of one's social superiors, derived from the gold tufts or tassel worn by noblemen and fellow-commoners on their college caps.

Academic dress underwent much inquiry and some revision at the time of the Reformation, chiefly in the direction of sobriety and uniformity, "excess of apparel" being repressed as severely as ever, but not with much more effect. There have been few far-reaching changes since the 17th century. Cambridge has of late years inquired into and revised her regulations as to dress, and in the *Ordinances* (latest ed. 1908, Statute A, cap. VII. p. 303) clear rules are laid down; the Oxford regulations (see *Statuta et Decreta Univ. Oxon.* for 1909, Tit. xiv., *de vestitu et habitu,* pp. 327–328) have not been revised lately, and some of them are a dead letter.

Doctors of both universities have three sets of robes: firstly, the full-dress gown of scarlet cloth; secondly, the congregation habit and hood of scarlet (now at Cambridge a cope, at Oxford the so-called "cope"); thirdly, the black gown. The first is worn by all doctors except the doctor of music, and is accompanied by the round cap of velvet. The Oxford D.D. also wears a cassock, sash and scarf. The scarlet gown is of a different and older shape than the M.A. and B.A. gowns. As now worn, it is faced with silk of the same colour as the hood of the faculty. The second, or cope, has now gone almost out of use, but is still worn when presenting for degrees, etc. It is sometimes worn over the black gown. There are several types of black gown, but the tufted gown of Loggan's day has now gone out of use. The M.D. and Mus.D. black gowns at Cambridge are now made after the pattern of the LL.D. gown, with wing-like sleeve and flap collar, trimmed with black lace, but the D.D., D.Sc. and Litt.D. wear the M.A. gown, the former with the scarf, the two latter with lace on the sleeve, placed horizontally for D.Sc. and vertically for Litt.D. Some doctors of divinity wear the full-sleeved gown with scarf. The head-dress of a D.D. is the square cap, of lay doctors the velvet bonnet with gold cord.

The Oxford sleeveless commoner's gown, though still by statute *talaris*, now reaches little below the waist, the full-sleeved scholar's gown to the knees. The tufted silk gown of the gentleman-commoner and the nobleman's gold-laced gown are not yet abolished by statute, but have fallen into disuse. Vice-chancellors have no official costume, but wear the habit of their degree. The chancellors of the older universities wear a black damask robe with gold lace, and a black velvet square cap with gold tassel or a doctor's velvet bonnet with gold cord; those of the newer universities have robes "created" by the robe-makers, who are nowadays to a large extent the arbiters of academic dress.

United States.—An intercollegiate commission in 1893 drafted a uniform code for academic caps, gowns, and hoods which has since been accepted by some 700 colleges and universities in the United States. Three types of gowns and three types of hoods are provided for bachelors, masters and doctors respectively. The square caps remain the same except that the doctor's may be made of velvet and have a tassel of gold. The bachelor's gown is made of black worsted material and may be distinguished by its pointed sleeves hanging nearly to the knee. The master's gown, made of silk, has closed sleeves (the arm coming through a slit at the elbow), which are square at the end, and extend well below the knee. The doctor's gown is also made of silk, and, like a judge's gown, has full round open sleeves, is faced with velvet and has three bars of velvet on each sleeve. The hoods are lined in silk with the colors of the institution granting the degree and trimmed with velvet of the color that represents the department of learning in which the degree was obtained. The velvet trimming of the doctor's gown may also be of the departmental color or it may be black if preferred. Colors of the more common departments of learning are as follows: arts and letters, white; theology and divinity, scarlet; laws, purple; philosophy, blue; science, golden yellow; medicine, green; dentistry, lilac; music, pink; engineering, orange. A few institutions, notably Harvard, retain an individual code for their hoods.

ROBESON, PAUL (1898–), American negro actor and singer, was born at Princeton, N.J., on Apr. 9, 1898. He graduated at Rutgers College with the highest scholastic average in the college's history, in addition to being a five-letter man in athletics and All-American football end for two successive years. In 1923 he completed the law course at Columbia University. His first stage appearance was in *Taboo* (1922) but he made his reputation with his creation of the rôle of Jim Harris in *All God's Chillun's Got Wings* and his playing of the title roles in *The Emperor Jones* (1923) and *Black Boy* (1926). In 1925 he played in *Voodoo* and *The Emperor Jones* in London. He afterwards played a short time in *Porgy* and in *Show Boat* in New York and in 1928 went to London in the latter play. His concert recitals of negro spirituals and work songs, first given in Paris in 1925 and New York in 1926, were highly successful and were continued in England and on the Continent in 1929.

ROBESPIERRE, MAXIMILIEN FRANÇOIS MARIE ISIDORE DE (1758–1794), French revolutionist, the son of an advocate, was born at Arras on May 6, 1758. His family, according to tradition, was of Irish descent. Maximilien was one of a family of four orphan children who were left in the care of their relatives, when their father left Arras after the Reformation on account of religion; and his direct ancestors in the male line had been notaries at the little village of Carvin near Arras from the beginning of the 17th century. His grandfather, being more ambitious, established himself at Arras as an advocate; and his father followed the same profession, marrying Jacqueline Marguerite Carraut, daughter of a brewer in the same city, in 1757. Of this marriage four children were born, two sons and two daughters, of whom Maximilien was the eldest; but in 1767 Madame Derobespierre, as the name was then spelt, died, and the disconsolate widower at once left Arras and wandered about Europe until his death at Munich in 1769. Maximilien was sent to the college of Arras, and the college of Louis-le-Grand at Paris. Here he had for fellow-pupils Camille Desmoulins and Stanislas Fréron.

Admitted an advocate in 1781, Robespierre returned to his native city to seek for practice. His reputation had already preceded him, and the bishop of Arras, M. de Conzié, appointed him criminal judge in the diocese of Arras in March 1782. This appointment, which he soon resigned, to avoid pronouncing a sentence of death, did not prevent his practising at the bar, and he speedily became a successful advocate. He now turned to literature and society, and came to be esteemed as one of the best writers and most popular dandies of Arras. He was a member of an Arras literary and musical society known as the "Rosati," of which Carnot was a member. The sympathetic quality of his voice won for his verses recited before this society applause not justified by their merits. In 1788 he took part in the discussion as to the way in which the states-general should be elected, showing clearly and forcibly in his *Adresse à la nation artésienne* that, if the former mode of election by the members of the provincial estates were again adopted, the new states-general would not represent the people of France. By the *Avis aux habitants de campagne* (Arras, 1789), which is almost certainly by him, he secured the support of the country electors, and, though but thirty years of age, poor and without influence, he was elected fifth deputy of the *tiers état* of Artois to the states-general. This election opened the way to his public career.

The Constituent Assembly.—When the states-general met at Versailles on May 5, 1789, the young deputy of Artois already possessed the one faculty which was to lead him to supremacy: he was a fanatic. Robespierre believed in the doctrines of Rousseau with all his heart, and would have gone to death for them; and in the belief that they would eventually succeed and regenerate France and mankind, he was ready to work with unwearied patience. While the Constituent Assembly occupied itself in drawing up a constitution, Robespierre turned from the assembly of provincial lawyers and wealthy *bourgeois* to the people of Paris. However, he spoke frequently in the Constituent Assembly, and often with great success, and was eventually recognized as second only to Pétion de Villeneuve—if second to him—as a leader of the small body of the extreme left,—the thirty voices, as Mirabeau contemptuously called them. When he instinctively felt that his doctrines would have no success in the Assembly, he turned to the Society of the Friends of the Constitution, known later as the Jacobin Club. The death of Mirabeau strengthened Robespierre's influence in the Assembly; but on May 15, 1791, he showed his jealous suspicion of his colleagues by proposing and carrying the motion that no deputies who sat in the Constituent could sit in the succeeding Assembly. The flight of the king on June 20, and his arrest at Varennes made Robespierre declare himself at the Jacobin Club to be *ni monarchiste ni républicain*. After the "Massacre" of the Champ de Mars (on July 17, 1791) he established himself, in order to be nearer to the Assembly and the Jacobins, in the house of Duplay, a cabinetmaker in the Rue St. Honoré, and an ardent admirer of his, where he lived (with but two short intervals) till his death. At last came his day of triumph, when on Sept. 30, on the dissolution of the Constituent Assembly, the people of Paris crowned Pétion and himself as the two incorruptible patriots.

On the dissolution of the Assembly he returned for a short visit to Arras, where he met with a triumphant reception. In November he returned to Paris and on Dec. 18 made a speech which marks a new epoch in his life. Brissot de Warville, the *âme politique* of the Girondin party which had been formed in the Legislative Assembly, urged vehemently that war should be declared against Austria, and the queen was equally urgent, in the hope that a victorious army might restore the old absolutism of the Bourbons. Two men opposed the projects of the queen and the Girondins—Marat and Robespierre. Robespierre feared a development of militarism, which might be turned to the advantage of the reaction. From that moment began the struggle which ended in the *coups d'état* of May 31 and June 2, 1793. Robespierre persisted in his opposition to the war; the Girondins, especially Brissot, attacked him violently; and in April 1792, he resigned the post of public prosecutor at the tribunal of Paris, which he had held since February, and started a journal, *Le Défenseur de la Constitution*, in his own defence. It is noteworthy that during

the summer months of 1792 in which the fate of the Bourbon dynasty was being sealed, neither the Girondins in the Legislative Assembly nor Robespierre took any active part in overthrowing it. But Robespierre, though shocked at the shedding of blood, was willing to take his seat on the Commune of Paris, which had overthrown Louis XVI., and might check the Girondins. The strong men of the Commune were glad to have Robespierre's assistance not because they cared for him or believed in him, but because of the help got from his popularity, his reputation for virtue, which had won for him the surname of "The Incorruptible," and his influence over the Jacobin Club and its branches, which spread all over France. He therefore presented the petition of the commune of Paris on Aug. 16, to the Legislative Assembly, demanding the establishment of a revolutionary tribunal and the summoning of a Convention. The massacres of September in the prisons, which Robespierre in vain attempted to stop, showed that the Commune had more confidence in Billaud than in him. Yet, as a proof of his personal popularity, he was a few days later elected first deputy for Paris to the National Convention.

The Convention.—On the meeting of the Convention the Girondins immediately attacked Robespierre; they were jealous of his influence in Paris, and knew that his single-hearted fanaticism would never forgive their intrigues with the king at the end of July. All personal disputes, however, gave way in December 1792 before the question of the king's trial, and here Robespierre took up a position which is at least easily understood. These are his words spoken on Dec. 3.

> This is no trial; Louis is not a prisoner at the bar; you are not judges; you are—you cannot but be—statesmen, and the representatives of the nation. You have not to pass sentence for or against a single man, but you have to take a resolution on a question of the public safety, and to decide a question of national foresight. It is with regret that I pronounce the fatal truth: Louis ought to perish rather than a hundred thousand virtuous citizens; Louis must die, that the country may live.

This great question settled by the king's execution, the impracticable plans of the Girondins drove Danton, Lazare Carnot, Robert Lindet, and even Billaud-Varenne to the side of Robespierre, whom, it is apparent, they thoroughly understood. In the month of May 1793 Camille Desmoulins, acting under the inspiration of Robespierre and Danton, published his *Histoire des Brissotins* and *Brissot démasqué;* Maximin Isnard declared that Paris must be destroyed if it pronounced itself against the provincial deputies; Robespierre preached insurrection at the Jacobin Club; and on May 31 and June 2 the Commune of Paris destroyed the Girondin party.

Committee of Public Safety.—On July 27, 1793; when the struggle was practically decided, the Convention elected Robespierre to the new Committee of Public Safety. Robespierre was always in a minority in the committee of twelve; at least seven of whom, Carnot, Billaud, Varenne, Collot d'Herbois, Prieur Duvernois, Prieur, Saint André and Lindet were men of action and not under his personal influence. Robespierre was not the inventor of the Terror or its machinery, the revolutionary tribunal and the representatives of the committee on mission in the provinces. He served it by his gift of eloquence. He had a fanatical following among the Jacobins and was one of the most popular orators in the Convention, on which his carefully prepared addresses made a deep impression. His panegyrics on the system of revolutionary government and his praise of virtue led his hearers to believe that the system of the Terror, instead of being monstrous, was absolutely laudable; his pure life and admitted incorruptibility threw a lustre on the Committee of which he was a member; and his colleagues were glad to avail themselves of these advantages so long as he did not interfere with their work. Moreover, he alone never left Paris, whilst all the others, except Barère, were constantly engaged on missions to the armies, the navy and the provinces. It has been asserted that Robespierre, Couthon and Saint-Just took upon themselves the direction of "la haute politique," while the other members acted only in subordinate capacities; undoubtedly it would have suited Robespierre to have had this believed, but as a matter of fact he was in no way especially trusted in matters of supreme importance.

It is clear therefore that Robespierre was not the sole author of the overthrow of the Dantonists and the Hébertists, though he thoroughly agreed with the majority and had no desire to save them, the Hébertist principle of decentralization and the Dantonist moderatism being equally obnoxious to him.

Fall of Danton.—Both parties must be crushed. Before the blows at the leaders of those two parties were struck, Robespierre retired for a month (from Feb. 13–March 13, 1794) from active business in the Convention and the Committee, apparently to consider his position; but he came to the conclusion that the cessation of the Reign of Terror would mean the loss of that supremacy by which he hoped to establish the ideal of Rousseau; for Danton, he knew, was essentially a practical statesman and laughed at his ideas and especially his politico-religious projects. He must have considered too that the result of his siding with Danton would probably have been fatal to himself. The result of his deliberations was that he abandoned Danton and co-operated in the attacks of the Committee on the two parties. On March 15 he reappeared in the Convention; on the 19th Hébert and his friends were arrested; and on the 24th they were guillotined. On March 30 Danton, Camille Desmoulins and their friends were arrested, and on April 5 they too were guillotined.

It was not until after the execution of Danton that Robespierre began to develop a policy distinct from that of his colleagues in the Committee, an opposition which ended in his downfall. He began by using his influence over the Jacobin Club to dominate the Commune of Paris through his devoted adherents, two of whom, Fleuriot-Lescot and C. F. de Payan, were elected respectively mayor and *procureur* of the Commune. He also attempted to usurp the influence of the other members of the Committee over the armies by getting his young adherent, Saint-Just, sent on a mission to the frontier. In Paris Robespierre determined to increase the pressure of the Terror: no one should accuse him of moderatism; through the increased efficiency of the revolutionary tribunal Paris should tremble before him as the chief member of the Committee; and the Convention should pass whatever measures he might dictate. To secure his aims, Couthon, his other ally in the Committee, proposed and carried on June 10 the outrageous law of 22nd Prairial, by which even the appearance of justice was taken from the tribunal, which, as no witnesses were allowed, became a simple court of condemnation. The result of this law was that between June 12 and July 28, the day of Robespierre's death, no less than 1,285 victims perished by the guillotine in Paris. It was the bloodiest and the least justifiable period of the Terror. But before this there had taken place in Robespierre's life an episode of supreme importance, as illustrating his character and his political aims: on May 7 he secured a decree from the Convention recognizing the existence of the Supreme Being. This worship of the Supreme Being was based upon the ideas of Rousseau in the *Social Contract,* and was opposed by Robespierre to Catholicism on the one hand and the Hébertist atheism on the other. In honour of the Supreme Being a great fête was held on June 8; Robespierre, as president of the Convention, walked first and delivered his harangue, and as he looked around him he may well have believed that his position was secured and that he was at last within reach of a supreme power which should enable him to impose his belief on all France, and so ensure its happiness. The devotion of Robespierre's adherents was further excited by the news that a half-witted girl, named Cécile Renault, had been found wandering near his house, with a knife in her possession, intending to play the part of Charlotte Corday. She was executed on June 17, on the very day that Vadier raised a laugh at Robespierre's expense in the Convention by his report on the conspiracy of Catherine Théot, a mad woman, who had asserted that Robespierre was a divinity.

The 9th Thermidor.—Robespierre felt that he must strike his blow now or never. Yet he was not sufficiently audacious to strike at once, as Payan and Jean Baptiste Coffinhal, the ablest of his adherents, would have had him do, but retired from the Convention for some weeks, as he had done before the overthrow of the Hébertists and the Dantonists, to prepare his plan of action. These weeks, the last of his life, Robespierre passed very

peacefully. He continued to live with the Duplays, with whose daughter Éléonore he had fallen in love, and used to wander with her in the Champs Élysées during the long summer evenings. At last, on July 26, Robespierre appeared, for the first time for more than four weeks, in the Convention and delivered a carefully studied harangue, which lasted for more than four hours, in which he declared that the Terror ought to be ended, that certain deputies who had acted unjustly and exceeded their powers ought to be punished, and that the Committees of Public Safety and General Security ought to be renewed. The majority of the Committee of Public Safety determined to act promptly. The Convention, moved by Robespierre's eloquence, at first passed his motions; but he was replied to by Joseph Cambon the financier, Billaud-Varenne, Amar and Vadier, and the Convention rescinded their decrees and referred Robespierre's question to their committees. On the following day, July 27, or in the revolutionary calendar the 9th Thermidor, Saint-Just began to speak on behalf of the motions of Robespierre, when violent interruptions showed the temper of the Convention. Jean Lambert, Tallien, Billaud-Varenne and Vadier again attacked Robespierre; cries of "Down with the tyrant!" were raised; and, when Robespierre hesitated in his speech in answer to these attacks, the words "C'est le sang de Danton qui t'étouffe" showed what was uppermost in the minds of the Mountain. Robespierre tried in vain to gain a hearing, the excitement increased and at five in the afternoon Robespierre, Couthon and Saint-Just, with two young deputies, Augustin Robespierre (younger brother of Maximilien) and Philippe François Joseph Lebas, the only men in all the Convention who supported them, were ordered to be arrested. Robespierre was speedily rescued from his prison, with the other deputies, by the troops of the Commune and brought to the Hôtel de Ville. There he was surrounded by his faithful adherents, led by Payan and Coffinhal. But the day was past when the Commune could overawe the Convention; for now the men of action were hostile to the Commune, and its chief was not a master of *coups d'état*. On the news of the release of Robespierre, the Convention had again met, and declared the members of the Commune and the released deputies outlawed. The national guards under the command of Barras made their way to the Hôtel de Ville; Robespierre was shot in the lower jaw by a young gendarme named Meda while signing an appeal to one of the sections of Paris to take up arms for him, though the wound was afterwards believed to have been inflicted by himself; and all the released deputies were again arrested. After a night of agony, Robespierre was the next day taken before the tribunal, where his identity as an outlaw was proved, and without further trial he was executed with Couthon and Saint-Just and nineteen others of his adherents on the Place de la Révolution on the 10th Thermidor (28th July) 1794.

Character.—The character of Robespierre, when looked upon simply in the light of his actions and his authenticated speeches, and apart from the innumerable legends which have grown up about it, is comparatively simple. A well-educated and accomplished young lawyer, he might have acquired a good provincial practice and lived a happy provincial life had it not been for the Revolution. Like thousands of other young Frenchmen, he had read the works of Rousseau and taken them as gospel. Just at the very time in life when this illusion had not been destroyed by the realities of life, and without the experience which might have taught the futility of idle dreams and theories, he was elected to the states-general. At Paris he was not understood till he met with his audience of fellow-disciples of Rousseau at the Jacobin Club. His fanaticism won him supporters; his singularly sweet and sympathetic voice gained him hearers; and his upright life attracted the admiration of all. As matters approached nearer and nearer to the terrible crisis, he failed, except in the two instances of the question of war and of the king's trial, to show himself a statesman, for he had not the liberal views and practical instincts which made Mirabeau and Danton great men. His admission to the Committee of Public Safety gave him power, which he hoped to use for the establishment of his favourite theories, and for the same purpose he acquiesced in and even heightened the horrors of the Reign of Terror. It is here that the fatal mistake of allowing a theorist to have power appeared: Billaud-Varenne systematized the Terror because he believed it necessary for the safety of the country; Robespierre intensified it in order to carry out his own ideas and theories. Robespierre's private life was always respectable: he was always emphatically a gentleman and man of culture, and even a little bit of a dandy, scrupulously honest, truthful and charitable. In his habits and manner of life he was simple and laborious; he was not a man gifted with flashes of genius, but one who had to think much before he could come to a decision, and he worked hard all his life.

On the family of Robespierre *see* A. J. Paris in the *Mémoires* (2nd series, vol. iii.) of the Academy of Arras; the *Oeuvres de Maximilien Robespierre* (3 vols., 1840), published by Laponneraye with preface by Armand Carrel, contain some of his speeches and the memoirs of Charlotte Robespierre on her brothers. A new edition of the Oeuvres (2 vols., 1913) is edited by A. Lesueur. The standard work on Robespierre's career is Ernest Hamel, *Histoire de Robespierre d'après des papiers de famille, les sources originales et des documents entièrement inédits* (3 vols., 1865–67). After the appearance of the first volume, the publisher refused to proceed for fear of prosecution until compelled to do so by the author. Another edition with a different title appeared in 1878. *See* also Ch. d'Hericault, *La Révolution de Thermidor* (2nd ed., 1878); Karl Brunnemann, *Maximilien Robespierre* (Leipzig, 1880); F. A. Aulard, *Les Orateurs de l'Assemblée Constituante* (1882); M. de Lescure, "Le Roman de Robespierre," in *La Société française pendant la Terreur* (1882); E. Hamel, *La Maison de Robespierre* (1895); Hilaire Belloc, *Robespierre* (1901); C. F. Warwick, *Robespierre and the French Revolution* (1909); A. Mathiez, *Études Robespierristes* (2 vols., 1897, 1918), and *Autour de Robespierre* (1925). Many of the books which have been written about Robespierre are most untrustworthy, and the picture of him given by Thomas Carlyle in his *French Revolution* is unjust.

BY COURTESY OF THE NATIONAL ASSOCIATION OF AUDUBON SOCIETIES

THE AMERICAN ROBIN (TURDUS MIGRATORIUS), ALSO CALLED ROBIN REDBREAST IN NEW ENGLAND

ROBIN, the name applied to a number of familiar birds; in England to *Erithecus rubecula* (*see* REDBREAST); in North America to *Turdus migratorius* and *P. confinis*, which are thrushes with a loud cheery song, reddish breast and dark slate back and wings. *T. migratorius* breeds north to Alaska, wintering from the northern United States southwards. The western robin (*T. m. propinquus*) is found from the eastern base of the Rocky Mountains to the Pacific.

ROBIN HOOD, English legendary hero. The oldest datable mention of Robin Hood at present known occurs in the second edition of *Piers Plowman*, the date of which is about 1377. In that poem the figure of Sloth is represented as saying—

> "I can nou3te perfitly my pater-noster, as
> the prest it syngeth:
> But I can rymes of Robyn Hood and Randolf
> Erle of Chestre."

He is next mentioned by Andrew of Wyntoun in his *Original Chronicle of Scotland*, written about 1420. Of his popularity in the latter half of the 15th and in the 16th centuries there are many signs. In the Elizabethan era and afterwards mentions abound. Of the ballads themselves, *Robin Hood and the Monk* is possibly as old as the reign of Edward II. (see Thomas Wright's *Essays on England in the Middle Ages*, ii. 174); *Robin Hood and the Potter* and *Robyn and Gandelyn* are certainly not later than the 15th century. Most important of all is *A Lytell Geste of Robyn Hode*, which was first printed about 1510 (*see* A. W. Pollard's *Fifteenth Century Prose and Verse*, 1903). This is evidently founded on older ballads; we read in *The Seconde Fytte*, 11. 176 and 177—

> "He wente hym forthe full mery syngynge,
> As men have told in tale."

In fact, it does for the Robin Hood cycle what a few years before Sir Thomas Malory had done for the Arthurian romances.

These are the facts about him and his balladry. Of conjectures there is no end. He has been represented as the last of the Saxons—as a Saxon holding out against the Norman conquerors

so late as the end of the 12th century (*see* Augustin Thierry's *Norman Conquest*, and compare Sir Walter Scott's *Ivanhoe*). J. M. Gutch maintains that he was a follower of Simon de Montfort. The Robin Hood story has probably some historical basis. Sloth in Langland's poem couples him with Randle, earl of Chester, whom we believe to have been the third Randle (*see* Bishop Percy's Folio Ms., ed. Hales and Furnivall, i. 260); and, possibly enough, Hood was contemporary with that earl, who "flourished" in the reigns of Richard I., John and Henry III. His myth was, as is evident from what we have already said, full-grown in the first half of the 14th century.

That the Robin Hood story attracted to it and appropriated other elements is illustrated by its subsequent history. Thus later on we find it connected with the Morris dance; but the Morris dance was not known in England before the 16th century or late in the 15th. The Maid Marian (*q.v.*) element has been thought to have been introduced for the purpose of these performances, which were held on May-day and were immensely popular (*see* Latimer's *Frutefull Sermons* [1571], p. 75; also *Paston Letters*, (ed. J. Gairdner, iii. 89). After 1615, the date of the pageant prepared for the mayoralty of Sir John Jolles, draper, by Anthony Munday and entitled *Metropolis Coronata*, the yeoman of the older version was metamorphosed into the earl of Huntingdon, for whom in the following century William Stukeley discovered a satisfactory pedigree! The earl of Huntingdon was probably a nickname for a hunter. The rise, development and decay of the myth deserve thorough study.

What perhaps is its greatest interest is its expression of the popular mind about the close of the middle ages. Robin Hood was at that time the people's ideal, as Arthur is that of the upper classes. He is the ideal yeoman, as Arthur is the ideal knight. He readjusts the distribution of property; he robs the rich and endows the poor. He is an earnest worshipper of the Virgin, but a vigorous hater of monks and abbots. He is the great sportsman, the incomparable archer, the lover of the greenwood and of a free life, brave, adventurous, jocular, open-handed, a protector of women. The story is localized in Barnsdale and Sherwood, *i.e.*, between Doncaster and Nottingham. In Yorkshire, Nottinghamshire and Lincolnshire a host of place-names testify to the popularity of the Robin Hood legend—Robin Hood's Bay, Robin Hood's Cave, Robin Hood's Chase, Robin Hood's Cup (a well), Robin Hood's Chair, Robin Hood's Pricks and many more.

The best collections of Robin Hood poems are those of J. Ritson (1795), F. J. Child in the 5th volume of his *English and Scotch Popular Ballads* (Boston, 1888); and F. Jackson, *Popular Ballads of the Olden Time*, 4th Series (1912). *See* also F. B. Gummere, *Old English Ballads* (Boston, 1894). The versions in the Percy Folio (edited by Hales and Furnivall, 1867, vol. i.) are unhappily mutilated; but they should be consulted, for some are of a unique character, and that on "Robin Hoode his death" is of singular interest. The earliest "Garland" was printed in 1670, and in 1678 appeared a prose version which was reprinted by W. J. Thomas in his *Early English Prose Romances* (vol. ii. 1858). Sir S. Lee's memoir in the *Dictionary of National Biography* is extremely erudite, and two valuable articles, contributed by Sir E. Brabrook to the *Antiquary* for June and July 1906, might be consulted. *See* also W. Stukeley, *Paleographia Britannica*, No. i. 115 (1795); A. Thierry, *Conquête de l'Angleterre* (1830); J. Hunter, *Great Hero of the Ancient Minstrelsy of England, Robin Hood* (1852).

ROBIN HOOD'S BAY, a fishing town and seaside resort in the Scarborough and Whitby parliamentary division of the North Riding of Yorkshire, England, 6½ m. S.E. of Whitby by the L.N.E. railway. The bay is a shallow indentation of the coast, fringed with a line of high cliffs which is broken in places by steep-sided gullies. On the adjoining moor are prehistoric British tumuli popularly called Robin Hood's Butts.

ROBINIA or **LOCUST-TREE,** a genus of about 15 species natives of North America and Central America, belonging to the family Leguminosae. The best-known species (*R. Pseudacacia*) was introduced into Europe in 1636. This tree, the false acacia, often called erroneously acacia, is now widely cultivated as an ornamental tree in Europe. It grows from 30 to 60 ft. high, and bears long, graceful compound leaves with 9 to 17 bright green oblong leaflets, and white fragrant flowers in loose pendulous racemes, recalling the laburnum. There are many varieties varying in the method of growth, the presence or absence of thorns (persistent spinose stipules) on the branches and the colour of the flower.

In the eastern United States, where it is native, it grows from 70 to 80 ft. high with a trunk 3 or 4 ft. in diameter. It is a valuable timber tree; the wood is heavy, hard, strong, close-grained and durable.

The clammy false acacia (*R. viscosa*), a tree sometimes 40 ft. high, with pinkish flowers, and the rose acacia or moss locust (*R. hispida*), a small shrub, with showy rose-coloured flowers, both natives to the south-eastern United States, are also cultivated for ornament.

ROBINSON, BENJAMIN LINCOLN (1864–), American botanist, was born at Bloomington, Ill., on Nov. 8, 1864, brother of James Harvey Robinson (*q.v.*). He graduated at Harvard university in 1887 and pursued further botanical study at the Universities of Strasbourg (Ph.D., 1889) and Bonn (Ph.D., 1890). He became assistant at the Gray herbarium in 1890, curator in 1892 and in 1899 was made Asa Gray professor of systematic botany, Harvard university. He was editor of portions of the *Synoptical Flora of North America*, by Asa Gray, Sereno, Watson, Robinson, and others (1892–97), and, with M. L. Fernald (*q.v.*), edited the 7th edition of *Gray's New Manual of Botany* (1908). In 1899 he became editor of *Rhodora*. He published a *Flora of the Galapagos Islands* and numerous papers on the classification of the higher plants of North America, Mexico and northern South America, especially on the Eupatorieae.

ROBINSON, EDWARD (1794–1863), American Biblical scholar, was born in Southington, Conn., on April 10, 1794. In 1837 he became professor of Biblical literature in Union Theological seminary, and left America for three years of study in Palestine and Germany, the fruit of which, his *Biblical Researches* (published simultaneously in England, Germany and America in 1841), brought him the gold medal of the Royal Geographical Society in 1842. *Later Biblical Researches* appeared in 1856. His plans to sum up his important topographical studies in a work on Biblical geography were cut short by cataract in 1861 and by his death in New York city on Jan. 27, 1863. A great Biblical scholar and exegete, Robinson must be considered the pioneer and father of Biblical geography. His *Biblical Researches*, supplemented by the *Physical Geography of the Holy Land* (1865), were based on careful personal exploration and tempered by a thoroughly critical spirit, which was possibly at times too sceptical of local tradition. Of scarcely less value in their day were his *Greek Harmony of the Gospels* (1845) and his *Greek and English Lexicon of the New Testament* (1836).

See H. B. Smith and R. D. Hitchcock, *The Life, Writings and Character of Edward Robinson* (1863); a biography of Mrs. Robinson was published, with a collection of her stories, in Leipzig, in 1874.

ROBINSON, EDWIN ARLINGTON (1869–), an American poet, was born at Head Tide (Maine), Dec. 22, 1869. From the public schools of Gardiner (Maine), he proceeded in 1891 to Harvard, but withdrew after two years. Most of his later life was spent in New York city, where he was for a time a subway inspector and, through President Roosevelt's recognition of his merit, a clerical worker in the Customs House. He received several awards of the Pulitzer prize for poetry.

His verse includes *The Torrent and the Night Before* (1896), *The Children of the Night* (1897), *Captain Craig* (1902), *The Town Down the River* (1910), *The Man Against the Sky* (1916), *Merlin* (1917), *Lancelot* (1920), *The Three Taverns* (1920), *Avon's Harvest* (1921), *Collected Poems* (1921), *Roman Bartholow* (1923), *The Man Who Died Twice* (1924), *Dionysus in Doubt* (1925), *Tristram* (1927) and *Cavender's House* (1929). Experiments in a different medium are the prose plays *Van Zorn* (1914) and *The Porcupine* (1915). Mr. Robinson's work, of singularly uniform poetic excellence and of penetrating insight, gives him a foremost place among contemporary writers.

See biographical and critical monographs by Lloyd Morris (with a bibliography by W. Van R. Whitall, 1923), by B. R. Redman (1926), and by Mark Van Doren (1927).

ROBINSON, HENRY CRABB (1775–1867), English journalist and diarist, the son of a tanner, was born at Bury St. Edmunds on March 13, 1775. He travelled much on the Continent of Europe, and acted as special war correspondent for the

Times in 1807–08. From 1813 to 1828 he practised at the bar. He is remembered chiefly as the friend of Lamb, Coleridge, Wordsworth and Southey. He was a great conversationalist, and his breakfast parties rivalled those of Samuel Rogers. He died in London on Feb. 5, 1867.

His *Diary* of 35 volumes, his *Journals* of 30 volumes, and his *Letters and Reminiscences* in 36 volumes, contain vivid pictures, drawn by an acute and sympathetic observer who had exceptional opportunities of studying contemporary celebrities. They are preserved at Dr. Williams's library in Gordon Square, London. Crabb Robinson seems to have intended to edit these for publication, but except for a selection edited by Thomas Sadler and entitled *The Diary, Reminiscences, and Correspondence of H. Crabb Robinson* (3 vols. 1869), and the *Correspondence of Henry Crabb Robinson with the Wordsworth Circle* ed. E. J. Morley (2 vols., 1927), they have never been reprinted. Crabb Robinson was one of the founders of the Athenaeum Club and of University college, London.

ROBINSON, JAMES HARVEY (1863–), American historian, was born in Bloomington (Ill.), on June 29, 1863. On graduating from Harvard university in 1887 he went to Germany, and studied history at Freiburg university. In 1891 he was lecturer on European history at the University of Pennsylvania and in 1892 he was appointed associate professor of history at Columbia university, becoming professor in 1895. He resigned his professorship in 1919 and devoted himself to the organization of the New School for Social Research in New York city. The "new history," of which he has been a leading exponent, challenges the traditional choice of material, maintaining that in the past far too much stress has been placed upon the course of politics and State rivalries, and too little on the rôle of thought in world changes. Dr. Robinson was an editor of the *Annals* of the American Academy of Political and Social Science (1891–95) and associate editor of *The American Historical Review* (1911–20). He wrote *An Introduction to the History of Western Europe* (1902–03; enl. ed. 1924–26); and other works.

ROBINSON, JOHN (1575–1625), English Nonconformist divine. Robinson settled in Amsterdam in 1608, but in the following year removed, with a large contingent, to Leiden, where he ministered to a community whose numbers gradually grew from one hundred to three hundred. In 1620 a considerable minority of these sailed for England in the "Speedwell," and ultimately crossed the Atlantic in the "Mayflower"; it was Robinson's intention to follow as soon as practicable, with the rest of his flock, but he died before the plan could be carried out, on March 1, 1625.

Amongst his publications may be mentioned *Justification of Separation from the Church* (1610), *Apologia Brownistarum* (1619), *A Defence of the Doctrine propounded by the Synod of Dort* (1624), and a volume of *Essays, or Observations Divine and Moral,* printed in 1625. His Works (with one exception, *A Manumission to a Manduction,* since published by the Massachusetts Historical Society, ser. iv., vol. i.), including a memoir, were reprinted by R. Ashton in three vols. in 1851. A summary of their contents is given in G. Punchard, *History of Congregationalism* (New York, 1867), iii. 300–344. *See* further CONGREGATIONALISM, and the literature there cited; also O. S. Davis, *John Robinson* (Hartford, Connecticut, 1897).

ROBINSON, SIR JOSEPH BENJAMIN (1840–), South African mine-owner, was born on Aug. 3, 1840, at Cradock, Cape Colony. He made his fortune in the diamond rush of 1867 on the Vaal river, by purchasing the stones from the natives and afterwards by buying diamond-bearing land. He was mayor of Kimberley in 1880, and for four years was a representative of Griqualand West in the Cape parliament. On the discovery of gold in the Witwatersrand district in 1886, Robinson purchased the Langlaagte and Randfontein estates. His views as to the westerly trend of the main gold-bearing reef were entirely contrary to the bulk of South African opinion at the time, but events proved him to be correct, and he became one of the richest men in South Africa. In 1908 he was created a baronet.

ROBINSON, JOSEPH TAYLOR (1872–), American politician, was born at Lonoke, Ark., on Aug. 26, 1872. After graduating at the University of Arkansas and receiving his law degree at the University of Virginia, he returned to Lonoke in 1895 to practise. He became interested in politics at once, was elected a member of the State legislature, 1895–97, and served as delegate to the Democratic national convention in 1900. In 1902 he was elected U.S. representative, in which office he was continued until he was elected governor of Arkansas in 1912. He was governor but a few weeks when he was elected by the State legislature to fill the position of U.S. senator left vacant by the death of Senator Jefferson Davis. Robinson was re-elected senator in 1918 and in 1924. In 1923 he was chosen to succeed Senator Underwood as chairman of the minority conference and Democratic floor leader. He possesses an unusual knowledge of parliamentary procedure, is a ready debater, and has been influential in securing much-needed legislation. He served as permanent chairman of the Democratic convention of 1928, and received the nomination of his party for the office of vice-president.

ROBINSON, LENNOX (1886–), Irish dramatist and author, was born at Douglas, county Cork, on Oct. 4, 1886, and educated at Bandon grammar school. His first play, *The Clancy Name,* was produced in 1908 at the Abbey theatre, Dublin, of which he was manager from 1910 to 1914. In 1915 he was appointed organizing librarian to the Carnegie Trust, a post which he held until 1925. From 1919–23 he was again manager of the Abbey theatre, and in 1923 became director. His plays *The Lost Leader* (1918) and *The Whiteheaded Boy* (1916) were both produced in London and in the United States. In addition to numerous plays, he has written one novel, *A Young Man from the South* (1917) and several volumes of short stories.

His plays include *The Cross Roads* (1909); *Two Plays* (1910); *Patriots* (1912); *The Dreamers* (1915); *The Round Table* (1924); *Crabbed Youth and Age* (1924); *The White Blackbird and Portrait* (1926). A collected edition was issued in 1928.

ROBOT. This term has long been in use in many languages. It is derived from the Czech word *robit* (work). It passed into popular use after 1923 to describe either mechanical devices so ingenious as to be almost human, or workers whom mechanical and repetitive work was making almost into machines. Its popular usage is based on the play *R.U.R.* (Rossum's Universal Robots), written by the Czechoslovakian writer, Karel Capek, in which society is described as depending on mechanical workers called robots, which can do any kind of mental or physical work and which when worn out are scrapped and replaced by new. In the play the robots develop intelligence and a spirit of revolt, turn upon their employers, and exterminate their creators.

The construction of a mechanical man has captivated the imagination of men since antiquity and early literature contains many schemes for the construction of some device that would require no human effort. It is not improbable that this idea has had a marked influence upon the development of mechanics and other branches of physics. In the Icelandic saga, Frithiof's ship needed no helmsman; she understood what was said to her and obeyed. In 1927 a steamship made a run of 21 days from San Francisco to Auckland, New Zealand, during which no human hand touched her steering apparatus. A modern robot had held her true to her compass course. (*See* NAVIGATION; GYROSCOPE.)

In the *Arabian Nights'* tale of the "Forty Thieves," Ali Baba stood before the cave and said "Open Sesame." The portal swung open without the aid of human hands. A robot controlling the door of an industrial plant in America actually opens when addressed in precisely the same words; addressed in any other manner the door remains immovable. In a mediaeval romance a great brazen head in the castle of a giant would tell those who inquired whatever they wished to know about the past, present or future. In Washington is a robot, known as the "Great Brass Brain" and to it are put questions about future ocean tides, which are promptly answered. It predicts the tides (*q.v.*) for every port in the world for years ahead with great precision. (*See* MATHEMATICAL INSTRUMENTS: *Harmonic Analyzers.*)

Mythical manlike monsters permeate the folklore of all peoples. Albertus Magnus in the Middle Ages, Roger Bacon, Descartes and other philosophers built androids or automatons in human form, which could open doors and play musical instruments. Anthropoid figures which apparently perform actions which call for independent thought are still to be seen and are often accepted with credulity by the public. On the other hand modern mechanical men have been constructed and placed at the disposal

of industry, that have sensitive fingers and ears, talk with a predetermined conversation, that are able to test by "a sense of taste" chemicals, and with some equivalent of the sense of smell and balance. By the use of photo-electric cells, the partial equivalent of the sense of sight has been accomplished. (*See* the articles SELENIUM CELLS, PHOTOELECTRICITY, AUTOMATIC MACHINES.)

Perhaps the most valuable outcome of these endeavours will be the development of mechanisms capable of taking over those tasks that men and women find too monotonous or otherwise burdensome. One such device is the Televox, invented in 1927 by R. J. Wensley of the Westinghouse Electric and Manufacturing Co. This device permits the use of the network of the telephone system for the distant control of an electrical mechanism by means of certain sounds. The mechanism is arranged to answer the telephone and execute orders in a manner peculiarly similar to that of a human being. It was developed for the use of public utility companies to supplement the use of supervisory control systems of electrical sub-stations, reservoir systems, gas regulators, etc.

The Televox can transmit electric meter readings, heights of water, gas pressures, position of valves and switches, and can execute actual mechanical operations at the direction of a distant operator. In using the Televox a call is put through exactly as though there were a human operator on the other end of the phone. The person making the call uses certain tones of the desired pitch to transmit the message. It is essential that a consistency of pitch be maintained. These tones are ordinarily delivered by electrically driven tuning forks. The telephone transmitter converts the tones into electrical vibrations, which at the distant station are caused to actuate steel reeds, which in turn actuate the selecting and operating relays. The responses are obtained from an instrument placed near the transmitter which sounds certain combinations of long and short notes, to form a code understandable by the operator at the other phone. The machine "hangs up" the receiver when the order has been executed, thereby ending the "conversation."

There are a number of processing machines which control all processes in a given industry, including temperature and humidity control during the process, starting, stopping, and varying the different materials which enter into the process in accordance with a time schedule, and independent of an outlet. If anything goes wrong, the machine stops and shows a red light until the operator has made the necessary changes. At the conclusion of the operation the machine shows a green light until the operator has removed the material in process. The Tagliabue Automatic Flue-Gas Analyzing Machine which makes an analysis for CO_2 and for CO every minute, and records the results, is such a robot.

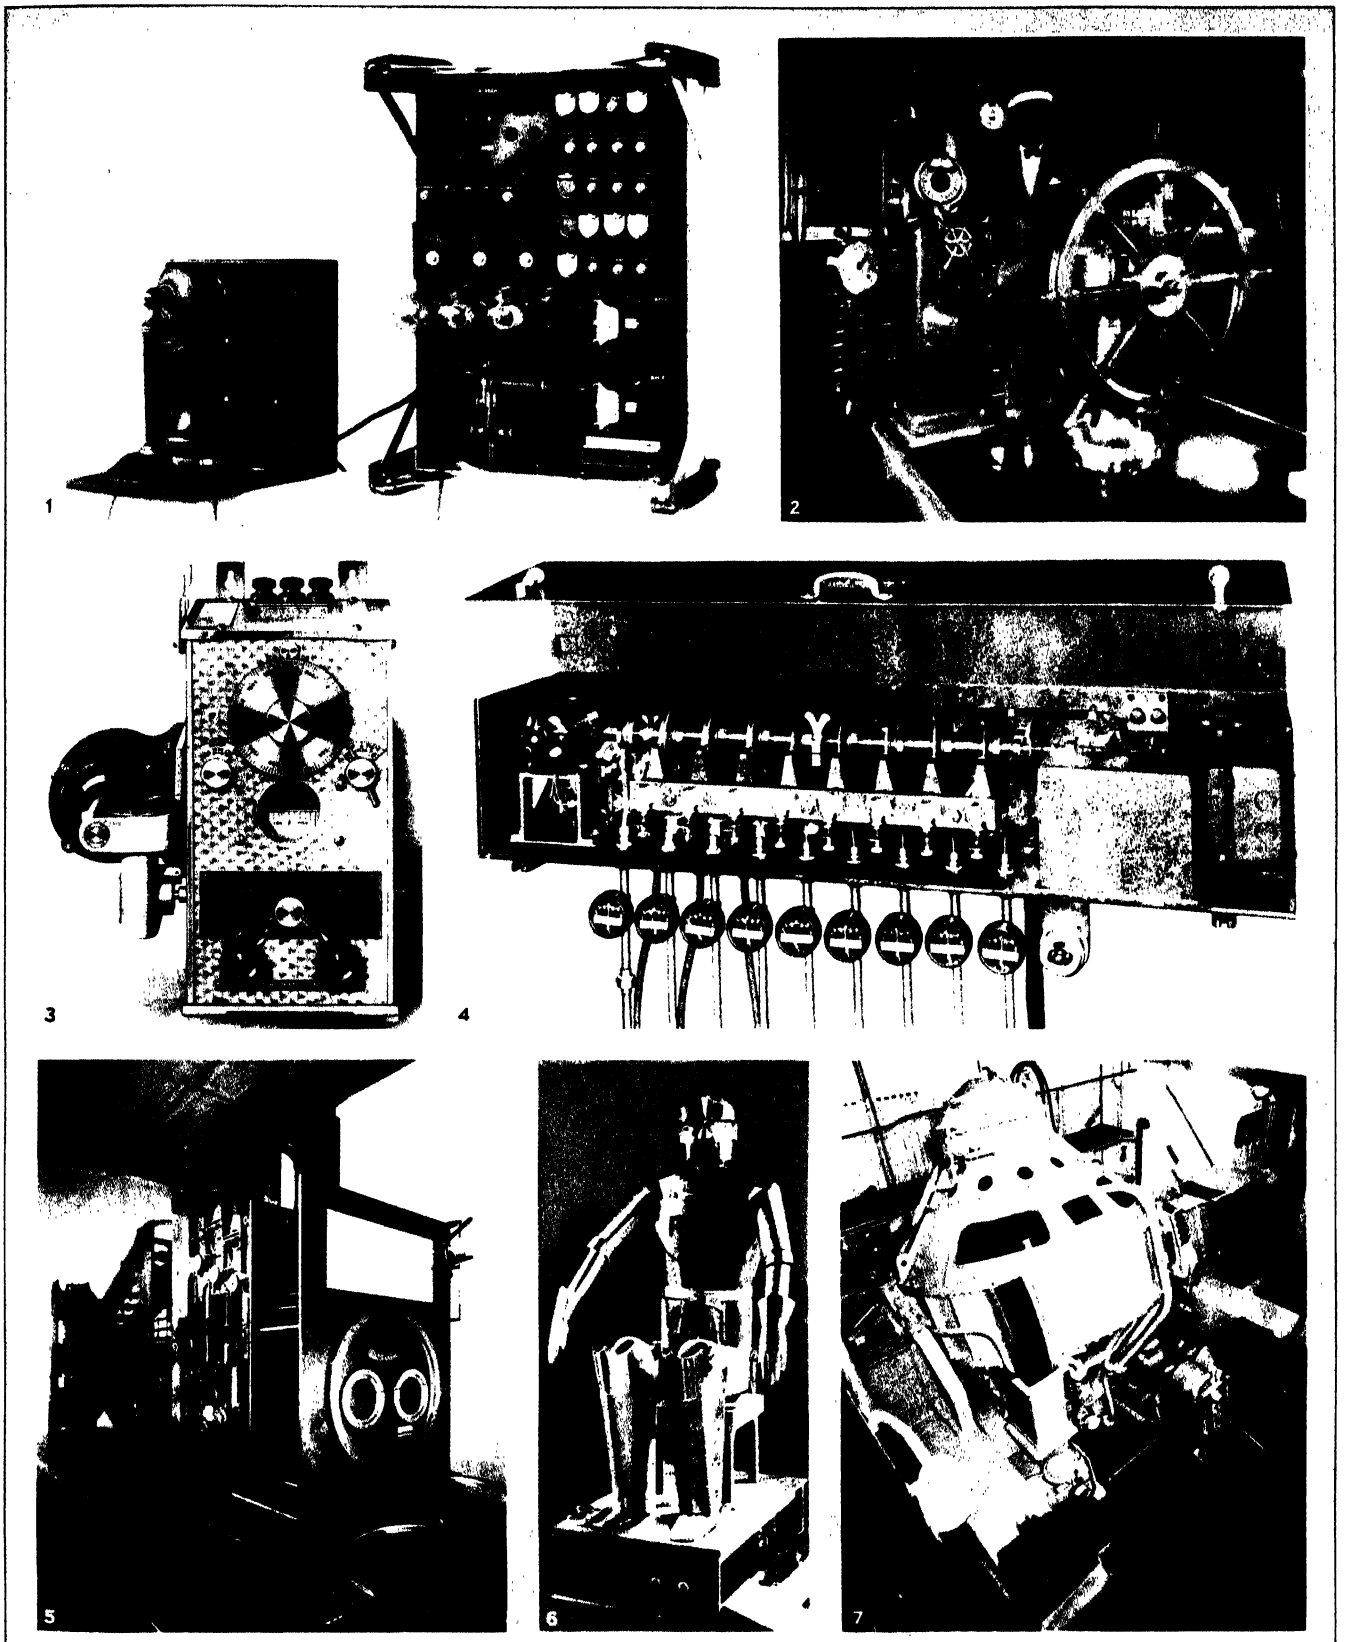
The Product Integraph (*q.v.*) is a robot which solves almost any second-order differential equation. It performs, by a combination of electrical and mechanical means, certain computations which are actually beyond the power of the human brain, so far demonstrated. Other processes, which if performed by mathematics would require from a week to a year to solve, are solved by the integraph in a few minutes or hours.

(For New York City traffic control system *see* TRAFFIC AND TRAFFIC REGULATION.) (W. H. TU.)

ROB ROY (1671–1734), the designation of a Highland outlaw whose prowess is the theme of one of Sir Walter Scott's novels, and who was by descent a Macgregor. He received the name Roy from his red hair, and latterly adopted Campbell as his surname on account of the acts proscribing the name of his own clan. At first he devoted himself to rearing cattle on his estates on the Braes of Balquhidder, but having formed a band of clansmen, he obtained, after the accession of William III., a commission from James II. to levy war on all who refused to acknowledge him as king. Shortly afterwards he married Helen Mary, daughter of Macgregor of Comar. On the death of Gregor Macgregor, the chief of the clan, in 1693 he was acknowledged chief, obtaining control of the lands stretching from the Braes of Balquhidder to the shores of Loch Lomond, and situated between the possessions of Argyll and those of Montrose. To assist in carrying on his trade as cattle-dealer he borrowed money from the 1st duke of Montrose, and, being unable to repay it, was in 1712 evicted and declared an outlaw. Taking refuge in the Highlands, Rob Roy supported himself by depredations on the duke and his tenants, all attempts to capture him being unsuccessful. During the rebellion of 1715, though nominally siding with the Pretender, he took no part in the battle of Sheriffmuir except in plundering the dead on both sides. He was included in the Act of Attainder; but through the influence of the duke of Argyll, he obtained, on making his submission at Inveraray, a promise of protection. He now established his residence at Craigroyston, near Loch Lomond, whence for some time he levied blackmail as formerly upon Montrose. Ultimately, through the mediation of Argyll, he was reconciled to Montrose, and in 1722 he made submission to General Wade; he was carried off, and imprisoned in Newgate, and in 1727 was pardoned just as he was to be transported to Barbados. He died at Balquhidder on Dec. 28, 1734, and was buried in Balquhidder churchyard.

The best lives are K. Macleay, *Historical Memoirs of Rob Roy* (1818; new ed., 1881); A. H. Millar, *Story of Rob Roy* (1883). *See* also Sir W. Scott's introduction to the novel *Rob Roy*. An early account, *The Highland Rogue, etc.* (1723), is ascribed to Defoe.

ROBSART, AMY, first name of LADY AMY DUDLEY (1532–1560), wife of Lord Robert Dudley, afterwards earl of Leicester. She was the daughter of Sir John Robsart of Norfolk, and was married to Lord Robert on June 4, 1550. When Elizabeth became queen in 1559 Lord Robert was soon known to be her favourite, and it was believed that she would marry him if he were free. His wife never came to court and was never in his company. In 1560 she went by her husband's directions to Cumnor Place, a house near Oxford, rented by his agent Anthony Forster or Forrester, member of parliament for Abingdon. Here she was found lying dead on the floor of the hall on Sept. 8, 1560, by her servants. The circumstances of her death were never cleared up.



See G. Adlard, *Amy Robsart and Leycester* (London, 1870), and W. Rye, *The Murder of Amy Robsart* (London, 1885).

ROC, or more correctly RUKH, a fabulous bird of enormous size which carries off elephants to feed its young. The legend of the roc, familiar from the *Arabian Nights*, was widely spread in the East; and in later times the home of the monster was sought in Madagascar, whence gigantic fronds of the *Raphia* palm very like a quill in form appear to have been brought under the name of roc's feathers (*see* Yule's *Marco Polo*, bk. iii. ch. 33). Such a feather was brought to the Great Khan, and we read also of a gigantic stump of a roc's quill being brought to Spain by a merchant from the China seas. The roc is hardly different from the Arabian *'ankā* (*see* PHOENIX); it is also identified with the Persian *sīmurgh*.

Jayakar (1906).

ROCAILLE, in architecture, a form of ornament much used in the rococo styles, based originally on the grotesque, artificial rockeries and shells of the Louis 15th period. (*See* LOUIS STYLES; ROCOCO.)

ROCAMADOUR, a village of south-western France, in the department of Lot, 36 m. N.N.E. of Cahors by road. Pop. (1926) 208. Rocamadour owes its origin to St. Amadour or Amateur, who, according to tradition, chose the place as a hermitage for his devotions to the Virgin Mary. The renown of Rocamadour as a place of pilgrimage dates from the early middle ages. Rocamadour is most strikingly situated. Its buildings rise in stages up the side of a cliff on the right slope of the gorge of the Alzou. Flights of steps ascend from the lower town to the churches half-way up the cliff. The chief of them is the church of Notre-Dame (1479), containing the wooden figure of the Madonna reputed to have been carved by St. Amadour. The interior walls of the church of St. Sauveur are covered with paintings and inscriptions recalling the pilgrimages of celebrated persons. The subterranean church of St. Amadour (1166) extends beneath St. Sauveur and contains relics of the saint. On the summit of the

ROBOTS AND THEIR FUNCTIONS IN VARIOUS INDUSTRIES

1. The American developed Televox which answers questions put to it and automatically executes orders, in a peculiarly human-like manner, enabling the use of the telephone for remote control. 2. Wheel-house in an automatically steered steamship. The gyro-pilot and the gyro-compass by which it is controlled are shown to the left. By properly adjusting the small handwheel, the large rudder wheel is operated to maintain the ship upon its course. 3. A single Robot used in pyrometry. 4. An automatic cycle controller, used in industry for the regulation of the various steps in a manufacturing process, in this case for controlling all the operations in the curing of rubber. 5. American Coast and Geodetic Survey tide predicting machine. 6. "Eric," a novel theatrical adaptation of the Robot, which moves and talks by means of the apparatus concealed within its armour. 7. The Gory ship stabilizer by means of which freedom from undue rolling is obtained

cliff stands the mediaeval château built to defend the sanctuaries.

ROCAMBOLE, *Allium Scorodoprasum* (family Liliaceae), a hardy bulbous perennial occurring in a wild state in sandy pastures and waste places throughout Europe, but not common in the south; in Great Britain it is rare, and found only in the north of England and the south of Scotland. The plant is grown for its bulbs, which are smaller and milder than those of garlic, and consist of several cloves chiefly produced at the roots. The cloves are planted about the end of February or in March, and treated like shallot.

ROCH, ST. (Lat. Rochus; Ital. Rocco; Span. Roque; Fr. Roch) (d. 1327), a confessor whose death is commemorated on Aug. 16; he is specially invoked against the plague. According to his *Acta,* he was born at Montpellier, France, about 1295. On the death of his parents in his twentieth year he gave all his substance to the poor. Coming to Italy during an epidemic of plague, he tended the sick in the public hospitals at Aquapendente, Cesena and Rome, and effected many miraculous cures by prayer and simple contact. After similar ministries at Piacenza he himself fell ill. He was expelled from the town, and withdrew into the forest, where he would have perished had not a dog belonging to a nobleman named Gothardus supplied him with bread. On his return to Montpellier he was arrested as a spy and thrown into prison, where he died on Aug. 16, 1327, having previously obtained from God this favour—that all plague-stricken persons invoking him should be healed. His cult spread through Spain, France, Germany, Belgium and Italy. A magnificent temple was raised to him at Venice.

See *Acta sanctorum,* August iii. 380–415; Charles Cahier *Les Caractéristiques des saints* (Paris, 1867), pp. 216–217. (H. Dz.)

ROCHAMBEAU, JEAN BAPTISTE DONATIEN DE VIMEUR, Comte de (1725–1807), French soldier, was born at Vendôme (Loir-et-Cher) on July 1, 1725. He was brought up at the Jesuit college at Blois, but entered a cavalry regiment. He served in Bohemia and Bavaria and on the Rhine, and in 1747 had attained the rank of colonel. He became governor of Vendôme in 1749, and after distinguishing himself in 1756 in the Minorca expedition was promoted brigadier of infantry. In 1757 and 1758 he fought in Germany, notably at Crefeld, received several wounds in the battle of Clostercamp (1760), and was appointed *maréchal de camp* in 1761 and inspector of cavalry. In 1780 he was sent, with the rank of lieutenant-general, in command of 6,000 French troops to help the American colonists under Washington against the English. He landed at Newport, Rhode Island, on July 10, but was held here inactive for a year, owing to his reluctance to abandon the French fleet, blockaded by the British in Narragansett Bay. At last, in July 1781, Rochambeau's force was able to leave Rhode Island and joined Washington on the Hudson. Then followed the celebrated march of the combined forces to Yorktown, where on Sept. 22, they joined the troops of Lafayette; Cornwallis was forced to surrender on Oct. 19. Congress voted Rochambeau and his troops the thanks of the nation and presented him with two cannon taken from the English. These guns, which Rochambeau took back to Vendôme, were requisitioned in 1792. On his return to France he was loaded with favours by Louis XVI. and was made governor of Picardy. During the Revolution he commanded the Army of the North in 1790, but resigned in 1792. He was arrested during the Terror, and narrowly escaped the guillotine. He was subsequently pensioned by Bonaparte, and died at Thoré (Loir-et-Cher) on May 10, 1807.

A statue of Rochambeau by Ferdinand Hamar, the gift of France to the United States, was unveiled in Lafayette square, Washington, by President Roosevelt on May 26, 1902.

The *Mémoires militaires, historiques et politiques, de Rochambeau* were published by Luce de Lancival in 1809. Of the first volume a part, translated into English by M. W. E. Wright, was published in 1838 under the title of *Memoirs of the Marshal Count de R. relative to the War of Independence in the United States.* Rochambeau's correspondence during the American campaign is published in H. Doniol, *Hist. de la participation de la France à l'établissement des États Unis d'Amérique,* vol. v. (1892). *See* Duchesne, "Autour de Rochambeau" in the *Revue des facultés catholiques de l'ouest* (1898–1900); E. Gachot, "Rochambeau" in the *Nouvelle Revue* (1902); H. de Ganniers, "La Dernière Campagne du maréchal de Rochambeau" in the *Revue des questions historiques* (1901); and J. J. Jusserand, "Rochambeau and the French in America" in *With Americans of Past and Present Days* (1916).

ROCHDALE, municipal, county and parliamentary borough, Lancashire, England, on the river Roch and the Rochdale canal, 10½ m. N.E. from Manchester and 196 m. N.W. from London by L.M.S. railway. Pop. (1921) 90,816. The site rises sharply from the Roch, near its confluence with the Spodden, and there are fine views from the high-lying public park. Several interesting old houses remain near the town. The parish church of St. Chad is on the site of a 12th century church, but itself retains no portion earlier than the Perpendicular period. Of educational charities the principal is the Archbishop Parker free grammar school (founded 1565). There are also technical and art schools; and a large Roman Catholic orphanage. Rochdale was the birthplace of the co-operative movement. The Equitable Pioneers society was founded here in 1844. A statue of John Bright (1891) recalls the connection of the statesman's family with Rochdale. Rochdale was incorporated in 1856, but the parliamentary borough has returned one member since 1832. The county borough was created in 1888.

Rochdale (Recedham, Rachedam, Rachedal) takes its name from the river on which it stands. A Roman road passed the site, and a Saxon castle stood in Castleton. In Edward the Confessor's reign most of the land was held by Gamel the Thane, but after the Conquest the manor came into the hands of Roger de Poictou, from whom it passed to the Lacys and became merged in the duchy of Lancaster. From 1462 to 1625 the crown leased it to the Byron family. In 1625 Charles I. conveyed the manor in trust, and in 1638 it was sold to Sir John Byron, afterwards Baron Byron of Rochdale, whose descendants held it till 1823 when it was sold to the Deardens. Manor courts are still held periodically. Henry III. (1240–41) granted to Edmund de Lacy the right to hold a weekly market on Wednesday and an annual fair on the feast of SS. Simon and Jude (Oct. 28).

ROCHDALE PIONEERS: *see* Co-operation.

ROCHEFORT, HENRI, Marquis de Rochefort-Luçay (1830–1913), French politician, was born in Paris on Jan. 30, 1830. He was already known as a successful journalist and writer of vaudevilles when he started a paper of his own, *La Lanterne.* The paper was seized on its eleventh appearance, and in August 1868 Rochefort was fined 10,000 francs, with a year's imprisonment. He then published his paper in Brussels, whence it was smuggled into France. Printed in French, English, Spanish, Italian and German, it went the round of Europe. After a second prosecution he fled to Belgium. A series of duels, of which the most famous was one fought with Paul de Cassagnac apropos of an article on Joan of Arc, kept Rochefort in the public eye. In 1869 he was returned to the Chamber of Deputies by the first *circonscription* of Paris. He renewed his onslaught on the empire, starting a new paper, the *Marseillaise,* as the organ of political meetings arranged by himself at La Villette. The staff was appointed on the votes of the members, and included Victor Noir and Pascal Grousset. The violent articles in this paper led to the duel which resulted in Victor Noir's death at the hands of Prince Pierre Bonaparte. The paper was seized, and Rochefort and Grousset were sent to prison for six months. The revolution of September was the signal for his release. He became a member of the 'government of National Defence, but he openly expressed sympathy with the Communards, and on May 11, 1871, he fled in disguise from Paris. A week earlier he had resigned with a handful of other deputies from the National Assembly rather than countenance the dismemberment of France.

Condemned under military law to imprisonment for life, he was transported to New Caledonia. In 1874 he escaped to San Francisco. He lived in London and Geneva until the general amnesty permitted his return to France in 1880. He then founded *L'Intransigeant* in the Radical interest. He was condemned to detention in a fortress in August 1889 at the same time as General Boulanger, whom he had followed into exile. After his return

(1895) to Paris he became a leader of the anti-Dreyfusards. Subsequently he was editor of *La Patrie*. Rochefort died at Aix-les-Bains in 1913.

Besides his plays and articles in the journals he published several separate works, among them being: *Les Petits Mystères de l'Hôtel des Ventes* (1862), a collection of his art criticisms; *Les Dépravés* (Geneva, 1882); *Les Naufrageurs* (1876); *L'Évadé* (1883); *Napoléon dernier* (3 vols., 1884); and *Les Aventures de ma vie* (5 vols., 1896).

ROCHEFORT, a small town of Belgium, on the Lomme, a tributary of the Lesse, in the south-east of the province of Namur close to the Ardenne. Resident pop. (1920) 3,248, doubled in July and August. It has ruins of the old castle, which gave the place its name and a title to a long line of counts who had the right of coining their own money. This castle underwent many sieges and suffered much in the earlier wars, especially at the hands of Marshal de Chatillon in 1636. Rochefort is noted for its healthiness, and is a favourite place of residence and resort. There are many grottoes, one of which, in the town itself, contains six halls or chambers; the largest, called the Sabbat, is remarkable for its great height. But the most famous are the grottoes of Han, three miles from Rochefort where the river Lesse passes by a subterranean and undiscovered passage under the hill called Boème or Boine. The endeavour to trace the course of the river led to the discovery of the grottoes, which consist of fifteen separate halls, connected by passages more or less short and emerging on the river in a dark and extensive cavern forming a sort of side creek or bay. Near Rochefort are the famous red marble quarries of St. Remy, and the old Cistercian abbey of that name is now a Trappist seminary.

ROCHEFORT, a town of western France, capital of an arrondissement in the department of Charente-Inférieure, 20 m. S.S.E. of La Rochelle on the State railway from Nantes to Bordeaux. Pop. (1926) 24,110.

The lordship of Rochefort, held by powerful nobles in the 11th century, was united to the French Crown by Philip the Fair early in the 14th century; but it was alternately seized during the Hundred Years' War by the English and the French, and in the Wars of Religion by the Catholics and Protestants. Colbert in 1665 chose Rochefort as the seat of a repairing port between Brest and the Gironde, so the town rapidly increased in importance, and the Dutch admiral Cornelius Tromp with his fleet failed to destroy the new arsenal. The naval school, afterwards transferred to Brest, was originally founded at Rochefort. Its fleet, under Admiral la Gallissonnière, a native of the place, defeated Admiral Byng in 1755 and did good service in the wars of the republic. But the destruction of the French fleet by the English in 1809 in the roadstead of Île d'Aix, the preference accorded to Brest and Toulon and the unhealthiness of its climate diminished its prosperity.

Rochefort is capital of the fourth maritime arrondissement, which stretches from the bay of Bourgneuf to the coast of Spain. The commercial harbour, higher up the river than the naval harbour, has two small basins, a third basin with a depth at neap-tide of 24 ft., at spring-tide of 30 ft., and a dry dock. Trade is in wood, cereals, salt and coal.

ROCHESTER, JOHN WILMOT, 2ND EARL OF (1647–1680), English poet and wit, the son of Henry Wilmot, the 1st Earl, was born at Ditchley in Oxfordshire on April 10, 1647, and succeeded his father as 2nd earl in 1658. He was educated at Wadham college, Oxford, and in 1661, although he was only 14 years of age, received the degree of M.A. On leaving Oxford he travelled in France and Italy with a tutor. He returned in 1664, and at once made his way to Charles II.'s court, where his youth, good looks and wit assured him of a welcome. In 1665 he joined the fleet serving against the Dutch as a volunteer. He became gentleman of the bedchamber to Charles II. John Dryden had dedicated to him his *Marriage-à-la-Mode* (1672); but his *Aurengzebe* (1675) was dedicated to Lord Mulgrave, who was Rochester's enemy. Consequently Rochester thwarted Dryden at every turn, and in 1679 a band of roughs set on the poet in Rose Alley, Covent Garden, and beat him. Rochester obviously felt no shame for this infamous attack, for in his "Imitation of the First Satire of Juvenal" he says, "Who'd be a wit in Dryden's cudgelled skin?" His health was already undermined, and in the spring of 1680 he retired to High Lodge, Woodstock Park. He began to show signs of a more serious temper, and at his own request was visited (July 20 to July 24) by Bishop Burnet, who attested the sincerity of his repentance. He died, however, two days after the bishop left him. When his son Charles, the 3rd earl, died on Nov. 12, 1681, his titles became extinct.

As a poet Rochester was a follower of Abraham Cowley and of Boileau, to both of whom he was considerably indebted. His love lyrics are often happy, but his real vigour and ability is best shown in his critical poems and satires. The political satires are notable for their fierce exposure of Charles II.'s weakness.

BIBLIOGRAPHY.—*Poems on Several Occasions by the Right Honourable the Earl of Rochester . . .* (Antwerp, 1680) was really printed in London. Other issues, slightly varying in title and contents, appeared in 1685, 1691 and 1696. *Valentinian, A Tragedy,* adapted from Beaumont and Fletcher, was printed in 1685; a scurrilous attack on Charles II. in the shape of a play in heroic couplets, *Sodom,* was printed in 1684, and is supposed, in spite of Rochester's denial, to have been chiefly his work. No copy of this is known, but there are two mss. extant. The completest edition of his works is *The Poetical Works of the Earl of Rochester* (1731–32). Expurgated collections are to be found in Johnson's, Anderson's and Chalmers's editions of the *British Poets.* His *Familiar Letters* were printed in 1686, 1697 and 1699. His Political Satires are available, with those of Sir John Denham and Andrew Marvell, in the *Bibliotheca Curiosa,* Some Political Satires of the Seventeenth Century, vol. i., Edinburgh, 1885.

ROCHESTER, LAWRENCE HYDE, EARL OF (1641–1711), English statesman, second son of Edward Hyde, earl of Clarendon, was born in March 1641. After the restoration of Charles II. he sat as member of parliament, first for Newport in Cornwall and afterwards for the university of Oxford, from 1660 to 1679. In 1661 he was sent on a complimentary embassy to Louis XIV. of France, while he held the court post of master of the robes from 1662 to 1675. In 1665 he married Henrietta (d. 1687), daughter of Richard Boyle, earl of Burlington and Cork. When his father was impeached in 1667, Lawrence joined with his elder brother, Henry, in defending him in parliament, but the fall of Clarendon did not injuriously affect the fortunes of his sons. They were connected with the royal family through the marriage of their sister, Anne, with the duke of York, afterwards James II., and were both able and zealous royalists. In 1687 Lawrence Hyde was made Viscount Hyde of Kenilworth, and in November following earl of Rochester. He was compelled to join in arranging the treaty of 1681, by which Louis XIV. agreed to pay a subsidy to Charles, at the very moment when he was imploring William, prince of Orange, to save Europe from the ambitions of the French monarch. In August 1684 he was removed from the treasury to the post of president of the council. He was still president of the council when James II. became king in February 1685, and he was at once appointed lord treasurer. But in spite of their family relationship and their long friendship, James and his treasurer did not agree. In January 1687 he was removed from his office of treasurer.

After the revolution of 1688 Rochester, after a brief protest, accepted the new régime. From December 1700 until February 1703 he was lord lieutenant of Ireland, and in 1710 he was again made lord president of the council. He died on May 2, 1711, and was succeeded by his only son, Henry (1672–1758), who in 1724 inherited the earldom of Clarendon. When Henry died without issue on December 10, 1758, all his titles became extinct.

The correspondence of Rochester with his brother the earl of Clarendon, together with other letters written by him, was published with notes by S. W. Singer (1828). Other authorities are G. Burnet, *History of his Own Time,* edited by O. Airy (Oxford, 1897–1900); John Evelyn, *Diary,* edited by H. B. Wheatley (1879); and Macaulay, *History of England.*

ROCHESTER, a city and municipal borough of Kent, England, on the river Medway, 33 m. E.S.E. of London by the S.R. Pop. (1921) 31,933. Its situation on the Roman way from the Kentish ports to London, as well as at a Medway crossing, gave Rochester (Durobrivae, Hrofescester or Hrobicester, Roffa) an early importance. It was a walled Romano-British town, and the original bridge across the Medway probably dated from that period. The church of St. Andrew was founded by King Aethel-

bert, who also made Rochester a bishop's see. Rochester was a royal borough in the time of William I., who raised a castle here, probably on Boley hill. Richard I. granted the citizens quittance of *passagium* from crusaders in the town of Rochester. In 1227 Henry III. granted them the city at a fee farm rent of £25; he also granted them a gild merchant, the right to be impleaded only within the city walls, and other liberties. These charters were confirmed by subsequent sovereigns down to Henry VI., who in 1446 incorporated the city by the title of the bailiff and citizens, and granted them the power of admiralty and many privileges. Edward IV. by his charter of 1461 altered the incorporation to the mayor and citizens. Charters were granted in successive reigns down to Charles I., whose charter of 1629 remained the governing charter until 1835.

Chatham lies east of the city on the same bank of the river, while Strood is opposite. The cathedral church of St. Andrew was originally founded by Augustine in 604, for whom Aethelbert built the church. It was partially destroyed by the Danes, but was rebuilt by Bishop Gundulph, the second Norman bishop (1077–1108). Gundulph at the same time (1089) established an order of Benedictine monks here. Bishop Ernulf (1115–24) completed and also renovated the church, lengthening it by two bays eastward; the old chapter-house remains. The Norman west front was built about 1125–30, and in 1130 the new cathedral was consecrated. The work included an extended choir by William de Hoo (1227), enlargement of the main transepts, the building of piers for a central tower, and treatment of the nave to the third bay. About 1352 a low central tower was built, to which a spire was added in the next century. Towards the end of the 15th century St. Mary's chapel was added.

The ruins of Gundulph's Tower stand detached from and are earlier than the church; it was built by Bishop Gundulph probably as a defensive work for the eastern boundary of the city. The crypt beneath the choir is Early Norman in the western part. The remainder is Early English, and there are traces of mural painting. The library attached to the modern chapter-house contains, among various relics, the *Textus Roffensis*, being records of the cathedral compiled in the time of Bishop Ernulf.

On the eminence overlooking the right bank of the river and commanding a wide view of the surrounding country are the remains of the Norman castle, part of which was built by Bishop Gundulph at the order of William Rufus in the 11th century. The castle was besieged by King John, by Simon de Montfort in the reign of Henry III., and by the followers of Wat Tyler. It was repaired by Edward IV., but soon afterwards fell into decay, although the massive keep still stands. This is the work of William de Corbeil, archbishop of Canterbury, to whom the castle was granted in 1126. It is a quadrangular four-storeyed structure, flanked by turrets, with a height of 120 feet. Remains of the 13th-century walls which once surrounded the city also exist. Gad's Hill, above Strood, to the north-west, was the residence of Charles Dickens.

At Borstal, south-west of Rochester, was a large convict prison where early experiments on the educational treatment of delinquent boys between the ages of 16 and 21 were carried out, which resulted in the Borstal System (*q.v.*).

Among the principal buildings in the city are the town hall (1687), the Richard Watt's almshouses (1579), and the almshouse of St. Catherine, which originated in 1316 as a leper's hospital. An Elizabethan mansion was acquired by the corporation for a museum as a memorial of Queen Victoria's diamond jubilee. The principal schools are the cathedral grammar school or King's school, founded in 1544, and the Williamson mathematical school (1704), formerly for sons of freemen but now open to all.

ROCHESTER, a city of south-eastern Minnesota, U.S.A., on the Zumbro river, at an altitude of 1,180 ft.; the county seat of Olmsted county and the seat of the Mayo Clinic. It is on Federal highways 14 and 55, and is served by the Chicago Great Western and the Chicago and North Western railways and by motor-bus lines in all directions. Pop. (1920) 13,722 (86% native white), estimated locally at 18,000 in 1928. The transient population is estimated at 300,000 annually. Rochester is an attractive city amid picturesque surroundings, in one of the most prosperous agricultural counties in the United States. There are wholesale groceries and commission houses, creameries, flour mills, a camera factory, and several other manufacturing industries. The city owns and operates a hydro-electric plant, as well as the electric plant and the water system. Just east of the city is the Rochester State hospital for the insane, in a tract of 1,375 ac., with accommodation for 1,300 patients. On July 21, 1883, a severe tornado devastated the northern part of the city, killing 26 persons and injuring 41. A direct consequence of this disaster was the founding of St. Mary's hospital by the Sisters of Saint Francis, who had opened a convent here in 1877. The hospital was opened to patients in 1889, with Dr. W. W. Mayo as consulting surgeon, and his sons, Drs. William J. and Charles H. Mayo, as attending surgeons. Its capacity has grown to 600 beds. About 300 graduates of medical schools are studying in the hospital, under the Mayo Foundation for Medical Education and Research, incorporated in 1915 by the Mayos and endowed by them (through the University of Minnesota) with about $2,000,000.

The first settler in Rochester built his log cabin in 1854 and laid out the main street by dragging a log through the brush. He called it Rochester because the falls near by reminded him of those at Rochester, N.Y. By 1858 there was a population of 1,500 and the settlement was incorporated as a city.

ROCHESTER, a city of Strafford county, New Hampshire, U.S.A., on the Cochecho and the Salmon Falls rivers, 18 m. N.W. of Portsmouth. It is served by four lines of the Boston and Maine railroad. Pop. (1920) 9,673 (85% native white); 1928 local estimate has placed it at 11,000. The town of Rochester (named for Lawrence Hyde, earl of Rochester) was incorporated by royal charter in 1722, but no settlement was made until 1728. It was chartered as a city in 1891.

ROCHESTER, a city of north-western New York, U.S.A., 70 m. E.N.E. of Buffalo, on the Genesee river, the State Barge canal and Lake Ontario; a port of entry and the county seat of Monroe county. It has a municipal airport and is served by the Buffalo, Rochester and Pittsburgh, the Erie, the Lehigh Valley, the New York Central, the Pennsylvania and the West Shore railways, inter-urban trolleys, motor-bus and truck lines, lake steamers and canal barges. Pop. (1920) 295,750 (24% foreign-born white); 1928 local estimate 329,400.

The city occupies 34 sq.m. on a broad, level plateau, ranging from 500 to 697 ft. above sea-level. Through the centre runs the Genesee river, in a deep gorge with banks 50 to 200 ft. high, and within the city limits are its three cataracts, which have a combined fall of 261 feet. At the mouth of the river is the port of Rochester. The State Barge canal also crosses the city. In the abandoned bed of the Erie canal a subway has been constructed, to accommodate trackage for suburban trolley lines and for a belt-line connecting all the railways, with a boulevard (Broad street) for vehicular traffic at the street level above. The city's 1,300 streets have a total mileage of 500 (339 m. paved). Its park system, planned by Frederick Law Olmsted, embraces 5 large and 28 small parks, covering 1,777 ac., and provides generous facilities for outdoor play and recreation. Durand-Eastman park (484 ac.) has 4 m. of frontage on Lake Ontario, and Genesee Valley park (600 ac.) contains some of the most picturesque stretches of the river. A city-planning bureau has been in existence since 1917, and zoning ordinances are in effect. There are over 170 churches, many of which are architecturally noteworthy, including St. Patrick's cathedral (Roman Catholic) and the Baptist temple.

Rochester is an important educational centre, the seat of the University of Rochester (Baptist; 1850); Rochester Theological seminary (Baptist; 1850), not connected with the university; St. Bernard's Theological seminary (Roman Catholic; 1893); the Rochester School of Optometry; and the Athenaeum and Mechanics' institute, founded in 1885 by Henry Lomb, of the Bausch and Lomb Optical Company, in continuation of the Rochester Athenaeum (established 1829), and housed in a large building given by George Eastman. The University of Rochester (founded 1850) consists of a college of arts and sciences, the

Eastman school of music, (established in 1918 by various gifts from George Eastman, aggregating $12,000,000 by 1928) and the school of medicine and dentistry (established in 1920 through gifts from George Eastman, the General Education Board and others). The total endowment of the university amounts to $24,500,000 (1928). The public-school system adopted by the people of the city (comprising 49 grammar, 4 junior high, 4 high, 2 continuation and 7 special schools in 1928) has led in developing the junior high school, in using the school buildings as community centres, and in various other improvements. There are about 40 parochial schools and 22 other schools under private auspices. The charitable organizations of the city are jointly financed through a community chest, which had its origin during the World War, and which raises annually about $1,500,000 contributed by over 90,000 citizens. The daily papers include the *Times-Union* (Independent; 1826), the *Democrat and Chronicle*, the *Herald* (Republican; 1832), the *Journal-American* (1922), and the German *Abendpost* (1851). Weeklies are published in Italian and Polish. Since Jan. 1, 1928, the city has operated under a commission-manager form of government. The assessed valuation for 1927 was $633,806,606.

The falls of the Genesee provide a vast water-power, which has been utilized for manufacturing throughout the city's history. There are some 1,700 manufacturing establishments, making 325 different commodities, most of which require mechanical skill. The aggregate factory output in 1925 was valued at $337,548,402. The leading products (measured by value) are men's clothing ($55,116,973 in 1925), electrical machinery, apparatus and supplies ($25,072,403), foundry and machine-shop products ($21,394,693) and boots and shoes, largely women's shoes ($17,974,270). There are more than a score of large nurseries in the city and around it, shipping seeds, bulbs and plants to all parts of the country. The city has an extensive wholesale and retail trade. The commerce of its port amounted in 1926 to 1,115,020 tons, valued at $9,671,626. Exports from the customs district in 1927 were valued at $8,345,237; imports at $8,248,605. Bank debits for the year aggregated $2,193,747,000.

When first visited by Europeans the region about Rochester was the home of the Seneca Indians. The Jesuit missionaries Chaumonot and Frémin worked among them in the 17th century. In 1687 the Marquis de Denonville fought a battle with the Iroquois near the falls, and there was a French post on Irondequoit bay in 1710. The district was included in the Phelps-Gorham purchase in 1788. In 1789 Ebenezer ("Indian") Allan built a saw-mill and a grist-mill at the falls; in 1802 the site of the present city passed into the hands of three men from Maryland, among them Nathaniel Rochester (1752–1831), who established a settlement, largely of New Englanders, at the falls in 1810–12; and in 1817 the village of Rochesterville was incorporated. During the early years it grew slowly, as it was not on the direct route from Albany to Buffalo and the region was malarial. There were only 1,502 inhabitants in 1820. Monroe county was erected in 1821, with Rochester as its judicial seat; the Rochester and Lockport section of the Erie Canal was opened in 1823; in the next two years the population doubled; and in 1834, with a population of 12,252, the village was chartered as a city. Rochester was the centre (1828–30) of the anti-Masonic political movement, and here Thurlow Weed published his *Anti-Masonic Enquirer*. Later it became an active abolitionist centre, and for many years before the Civil War was a busy station on the "underground railroad." Myron Holley began the publication of the *Freeman* here in 1839, and in 1847 Frederick Douglass established the *North Star*. It was the home of Susan B. Anthony after 1846, and a gathering-place for the advocates of women's rights. About 1850 it was the scene of the spiritualistic demonstrations (the "Rochester Rappings") of Margaret and Katharine Fox. Rochester has had a series of sobriquets. For many years, while the Genesee valley was the principal wheat field of the country, it was the leading flour-milling centre of the United States, and was known as "the Flour City." When the milling industry declined and the horticultural interests (introduced in 1840) assumed greater importance, "Flower" was substituted for "Flour"; later, with the development of the Eastman Kodak Company, it was called also "the Kodak City." The population of the city was 36,403 in 1850; 89,366 in 1880; 162,608 in 1900. In the first quarter of the 20th century the area of the city was doubled, registration in the public schools increased about threefold, the assessed valuation of property was multiplied by four, and postal receipts by five.

ROCHESTER, a borough of Beaver county, Pennsylvania, U.S.A., on the Ohio river, at the mouth of the Beaver, 25 m. N.W. of Pittsburgh; served by the Pennsylvania railroad. Pop. (1920) 6,957 (89% native white). Rochester is a busy unit in the Beaver Valley industrial district. (*See* BEAVER FALLS.) The borough was settled about 1799 and incorporated in 1849.

ROCHET, an ecclesiastical vestment proper to bishops in the Roman Catholic and Anglican churches. Though originally alike, the Roman and Anglican rochets now differ greatly in form. Both are made of fine white linen (lawn) or muslin, but with this the resemblance ceases. The Roman rochet reaches about to the knee and is distinguished from the surplice by its narrow sleeves, the lower edges of which are usually garnished with lace, lined with violet or red silk in the case of prelates, or—more rarely—with embroidered borders. The Anglican rochet keeps more closely to the mediaeval form, reaching nearly to the feet. The main modification has been in the sleeves. These were originally narrow, but after the Reformation they tended to expand until, in the 18th century, they developed into the balloon-shaped "lawn-sleeves" characteristic of Anglican bishops.

ROCHFORD, a town in south-eastern Essex, England, 39 m. E. by N. from London by the Southend branch of the L.N.E. railway. Pop. (1921) 2,077. It lies on the small river Roche near the head of a long estuary. The town has a Perpendicular church (St. Andrew); a corn exchange and some agricultural trade. Rochford hall, a gabled mansion of various dates, belonged once to the Boleyns; Anne Boleyn, the unfortunate queen of Henry VIII., was born here. Near Rochford is Ashingdon, the scene of the fight of Assandun in 1016 between Canute and Edmund Ironside, in which the English were defeated.

ROCK, in geology a mass of the mineral matter of which the crust of the earth is composed (*see* PETROLOGY and GEOLOGY). In more general usage a "rock" is a large mass of this mineral matter, as distinguished from smaller pieces, "stones."

ROCKEFELLER, JOHN DAVISON (1839–), American capitalist, born at Richford, N.Y., July 8, 1839. When he was 14 years old the family moved to Cleveland, Ohio, where he attended the public school and then became an assistant bookkeeper (1855) in a commission house, earning $50.00 the first three months. Soon he was advanced to $25.00 per month and by 1858 he had saved enough to become a partner in a produce commission firm. In 1862 he and his partner had $4,000 to invest together with Samuel Andrews, inventor of a more economical process for cleaning crude oil, in an infant business which was beginning to be spoken of as "oil refining." In 1867 the firm of Rockefeller and Andrews became Rockefeller, Andrews and Flagler, and by Jan., 1870, the partners did about one-fifth the refining business of Cleveland, then the chief oil refining city in America. In that month, together with his brother William, Stephen V. Harkness and other associates, he organized and became president of the Standard Oil Company. The capitalization was $1,000,000 in 10,000 shares of which John D. Rockefeller held 2,667 and the firm of Rockefeller, Andrews and Flagler 1,000 shares. This corporation under Rockefeller's leadership was within ten years to establish itself as the most important factor in the petroleum industry in America.

When Rockefeller entered the oil industry it was in a highly chaotic state, subject to ruthless competition between local companies of small means, subject to disastrous fires, the uncertainties of drilling, wildcat financing, and, finally, to a totally unsystematic control of production and distribution. To group all units of the industry under one leadership and to use their combined strength and control to bring about economies and improvements, to control supply and stabilize prices, was Rockefeller's dream. His success was to have far-reaching results, for the Standard Oil Company was the first great American combination to be con-

spicuously successful, and served by its example to further the trend toward consolidation and monopoly.

The spectacular advance of Standard Oil to supremacy was initiated with the aid of the South Improvement Company, an association of leading refiners, formed in 1872. These associates prevailed upon the Pennsylvania, Erie, and New York Central railways to grant 25–50% rebates on all oil shipped for members of the association, and, in addition, to give "drawbacks" on all oil transported for competitors. With this effective mechanism for suppressing competition the other refiners in Cleveland were approached and urged to sell, being offered in payment their choice of either cash or Standard Oil stock. Of the 26 companies in the city 21 accepted the offer. Although public opinion forced the railways to repudiate their agreement within three months, the important object was already obtained with the Standard in possession of the Cleveland refineries, and Rockefeller now master of about one-third of the refining business of the country. By 1875 the large refineries in New York, Philadelphia and Pittsburgh had likewise merged their identity with Standard Oil and by 1878 Rockefeller had control of over 90% of the refineries in the United States. He next concentrated on the marketing machinery, acquiring control of companies which were marketing oil, acquiring oil terminals in the chief cities, and gathering up, one after another, the pipe lines which were being laid down by competitors in the hope of defeating his hold on the railways.

The dissolution of the South Improvement Company in 1872, incident to a Congressional investigation and popular protest, necessitated a new form of organization to achieve unified control. The Central Association of Refiners was organized in 1875, but Rockefeller wanted a tighter form of organization for the sake of greater security. His form of organization was a mystery until revealed by an investigation of the New York State senate in 1888. The inquiry revealed that 39 corporations, with property in many different States, which had varying laws to curb corporations, had turned over their stock and the right to control it to an organization having no legal existence, a "trust," consisting of nine "trustees," who had united to do things no incorporated company could do. "This," wrote the committee, "is the original 'trust.'" The word had become common in 1882, about three years after the device had been adopted by the Standard Oil Company. When formed, the Standard Oil Trust was capitalized at $70,000,000, which was subsequently increased to $102,233,700. In 1892 the Ohio Supreme Court declared the Standard Oil Trust illegal, but it was not dissolved until 1899. The Standard interests were then reorganized as the Standard Oil Company of New Jersey, but in 1911 the U.S. Supreme Court declared this combination a violation of the Sherman Anti-trust Act and ordered its dissolution.

Mr. Rockefeller was president of the Standard Oil Company of New Jersey until Dec. 4, 1911, when he retired and turned the management of his business interests over to his son. The company dissolved and distributed to its stockholders the stock held in the 37 separate companies. Though a few men continued to control a majority interest in all of the separate companies, as time passed the consolidated interest weakened greatly. In 1892 Rockefeller had owned 256,854 shares of the 972,500 shares of the trust's capitalization. In 1928, together with his son, he owned but little in some of the companies. The average Rockefeller holding was about 15%. Before his retirement Rockefeller had become the wealthiest man in America, and perhaps the wealthiest in modern history, possessing a fortune estimated by some as high as one thousand million dollars. The proper disposal of these riches had become his chief problem. Rockefeller never made ostentatious show of his wealth. A large share of it went back into industry, more and more into fields not directly connected with oil. Iron ore lands in Minnesota, coal-lands in Colorado, and stocks in many railways formed a large part of his investments.

As early as 1890 Rockefeller began to organize a system of philanthropic giving as a means of securing the most efficient disposal of his vast fortune. As in business so in philanthropy he again became a pioneer, distributing the largest group of gifts that has ever been made for the promotion of the well-being of mankind throughout the world. The philanthropies are described in full in the article ROCKEFELLER BENEFACTIONS.

For the rise of his fortune *see* G. H. Montague, *Rise and Progress of the Standard Oil Company* (1903) and I. M. Tarbell, *History of the Standard Oil Company* (1904) containing opposing views of his methods, the former sympathetic, the latter hostile; also B. J. Hendrick, *The Age of Big Business* (1919); Mark Sullivan, *Our Times, America Finding Herself* (1927). For his philanthropies, *see* M. DeHowe, *Causes and Their Champions* (1926). *Also see* J. D. Rockefeller, *Random Reminiscences of Men and Events* (1909).

ROCKEFELLER, JOHN DAVISON, JR. (1874–), American capitalist, born in Cleveland, Ohio, Jan. 29, 1874, and educated at Brown university (A.B., 1897). After a few years of business experience in his father's offices he became his father's assistant in the management of the enterprises, especially those of a philanthropic nature, which the latter had developed. Upon the elder Rockefeller's retirement in 1911, John D. Rockefeller, Jr., succeeded to many of the directorates, and became ultimately the elder's plenary representative in the administration of the Rockefeller interests. A number of the business directorates were subsequently relinquished, and a larger proportion of the son's time was given to philanthropic and civic undertakings. He became associated with his father before the first benevolent corporation was chartered and participated in the development of all of them. He became chairman of the board of the Rockefeller Foundation, a trustee of the Rockefeller Institute, and a director of the General Education Board. The serious strike in the Colorado Fuel and Iron Company in 1912–13 drew his attention to industrial relations and he became much interested in industrial representation. He has interested himself in better housing conditions in New York city, and especially in the building of model apartments, both for white people and for the negro population. He has also financed the work of many separate scientific undertakings, notably the Byrd flight to the North Pole in 1926. In 1928 he offered $10,000,000 to Egypt to help establish a museum for her antiquities, which was declined.

For his other philanthropies *see* ROCKEFELLER BENEFACTIONS. Besides numerous articles, he published *The Colorado Industrial Plan* (1916) and *The Personal Relation in Industry* (1924).

ROCKEFELLER BENEFACTIONS. It was estimated that up to the end of 1927 John D. Rockefeller had given for philanthropic and charitable purposes more than $500,000,000—the largest group of charitable and educational gifts ever made. In this distribution he aimed at stimulating others to give in addition to securing the most effective utilization of the bulk of his own fortune. Nearly four-fifths of his donations went to the four great benevolent corporations which he created: the Rockefeller Foundation, the General Education Board, the Laura Spelman Rockefeller Memorial (united in 1929 with the Rockefeller Foundation. A new fund, the Spelman Fund of New York, was incorporated in 1928, *see* below), and the Rockefeller Institute for Medical Research. Quite as significant as the magnitude of these gifts was the fact that they were free from all restrictions, having been given outright for the purposes of the respective corporations, the trustees of which have power to dispose of the principal as well as the income. As the corporate purposes of these organizations are extremely broad, and the gifts free from restrictions, they will always be adaptable to the changing needs of future generations.

The Rockefeller Foundation was chartered in 1913 "to promote the well-being of mankind throughout the world." Its chief activities have been (1) co-operation with Governments in the control of hookworm disease, malaria and yellow fever, and in the development of general public health organization, and (2) aid in developing medical, public health and nursing education in various centres through appropriations toward buildings and endowments, and through fellowships, surveys and the dissemination of information on new administrative and teaching methods. On Jan. 3, 1929, the Rockefeller Foundation and the Laura Spelman Rockefeller Memorial were consolidated, the consolidated corporation retaining the name of the Rockefeller Foundation. The work of the new Rockefeller Foundation, which aims primarily at the advancement of knowledge, is administered under the president

(1) through an International Health Division, and (2) through four directors, one each for the natural sciences, medical sciences, social sciences and humanities. The combined book-value of capital funds of the Rockefeller Foundation when the above-mentioned consolidation took place was $203,298,503.34. With $35,000,000 deducted from principal to provide for outstanding obligations there remained a net capital fund of about $168,000,000, both the income and principal of which are available for appropriation. The foundation's resources and policies are controlled by a self-perpetuating board of unsalaried trustees. From the time of its organization in 1913 up to Dec. 31, 1928, the foundation has disbursed from income and principal slightly over $144,000,000. (G. E. V.)

The General Education Board.—To the next largest of his benevolences, Rockefeller had given, up to Dec. 1924, $130,898,119. Up to July 1928, the board had appropriated for "the promotion of education in the United States of America, without distinction of race, sex or creed," the sum of $176,689,425, of which $94,148,124 was from the principal. Most of this had been given toward endowments of colleges, excluding professional departments, the rule being to make gifts contingent upon the raising of additional sums by the beneficiaries. During 1924, the board discontinued this activity. The board co-operates with medical schools, colleges and universities with a view to developing teaching and research in the fundamental sciences, public education, industrial art and negro education. Of sums appropriated by the board, $60,883,362 have been in the field of medicine; $78,631,802 to colleges and universities for general endowment; for negro education $18,872,442; and for other educational purposes the sum of $18,301,819. (T. Ar.)

The Laura Spelman Rockefeller Memorial was founded in 1918 by John D. Rockefeller, in memory of his wife, Laura Spelman Rockefeller. The memorial was incorporated for the purpose of forwarding human welfare in all parts of the world. The principal of the fund (approximately $73,000,000), as well as the income, may be used by the trustees in their discretion. Aside from a number of miscellaneous appropriations which have been decreasing, the appropriations of the memorial fall into two general categories: (1) the field of child welfare, and (2) the field of the social sciences. In the field of child welfare the memorial has assisted in four general types of activity: scientific research, the preparation of teaching materials, the training of leaders for child study work, and experiments and demonstrations in the practical organization of parent and teacher groups for the study of child life and child welfare. In support of social science the appropriations of the memorial fall into three groups: (1) appropriations to universities and research institutions; (2) appropriations for fellowships; (3) appropriations to central bodies such as the Social Science Research Council, the National Research Council and the American Council of Learned Societies.

The Rockefeller Institute for Medical Research in New York was founded in 1901 "to conduct, assist and encourage investigations in the sciences and arts of hygiene, medicine and surgery, and allied subjects, in the nature and causes of disease and the methods of its prevention and treatment, and to make knowledge relating to these various subjects available for the protection of the health of the public and the improved treatment of disease and injury." The Rockefeller Institute is composed of three departments: the laboratories in New York city, in which biological, chemical and physical investigations are conducted; a hospital, in which diseases of man are treated and studied; and laboratories and animal quarters near Princeton, N.J., where corresponding investigations are carried out on diseases of animals.

In addition to the investigations conducted in its own laboratories and hospital, expeditions are sent out for the purpose of studying diseases of man or animals under the natural conditions of their prevalence, or in order to ameliorate their ravages through methods which have been discovered in the course of investigations. Since the discovery of the often obscure causes of disease or the means of amelioration must frequently follow from a knowledge of pure science gained for its own sake, the pursuit of pure science subjects in fields related to medicine is one of the major activities of the Rockefeller Institute.

The organization of the Rockefeller Institute is divisible into a corporation which has general oversight and control of its activities, and a scientific staff which is directly charged with the responsibility of carrying on the scientific investigations. The corporation in turn is made up of trustees who are charged with the maintenance and care of the endowment and property of the institute, and a board of scientific directors which appoints the scientific staff and approves the general policy of investigation pursued. The board of scientific directors is an external body, composed of medical and other scientific men, meeting quarterly, and informed of the character and progress of the various researches under way or to be undertaken. The completed researches of the institute are published in scientific journals or issued as monographs, and are periodically assembled into volumes of studies, which are issued to institutions of learning, libraries and scientific workers throughout the world. (S. F.)

The Spelman Fund of New York.—This fund was incorporated on Dec. 19, 1928, for charitable, educational and scientific purposes. The principal of the fund which amounts to $10,000,000 was appropriated by the trustees of the Laura Spelman Rockefeller Memorial at the time the memorial was consolidated with the Rockefeller Foundation. The trustees of the Spelman Fund have power to use the principal as well as the income to carry on its purposes. The charter of the fund provides that "the territory in which the operations of the Corporation are principally to be conducted is the United States of America, its possessions and dependencies, but the operations of the Corporation shall not be limited to such territory."

The charter states that the Spelman Fund "is formed for exclusively charitable, scientific and educational purposes, including the advancement and diffusion of knowledge concerning child life, the improvement of inter-racial relations, and co-operation with public agencies." (Ar. W.)

John D. Rockefeller, Jr.—In his public gifts—more than $60,000,000 up to 1929—John D. Rockefeller, Jr., has advanced his father's purpose to promote the well-being of mankind throughout the world. Notable among these gifts have been: to the Northern Baptist Convention, $2,300,000; Bureau of Social Hygiene, $2,850,000; Brown university, $500,000; Inter-Church World Movement, $1,500,000; International House, where hundreds of Columbia university students from many lands live harmoniously together, $2,360,000; New York Public library, $3,500,000; Cathedral of St. John the Divine, $500,000; Young Men's Christian Association International Committee, $1,500,000; Hampton Tuskegee Institute (for negroes), $2,500,000; Metropolitan Museum of Art, $2,000,000; toward restoration of gardens of Versailles and the Cathedral of Reims, $2,500,000; toward restoration of the Imperial university of Tokyo, Japan, 4,000,000 yen ($1,540,000); International Education Board, $21,000,000, to advance scientific research and education and to promote agricultural science and practice throughout the world; to the League of Nations library, $2,000,000; to erect and maintain an archaeological museum in Palestine, $2,000,000; to New York Botanical Gardens, $500,000; to colleges in the Near East, $450,000; to New York Zoological Society, $500,000; to aid the restoration and preservation of Williamsburg, Va., $5,000,000.

ROCKET AND ROCKET APPARATUS. The term rocket is now generally applied to the sky-rocket, which is fully described under Fireworks.

War Rockets.—Apart from its recreative use, the rocket has from the earliest times attracted the attention of the military engineer for warlike purposes, first in Asia and later in Europe. No great progress, however, was made until the experiments of William Congreve in continuation of those carried out by General Desaguliers when in charge of Woolwich Laboratory. He set himself the task of producing a rocket capable of carrying an incendiary, or explosive charge and having a range up to two miles. After some preliminary trials he obtained permission for the construction of rockets to his design in the Royal Laboratory. The results obtained were so promising that in 1805 Sir Sydney Smith's

expedition against Boulogne included a number of boats especially fitted for firing salvos of rockets. Rough weather prevented their use on that occasion, but the following year they were used against the same place and, although deflected by the wind from the fortifications, which were the real objectives of their employment, they are credited with having done on this occasion very considerable damage in the town itself.

In 1812 the Field Rocket Brigade was formed and was ordered a year later to join the Allies before Leipsic under the command of Captain Bogue of the Horse Artillery, being the only English present. The effect of the rockets on this occasion, the first time they had ever been used in European land warfare, was very marked. The Rocket Brigade also distinguished itself two years later at Waterloo.

For the greater part of the nineteenth century war rockets constituted an important part of artillery resources, although they did not come within measurable distance of superseding artillery, as Congreve in his enthusiasm had forecast. With the development of the rifled bore, breech loading, independent recoil and smokeless powder, the advantages claimed for the war rockets were discounted and at the end of the nineteenth century they had become obsolete.

During the Great War rockets were also designed for use against aircraft, but no marked success attended the use of any of the types employed.

Signal and Life-saving Rockets.—Many forms of signal rockets have been designed; they are generally similar to those used for displays, being constructed to give various effects, as coloured stars, flash and sound, or a light suspended from a parachute. Their sizes vary between ½lb. to 2lb. according to the use for which they are intended.

The life-saving or line-carrying rocket has rendered a great service to humanity; by its use a line is carried to establish communication between shore and a wrecked vessel. The French pyrotechnist, Ruggieri, writing in 1802, claims that his father suggested the principles of the line-carrying rocket. The credit of its application in Great Britain, however, must be conceded to Trengrouse of Helston, Cornwall, about 1807. The development of the idea was delayed for some years by the adoption of the Manby apparatus, which was designed to carry a line by means of a shot fired from a mortar, a system over which the rocket has the great advantage that it traces its flight at night and can be seen by both the firer (who can correct his aim in the event of a miss) and by those to whom it is directed.

In 1826 four rocket stations were established in the Isle of Wight by Dennet of Newport, but it was not until 1855, when Colonel Boxer of the Royal laboratory, produced a rocket of greater range by adopting Frezier's idea of joining two rockets so that when the first had burnt out the second came into action, that the rocket principle was adopted officially. Rocket Stations were established round the coast and manned by the Coast Guard and volunteer crews. These have rendered the most valuable service and since 1870 have been instrumental in saving between twelve and thirteen thousand lives.

A further development of the line-carrying rocket is a light, easily portable apparatus designed to be carried on ships, a system which has obvious advantages. As a wreck is usually driven on the lee shore, a rocket fired from the ship will travel with the wind; also, the land presents a much better target than does the ship if the rocket is fired from the shore, and further, a vessel so equipped has the means of establishing communication with another at sea. The Schermuly apparatus is designed for this purpose; the system consists of the ejection of a steel rocket from a pistol with an enlarged barrel, the flash of the cartridge igniting the rocket. This method combines the advantages of the rocket and gun, or mortar systems—the rocket is more easily aimed and is in flight immediately the pistol trigger is operated, the delayed action after ignition of the rocket being one of the greatest drawbacks of the older system, particularly if fired from a moving vessel. A six pound rocket will carry a ½″ hemp line a distance of 350 yards. It seems certain that this apparatus will universally be adopted, vessels being compelled to carry it as is the case with wireless apparatus. (A. St. H. B.)

Rocket Propulsion.—The pioneer work on the use of the exhaust of a rocket to propel a body was done by Prof. R. H. Goddard of Clark University, Worcester, Mass., who has studied the problem since 1909. In 1928 experiments were carried out on a rocket intended to travel into the rarefied upper air so as to obtain data as to its composition and condition. In 1918 Prof. Goddard, under the auspices of the Smithsonian Institution, published data supporting the practicability of a rocket flight to the moon. In 1928, after mathematical studies by Prof. Max Vallier of Munich and Albert Mueller, a rocket automobile was tested at the racing track of the Fritz Opel motor car factory at Russelsheim near Frankfurt. From the rear of the car project twelve large tubes arranged in a rectangle. From these tubes the exploding gases emerge. Speeds of slightly over 60m. an hour were attained within eight seconds of starting.

The extension of this principle to aeroplanes has been investigated with promising results.

ROCKFORD, a city of northern Illinois, U.S.A., on the Rock river, 17 m. S. of the Wisconsin line and midway between the east and west boundaries of the State; the county seat of Winnebago county. It is on Federal highways 20 and 51, has a municipal airport, and is served by the Burlington Route, the Chicago and North Western, the Chicago, Milwaukee, St. Paul and Pacific, the Illinois Central and electric railways, and by motor-bus lines in all directions. Pop. (1920) 65,651 (26% foreign-born white, the majority from Sweden); estimated locally at over 92,000 in 1928. The city occupies 11·5 sq.m. on both sides of the river, and has 691 ac. in parks and playgrounds. On a wooded bluff, in a beautiful campus of 10 ac., stands Rockford college, one of the oldest standard colleges for women in the United States, opened as a seminary in 1849. Enrolment is limited to about 650. The public schools (22 elementary, two junior high, one high, and one continuation) have an enrolment of over 13,000, and the parochial schools (five elementary and one high) of 2,000. There are 61 churches in the city, and a Roman Catholic pro-cathedral. Rockford has been an important manufacturing centre since its earliest days. Water-power is supplied by a dam 800 ft. long, built in 1844. There were 366 manufacturing establishments in 1927, with output for the year valued at $126,032,500. Bank deposits on July 1, 1928, totalled $38,775,000. The assessed valuation of property was $96,055,664. Rockford was founded by New Englanders in 1834 and was chartered as a city in 1852. In 1860 the population was 6,979, and it has doubled, or more than doubled, in each 20-year period since then. In Sept. 1928, a tornado struck the city, causing some loss of life and great destruction of property.

ROCKHAMPTON, a seaport on the east coast of Queensland, Australia, situated on both banks of the Fitzroy river at the head of ocean navigation 35–40 m. from the sea. The Fitzroy and its tributaries (Dawson, Mackenzie, etc.; max. length 520 m.) drain a basin of 50,000 sq.m. of great diversity and economic value. The hinterland of Rockhampton thus includes extensive high-class pastoral areas extending at least as far west as Longreach (428 m. by rail); rich agricultural and dairying lands which include the Dawson river irrigation area (total projected area: 200,000 ac.; 30,000 [1926–27] available), besides large mineral resources including coal-fields (*e.g.*, Blair Athol mines). Around Rockhampton itself is a fertile agricultural area producing tropical fruits, maize, and dairy products. The climate is hot and humid but not unhealthy (av. ann. temps.: 82–62 F; av. ann. rainfall 110 in. falling within some 44 days of the summer). The town itself (pop. 30,000) is well designed, has wide streets, many substantial buildings (including two cathedrals), and possesses good water, gas, electricity and tram services besides fine public parks and gardens. The harbour (wharfage 2,000 ft. with 8–20 ft. alongside) has been improved at considerable expense, and is kept open for vessels of 18–20 ft. draught by dredging. Difficulties are the shifting sand and mud banks due to severe floods which are liable to occur during summer. Rockhampton is the base of a branching inland railway system which taps the widely separated Longreach (428 m.), Welford

(520 m.), Blair Athol (240 m.), Springsure (206 m.), and other centres, and which is being continually extended and developed. Along the coast the Great Northern line links Rockhampton with other coastal towns, with Brisbane, with various seaside resorts (Emu Park, Yeppoon), and the ports of Gladstone (*c.* 80 m.) and nearer by Port Alma, to which ocean vessels often resort. Railway repairing works and other industries are carried on in the town and near by is one of the largest meat-preserving and freezing works in Australia. The total trade amounted (1925–26) to £1,860,000 (1926–27: overseas trade alone: £760,000), and the total shipping to 274,000 tons (1926–27: overseas and interstate alone, 17,000 tons). In respect of the value of its trade Rockhampton is the second port of Queensland.

ROCK HILL, a city of York county, South Carolina, U.S.A., 60 m. E. of Spartanburg, on Federal highway 21 and two lines of the Southern railway. Pop. 8,809 in 1920, 22% negroes; estimated locally at 12,000 in 1928, with an additional 4,000 in the immediate suburbs. The city lies at an altitude of 670 ft. It has cotton-mills (about 133,000 spindles and 4,000 looms in 1928) and other important manufacturing plants, with an annual output valued at $10,000,000. Winthrop college for women (founded in 1886 by David Bancroft Johnson, who remained its president until his death in 1929, and chartered in 1891 as a State institution) has an enrolment of over 1,800 and a plant valued at $3,000,000. Rock Hill was incorporated as a village in 1870, as a city in 1892. It has a commission-manager form of government.

ROCKINGHAM, CHARLES WATSON WENTWORTH, 2ND MARQUESS OF (1730–1782), twice prime minister of England, was the son of Thomas Watson Wentworth (*c.* 1690–1750), who was created earl of Melton in 1733 and marquess of Rockingham in 1746.

Charles Watson Wentworth was educated at Westminster school and St. John's College, Cambridge. In 1751 he became lord-lieutenant of the North and East Ridings of Yorkshire and a lord of the bedchamber, and in 1760 was made a knight of the Garter. In May 1762 the king's favourite, the earl of Bute, became first lord of the treasury, and the marquess of Rockingham was amongst those who in the following year were dismissed from their lord-lieutenancies. In July 1765 Lord Rockingham formed his first administration with General Conway and the duke of Grafton as secretaries of state. The cabinet seemed stronger than it really was, for it was divided by intestine quarrels, and the earl of Chatham refused to have anything to do with it. In May 1766 the duke of Grafton, a far abler man than Rockingham, though neither so conciliatory in his manners nor so generally popular, seceded from the government, and in August 1766 he succeeded his former chief as first lord of the treasury and prime minister. Lord Rockingham again became prime minister in 1782, with Fox and Shelburne (afterwards marquess of Lansdowne) as secretaries of state. This time he enjoyed office for but a few weeks, for he died on July 1, 1782. He left no issue, and his titles became extinct.

See *Memoirs of the Marquis of Rockingham and his Contemporaries,* by George Thomas, earl of Albemarle (2 vols., 1852); Horace Walpole's *Memoirs* of the reign of George III., edited by G. F. R. Barker (1894); and the other letters, papers and diaries of the time.

ROCK ISLAND, a city of western Illinois, U.S.A., on the Mississippi river, 180 m. W. by S. of Chicago, adjoining Moline and opposite Davenport, Ia.; the county seat of Rock Island county. It is 2 m. above the mouth of the Rock river and the Hennepin canal (connecting the Mississippi and the Rock rivers with the Illinois), is on Federal highways 32 and 61, has air-mail service east, west and south, and is served by the Burlington Route, the Chicago, Milwaukee, St. Paul and Pacific, the Davenport, Rock Island and Northwestern, the Rock Island and the Rock Island Southern railways, and by river steamers and barges, ferries and motor-bus and truck lines. Pop. (1920) 35,177 (83% native white); estimated at 47,000 in 1928. The island from which the city takes its name, one of the largest (990 ac.) and most beautiful in the Mississippi, is owned by the U.S. Government, and occupied by an arsenal. Government bridges connect it with all three cities. Rock Island (the city) has an area of 10 sq.m. and an assessed valuation in 1926 of $12,056,116. It is the seat of Augustana college and Theological seminary (Evangelical Lutheran; 1860) and of the home offices of the Modern Woodmen of America and the Royal Neighbors of America (large fraternal orders). The manufacturing industries are important and diversified, employing 9,500 workers and producing goods valued at $55,000,000 annually. On the tree-covered site of Rock Island there were villages (dating from as early as 1730) of the Sauk and Fox Indians, who helped the British in the War of 1812. The island was fortified by the British, and engagements took place in the vicinity in July and Oct. 1814. In 1816 the United States built Ft. Armstrong (abandoned 1836) on the west end of the island. It became one of the important frontier military posts, and was the headquarters of operations in the Black Hawk War and the scene of the signing of the treaty on Sept. 21, 1832. Black Hawk was born in one of the villages on the Rock river, and a bluff near its mouth is called Black Hawk's Watch-tower. The first white settlement on the mainland was made in 1826. The town was incorporated in 1837 and was chartered as a city in 1849. The arsenal was established on Rock Island by act of Congress in 1862. During the Civil War 12,000 Confederate soldiers were confined on the island, of whom 2,000 died during imprisonment.

ROCKLAND, a city of Maine, U.S.A., the county seat of Knox county; on Penobscot bay, 86 m. E.N.E. of Portland. It is on the Atlantic highway, and is served by the Maine Central railroad and the Eastern Steamship lines. Pop. (1920) 8,109 (92% native white); 1928 local estimate, 9,000. Rockland is the gateway to the numerous summer resorts on the shores and islands of Penobscot bay. Lime-burning, cement-manufacturing, ship-building and deep-sea fisheries are the dominating industries. The city ships 15,000,000 lb. of fish annually and more lobsters than any other port in the country. Just outside the harbour is the trial course where the speed of Government boats is tested. Rockland was settled in 1769, and began to grow with the establishment of the lime industry in 1795. It was set off from Thomaston and incorporated as the town of East Thomaston in 1848; adopted its present name in 1850; and in 1852 was chartered as a city.

ROCKLAND, an inland town of Plymouth county, Massachusetts, U.S.A., with an area of 10 sq.m.; 20 m. S. by E. of Boston, on the New York, New Haven and Hartford railroad. Pop. (1920) 7,544 (86% native white). The town was set off from Abington and incorporated in 1874.

ROCK SPRINGS, a city of Sweetwater county, Wyoming, U.S.A., in the south-western part of the State, on Bitter Creek, at an altitude of 6,256 feet. It is on the main line of the Union Pacific railroad, and is a station on the transcontinental air-mail route. Pop. (1925) 6,875. Rock Springs (named from a large saline spring issuing from the base of a bluff) is one of the most important coal-mining centres of the West and the trading point for a wide region covered with sheep ranches. The city was incorporated in 1888.

ROCKVILLE, a city of Tolland county, Connecticut, U.S.A., on the Hockanum river, 15 m. N.E. of Hartford. It is served by the New York, New Haven and Hartford railroad. Pop. (1920) 7,726 (29% foreign-born white). At Rockville, in 1841, fancy cassimeres were first made in the United States, and in 1870 the Hockanum mills (established 1809) produced the first American-made worsted for men's clothing. Settlement here began about 1726, and Rockville was chartered as a city in 1889.

ROCKVILLE CENTER, a village of Nassau county, New York, U.S.A., on the southern shore of Long Island, 22 m. E. of Brooklyn; served by the Long Island railroad. Pop. (1925) 10,316 (State census). The village, settled about 1827, was incorporated in 1870.

ROCKY FORD, a city of Otero county, Colorado, U.S.A., on the Arkansas river, Federal highway 50, and the Santa Fe railway, in the south-eastern part of the State, at an altitude of 4,177 feet. The population was 3,746 in 1920, 94% native white, and about 5,000 in 1928. Rocky Ford produces the most delicious cantaloupes in the country, and is noted also for its honey-dews,

casabas, watermelons and Valencia onions. The first Thursday in September is Watermelon Day, when 25,000 melons are given to visitors. The cantaloupe industry had its origin here (about 1888). Over 3,500 carloads are shipped each season. The city was founded in 1883 and incorporated in 1887.

ROCKY MOUNT, a city of North Carolina, U.S.A., in Nash and Edgecombe counties; 47 m. E.N.E. of Raleigh, on the Tar river and Federal highway 17-1. It is served by the Atlantic Coast Line railroad. Pop. 12,472 in 1920, 36% negroes; estimated locally at 25,000 in 1928. It is an important bright-leaf tobacco and cotton market, handling 37,500,000 lb. of the former and 10,000 bales of the latter in 1928. Rocky Mount has the oldest cotton-mill in the State (established in 1813, and operating 54,000 spindles in 1928), and various other manufacturing plants. The city operates under a council-manager form of government, and owns its power plant and gas plant. Rocky Mount was incorporated as a town in 1867 and as a city in 1907.

ROCKY MOUNTAIN GOAT (*Oreamnus montanus*), a North American hollow-horned ruminant of the family *Bovidae*, distinguished by its whiteness. It is the only ruminant, with the exception of the white Alaskan wild sheep, which is entirely white at all seasons of the year. In the winter coat, the hair is long and pendent, especially on the neck and chest, and elongated into a short beard on the sides of the lower jaw behind the chin; at the base of the long hair is a thick, woolly under-fur. In summer the coat becomes comparatively short. The muzzle is hairy, the ears are of moderate size, and the tail is short. There is a large globular gland at the base of each horn. The black horns, ringed in their basal portion, are comparatively short and not unlike those of the Asiatic serows (*q.v.*), in being subcylindrical and curving slightly backwards. The lateral hoofs are well developed. The cannon-bones are remarkably short and wide. The shape of the animal is ungainly, owing to a huge hump on the withers, at which point the height is about 3ft. The affinities of the white goat (which is really a member of a group intermediate between goats and antelopes) are probably with the Asiatic serows and takin.

ROCKY MOUNTAIN GOAT (OREAMNUS MONTANUS)

See Madison Grant, "The Rocky Mountain Goat," published in the 9th *Annual Report of the New York Zoological Society* (1905).

ROCKY MOUNTAINS, THE, are the principal division of that vast system of highlands occupying the western third of the United States and a narrower belt in western Canada. Standing between the great continental plains on the east and the region of elevated basins and plateaux stretching from Nevada to central British Columbia on the west, they constitute the backbone of the continent, as well as a major topographical feature of the entire globe.

At the south, the Rockies first become prominent in northern New Mexico where there are elevations above 13,000 feet. Thence they sweep for 2,200 m. through the United States and Canada to the Yukon. In Canada, for 450 m. they form the boundary between Alberta and British Columbia, where they are known as the "Canadian Rockies." Their greatest width and elevation are attained in Utah and Colorado. Here the system of ranges is 300 m. across. In Colorado there are 46 summits surpassing 14,000 ft., Mt. Elbert (14,419 ft.) being the highest of the system and the second highest peak in the United States. Colorado contains about 254 mountains between 13,000 and 14,000 feet. North-west of Colorado breadth and elevation diminish, until at the Canadian boundary the ranges are less than 100 m. wide, with few elevations exceeding 9,500 feet.

From Colorado almost to the Peace river in British Columbia, the Rockies carry the watershed of the continent—the continental divide. But this does not mean that they present a continuous chain of great peaks. On the contrary the zone of uplift is rather a vast complex of separate ranges, interrupted at places by wide gaps of lofty rolling plateaux.

In the United States, the crest-line of the Rocky Mountains definitely breaks down at two places—the plateaux of Yellowstone Park and Great Divide Basin in southern Wyoming (60 m. by 100 m.). The three divisions thus produced—north, central and southern—may be taken as a convenient basis of description. They correspond approximately with the States of Montana, Wyoming and Colorado (with which Utah is associated). The elevations of these major breaks or passes are as follows: in southern Arizona, 4,615 ft. (Southern Pac. R.R.); in New Mexico, Campbell's Pass, 7,250 ft. (Santa Fe R.R.); in Great Divide Basin, 7,102 ft. (at Creston, Union Pacific R.R.); in Yellowstone Park plateaux, about 8,300 ft.

The Southern Rockies.—The Rockies of Colorado are dealt with elsewhere. (*See* COLORADO and NATIONAL PARKS.) The most magnificent groups are probably the Sawatch range (80 m. by 20 m.) and the Sangre de Cristo range (40 m. by 10 m.) in the central part of the State. In the south-western corner the Elk, San Miguel (with the spectacular Lizard Head, 13,156 ft.), Needle and other groups, form an incredibly wild and rugged mass of peaks.

The Wasatch mountains of central Utah, overlooking the great basin for 100 m., present abrupt ranges, of which Mt. Delano (12,240 ft.) is the highest. Associated with the Wasatch mountains is the Uinta group (150 m. by 25 m.), of which Kings Peak (13,500 ft.) is loftiest. Five others exceed 13,000 feet.

The Central Rockies.—The ranges just mentioned connect with the main axis of elevation of the Rockies in the region of Yellowstone Park through a belt of rather indefinite uplands running north and south along the western boundary of Wyoming. Here are the Crawford mountains, the Wyoming Range, the Gros Ventre mountains, the Snake River Range and the Teton Range. The Teton Range presents perhaps the most splendid spectacle of all the Rocky Mountain ranges. It is 40 m. long and 10 m. wide, rugged and precipitous. Granite spires rise abruptly 6,000 to 7,000 ft. above the flats of Jackson's Hole. The principal peaks are the Three Tetons (Grand Teton, 13,747 ft.) and Mt. Moran (12,100 ft.) at the northerly extremity.

Reverting to the continental divide of the western part of Wyoming, the important uplift of the Wind River Range is next in order, north-west of Great Divide Basin. It is about 100 m. long, the core being upwards of 13,000 ft. in elevation and sending out long lateral ridges between which remarkable canyons occur. Its most prominent summits are Fremont Peak (13,720 ft.), ascended in 1842 by John C. Frémont; Gannett Peak (13,785 ft.), the highest in Wyoming, and Chimney Rock (13,340 ft.). Numerous small glaciers are on the north-east slopes. The largest, Dinwoody, covers several square miles. The scenery and mountains are distinctly alpine in character, with many fine waterfalls and lakes.

North-east of the Wind River Range, across the Big Horn Basin, lie the Big Horn mountains, a prodigious off-shoot of the main range towards the great plains, 120 m. long and 30 to 50 m. wide. The axis averages from 11,000 to 13,000 ft. in elevation, rising some 9,000 ft. above the neighbouring prairies. A few of the peaks surpass 13,000 ft. and bear small glaciers in their rugged amphitheatres. The highest summit is Cloud Peak (13,165 ft.).

The Northern Rockies.—Between the northern boundary of Yellowstone Park and the Yellowstone river, the Beartooth and neighbouring ranges display what are probably the principal mountain masses of this division. In the vicinity of Mt. Cowen (11,190 ft.) and Emigrant Peak (10,960 ft.) the relief becomes as great as 6,400 ft., and Granite Peak (12,850 ft.), the highest mountain in Montana, is situated here, as are Grasshopper Glacier and other small ice bodies. The Beartooth Range has a score of summits of 12,000 ft. or more.

The continental divide, however, leaves Yellowstone Park in a

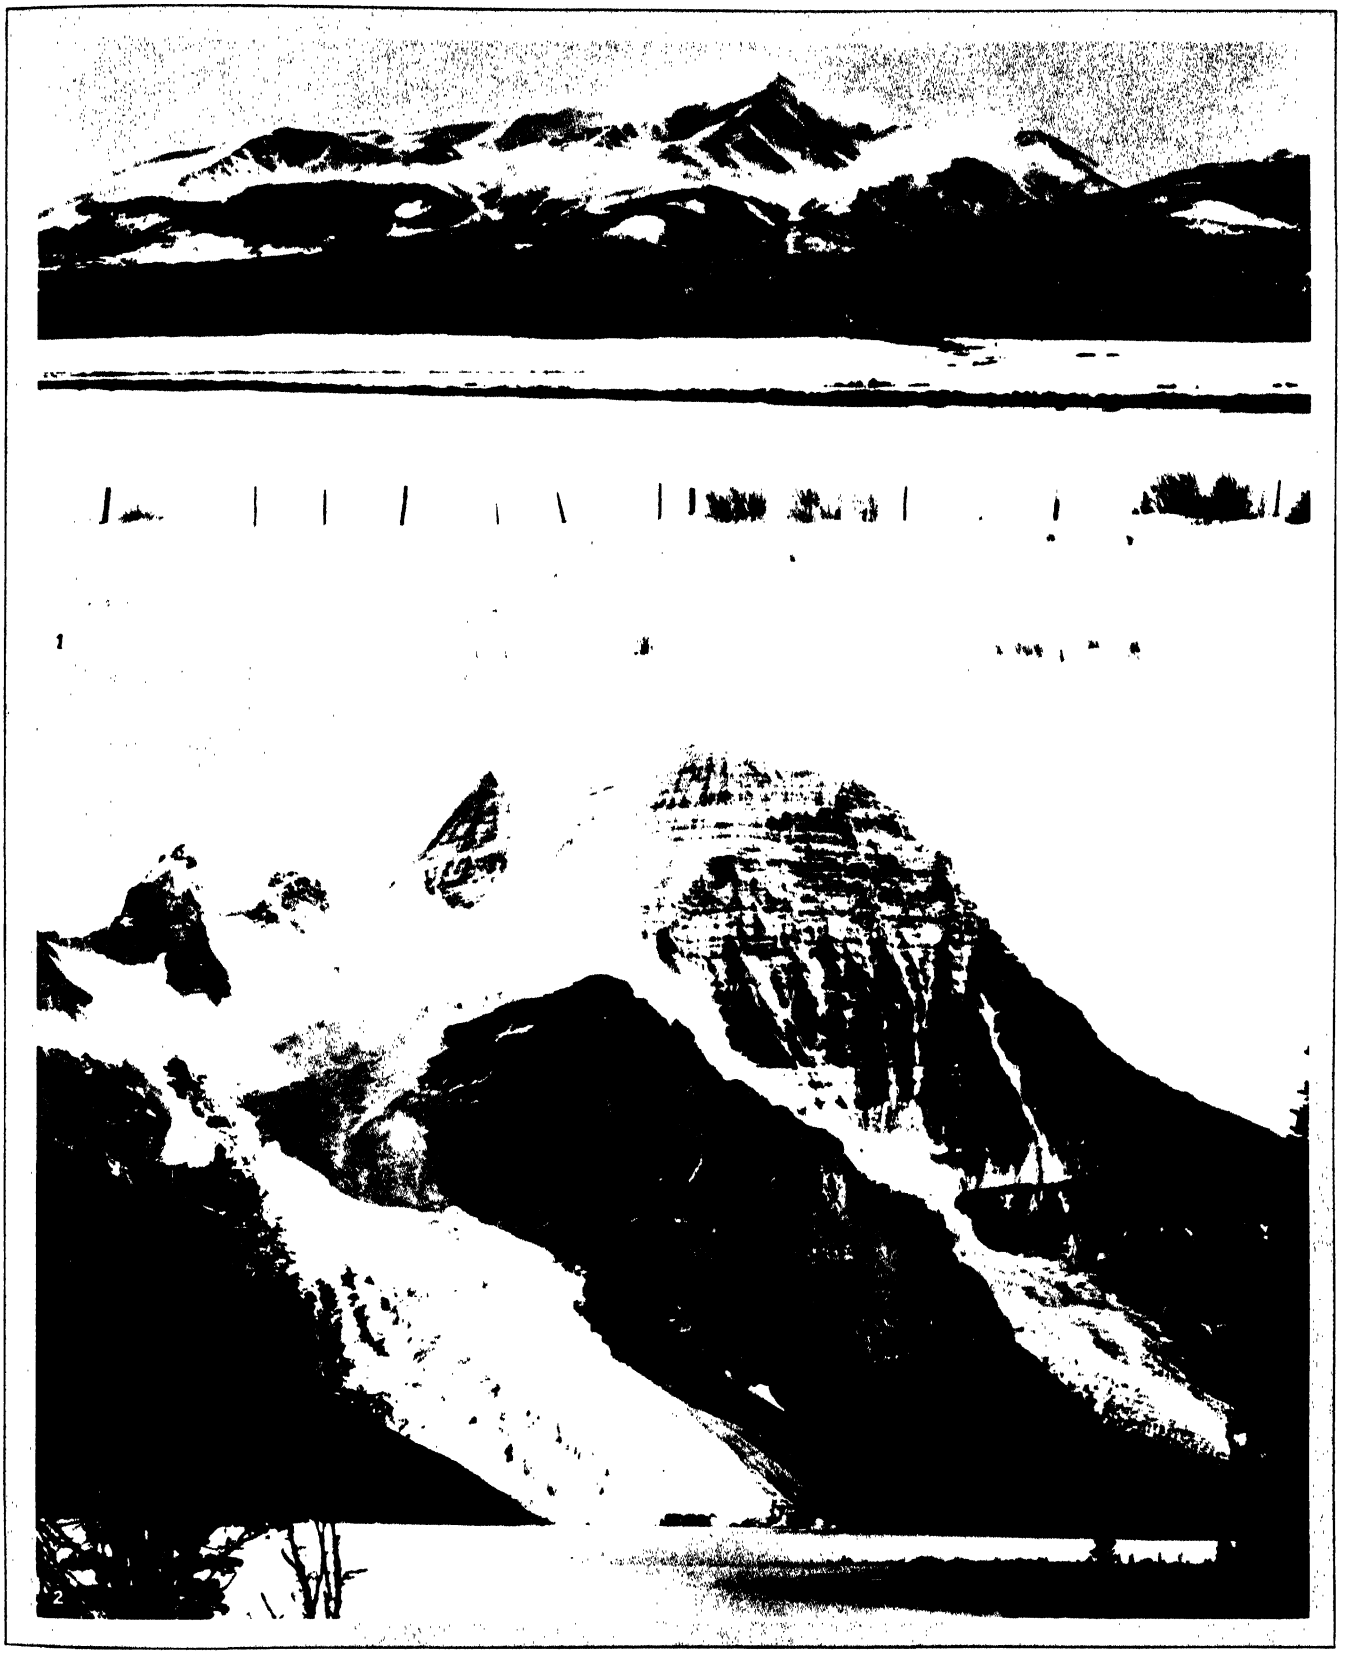
north-westerly direction. At the 114th meridian it swings off abruptly to the north-east through the Butte and Helena districts. Beyond this swing, the western axis of elevation continues north-westward as the Bitterroot mountains to within 125 m. of the Canadian border. They form the boundary between Idaho and Montana, the average elevation being between 7,000 and 8,000 feet. The highest peaks occur on projecting lateral spurs—El Capitan (9,936 ft.) and St. Mary (9,333 ft.). This 125-m. interval is filled by the Coeur d'Alene (6,000 ft.) and Cabinet ranges, the latter boasting of a glacier on Bear Peak (about 9,000 ft.). West of the Bitterroots in central Idaho lies a labyrinth of peaks and ridges (11,000 to 12,000 ft.), Mt. Hyndman (12,078 ft.) being the highest in that State.

In the region of Butte and Helena, the continental divide is generally featureless, the passes around Butte averaging 6,000 ft. or less. Mullan Pass near Helena is 5,870 feet. The Anaconda range contains Mt. Haggin (10,598 ft.) and Mt. Evans (10,635 ft.). Beyond Helena, the divide veers to the north-north-west and follows the Lewis Range, which is so wild and rugged that no wagon roads cross it for 200 miles. Opposite to the Lewis Range, the westerly margin of the Rockies is defined by the White Fish Range (west of the north fork of Flathead river) and the Mission Range (60 m. long, south-east of Flathead lake). The latter culminates in the glacier-bearing Mt. MacDonald (9,800 ft.). Between the Mission and Lewis ranges is the Swan range (Mt. Holland, 10,400 ft.). The principal continental pass hereabouts is Marias Pass (5,213 ft.), crossed by the Great Northern Railroad.

The finest scenery in this quarter is within Glacier National park (*see* NATIONAL PARKS) with 20 peaks between 9,000 and 10,000 ft. and six between 10,000 and 10,438 feet. Mt. Cleveland is the loftiest summit. The park contains about 40 small glaciers and several large ones (from two to five sq.m. apiece), besides a myriad of attractive lakes.

The Canadian Rockies.—In Canada the axis of the Rockies is continuous for 1,000 miles. It is simpler, straighter and more sharply defined.

The Rockies proper, a belt averaging some 70 m. across, are here considered as dissociated from the adjoining groups of the Purcells, Selkirks, Columbia and Pacific coast mountains. Prominent passes of the divide are: Crows Nest Pass (C.P.R.R.), 4,453 ft.; Vermillion Pass (motor road), 5,376 ft.; Kicking Horse Pass (C.P.R.R.), 5,320 ft., and Yellowhead Pass (C.N.R.R.), 3,711 ft. Proceeding north-westerly from the U.S. boundary, there are no glaciers for 100 m., the peaks being mostly below 9,000 feet. A little farther on is Mt. Joffre (11,316 ft.), the first real glacier-hung peak. From here to beyond Mt. Robson (12,975 ft., the highest of all) the system is continuously alpine for about 275 miles. Two hundred miles from the boundary the Canadian Pacific railway crosses the chain near the famous Lake Louise. Halfway between this and Mt. Joffre stands the handsome Mt. Assiniboine (11,870 ft.). In the 150 m. gap between the C.P.R.R. and the Canadian National railway at Jasper, are situated Mt. Forbes (11,902 ft.) and Mt. Columbia (12,294 ft.), the fifth and second in rank in the Canadian Rockies respectively. In these mountains about 50 peaks surpass 11,000 feet. Glaciers and snowfields abound, and with the neighbouring groups just mentioned there is presented the best sweep of truly alpine territory to be found in America short of Alaska. The north-westerly 500 m. of the range are imperfectly known, although the mountains are lower. (*See* MOUNTAINEERING: section *United States.*)



(H. PAL.)

ROCOCO, a term used to describe a phase of European art originating in France and commencing in the first quarter of the 18th century. Its name is derived from the French word *Rocailles* which was used to designate the artificial grottoes and fantastic arrangements of rocks in the gardens of Versailles; and it indicates one of the features of the rococo style in its typical form—its absolute freedom and irregularity of rhythm, the twisted curves of a shell being as it were the standard of the whole system of design. Historically, it was an extreme development of the ideas of individual imagination and love of broken curves which characterized baroque art (*q.v.*). For the grave and pompous dignity of the style of Louis XIV., the rococo substitutes playfulness and exquisite gracefulness and charm. Up to about the middle of the 18th century, rococo art remained gay and freakish and showed much exotic influence as, for instance, the influence of Chinese art. Then a renewal of interest in classical art and archaeology which had meanwhile taken place in Italy began to make itself felt in French art. During the later phase of the rococo, much of the playfulness disappeared, and a greater calm and balance were introduced into the style; but, nevertheless, it retained gracefulness and charm, till eventually, between 1780 and 1790, the severe neo-classical movement superseded it. This later phase of the rococo must in fact be regarded as a stage of transition from the rococo proper to the neo-classical art or Louis XVI. (*See* LOUIS STYLES.)

BIBLIOGRAPHY.—C. Gurlitt, *Geschichte des Barockstiles, des Rococo und des Klassicismus in Belgien, Holland, Frankreich, England* (Stuttgart, 1888); S. Sitwell, *Southern Baroque Art* (1924) and *German Baroque Art* (1927).

ROCROI, a town of northern France, in the department of Ardennes, 22 m. N.N.W. of Charleville by rail, and within 2 m. of the Belgian frontier. Pop. (1926) 968. The place, originally called Croix-de-Rau or Rau Croix, was fortified in the 16th century and besieged by the imperialists in 1555. Invested by the Spaniards in 1643, it was relieved by Louis II., the duke of Enghien (afterwards the Great Condé). Captured in 1658 by the same duke for Spain, it was not restored to France till the Treaty of the Pyrenees in 1659. In 1815 Rocroi was besieged by the allies. As a fortified place Rocroi commands the Ardennes plateau between the valley of the Meuse and the headwaters of the Oise. The present fortifications, constructed by Vauban, form a pentagon and entirely close in the town.

Battle of Rocroi.—In 1643 (*see* THIRTY YEARS' WAR) the Spaniards, under Melo, invading France through the Ardennes, laid siege to Rocroi. The town lay in a small plain, surrounded by woods and marshes, and could only be approached through a narrow defile. Contrary to the advice of his cautious lieutenant, Marshal de l'Hopital, the young duc d'Enghien, later known as prince de Condé (*q.v.*), though his army was inferior, decided to attack the Spaniards before the town. Either taken by surprise or deliberately courting battle, Melo omitted to block the defile and Enghien, covered by a vigorous display of cavalry under the dashing Gassion, led his army through it in safety and formed up on a low ridge facing the Spanish lines. His infantry, commanded by Espenan, was in the centre, cavalry under Gassion on the right, cavalry under la Ferté on the left, a small reserve under Sirot in rear—altogether 16,000 infantry and 7,000 cavalry, with 12 guns. The Spanish army, now concentrated on a parallel ridge facing the French, was similarly organized, 18,000 infantry in the centre under the veteran Fontaine, cavalry on the right under Isembourg, on the left under Albuquerque—27,000 men and 18 guns. Melo also expected a reinforcement of 6,000 men under Beck. Evening was approaching when la Ferté, wishing to outshine the more favoured Gassion, suddenly led his wing forward without orders, designing, perhaps, to throw a relief into Rocroi. Enghien instantly ordered him back, and Melo surprisingly allowed him to return untouched. Night fell without further action. On May 19 the French army stood to arms at 3 A.M., Enghien, like Henry of Navarre, donning a hat adorned with white plumes instead of an armoured helmet. A deserter had reported that a battalion of musketeers was in ambush in a wood on the French right. Enghien sent a regiment of infantry to dislodge them, while cavalry, moving round behind the wood, caught them as they retired and cut them to pieces. Relieved of this danger, Enghien set himself to his main task. He himself led eight squadrons against Albuquerque's front, while Gassion with a similar force attacked his left flank. Albuquerque's force melted away before the simultaneous onslaught, and Enghien, ordering Gassion to pursue, swung his own squadrons against the left of the Spanish infantry. Meanwhile la Ferté, though ordered not to commit himself till the right attack had developed favourably, had again disobeyed. He led a ragged attack against Isembourg, was completely defeated, himself and his guns captured, while his

THE ROCKIES IN THE UNITED STATES AND CANADA

1. The Rocky Mountains in the United States: view showing Mount Elbert near Leadville, Colorado, the second peak in the United States in height—Mt. Whitney in California being the highest. The altitude of Mount Elbert is 14,419 feet
2. The Rocky Mountains in Canada: Mount Robson, British Columbia, having an altitude of 12,975 feet

men fled, hotly pursued by the Spaniards. Fortunately Sirot's reserve stood firm and threw off Isembourg's attack. Espenan also had advanced against the Spanish infantry, but seeing la Ferté's disaster, drew off. At this critical moment Enghien with his cavalry struck the second line of Spanish infantry in the rear and, dispersing them, swept on to attack Isembourg's victorious cavalry. Taken completely by surprise, Isembourg's men fled, leaving their own and la Ferté's captured guns in Enghien's hands. There now remained only the front line of the Spanish infantry, the famous *tercios viejos*, standing in square upon the ridge. Beck, however, was approaching and the battle might yet be lost; collecting horse and foot Enghien led them to the attack. The Spaniards stood motionless till the French were within 50 paces; then the front face of the square opened and 18 guns belched death at the oncoming French; crashing musketry joined their roar and the attackers fell back with terrible loss. Twice Enghien renewed the attack, only to be beaten off, but the Spanish ammunition was running low, their losses were heavy, the recaptured French guns were brought into action, Sirot came up with his reserve and Gassion from his pursuit. Realizing that further resistance was hopeless, the Spanish officers signalled their desire for quarter; Enghien stepped forward to receive their surrender, but the Spanish infantry, misunderstanding his intention, opened fire upon him. Infuriated at this apparent treachery, the French hurled themselves upon the square and, overwhelming it, massacred the gallant Spaniards almost to a man. Beck, warned of his danger, retreated and the victory was complete. The price of it was 2,000 Frenchmen killed and as many wounded, but 8,000 Spaniards lay dead upon the field, and 7,000 more, nearly all wounded, were prisoners in the hands of the French. Rocroi marked the beginning of the long period of French military glory which was ended only by Marlborough and Eugene.

ROD, EDOUARD (1857–1910), French-Swiss novelist, was born at Nyon, in Switzerland, on March 31, 1857. He studied at Lausanne and Berlin, and in 1878 found his way to Paris. In 1881 he dedicated his novel, *Palmyre Veulard*, to Zola, of whom he was at this period a disciple. A series of novels of similar tendency followed. In *La Course à la mort* (1885) he turned to the analysis of moral motives. He is at his best in presenting cases of conscience, the struggle between passion and duty, and the virtues of renunciation. *Le Sens de la vie* (1889), one of his most famous books, is in the nature of a complement to *La Course à la mort*. Of his many later works, *La Vie privée de Michel Teissier* (1893), translated as *The Private Life of an Eminent Politician* (1893) is justly famous. He was an ardent student of Rousseau, and his play *Le Réformateur* (1906), is based on an episode in Rousseau's life. He died in January 1910.

RODBERTUS, KARL JOHANN (1805–1875), German socialist, was born at Griefswald on Aug. 12, 1805, where his father was professor at the university. He studied law at Göttingen and Berlin, was employed in legal offices in Prussia, and, after travelling for some time, bought the estate of Jagetzow in Pomerania (whence his name of Rodbertus-Jagetzow), and settled there in 1836. Henceforward he devoted himself chiefly to economic studies and to local and provincial affairs. In 1847 he was elected a member of the provincial diet, and in the following year he supported German unity and advocated the independence of the popular assembly. As a member of the Prussian national assembly in 1848, he was made Minister of public worship and education, and he sat for Berlin in the second chamber of 1849. He died on Dec. 8, 1875.

The general position of Rodbertus was "social, monarchical and national." He held the purely economic part of the creed of the German social-democratic party, but disagreed with their methods, and with those of the Arbeiterverein which he refused to join. While regarding the establishment of a socialist state as eventually possible, he accepted existing institutions as the result of past development and looked to the ruler of a united Germany to solve all social problems. The basis of the economic teaching of Rodbertus is the principle laid down by Adam Smith and Ricardo, and insisted on by all the later socialists, that labour is the source and measure of value. In connection with this he developed the position that rent, profit and wages are all parts of a national income produced by the united organic labour of the workers of the community. Consequently wages of labour cannot be paid out of capital; for they are only that part of the national income which is received by the workmen, of a national income which they have themselves produced. The wages fund theory is thus disposed of. But the most important result of the theory is his view that the possession of land and capital enables the landholders and capitalists to compel the workmen to divide the product of their labour with those non-working classes, and in such a proportion that the workers only obtain as much as can support them in life.

A fundamental part of the teaching of Rodbertus is his theory of social development. He recognized three stages in the economic progress of mankind: (1) the ancient heathen period in which property in human beings was the rule; (2) the period of private property in land and capital; (3) the period, still remote, of property as dependent on service. The goal of the human race is a society organized on a communistic basis, where land and capital will be national property, and the entire national production will be under national control; and means will be taken to estimate the labour of each citizen that he shall be rewarded according to its amount. Rodbertus believed that 500 years must elapse before the ethical force of the people would be sufficient to realise this stage of development.

The following are the most important works of Rodbertus: *Die Forderungen der arbeitenden Klassen* (1831); *Zur Erkenntniss unserer staatswirtschaftlichen Zustände* (1842); *Sociale Briefe an von Kirchmann* (1850); *Creditnot des Grundbesitzes* (2nd ed., 1876); "Der Normal-Arbeitstag," in *Tüb. Zeitschrift* (1878); "Letters" to A. Wagner, etc., *Tüb. Zeitschrift* (1878–79); *Letters* to Rudolf Meyer (1882). Rodbertus has received great attention in Germany, especially from Adolf Wagner (*Tüb. Zeitschrift*, 1878); *see* also Kosak's *Rodbertus sozialökonomische Ansichten* (Jena, 1882); an excellent monograph by G. Adler, *Rodbertus, der Begründer des wissenschaftlichen Sozialismus* (Leipzig, 1884); Dietzel, *Karl Rodbertus, Darstellung seines Lebens und seiner Lehre* (Jena, 1886); Jentsch, *Rodbertus* (Stuttgart, 1899); and E. C. K. Gonner, *Social Philosophy of Rodbertus* (London, 1899).

RODENTIA, an order of placental mammals characterised by their peculiar front or incisor teeth, which are reduced to a single functional chisel-like pair in each jaw, specially adapted for gnawing, and growing throughout life. Rodents may be characterised as terrestrial, or in some cases arboreal or aquatic, placental mammals of small or medium size, with a milk and a permanent series of teeth, plantigrade or partially plantigrade, and generally five-toed, clawed (rarely nailed or semi-hoofed) feet, clavicles or collar-bones (occasionally imperfect or rudimentary), no canine teeth, and a single pair of lower incisors, opposed by only one similar and functional pair in the upper jaw.

In all rodents the upper incisors resemble the lower ones in growing uninterruptedly from persistent pulps, and (except in the hare group, Duplicidentata) agree with them in number. The premolars and molars may be rooted or rootless, with tuberculated or laminated crowns, and are arranged in an unbroken series. The orbits are always open behind, never being surrounded by bone. All rodents are vegetable feeders.

Anatomy.—The skull is characterised by large premaxillae, completely separating the nasals from the maxillae; by the presence of zygomatic arches; by the wide space between incisors and cheek-teeth; and (except in Duplicidentata) by the antero-posteriorly elongated glenoid vacuity for the articulation of the lower jaw. The orbit is more or less completely continuous with the temporal fossa. The palate is narrow from before backwards, this being specially the case in the hares, where it is reduced to a mere bridge between the premolars. Tympanic bullae are always present and generally large; in the gerbils and jerboas there are supplemental mastoid bullae which form great hemispherical bony swellings at the back of the skull, in these genera and the hares the auditory meatus being tubular. The lower jaw is characterised by its abruptly narrowed and rounded front part supporting the pair of large incisors, by the small coronoid process, and the great development of the lower hind, or angular, portion. The cheek-teeth may be either rooted or rootless, and either cusped or formed

of parallel plates. When there are more than three cheek-teeth, those which precede the last three have succeeded milk-teeth, and are premolars.

Classification.—Some diversity of view obtains among naturalists with regard to the classification of the order; the scheme here followed being the one adopted (with some modifications of nomenclature) by Mr. Oldfield Thomas. All authorities agree in dividing rodents into two great sub-orders, the one, *Duplicidentata*, comprising only the hares, rabbits and picas, and the other, *Simplicidentata*, all the rest. In the latter there is only one pair of upper incisors, the enamel is on the front surface only.

SUBORDER SIMPLICIDENTATA

Section Sciuromorpha.—In this section the zygomatic arch, which is slender, is chiefly formed by the jugal; the angular part of the mandible arises from the inferior surface of the socket of the lower incisor. Collar bones well developed; tibia and fibula distinct. This section may be divided into 5 families:—(I.) *Anomaluridae:* arboreal rodents without postorbital processes; dentition i. $\frac{1}{1}$, p. $\frac{1}{1}$, m. $\frac{3}{3}$, and auditory bullae large. Near the root of the tail, on its underside, are a series of imbricated scales, which may be large and pointed (*Anomalurus*), or small and ridge-like (*Idiurus* and *Zenkerella*). A cutaneous parachute-like expansion, supported by a cartilaginous spur from the elbow, connects the limbs and tail in genera *Anomalurus* and *Idiurus;* it is absent in *Zenkerella*. This family is entirely confined to Africa where the various species are distributed over the greater part of Equatorial Africa from Liberia to Kenya Colony, as far south as Northern Rhodesia. The genus *Anomalurus*, the large Scaly-tailed Flying Squirrels, contains a large number of handsomely coloured species. The genus *Idiurus* contains the Pigmy Scaly-tails which are much smaller than the species of *Anomalurus*, with less bushy tails and brownish grey in colour; the three known species are found in West and Central Africa, from the Cameroons to the Ituri Forest, E. Congo. The Flightless Scaly-tail (*Z. insignis*) hails from the Cameroons.

(II.) **Sciuridae,** arboreal or terrestrial forms with distinct post-orbital processes and without caudal scales; dentition $i\frac{1}{1}$, p. $\frac{2}{1}$, m. $\frac{3}{3}$; this family is widely distributed in both Old and New Worlds. **Sciurinae:** this subfamily includes the typical squirrels, long-tailed and slender-bodied. Most of the species are arboreal, with compressed incisors. In Africa there are 13 different genera of *Sciurinae:* (1) *Aethosciurus* a genus allied to the typical one but distinguished by the baculum being simple; from the following genus it differs in the possession of two upper premolars. (2) *Heliosciurus*, East, West and Central Africa as far south as N. Rhodesia; cheek teeth $\frac{4}{4}$; species numerous, usually greyish above, white or orange-coloured below. (3) *Myrsilus*, one species, *M. aubinii*, the West African Giant Squirrel (length of body 9 inches). Cheek teeth $\frac{4}{4}$. (4) *Funisciuris*, the Side-striped Squirrels, distinguished by their more elongated skulls, teeth highly specialized, cheek teeth $\frac{5}{4}$; confined to the West African Forest Zone. (5) *Paraxerus*, closely allied to *Funisciurus*, skull less elongated, teeth less specialized; confined to the Ethiopian Region. (6) *Tamiscus*, closely related to *Paraxerus*, distinguished by the presence of two or four black stripes running down the back, with light coloured lines between them. These Dwarf Striped Squirrels occur in the East Congo, Uganda, and the Sudan. (7) *Myosciurus*, a genus containing one very small species *M. minutus* (head and body 60 mm.) not any larger than the Common Mouse; found only in the Cameroons and Gaboon. (8) *Protoxerus*, African Giant Squirrels, found in Fernando Po, the Gold Coast eastwards through the Congo to Kenya Colony, being more or less equatorial in distribution. These squirrels are very large (head and body 11 inches) and heavily built. (9) *Epixerus*, the Red-faced Giant Squirrels, of the Gaboon west to Ashanti; like *Protoxerus* but with the skull elongated. (10) *Atlantoxerus*, the N. African Ground Squirrel, *A. getulus*, is a large form (head and body 8 inches) with a broad, depressed skull; cheek-teeth $\frac{4}{4}$, molars simple in structure. Hair, as in all ground squirrels, harsh and scanty; back brownish with four dark stripes. (11) *Xerus*, the East African Ground Squirrels, reddish coloured species with unstriped bodies; skull with convex profile, and cheek-teeth $\frac{4}{4}$; found in Abyssinia, Somaliland, and Kenya Colony. (12) *Geosciurus*, contains but a single species, *G. capensis*, the South African Ground Squirrel, rather larger than the East African species, with a well-marked light flank-stripe. (13) *Euxerus*, the Equatorial Ground Squirrels, differ from the other members of the group in having long narrow skulls and narrow zygomata; cheek-teeth $\frac{4}{4}$. The species are found throughout the West African Forest region and spread eastward to the Sudan and East Africa.

The European, American and Asiatic *Sciurinae* are equally numerous, a large number of genera being now recognised. The typical genus, *Sciurus*, together with a number of New World genera, is distinguished by the large size of the baculum, which has a compressed terminal blade hollowed on the right side which carries below a downwardly directed process. The genera which have been grouped with the typical genus are *Tenes*, and all the American forms, except *Tamiasciurus*, the genus of Chickarees, or North American Red Squirrels, which on account of the suppression of the baculum is considered to represent a different group.

The North American Squirrels.—The North American Squirrels are a very numerous group and in addition to those which belong to the typical subgenus, such as *Sciurus* (*Sciurus*) *aureogaster* from California, and *S.* (*S.*) *poliopus* from Mexico, and the genus *Tamiasciurus*, or Red Squirrels, referred to above, a large number of species and sub-species are placed in the genera *Guerlinguetus* and *Baiosciurus*.

The small American Squirrels, the Pigmy Tree Squirrels, from Central and South America may be regarded as represented by a distinct genus *Microsciurus;* the bodily size is much smaller than in the other American forms.

The remainder of the South American Squirrels may be included in 9 genera; *Syntheosciurus*, containing one species, *S. brochus*, from Panama; a small form with a narrow skull and long rostrum; premolars $\frac{2}{1}$, mammae 6. *Leptosciurus*, a series of forms with short tails, from Colombia, Peru and Bolivia. *Notiosciurus*, a single small species, *N. rhoadsi*, is included in this genus; it comes from Ecuador, and possesses a narrow, short-nosed skull, and has the naked area on the hind feet much reduced. *Mesosciurus*, a large genus containing a number of different forms from the northern part of South and Central America; the skull has a longer rostrum than in *Guerlinguetus;* p. $\frac{1}{1}$, mammae 6. In *Hadriosciurus* (p. $\frac{1}{1}$, mammae 8) the size is large and tail long and heavier than in *Urosciurus*. *Urosciurus*, the Giant South American Squirrels, contains a number of large species (head and body 350 mm.; tail 320 mm.), with long, broad tails; the coat is short and harsh, and the skull long and narrow. The species, which come from the Amazon basin, are highly coloured, being a mixture of orange and black. *Simosciurus*, from Ecuador and Peru, is similar in size to *Urosciurus* but the tail is not so bushy or broad, and the pelage is longer and softer.

The Great-eared Squirrel of Borneo, *Reithrosciurus macrotis*, appears to be allied to the typical group; it is over two feet in length, half the length being occupied by a very large and bushy tail; the black ear-tufts are two inches long. The Giant Squirrels of Asia are grouped together in the genus *Ratufa*, the species being very numerous and some of them very strikingly coloured; they are found in India, Ceylon, Assam, Burma, Siam, Malay Peninsula, Sumatra, Java, Borneo, the Rhio Archipelago, eastward to the Natuna Islands and Celebes. A great variety of smaller forms is also found in Asia representing a number of different genera. *Dremomys* is a genus that contains some of the long-nosed Asiatic squirrels, inhabiting S. China and Formosa, Himalayas, Burma, Malay Peninsula and Borneo. A closely allied genus, also possessing a long snout, is *Menetes*, from Burma, Siam and the Malay Peninsula, distinguished by its well-marked flank-stripes; species *M. berdmorei*. Allied to *Menetes* and the following genus is the Chinese *Rupestes* (*R. forresti*), a long-nosed genus with no small anterior premolar. In the Chinese *Sciurotamias* the skull closely resembles that of Rupestes, but the colouring is quite different, being yellowish-brown above and yellowish-grey below, without the pale flank-stripe.

Lariscus is another genus belonging to this group; about seven or eight different forms have been described from Borneo, Singapore, Java, Sumatra, and the Malay Peninsula; distinguished by their shorter tails and by the presence of three dark dorsal stripes. *Tomeutes* is a widely distributed genus probably allied to *Callosciurus;* a large number of species has been described, the best known of which is *T. hippurus* from the Malay Peninsula. The genus spreads from Nepal into China and east to Celebes and the Philippines. The genus *Funambulus* includes the well-known Palm-Squirrels of India, which are confined to the Indian Peninsula and Ceylon; it is of interest to note that excluding the giant squirrels and flying squirrels no other form of squirrel occurs in the Peninsula.

The genus *Tamiops* is a group allied to the Palm Squirrels but distinguished by the dorsal stripes being black in colour and 1 or 3 in number; they are found in Assam, Manipur, Tenasserim, Yunnan and Siam. *Nanosciurus*, the Oriental Pigmy Squirrels, are very similar to the West African Pigmy Squirrels, but have larger molars and $\frac{5}{5}$ cheek-teeth instead of $\frac{4}{4}$; seven different forms have been described from Malacca, Sumatra, Borneo, and the Philippines. *N. samaricus*, from Samar, has the following dimensions:—head and body 88 mm.; tail 69 mm.; hindfoot 25 mm. A group of small squirrels from the Guianas has been placed in the genus *Sciurillus* (p. $\frac{4}{4}$, mammae 6); in general dimensions rather larger than Nanosciurus.

The Chipmunks, *Eutamias* and *Tamias*, are small, striped squirrels which may be regarded as a connecting link between the true squirrels and the Marmots, Prairie-dogs, *Spermophiles*, and Antelope Squirrels. The group is found in North America and Eastern Asia.

Marmotinae.—The Prairie-dogs (*Cynomys*) are entirely confined to the New World, and are distinguished by their very short tails, rudimentary ears, and large teeth; postorbital processes well developed, and palate contracted posteriorly. About 9 forms are recognised, divided into two subgenera, the typical one, and *Leucocrossuromys*. The genus *Citellus*, including the Spermophiles, Pouched Marmots, American Ground Squirrels or Souslik, is found throughout a large area of the Northern Hemisphere, from Hungary eastward through Asia and North America to the central United States. Like the Prairie-dogs the members of this genus are strictly terrestrial, with a short flattened tail. General size medium (head and body 195–220 mm.; tail 60–75 mm.). *Ammospermophilus* (Antelope-squirrels), *Callospermophilus* and *Otospermophilus* are closely allied genera inhabiting the New World. The Marmots (*Marmota*) have a similar distribution, being found from the Alps eastward through Asia and North America. These animals are more badger-like in form than Sciurine, the body being massive and the tail short and bushy; unlike the two preceding genera cheek-pouches are either absent or but little developed. Dimensions of *M. marmota* (Alps):—head and body 550 mm.; tail 150 mm.

(III.) **Petauristidae.**—Flying Squirrels of the Northern Hemisphere, extending from Scandinavia and northern Russia eastward throughout the greater part of Asia to the southern United States; in general appearance squirrel-like, but having the fore and hind limbs connected by a parachute-like fold of skin, supported by a cartilaginous spur arising from the wrist. Eleven genera are known, the most important of which are the following:—*Eupetaurus*, a large flying squirrel (head and body 515–610 mm.; tail 380–480 mm.; hindfoot 86 mm.) with hypsodont or tall-crowned cheek-teeth, in this respect differing from all the other *Petauristidae*. *E. cinereus* is dark grey in colour and has been recorded only from Astor and Gilgit. Another genus of large Asiatic Flying Squirrels is *Petaurista*, which includes some very brightly coloured forms; teeth normal, brachyodont. These squirrels are found over a large part of Asia, extending from the Indian Peninsula and Ceylon, through Nepal, Bengal and Burma into China, Siam, the Malay Peninsula and Islands as far east as Japan. Among the smaller flying squirrels the following may be noted: *Petromyscus*, with brachyodont teeth, and small ears; found in Malacca and Borneo; and *Sciuropterus*, with the molar ridges well developed, found in Scandinavia, Russia and eastward to Japan.

(IV.) **Aplodontidae** or American Sewellels, distinguished from the *Sciuridae* by the absence of postorbital processes and the cheek-teeth being rootless; premolars $\frac{2}{2}$. The Sewellels are medium-sized terrestrial rodents with short tails and very small eyes.

(V.) **Castoridae** or Beavers, found both in the Old and the New World, confined to the forested portions of the Northern Hemisphere south to the Mediterranean region and southern United States. The skull lacks the postorbital process and the cheek-teeth are rootless, premolars $\frac{1}{1}$; size of body large, tail flat and broad, hindfeet webbed, and habits aquatic. Two species are recognized, *C. fiber* from Scandinavia and a few of the larger European rivers; and *C. canadensis* from North America.

Section MYOMORPHA.—The jugal seldom extends far forward, the zygomatic arch being supported by the zygomatic process of the maxilla; tibia and fibula united; postorbital processes absent, and angle of mandible usually arising as in the Sciuromorpha.

Muscardinidae or Dormice, widely distributed over the Old World, from England to Japan; and south as far as Cape Colony; usually the members of this family are of small size with large rather bushy tails and large ears. There is no caecum and the premolars are $\frac{1}{1}$. The typical genus *Muscardinus*, extends from England into Asia Minor, and south to the Mediterranean. The Common British Dormouse, *M. avellanarius*, is the smallest member of the family. Three other genera of this family are found in Europe: (i.) *Eliomys*, which extends eastward into Asia Minor and south to Northern Africa; (ii.) *Dyromys*, which occurs in Hungary and Switzerland, spreading eastward to Central Asia through Asia Minor; and (iii.) *Glis*, found in Central and Southern Europe extending east to Asia Minor and south to Sardinia and Spain. The latter genus contains the Edible Dormouse, a large grey-coloured form (head and body about 170 mm.); easily distinguished from the other European species by its large size and squirrel-like appearance. In Africa the family is well represented from south of the Sahara to Cape Colony; *Graphiurus ocularis* being a large grey-coloured form from Cape Colony, Namaqualand and Damaraland. The other African genus is *Claviglis*, containing a large number of small and medium sized species.

The group is represented in India by the Spiny Dormouse *Platacanthomys lasiurus*, with a spiny coat; and in China by the genus *Typhlomys*, with one species *T. cinereus*, a slate-grey coloured animal with a plumed tail.

Muridae.—The next family is the *Muridae*, the largest mammalian family; its typical members are mice of the House Mouse variety. The most important of the groups are the following:—**Hydromyinae** which contains the Australian Water Rats and various genera from the Philippines and New Guinea. *Hydromys*, the Australian and New Guinea Water Rats, has soft, thick fur and large laterally compressed tail. *Chrotomys* is an allied genus from Luzon, Philippines, which has the back prominently striped; size of body about that of a common rat (head and body 196 mm.; tail 110 mm.). *Crunomys*, probably an aquatic form related to the foregoing genus, and *Celaenomys*, which looks like *Chrotomys* without the stripes, are too closely allied genera also from Luzon.

Rhynchomyinae, a subfamily created to receive an extraordinary Philippine rat with very reduced teeth; general form rather shrew-like, muzzle elongate.

Gerbillinae.—A large subfamily is the *Gerbillinae*, with a number of genera, spread over a considerable portion of Africa and Asia. Of the African genera *Gerbillus Dipodillus* and *Meriones* extend into Asia. The majority of these animals have long, hairy tails and long feet; others such as *Microdillus, Desmodillus, Desmodilliscus*, and *Pachyuromys*, have short and fleshy tails. In most species the colour is bright buffy-brown or orange above, white below. *Taterona* is found over the whole of Africa south of the Sahara; the closely allied Asiatic genus, *Tatera*, inhabits Peninsular India and Ceylon. *Taterillus* extends across Equatorial Africa from Nigeria to Kenya Colony and the Sudan. The genus *Gerbillus* is found in south and northern Africa and India, and *Dipodillus* extends from West Africa to Kenya Colony and North Africa and India. *Ammodillus* and *Microdillus* are two dwarf forms from Somaliland. *Desmodilliscus* is a pigmy group

from the Sudan and Northern Nigeria, and *Desmodillus* is the fat-tailed gerbil of South Africa; and *Pachyuromys* is a similar animal from North Africa. *Psammomys* is found in Northern Africa and Palestine, and *Rhombomys*, which resembles the foregoing genus, comes from Russia, Siberia and Central Asia.

Otomyinae, a subfamily which contains the Swamp Rats of Africa. The members of this group are all heavily built animals with long, soft fur and tails of medium length. The African Tree Mice and Rats and Fat Mice form another natural group, the *Dendromyinae*, which contains the Pigmy Tree Mice (*Dendromus*) and the West African Bush Mouse (*Prionomys batesi*); both genera are remarkable for their semi-prehensile tails and long hind-feet; some of the Tree Mice have dark stripes on the back, whereas *Prionomys* is pale chocolate in colour. The Spiny Tree Rats (*Deomys*) from West and Central Africa are remarkable for their long tails and spiny coats. The short-tailed members of this subfamily are the Fat Mice (*Steatomys*) from South and West Africa, and the Mouse Gerbilles of Cape Colony.

Murinae.—By far the largest subfamily is the typical one, the *Murinae*, which contains a great number of genera, only a few of which it will be possible to deal with in this review.

The Genus Mus.—The typical genus *Mus* is represented by the House Mouse and a few other species such as *M. bactrianus* from Northern India and *M. muralis* from St. Kildar; about nine species of this genus are found in Europe; it was originally confined to the Old World but has been introduced into nearly every part of the world. Closely allied is the genus *Rattus*, containing the well-known Black and Brown Rats and over a hundred other forms. Much larger species are found in the allied genera *Bandicota*, *Gunomys* and *Nesokia*, the Bandicoot Rats which are found in India, Arabia and Northern Africa. In Africa there is a genus of Giant Rats known as *Cricetomys*, which measure about 2 ft. 6 in. in total length; the tail is very long and has a white tip. One of the most remarkable genera is *Acomys*, which contains the Spiny Mice, distributed over the greater part of Africa, south-western Asia, Cyprus and Crete; these Mice are almost as spiny as hedgehogs and vary in colour from uniform slaty-grey to bright red with white underparts. The Field Rats of Africa are included in three genera, *Arvicanthis*, uniformly coloured rats; *Lemniscomys*, rats with one or many stripes; and *Rhabdomys*, the four striped rats. Among the Australasian members of the subfamily mention may be made of the following:—*Mastacomys fuscus*, resembles a common rat but with larger ears and broader molars. *Capromys*, a genus of naked-tailed, woolly rats with short, rounded ears; two species are known, both from the Solomon Islands. *Anisomys imitator*, a coarse-haired rat with 6 mammae and only the basal part of the tail dark, the remainder yellowish-white (head and body 300 mm.; tail 320 mm.). *Mallomys*, very large rats (head and body 470 mm.; tail 400 mm.); fur very long with a number of white tipped hairs interspersed; the species are found in New Guinea. *Hyomys meeki* similar to *Mallomys* but rather smaller in size (head and body 390 mm.). The Australian Mice are numerous, the chief genus being *Pseudomys*. The Jerboa-Rats are included in the genus *Conilurus*, distinguished by their elongated hind-limbs and tufted tails; these rats are confined to North Australia. A nearly allied genus is *Mesembriomys* from the Northern Territory; large rats with long jerboa-like tails.

The subfamily *Murinae*, which contains more than fifty genera, is characterised by the molars being tuberculate, brachyodont, and rooted; the tubercles of the cheek-teeth being arranged in three longitudinal rows. In addition to the genera already mentioned as occurring in Europe, the forms *Epimys*, *Apodemus*, and *Micromys* are also found in Europe; the latter genus contains the well-known Harvest Mice, small reddish-orange coloured mice with semi-prehensile tails. The forms of *Apodemus*, the Field Mice, are widely distributed from Ireland to Japan. One of the most curious subfamilies of the *Muridae* is the *Lophiomyinae*, sometimes reckoned to be of family rank. It contains but a single genus, *Lophiomys*, the members of which are confined to East Africa; they differ from the typical *Muridae* in having the temporal fossa roofed over with bone; the hair on the back forms a well marked crest. These animals are of considerable size, the head and body measuring 270 mm. in length.

The subfamilies *Cricetinae* and *Microtinae* contain the Hamp sters and Voles respectively; the former group which has a Murine dentition, the molars being rooted, is found over America, S.E and Central Europe, Central Asia and Southern Africa; the African representative is the genus *Mystromys*. The typica genus *Cricetus*, contains the well-known Hampster of Europe and Asia Minor. A large number of American genera is included in this subfamily. The members of the *Microtinae*, which contain the Lemmings and Voles, are distinguished by their prismatic hypsodont or rootless, flat-crowned molars; a numerous group distributed over both hemispheres.

Spalacidae, mole-like animals, modified for a subterranean life found over South Eastern Europe, Asia and Africa. The typica genus, *Spalax*, contains the Blind Moles of Europe, which extend into Egypt and western Asia. The Bamboo Rats of India, etc. fall into three genera, *Nyctocleptes* and *Rhizomys*, being very large (head and body 386 mm.) forms, and *Cannomys*, a smaller group from Siam, Burma and Bhutan. In Africa there is the closely allied genus *Tachyoryctes*, medium-sized moles with very soft, usually rufous-coloured fur. The American Pocket-Gophers (*Geomys* and *Thomomys*) form the family *Geomyidae*. The Kangaroo-Rats of the New World, *Dipodomys*, *Perodipus* and *Microdipodops*, form with the genus *Heteromys*, from Colombia and Venezuela, the family *Heteromyidae*. Another group of burrowing mole-like rodents is the *Bathyergidae* which is confined to Africa; including *Heterocephalus*, the naked moles of East Africa and the genus *Cryptomys* which is found over a great part of the continent. The *Jaculidae* have the body modified for jumping, the tail being long and plumed and the hind-feet large; the fore-limbs are usually much reduced in size. This family contains three sub families:—(1) *Sicistinae*, found in the eastern hemisphere, west as far as Norway; small mouse-like animals, with long tails and feet, and a black dorsal stripe. (2) *Jaculinae*, the Jerboas, confined to the Palaearctic and Ethiopian Regions, distinguished by their very elongated hind-feet; several genera can be distinguished *Jaculus* includes the 3-toed forms, the majority of the forms coming from Northern Africa; *Alactaga* is a closely allied genus which spreads as far north as Southern Russia. (3) *Zapodinae*, in which the American members of this family are grouped.

Section Hystricomorpha.—In this section the zygomatic arch is massive, and the jugal is not supported by the maxillary zygomatic process; mandible with the angular portion arising from the outer side of the lower incisor-socket. One premolar in each jaw, and fibula distinct.

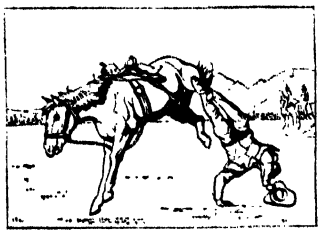
Family *Pedetidae*, the Jumping Hares of Africa. This group is very difficult to classify, but on the whole it seems best to place it in the present section rather than with the Myormorpha. The molars are rootless and the hind-limbs elongated. The genera dimensions are large, the body being about the size of a hare's The next family, the *Ctenodactylidae*, includes four curious genera:—*Ctenodactylus*, the Gundis of Algeria and Tunis, small thickset animals with very short tails and pale buff in colour *Massoutiera*, the long-tailed Gundis of N.W. Africa; *Pectinator* a very similar animal but with a longer, more bushy tail, from Somaliland; and *Petromys*, the Rock Rat, of S.W. Africa. The *Capromyidae* contains the African Cane-Rats (*Thryonomys*) and the West Indian genus of arboreal forms known as *Capromys* The South American Coypu (*Myocastor*) is also sometimes placed in this family, sometimes in a separate group altogether. In this genus the incisors are very large, the tail fairly long and naked and the hind feet webbed. In the true Porcupines (*Hystricidae*) the skull is greatly inflated and the tail short; the typical genus *Hystrix* inhabits the greater part of Africa and the Mediterranean region of Europe. The Indian and other Asiatic porcupines related to *Hystrix* are now considered to represent a distinct genus, *Acanthion*. The Brush-tailed Porcupines of the genus *Atherurus*, are common to both West Africa and Asia; these porcupines are at once distinguished from the typical ones by the much longer scaly tail which terminates in a brush of bristles. The porcupines of America are grouped together in the family *Erithizontidae* The typical genus is represented by the Canadian Porcupine (*E*

dorsalis) in which the tail is short, and the spines of the body are nearly hidden by a growth of long hair. *Synetheres*, from South and Central America, is a long and prehensile-tailed genus of Tree Porcupines.

In the South American family *Chinchillidae* there are two or three genera of terrestrial rodents with elongated hind-limbs, very soft fur, and bushy tails. The typical genus, *Chinchilla*, contains one species, *C. lanigera*, which provides the well-known Chinchilla fur; it is found only in the Peruvian and Chilian Andes. Almost equally soft is the fur of the much larger Viscachas (*Viscaccia*), animals about the size of a large rabbit, with long hind-feet, long, bushy tails, and bearing a median dark dorsal stripe down the back. The Paca (*Coelogenys*) and the Agoutis, of Central and South America, form another family, the *Dasyproctidae;* these animals are of large size with short or obsolete tails, and hoof-like claws. The Agoutis have slender limbs, with three hind toes, whereas the Paca has five hind toes and an enormously developed zygomatic region; the latter species is about two feet in length. The family *Dinomyidae*, represented by a single species from Peru, *D. branicki*, differs in having a long, bushy tail, cleft upper lip, and four digits on each foot. The family *Caviidae* is the last of the *Simplicidentata* and contains about 7 different genera, one of them, *Hydrochaerus*, containing the largest existing rodent. This animal, the Capybara (*H. capybara*) is massively built and is about the size of a medium-sized pig (length of body 4 ft.). The body is covered in long, coarse hair, the feet are fully webbed, and the molars complex; the Capybara occurs only in South America. The Patagonian Cavy, *Dolichotis patachonica* is rather larger than a big rabbit, having very large ears and a short tail; in general colour usually rufous. This beast inhabits the arid plains of Patagonia and La Plata. Lastly, the true Cavies (*Cavia*) are small tailless animals with short limbs and reduced ears; they are entirely neotropical.

SUBORDER DUPLICIDENTATA

Two pairs of upper incisors always present, with enamel extending round to their posterior surfaces. The suborder includes the Picas, Hares and Rabbits.



The family *Ochotonidae* includes the Picas or Tailless Hares, which, in addition to the absence of a tail, are further distinguished from the hares and rabbits by the much smaller ears and smaller size of the body; the number of different forms is very great, the Picas being widely distributed over the mountainous parts of Central Asia and extending into South-eastern Europe and North America.

The family *Leporidae* contains the hares and rabbits, in which the hind-limbs are elongated, the tail short and recurved, and the ears long. Premolars $\frac{3}{2}$. The typical genus, *Lepus*, occurs in Europe, Asia, North America and Africa. The species and races are very numerous, some 19 different forms being found in Europe alone. In N. India there is a hare which is considered to represent a distinct genus *Caprolagus; C. hispidus* differs from all true *Lepus* in having an entirely brown-coloured tail and the ears being shorter than the head; in *Lepus* the ears are at least as long as the head, and the tail white beneath. The genera *Nesolagus* and *Pentolagus* are nearly allied to *Caprolagus*. The "Cotton-tails" of North and South America belong to the genus *Sylvilagus*. The Red Hares of South and South-east Africa, *Pronolagus*, more resemble rabbits in form, and usually have bright red tails. The Common Rabbit belongs to the genus *Oryctolagus*, distributed originally over North Africa and Southern and Central Europe; distinguished from *Lepus* by its shorter ears and hind limbs, and the fact that the young are born blind.

RODEO, a series of contests in sports associated with, or suggested by, the routine of the American cowboy. It is an outdoor exhibition, customarily given annually, and in Western towns supplanting the county fair and carnival characteristic of agricultural districts in the Middle West.

A *rodeo*, in the jargon of Mexican cattle-herders, is a gathering together ("round-up") of cattle, or the enclosure of a herd. *Rodeo* and several like Spanish words have filtered, by way of the cowboys of the South-west, into the common vocabulary of the Western States. In the "classic" era of the American cowboy (1867–84), when the cattle of several variously-owned herds roamed over the same unfenced range, the stock was assembled semi-annually at a round-up, at which the cowboys of the several ranches incidentally entertained themselves with feats of skill and informal contests, as well as with progressive poker and the drooling of ballads. From these beginnings developed rodeo, the name alike with the entertainment. The first well-advertised, well-organized cowboy contest was held in Denver, Colo., in 1896. The first of the Cheyenne, Wyo., "Frontier Days" annual celebrations was held in 1897.

A BRONCO THROWING ITS RIDER

The Cheyenne rodeo, the Pendleton, Ore., round-up and the Calgary, Alberta, stampede are traditionally the three greatest of the annual rodeos. Victory in the more spectacular contests brings impressive trophies and cash prizes, and may secure the respectful attention of the motion-picture magnates. Belle Fourche, S.D., Las Vegas, N.M., Prescott, Ariz., Tucson, Ariz., Monte Vista, Colo., and Sumas, Wash., are among the Western towns annually staging rodeos which draw many professional rodeo-contestants as well as actual cowboys from the nearby ranches. From 1926 rodeos styled "World Series Rodeo" have been presented in New York.

The Cheyenne Frontier Days celebration of July 26–30, 1927, which may be taken as typical of the best-organized rodeos, included in its contests a bucking-bronco riding contest, a cowgirls' relay race, a two-steer roping contest, a wild horse or wild mule race, a wild-cow milking contest, a two-steer bull-dogging contest and "trick and fancy riding" contests. The bucking-horse contest (always the most important) offered the highest purse,

A COWBOY THROWING A STEER AT A WESTERN RODEO

$2,100. The Roosevelt hotel trophy, valued at $1,000, for the "world's champion all-around cowboy," must be competed for both at Cheyenne and Calgary, and is the award of greatest prestige in rodeo. A "bull-dogging contest" is more informatively called a steer-wrestling contest. The "World Series" rules are: "Wrestler and hazer will be allowed to leave the chute with steer, and wrestler's mount and steer may be Lap-and-Tap when crossing dead line, but wrestler must not have hand on steer or leap before crossing dead line. Penalty 15 seconds. . . . This is a twist-down contest—wrestler must stop steer and knock him down. If steer is knocked down, he must be let up on all four feet and thrown

again, and should steer start running after once being stopped and then be thrown against the ground, the steer must be let up again and twisted down. Ten seconds fine will be added to steer wrestler's time, for knocking down steer either accidentally or purposely"—or, as the Cheyenne rules more compactly put it, "if contestant hooligans steer, any question as to cleanness of throw and fall will be left entirely to the judges." Incidentally, "bulldogging" was literally performed at the Cheyenne rodeo of 1904, when a negro from Texas sank his teeth into the steer's upper lip, and, without using his hands, twisted the steer to the ground.

Charles B. Cochran, the London theatrical producer, hired 150 American cowboys to compete with others from Canada, the Argentine and Australia in an international rodeo at the British Empire exhibition of 1924. Most unfortunately, a steer's leg was broken in the course of the first evening's performance. Many of the audience of 40,000 hissed and booed, and the Royal Society for the Prevention of Cruelty to Animals initiated legal processes. When the defendants appeared before the magistrate in Hendon, they wore their full ornate regalia, each man "packing" a gun. The summonses were dismissed; but the prince of Wales was deterred from accepting the gift of a cow-pony, and the impression that rodeos involved cruelty to the cattle and horses has not been wholly dissipated. It is comparatively untrue and is a very small handicap to a sport firmly rooted in the American West. (E. D. Br.)

RIDING A BRONCO AT THE PENDLETON ROUND-UP

RODERICK or RUADRI (d. 1198), king of Connaught and high king of Ireland, was the son of Turlough (Tordelbach) O'Connor, king of Connaught, who had obtained the overkingship in 1151, but had lost it again in 1154 through the rise of Muirchertach O'Lochlainn in Ulster. Roderick succeeded to Connaught in 1156, and after ten years' fighting won back the title of high king. His ill-advised persecution of Dermot (Diarmait MacMurchada), king of Leinster, furnished the pretext for the Anglo-Norman invasion of Ireland. Roderick endeavoured to expel the invaders, but was driven behind the Shannon. He delayed his submission to Henry II. until 1175, when a treaty was concluded at Windsor. Roderick, under this agreement, held Connaught as the vassal of England, and exercised lordship over all the native kings and chiefs of Ireland; in return he undertook to pay an annual tribute. The treaty did not put an end to the wars of the Norman adventurers against Connaught and Roderick's dependants. He held out till 1191; but then, weary of strife, retired to the cloister. He died in 1198, the last of the high kings of Ireland.

RODEZ, a town of southern France, capital of the department of Aveyron, 51 m. N.N.E. of Albi by rail. Pop. (1926) 10,693. Rodez, *Segodunum* under the Gauls, *Ruthena* under the Romans, was the capital of the *Ruteni*, a tribe allied to the Arverni, and was afterwards the chief town in the district of Rouergue. In the 4th century it became Christian, and St. Amans, its first bishop, was elected in 401. In the middle ages the bishops held temporal power in the "cité," and the counts in the "bourg." The Albigenses were defeated near Rodez in 1210. The countship of Rodez, detached from that of Rouergue at the end of the 11th century, belonged first to the viscounts of Carlat, and from the early 14th century to the counts of Armagnac. From 1360 to 1368 the English held the town. After the confiscation of the estates of the Armagnacs in 1475 the countship passed to the dukes of Alençon and then to the D'Albrets. Henry IV. finally annexed it to the Crown of France.

Rodez is situated on the southern border of the Causse of Rodez, on an isolated plateau bordered on the east and south by the river Aveyron. The cathedral (1277–1535) has a great Flamboyant rose-window in the principal façade, which is flanked by two square towers and has no portal. Each transept has a fine Gothic doorway. On the north side of the building rises a 16th century tower. The episcopal palace (17th and 19th centuries), is flanked by a massive tower, relic of an older palace.

The town is the seat of a bishop, a prefect and a court of assizes, and has tribunals of first instance and commerce, and a chamber of commerce. The industries include wool-spinning and the weaving of woollen goods.

RODGERS, JOHN (1771–1838), American sailor, was born in Harford county, Md., on July 11, 1771. He entered the U.S. navy when it was organized in 1798. He was second in command to Commodore James Barron (1769–1851) in the expedition against the Barbary pirates, and succeeded him in the command in 1805. In this year he brought both Tunis and Tripoli to terms, and then returned to America. In 1811 he was in command as commodore of the U.S. frigate "President" off Annapolis when he heard that an American seaman had been "pressed" by a British frigate off Sandy Hook. Commodore Rodgers was ordered to sea "to protect American commerce." On May 16, 1811, he sighted and followed the British sloop "Little Belt," and after some hailing and counter-hailing, of which very different versions are given on either side, a gun was fired, each side accusing the other of the aggression, and an action ensued in which the "Little Belt" was cut to pieces. The incident, which was represented as an accident by the Americans, and believed to be a deliberate aggression by the British navy, had a share in bringing on the War of 1812. When hostilities broke out Rodgers commanded a squadron, and was wounded by the bursting of one of his guns while pursuing the British frigate "Belvedere." He was subsequently president of the Board of navy commissioners in 1815–24 and in 1827–37. He died in Philadelphia on Aug. 1, 1838.

RODIN, AUGUSTE (1840–1917), French sculptor, was born in 1840 in Paris. He began by attending Barye's classes, but did not yield too completely to his influence. From 1864 to 1870, under pressure of necessity, he was employed in the studio of Carrier-Belleuse, where he learnt to deal with the mechanical difficulties of a sculptor. Even so early as 1864 his individuality was manifested in his "Man with a Broken Nose." After the war of 1870 finding nothing to do in Paris, Rodin went to Brussels, where from 1871 to 1877 he worked, as the colleague of the Belgian artist Van Rasbourg, on the sculpture for the outside and the caryatids for the interior of the Bourse, besides exhibiting in 1875 a "Portrait of Garnier." In 1877 he contributed to the Salon "The Bronze Age," which was cast in bronze for the Salon of 1880 and is now in the Luxembourg. Between 1882 and 1885 he sent to the Salons busts of "Jean-Paul Laurens" and "Carrier-Belleuse" (1882), "Victor Hugo" and "Dalou" (1884), and "Antonin Proust" (1885).

From about this time he chiefly devoted himself to a great decorative composition six metres high, which was not finished for twenty years. This is the "Portal of Hell," the most elaborate perhaps of all Rodin's works, executed to order for the Musée des arts décoratifs. It is inspired mainly by Dante's *Inferno*, the poet himself being seated at the top, while at his feet, in undercut relief, we see the writhing crowd of the damned, torn by the frenzy of passion and the anguish of despair. The lower part consists of two bas-reliefs, in their midst two masks of tormented faces. Round these run figures of women and centaurs. Above the door three men cling to one another in an attitude of despair. After beginning this titanic undertaking, and while continuing to work on it, Rodin executed for the town of Damvillers a statue of "Bastien-Lepage"; for Nancy a "Monument to Claude de Lorrain," representing the Chariot of the Sun drawn by horses; and for Calais "The Burgesses of Calais" surrendering the keys of the town and imploring mercy. In this, Rodin, throwing over all

school tradition, represents the citizens not as grouped on a square or circular plinth, but walking in file. This work was exhibited at the Petit Gallery in 1889. A replica of it is now placed on the embankment at Westminster.

At the time of the secession of the National Society of Fine Arts, or New Salon, in 1890, Rodin withdrew from the old Society of French Artists, and exhibited in the New Salon the bust of his friend "Puvis de Chavannes" (1892), "Contemplation" and a "Caryatid," both in marble, and the "Monument to Victor Hugo" (1897), intended for the gardens of the Luxembourg. In this the poet is represented nude, as a powerful old man extending his right arm with a sovereign gesture, the Muses standing behind him. In 1898 Rodin exhibited two very dissimilar works, "The Kiss," exhibited again in 1900, a marble group representing Paolo Malatesta and Francesca da Rimini, and the sketch in plaster for a "Statue of Balzac." This statue, a commission from the Society of Men of Letters, had long been expected, and was received with vehement dissensions. The society who had ordered it "refused to recognize Rodin's rough sketch as a statue of Balzac," and withdrew the commission, giving it to the sculptor Falguière. Falguière exhibited his model in 1899. In the same Salon, Rodin, to prove that the conduct of the society had made no change in his friendship with Falguière, exhibited a bust in bronze of his rival, as well as one of "Henri Rochefort."

In 1900, the city of Paris, to do honour to Rodin, erected at its own expense a building close to one of the entrances to the Great Exhibition, in which almost all of the works of the artist were to be seen, more especially the great "Portal of Hell," still quite incomplete, the "Balzac," and a host of other works, many of them unfinished or mere rough sketches. Here, too, were to be seen some of Rodin's designs, studies and water-colour drawings. He has also executed a great many etchings and *sgraffiti* on porcelain for the manufactory at Sèvres. His best-known etching is the portrait of Victor Hugo. Rodin's "Hand of God" was exhibited in the New Gallery, London, in 1905. In 1904 Mr. Ernest Beckett (Lord Grimthorpe) presented the British nation with the sculptor's "Le Penseur." In the same year Rodin became president of the International Society of Sculptors, Painters and Engravers, in succession to James McNeill Whistler.

He died on Nov. 17, 1917, and was buried at Meudon.

Many of Rodin's works are in private collections. At the Luxembourg he is represented by a "Danaïd" (marble), "Saint Jean" (bronze, 1880), "She who made the helmet" (bronze statuette), busts of "J. P. Laurens," and "A Lady." A statue of Victor Hugo is in the Musée Galliera. The fine collection of Rodin's sculpture at South Kensington, a gift by the artist, includes "St. John the Baptist," "Age of Bronze," "L'Enfant prodigue," "Cybele," "The Muse," "Fallen Angel" (group), "Torso of Woman," "France" (head), "Figure of Woman," "Head," "Balzac" (bust), busts of Mlle. C. C., Miss E. Fairfax, la duchesse de C. C. (two), George Wyndham, Mr. Ryan (all the above in bronze); "Cupid and Psyche" (marble group); "Dante" (mask, terra-cotta); "Young Mother," "Despair" (sketches, plaster); also 4 drawings and 4 dry-points. The Metropolitan Museum, New York, has several sculptures and drawings.

RODNEY, GEORGE BRYDGES RODNEY, BARON (1718–1792), English admiral, second son of Henry Rodney of Walton-on-Thames, was born in February 1718. George was sent to Harrow, being appointed, on leaving, by warrant dated June 21, 1732, a volunteer on board the "Sunderland." While serving on the Mediterranean station he was made lieutenant (1739) on the "Dolphin." In 1742 he attained the rank of post-captain, having been appointed to the "Plymouth." After serving in home waters, he obtained command of the "Eagle" (60), and in this ship took part in Hawke's victory off Ushant (Oct. 14, 1747) over the French fleet. On that day Rodney gained his first laurels for gallantry, under a chief to whom he was in a measure indebted for subsequent success. In 1749 he was appointed governor and commander-in-chief of Newfoundland, with the rank of commodore, it being usual at that time to appoint a naval officer, chiefly on account of the fishery interests. He was elected M.P. for Saltash in 1751, and married his first wife, Jane Compton (1730–1757), sister of the 7th earl of Northampton, in 1753. During the Seven Years' War Rodney rendered important services. In 1757 he had a share in the expedition against Rochefort, commanding the "Dublin" (74). Next year, in the same ship, he served under Boscawen at the taking of Louisburg (Cape Breton). In 1759 and again in 1760 he inflicted great loss on the French transports collected on the Normandy coast for an attack on Great Britain. Elected M.P. for Penryn in 1761, he was in October of that year appointed commander-in-chief of the Leeward Islands station, and within the first three months of 1762 had reduced the important island of Martinique, while both St. Lucia and Grenada had surrendered to his squadron. At the peace of 1763 Admiral Rodney returned home, having been during his absence made vice-admiral of the Blue and having received the thanks of both houses of parliament.

In 1764 Rodney was created a baronet, and the same year he married Henrietta, daughter of John Clies of Lisbon. From 1765 to 1770 he was governor of Greenwich Hospital. In 1771 he was appointed rear-admiral of Great Britain, and in 1778 admiral of the White. From 1771 to 1774 he held the Jamaica command, and during a period of quiet was active in improving the naval yards on his station. Election expenses and losses at play in fashionable circles had shattered his fortune; he could not secure payment of the salary as rear-admiral of Great Britain; and he lived for some time in Paris until the generosity of a friend enabled him to meet his debts.

Sir George was appointed once more commander-in-chief of the Leeward Islands late in 1779. His orders were to relieve Gibraltar on his way to the West Indies. He captured a Spanish convoy off Cape Finisterre on Jan. 8, 1780, and eight days later defeated the Spanish admiral Don Juan de Langara off Cape St. Vincent, taking or destroying seven ships. On April 17 an action, which, owing to the carelessness of some of Rodney's captains, was indecisive, was fought off Martinique with the French admiral Guichen. Rodney, acting under orders, captured the valuable Dutch island of St. Eustatius on Feb. 3, 1781. It had been a great *entrepôt* of neutral trade, and was full of booty, which Rodney confiscated. As large quantities belonged to English merchants, he was entangled in a series of costly lawsuits.

After a few months in England, recruiting his health and defending himself in parliament, Rodney returned to his command in Feb. 1782, and a running engagement with the French fleet on April 9 led up to his crowning victory off Dominica, when with thirty-five sail of the line he defeated the comte de Grasse, who had thirty-three sail (April 12). The French inferiority in numbers was more than counterbalanced by the greater size and superior sailing qualities of their ships, yet five were taken and one sunk, after eleven hours' fighting. This important battle saved Jamaica and ruined French naval prestige, while it enabled Rodney to write: "Within two little years I have taken two Spanish, one French and one Dutch admiral."

On his return to England Rodney received a barony and a pension of £2,000 a year. From this time he led a quiet country life till his death (May 24, 1792), in London.

Rodney was unquestionably a most able officer, but he was also vain, selfish and unscrupulous, both in seeking prize money, and in using his position to push the fortunes of his family. He made his son a post-captain at fifteen. He was accused by his second-in-command, Hood, of sacrificing the interest of the service to his own profit, and of showing want of energy in pursuit of the French on April 12, 1782. It must be remembered that he was then prematurely old and racked by disease.

See General Mundy, *Life and Correspondence of Admiral Lord*

Rodney (2 vols., 1830); David Hannay, *Life of Rodney;* Rodney letters in 9th *Report* of Hist. mss. Com., pt. iii.; "Memoirs," in *Naval Chronicle,* i. 353–393; and Charnock, *Biographia Navalis,* v. 204–228. Lord Rodney published in his lifetime (probably 1789) *Letters to His Majesty's Ministers, etc., relative to St. Eustatius, etc.,* of which there is a copy in the British Museum. Most of these letters are printed in Mundy's *Life,* vol. ii., though with many variant readings.

RODÓ, JOSÉ ENRIQUE (1872–1917), Uruguayan philosopher, author and politician, was born in Montevideo on July 15, 1872. He was educated in a free lay school and at the University of Montevideo, where he showed extraordinary aptitude for history, literature and philosophy. In 1895 he was one of the founders of the *National Review of Literature and Social Sciences,* in which, in the following year he published an essay on literary criticism, "El que vendrá," which brought him immediate recognition as a writer and critic. In 1898 he was made professor of literature in the university, and two years later was appointed director of the National library, but in 1901 he gave up both positions to enter congress, to which he was elected in 1902 and 1908 and where he took an earnest part in initiating social legislation; he was not, however, a radical, and in a pamphlet, *Liberalismo y jacobismo* (1907), he strenuously opposed government anti-church legislation. In 1910 he represented Uruguay at the centenary of Chilean independence. Rodó's influence, however, as a rallying point of Latin-American youth was due to his authority as exponent of optimism, as stylist and as advocate of unity in Spanish-American literature and culture. His first important philosophical work, *Ariel,* based on Renan's eclecticism, appeared in 1900 in defence of Latin-American culture against the utilitarianism of the United States. In 1909 he published *Motivos de Proteo,* an assertion of the inevitability of change and the possibility of self-improvement, which represents Rodó's highest attainment as thinker and master of the Spanish language, and caused him to be hailed by Spanish-Americans as their philosopher *par excellence.* His essays on Rubén Darío (1899), Bolívar and Montalvo won him a similarly unique place in Spanish-American letters, to which, in those on Bolívar and Montalvo, included in *El Mirador de Próspero* (1913), he gave models of historical and critical essays. He died at Palermo in May 1917.

Ureña, "José Enrique Rodó," *Cuba Contemporánea* (Aug. 1918); Andrés González-Blanco, *Escritores representativos de América* (Madrid, 1917); V. G. Calderón, *Semblanzas de América* (Madrid, 1919); I. Goldberg, *Studies in Spanish-American Literature* (New York, 1920). (W. B. P.)

RODOSTO, a town of European Turkey, in the vilayet of Rodosto, on the coast of the Sea of Marmora, 78 m. west of Constantinople. Pop., vilayet (1924), 95,753. The Bay of Rodosto is enclosed by the great promontory of Combos, a spur about 2,000 ft. in height from the hilly plateau to the north. The church of Panagia Rheumatocratissa contains the graves, with long Latin inscriptions, of the Hungarians who were banished from their country in 1686 by the imperialist captors of Buda. Rodosto was long a great depot for the produce of the Adrianople district, but its trade suffered when Dédéagatch became the terminus of the railway up the Maritsa, and the town is now dependent on its maritime trade, especially its exports to Constantinople. It is the administrative centre of a district (*sanjak*) producing and exporting barley, oats, spelt and canary seed, and largely planted with mulberry trees, on which silkworms are fed. White cocoons are exported to western Europe, silkworms' eggs to Russia and Persia.

Rodosto is the ancient *Rhaedestus* or *Bisanthe,* said to have been founded by Samians. From 1920 to 1922 it was in Greek territory but was restored to Turkey by the Treaty of Lausanne.

RODRIGUEZ (officially RODRIGUES), an island in the Indian ocean in 19° 41′ S., 63° 23′ E.; a dependency of the British colony of Mauritius, from which it is 400 m. distant. It is a station on the "all-British" cable route between South Africa and Australia. With a length from east to west of 13 m. it is from 3 to 6 m. wide. It is surrounded by a fringing reef of coral, studded with islets. This reef, only 100 yd. wide on the east, extends 3 m. west, and both north and south forms a flat area partly dry at low water. Two passages through the reef are available for large vessels—these passages leading respectively to Port Mathurin on the north coast and to Port South-East.

The island is a mass of volcanic rock, mainly a doleritic lava, rich in olivine. The land is hilly and the main ridge rises abruptly on the east, but more gradually on the west, where there is a wide plain of coral limestone, studded with caves. Of several peaks on the main ridge the highest is Mt. Limon (1,300 ft.). The ridge is deeply cut by ravines, the upper parts of which show successive belts of lava separated by thin beds of ashes, agglomerate and ochre-coloured clays. In places the cliffs rise 300 ft. and exhibit 12 distinct lava flows. The climate is like that of Mauritius, but Rodriguez is more subject than Mauritius to hurricanes during the north-west monsoon (November to April).

Flora and Fauna.—When discovered, Rodriguez was clothed with fine timber trees; but goats, cattle and bush-fires have combined to destroy the greater bulk, and the indigenous plants have in many cases been ousted by intrusive foreigners. Parts are still well wooded, and elsewhere there is excellent pasturage. The sweet potato, manioc, maize, millet, the sugar-cane, cotton, coffee, rice and tobacco are cultivated. Wheat is seldom seen, but beans (*Phaseolus lunatus*), lentils, gram (*Cicer arietinum*), dholl (*Cajanus indicus*) and ground-nuts are all grown. Mangoes, bananas, guavas, pineapples, custard-apples, and especially oranges, citrons and limes flourish.

At present the only indigenous mammal is a species of fruit-eating bat (*Pteropus rodericensis*), and the introduced species are familiar creatures as deer, pig, rabbit, rat, mouse, etc., but until recently there occurred a very large land-tortoise (*Testudo vosmaeri*), and its limestone caves have yielded a large number of skeletons of the now extinct bird, the solitaire (q.v., *Pezophaps solitarius*). Of indigenous birds 13 species have been registered. The guinea-fowl (introduced) has become exceedingly abundant, partly owing to a protective game-law; and a francolin (*Francolinus ponticerianus*), is also common. The marine fish-fauna does not differ from that of Mauritius, and the fresh-water species, with the exception of *Mugil rodericensis* and *Myxus caecuticus,* are common to all the Mascarenes. The insects comprise at least 60 species of Coleoptera, 15 Hymenoptera, 21 Lepidoptera, 15 Orthoptera, and 20 Hemiptera. Forty-nine species of coral have been collected, showing a close affinity to those of Mauritius, Madagascar and the Seychelles.

History.—Rodriguez or Diego Ruy's island was discovered by the Portuguese in 1645. In 1690 Duquesne prevailed on the Dutch Government to send a body of French Huguenots to the Island of Bourbon, at that time, he believed, abandoned by the French authorities. The refugees, however, found the French in possession and therefore proceeded to Rodriguez where eight of their number were landed on April 30, 1691, with a promise that they should be visited by their compatriots within two years. The two years were spent without misadventure but, instead of waiting for the arrival of their friends, the colonists left the island on May 8, 1693, and made their way to Mauritius, where they were treated with great cruelty by the governor. From the Dutch the island passed to the French, who colonized it from Mauritius. Large estates were cultivated, and the islanders enjoyed considerable prosperity. In 1809–10 Rodriguez was seized by the British, in whose possession it has since remained. The abolition of slavery proved disastrous to the prosperity of the island, and in 1843 the population had sunk to about 250. Since that time there has been a gradual recovery in the economic condition and a steady increase in population. The inhabitants are mainly of African origin, being descendants of slaves introduced by the French, and negro immigrants direct from Africa. There are a few families of European descent (besides the comparatively large staff maintained by the Eastern Telegraph Company) and a small colony of Indians and Chinese. The bulk of the people are French-speaking and Roman Catholics. There are two small settlements, Port Mathurin, the capital, and Gabriel, in the centre of the island. The island is administered by a magistrate appointed by the governor of Mauritius, and the laws are regulations issued by the governor in executive council.

See F. Leguat, *Voyages et aventures* (1708), edit. by Capt. P. Oliver, in vols. lxxxii. and lxxxiii. of the Hakluyt Soc. publications (1891). *See* also C. Grant, *Hist. of Mauritius and the Neighbouring Islands* (1801); Higgin, in *Journ. R.G. Soc.* (1849); the *Reports* of the Transit of Venus Expedition, 1874–75, published as an extra volume of the *Philosophical Transactions*, clxviii. (Botany, by I. B. Balfour; Petrology, by N. S. Maskelyne, etc. 1879); Behm, in *Petermann's Mittheilungen* (1880); A. J. Bertuchi, *The Island of Rodrigues* (1923); and the annual reports on Mauritius.

RODZIANKO, MICHAEL VASSILIEVICH (1859–), Russian politician, was born in 1859, of a family of great landowners. After a short period in the Horse Guards he retired to his estates in Novgorod, taking an active part in local life, and being elected member of the conferences of Zemstova and Towns. In 1905 he was elected member of the first Duma, and was re-elected at all subsequent elections. He joined the right wing of the Octobrist (moderate liberal) party, and, with the support of the conservatives, was elected president of the third Duma after the resignation of A. Guchkov in March 1911. As president of the fourth Duma he took part in the struggle for constitutional changes in the Government, strongly opposing the reactionary policy of the Government, and defending the rights and privileges of the Duma. As president of the provisional committee of the State Duma at the moment of the revolution, Rodzianko sent a telegram to the Tsar pointing out the necessity of his abdication. After the Bolshevik revolution he emigrated to Germany.

ROE, HUMPHREY VERDON (1878–), British aeronautic engineer, was born on April 18, 1878. He served in the South African War, and joined the Royal Air Force during the World War (1917), being wounded in France in 1918. In the same year he married Dr. Marie Carmichael Stopes and with her founded at Holloway the first birth control clinic (1921). Roe is known as the inventor of the Avro biplane. He made his first flight on June 8, 1908, and in 1909 made the wonderful achievement of flying in an aeroplane with an engine of only 9–10 h.p.

ROE (or ROW), SIR THOMAS (*c.* 1581–1644), English diplomatist, born at Low Leyton, Essex, was educated at Magdalen college, Oxford. He was made esquire of the body to Queen Elizabeth, was knighted in 1605, and in 1610 was sent by Henry, prince of Wales, to the West Indies and South America to discover gold. Elected M.P. for Tamworth (1614) and Cirencester (1621), his reputation was secured by his successful mission to the court of the great Mogul, Jahāngīr, at Agra, where he obtained protection for an English factory at Surat. Appointed ambassador to the Porte in 1621, Roe secured further privileges for English merchants, concluded a treaty with Algiers in 1624, and gained the support of the Transylvanian prince, Bethlen Gabor, for the European Protestant alliance and the cause of the Palatinate.

Through his friendship with the patriarch of the Greek Church the Codex Alexandrinus was presented to James I., and Roe himself collected several valuable mss., which he gave to the Bodleian library. In 1629, he mediated successfully between the kings of Sweden and Poland; in 1630 he negotiated treaties with Danzig and Denmark, and in 1637 was appointed chancellor of the Order of the Garter. Subsequently he took part in the peace conferences at Hamburg, Regensburg and Vienna; in June 1640 he was made a privy councillor, and in October he became member of parliament for the University of Oxford. He died on Nov. 6, 1644.

His *Journal* of the mission to the Mogul, several times printed, has been re-edited, with an introduction by W. Foster, for the Hakluyt Society (1899). Of his correspondence, *Negotiations in his Embassy to the Ottoman Porte, 1621–28*, vol. i., was published in 1740, but the work was not continued. Other correspondence, consisting of letters relating to his mission to Gustavus Adolphus, was edited by S. R. Gardiner for the Camden Society Miscellany (1875), vol. vii., and his correspondence with Lord Carew in 1615 and 1617 by Sir F. Maclean for the same society in 1860. Several of his mss. are in the British Museum collections. Roe published a *True and Faithful Relation . . . concerning the Death of Sultan Osman . . . 1622;* a translation from Sarpi, *Discourse upon the Resolution taken in the Valteline* (1628); and in 1613 Dr. T. Wright published *Quatuor Colloquia*, consisting of theological disputations between himself and Roe; a poem by Roe is printed in *Notes and Queries* iv. Ser. v. 9. *The Swedish Intelligencer* (1632–33), including an account of the career of Gustavus Adolphus and of the Diet of Ratisbon (Regensburg) is attributed to Roe in the catalogue of the British Museum. Several of his speeches, chiefly on currency and financial questions, were also published. Two other works in mss. are mentioned by Wood: *Compendious Relation of the Proceedings . . . of the Imperial Diet at Ratisbon* and *Journal of Several Proceedings of the Order of the Garter.*

ROEBLING, JOHN AUGUSTUS (1806–1869), American civil engineer, was born at Mühlhausen, Prussia, on July 12, 1806. Soon after his graduation from the polytechnic school at Berlin he removed to the United States, and in 1831 entered on the practice of his profession in Western Pennsylvania. He established at Pittsburgh a wire rope factory, and in May 1845 completed his first important structure, a suspended aqueduct across the Allegheny river. This was followed by the Monongahela suspension bridge at Pittsburgh and several suspended aqueducts on the Delaware and Hudson canal. Removing his wire factory to Trenton (N.J.), he began, in 1851, the erection at Niagara Falls of a long-span wire suspension bridge with double roadway, for railway and vehicular use (*see* BRIDGE), which was completed in 1855. Owing to the novelty of its design, the most eminent engineers regarded this bridge as foredoomed to failure; but, with its complete success, demonstrated by long use, the number of suspension bridges rapidly multiplied, the use of wire ropes instead of chain cables becoming all but universal. The completion, in 1867, of the still more remarkable suspension bridge over the Ohio river at Cincinnati, with a clear span of 1,057ft., added to Roebling's reputation, and his design for the great bridge spanning the East river between Manhattan and Brooklyn, New York city, was accepted. While personally engaged in laying out the towers for the bridge, Roebling received an accidental injury, which resulted in his death, at Brooklyn, from tetanus, on July 22, 1869. The bridge was completed under the direction of his son, Washington Augustus Roebling (b. 1837).

ROEBOURNE, a settlement of the North-west Division of Western Australia, 8 m. from the N.W. coast, about lat. 20° 40′ S., long. 117° E., 920 m. direct N. of Perth. It is a centre of a rich and varied mineral district; gold, silver, tin, lead, copper, diamonds and other precious stones are found. There are extensive pearl fisheries off its port at Cossack Bay.

ROEBUCK, JOHN (1718–1794), English inventor, was born in 1718 at Sheffield; after attending the grammar school there and Doddridge's academy at Northampton, he studied medicine at Edinburgh, where he was imbued with a taste for chemistry by W. Cullen and J. Black, and he finally graduated M.D. at Leyden in 1742. He started practice at Birmingham, but devoted much of his time to chemistry, especially in its practical applications. Among the most important of his early achievements in this field was the introduction, in 1746, of leaden condensing chambers for use in the manufacture of sulphuric acid. Together with Samuel Garbett he erected a factory at Prestonpans, near Edinburgh, for the production of the acid in 1749, and for some years enjoyed a monopoly. He engaged next in the manufacture of iron and in 1760 established ironworks at Carron, in Stirlingshire. There he introduced various improvements in the methods of production, including the conversion (patented in 1762) of cast iron into malleable iron "by the action of a hollow pit-coal fire" urged by a powerful artificial blast. He became interested in James Watt's engine and in return for a two-thirds share in the invention assisted in perfecting its details, but financial troubles caused him to part with his share to Matthew Boulton in return for the cancellation of a debt of £1,200. He died on July 17, 1794.

ROEBUCK, JOHN ARTHUR (1801–1879), British politician, was born at Madras on Dec. 28, 1801, and brought up in Canada. He was called to the English bar in 1824, and became M.P. for Bath in 1832. In 1838 he appeared at the bar of the Commons to protest, in the name of the Canadian Assembly, against the suspension of the Canadian constitution. In 1855, having overthrown Lord Aberdeen's ministry by carrying a resolution for the appointment of a committee of inquiry into the mismanagement in the Crimean War, he presided over the proceedings of the committee. For nearly 30 years he was M.P. for Sheffield. He died on Nov. 30, 1879, in London.

ROEBUCK, the smallest European deer (a full-grown buck standing 27 in. at the shoulder), the typical representative of a genus (*Capreolus*) in which the antlers lack a brow-tine and belong to the forked type, while the tail is rudimentary (*see* DEER). The antlers are short, upright, and deeply furrowed, the beam forking at about two-thirds of its length and the upper prong again dividing, thus making three points. The coat in summer is foxy red above and white below; in winter this changes to a greyish fawn, with a white rump-patch. The roebuck or roedeer (*C. capreolus*) inhabits southern and temperate Europe as far east as the Caucasus, where, as in Syria, it is represented by another species. It frequents woods, preferring such as have underwood and are in the neighbourhood of cultivated ground. The latter it visits in the evening in search of food. Before pairing, the bucks pursue the does round specially trodden circular or octagonal runs. Pairing takes place in August, but the fawns are not born till the following May. Roe were formerly abundant in all the wooded parts of Great Britain, but are now restricted to the Highlands of Scotland and a few localities farther south. They take readily to water. The Siberian roe (*C. pygargus*), common in the Altai, is larger and paler, with shorter and more hairy ears and small irregular snags on the inner border of the antlers. The Manchurian roe (*Capreolus manchuricus*) is about the size of the European species, with antlers of the type of those of the Siberian roe, but more slender.

ROEDERER, PIERRE LOUIS, COMTE (1754–1835), French politician and economist, was born at Metz on Feb. 15, 1754, the son of a magistrate. He became councillor at the parlement of Metz, and was commissioned in 1787 to draw up a list of remonstrances. His work advocating the suppression of internal customs houses (*Suppression des douanes intérieures,* 1787) is a treatise on the laws of commerce and on the theory of customs imposts. In the Constituent assembly he was a member of the committee of taxes, prepared a new system of taxation, drew up a law on patents, occupied himself with the laws relating to stamps and *assignats,* and successfully opposed the introduction of an income tax. After the close of the Constituent assembly he was elected, on Nov. 11, 1791, *procureur général syndic* of the department of Paris. When he saw the perilous drift of things, he had tried to get into touch with the king; and it was on his advice that Louis, on the fatal 10th, took refuge in the Assembly. Roederer was in hiding until after Robespierre's fall. Under the Empire, Roederer, whose public influence was considerable, was Joseph Bonaparte's minister of finance at Naples (1806), administrator of the grand duchy of Berg (1810), and imperial commissary in the south of France. During the Hundred Days he was created a peer of France. The Restoration government stripped him of his offices and dignities, but he recovered the title of peer of France in 1832. He died on Dec. 17, 1835.

His writings include: *Louis XII.* (1820); *François I.* (1825); *Comédies historiques* (1827–30); *L'Esprit de la révolution de 1789* (1831); *La Première et la deuxième année du consulat de Bonaparte* (1802); *Chronique des cinquante jours* (1832); *Mémoire pour servir à l'histoire de la société polie en France* (1835).

See his *Oeuvres,* edited by his son (1853 *seq.*); Sainte-Beuve, *Causeries du lundi,* vol. viii.; M. Mignet, *Notices historiques* (1853).

ROEMER, FRIEDRICH ADOLPH (1809–1869), German geologist, was born at Hildesheim, in Prussia, on April 14, 1809. In 1845 he became professor of mineralogy and geology at Clausthal, and in 1862 director of the School of Mines. He first described the Cretaceous and Jurassic strata of Germany in *Die Versteinerungen des Norddeutschen Oolithen-gebirges* (1836–39), *Die Versteinerungen des Norddeutschen Kreidegebirges* (1840–41) and *Die Versteinerungen des Harzgebirges* (1843). He died at Clausthal on Nov. 25, 1869.

His brother, CARL FERDINAND VON ROEMER (1818–1891), educated for the legal profession at Göttingen, also became interested in geology, and abandoning law in 1840, studied science at the University of Berlin. Two years later he published his first work, *Das Rheinische Übergangsgebirge* (1844), in which he dealt with the older rocks and fossils. In 1845 he visited America, the results of his work being published in *Texas* (1849), and *Die Kreidebildungen von Texas und ihre organischen Einschlüsse* (1852). From 1847 to 1855 *privatdozent* at Bonn, he was then appointed professor of geology, palaeontology and mineralogy in the University of Breslau, a post which he held until his death on Dec. 14, 1891.

He prepared, with H. G. Bronn, the third edition of *Lethaea geognostica,* and later published one section, *Lethaea palaeozoica,* of an enlarged and revised edition. In 1862 he superintended the preparation of a geological map of upper Silesia, and the results of his researches were embodied in his *Geologie von Oberschlesien.*

ROEMER, OLE (Latinized OLAUS) (1644–1710), Danish astronomer, was born at Aarhuus, Jutland, on Sept. 25, 1644. He became in 1662 the pupil and amanuensis of Erasmus Bartholinus at Copenhagen. In 1671 he assisted J. Picard to determine the position of Tycho Brahe's observatory (Uraniborg, on the island of Hveen). In 1672 he went to Paris with Picard, and spent nine years on observations at the new royal observatory and hydraulic works at Versailles and Marly. After a scientific mission to England (1679), on which he met Newton, Halley and Flamsteed, he returned to Copenhagen in 1681 as royal mathematician and professor of astronomy in the university. He also held several public offices, including that of mayor (1705). He died at Copenhagen on Sept. 23, 1710.

Roemer is remembered as the discoverer of the finite velocity of light, which was suggested to him by his observations on the eclipses of Jupiter's moons. The first noteworthy transit instrument was in 1690 erected at his house. He also set up at the university observatory an instrument with altitude and azimuth circles, and an equatorial telescope. He also built and equipped the "Tusculan" observatory at Vridlösemagle, near Copenhagen. His observations perished in the great fire of Oct. 21, 1728, except those discussed by J. G. Galle in *O. Roemeri triduum observationum astronomicarum a. 1706 institutarum* (Berlin, 1845).

Doberck, *Nature,* xvii. 105; C. Huygens, *Oeuvres complètes,* t. viii. pp. 30–58; L. Ambronn, *Handbuch der astr. Instrumentenkunde,* ii. 552, 966; T. J. J. See, *Pop. Astronomy,* No. 105, May 1903.

ROERICH, NICOLAS CONSTANTINOVICH (1874–), Russian painter of Scandinavian origin, established his reputation by painting pictures of Russian prehistoric life and the wanderings of Vikings. After beginning with realistic pictures, his manner evolved under the influence of the Byzantine Icon and of Oriental art, towards a purely decorative and monumental style. Roerich studied the technique of ancient Russian frescoes and his wall paintings for the Kazan railway station at Moscow, representing combats between Russians and Tatars, are considered his most important work. He executed a number of works for the theatre: for the Russian ballet he painted the scenery in *Prince Igor;* for Stanislavsky the setting of *Peer Gynt.* He wrote the libretto for and also designed the scenery and the costumes of *The Rite of Spring,* for which Stravinsky composed the music. After the Russian revolution of 1917 he settled in America, and his art grew more and more abstract, tending towards occult mysticism. In 1924 he undertook a journey to India which gave him new inspiration for his later work.

ROERMOND, a town in the province of Limburg, Holland, on the right bank of the Maas at the confluence of the Roer, and a junction station 28 m. by rail N.N.E. of Maastricht. Pop. (1927), 16,630. The old fortifications have been dismantled and partly converted into fine promenades. A bridge across the Roer, dating from 1771, connects Roermond with the suburb of St. Jacob. Roermond is the seat of a Roman Catholic episcopal see. The finest building in the town is the Romanesque minster church of the first quarter of the 13th century. In the middle of the nave is the tomb of Gerhard III., count of Gelderland, and his wife Margaret of Brabant. It was formerly the church of a Cistercian nunnery, and in modern times has been elaborately restored. The cathedral of St. Christopher is also of note; on the top of the tower (246 ft.) is a copper statue of the saint, and

the interior is adorned with paintings by Rubens, Jacob de Wit (1695–1754) and others. The old bishop's palace is now the courthouse, and the old Jesuits' monastery with its fine gardens a higher-burgher school. Woollen, cotton, silk and mixed stuffs, paper, flour and beer are manufactured at Roermond.

ROGATION DAYS, in the Calendar of the Christian Church, the three days before Ascension Day. Their observance, by fasting and chanting litanies in procession, was introduced by St. Mamertus, bishop of Vienne (d. *c.* 475), and was ordered throughout France by the first Council of Orleans in 511. Leo III. (pope 795–816) introduced rogation days, but without fasting, at Rome. The custom had spread earlier into the English Church, where it was confirmed in 747 by the Council of Clovesho. After the Reformation the processions gradually ceased to be ecclesiastical in England, and now survive only in the perambulation of the parish boundaries on or about Ascension Day.

See also PROCESSION and LITANY.

ROGER (d. 1181), archbishop of York, known as Roger of Pont l'Evêque, was a member of the household of Theobald, archbishop of Canterbury, where he quarrelled violently with another future archbishop, Thomas Becket. In 1148 he was appointed archdeacon of Canterbury, and soon afterwards chaplain to King Stephen, who sent him on an errand to Rome in 1152; then in Oct. 1154 he was consecrated archbishop of York in Westminster abbey. When Henry II. entered upon his struggle with Becket he secured the support of Roger, and having been appointed papal legate in England, the archbishop visited Pope Alexander III. and the French king, Louis VII., in his master's interests. In June 1170 he crowned the king's son Henry, in spite of prohibitions from the pope and from Becket, and for this act he was suspended. He quarrelled with Richard, the new archbishop of Canterbury, about the respective rights of the two archiepiscopal sees, until 1176, when the king arranged a truce; and he was constantly endeavouring to assert his supremacy over the Scottish church. He died at York on Nov. 21, 1181.

ROGER (d. 1139), bishop of Salisbury, was originally priest of a small chapel near Caen. The future King Henry I., who happened to hear mass there one day, was impressed by the speed with which Roger read the service, and enrolled him in his own service. Roger, though uneducated, showed great talent for business, and Henry, on coming to the throne, almost immediately made him chancellor (1101). Soon after Roger received the bishopric of Salisbury. In the Investitures controversy he skilfully managed to keep the favour of both the king and Anselm. Roger devoted himself to administrative business, and remodelled it completely. He created the exchequer system, which was managed by him and his family for more than a century, and he used his position to heap up power and riches. He became the first man in England after the king, and was in office, if not in title, justiciar. He ruled England, while Henry was in Normandy, and succeeded in obtaining the see of Canterbury for his nominee, William of Corbeil. Duke Robert seems to have been put into his custody after Tinchebrai. Though Roger had sworn allegiance to Matilda, he disliked the Angevin connection, and went over to Stephen, carrying with him the royal treasure and administrative system (1135). Stephen placed great reliance on him, on his nephews, both bishops and on his son Roger, who was treasurer.

Roger himself had built at Devizes a splendid castle. He and his nephews seem to have secured a number of castles outside their own dioceses, and the old bishop behaved as if he were an equal of the king. At a council held in June 1139, Stephen found a pretext for demanding a surrender of their castles, and on their refusal they were arrested. After a short struggle all Roger's great castles were sequestrated. This quarrel with the church, which immediately preceded the landing of the empress, had a serious effect on Stephen's fortunes. Roger died at Salisbury in December 1139. He was a great bureaucrat, and a builder whose taste was in advance of his age. But his contemporaries were probably justified in regarding him as worldly, ambitious, avaricious, unfettered by any high standard of personal morality.

See Sir J. Ramsay's *Foundations of England,* vol. ii., and J. H. Round's *Geoffrey de Mandeville.*

ROGER I. (1031–1101), ruler of Sicily, was the youngest son of Tancred of Hauteville. Arriving in Southern Italy soon after 1057, he shared with Robert Guiscard the conquest of Calabria, and in a treaty of 1062 the brothers apparently made a kind of "condominium" by which each was to have half of every castle and town in Calabria. Robert now commissioned Roger to reduce Sicily, which contained, besides the Muslims, numerous Greek Christians subject to Arab princes who had become all but independent of the sultan of Tunis. In May 1061 the brothers crossed from Reggio and captured Messina. After Palermo had been taken in January 1072 Robert Guiscard, as suzerain, invested Roger as count of Sicily, but retained Palermo, half of Messina and the north-east portion of the island. Not till 1085, however, was Roger able to undertake a systematic crusade. In March 1086 Syracuse surrendered, and when in February 1091 Noto yielded the conquest was complete. Much of Robert's success had been due to Roger's support. Similarly the latter supported Duke Roger, his nephew, against Bohemund and other rebels, in return for which the duke surrendered to his uncle in 1085 his share in the castles of Calabria, and in 1091 the half of Palermo.

At the enfeoffments of 1072 and 1092 no great undivided fiefs were created, and the mixed Norman, French and Italian vassals owed their benefices to the count. No feudal revolt of importance therefore troubled Roger. Politically supreme, the count became master of the insular Church. While he gave full toleration to the Greek Churches, he created new Latin bishoprics at Syracuse and Girgenti and elsewhere, nominating the bishops personally, while he turned the archbishopric of Palermo into a Catholic see. The Papacy granted to him and his heirs in 1098 the Apostolic Legateship in the island. Roger was tolerant towards Arabs and Greeks, allowing to each race the expansion of its own civilization. In the cities the Muslims, who had generally secured such terms of surrender, retained their mosques, their kadis, and freedom of trade; in the country, however, they became serfs. He drew from the Muslims the mass of his infantry, but the Latin element began to prevail with the Lombards and other Italians who flocked into the island in the wake of the conquest, and the conquest of Sicily was decisive in the steady decline of Mohammedan power in the western Mediterranean. Roger, the "Great Count of Sicily," died on June 22, 1101, and was buried in S. Trinità of Mileto. His third wife, Adelaide, niece of Boniface, lord of Savona, gave him two sons, Simon and Roger, of whom the latter succeeded him.

See E. Caspar, *Roger II. und die Grundung der normannisch-sicilischen Monarchie* (Innsbruck, 1904). (E. Cu.)

ROGER II. (1093–1154), king of Sicily, son of the preceding, began to rule as count in 1112, and from the first aimed at uniting the whole of the Norman conquests in Italy. In 1127, Roger claimed the Hauteville possessions, and the overlordship of Capua, for which Richard II. in 1098 had sworn homage to Duke Roger, in virtue of a promise made by William, the late duke of Apulia. The union of Sicily and Apulia, however, was resisted by the subjects of the duchy itself, and by the pope at Capua (Dec. 1127) who preached a crusade against the claimant, setting against him Robert II. of Capua and Ranulf of Alife, or Avellino, brother-in-law of Roger. The coalition, however, failed, and in August 1128 Honorius invested Roger at Benevento as duke of Apulia. The baronial resistance, backed by Naples, Bari, Salerno and other cities, whose aim was civic freedom, also gave way, and at Melfi (Sept. 1129) Roger was recognized as duke by Naples, Capua and the rest. He at once began to enforce order in the Hauteville possessions, where the ducal power had long been falling to pieces. For the binding together of his states the royal name seemed essential, and the death of Honorius in February 1130, followed by a double election, seemed the decisive moment. While Innocent II. fled to France, Roger supported Anacletus II. The price was a crown, and on Sept. 27, 1130, a bull of Anacletus made Roger king of Sicily. He was crowned in Palermo on Dec. 25, 1130.

This plunged Roger into a ten years' war. Bernard of Clairvaux, Innocent's champion, built up against Anacletus and his

"half heathen king," a coalition joined by Louis VI. of France, Henry I. of England and the emperor Lothar. Meanwhile the forces of revolt in South Italy drew to a head again, and on June 24, 1132, the king was defeated at Nocera by Ranulf. Nevertheless, by July 1134, he forced Ranulf, Sergius, duke of Naples, and the rebels to submit, while Robert was expelled from Capua. Meanwhile Lothar's contemplated attack upon Roger had gained the backing of Pisa, Genoa and the Greek emperor, all of whom feared the growth of a powerful Norman kingdom. In February 1137 Lothar moved south and was joined by Ranulf and the rebels; in June he besieged and took Bari. At San Severino, after a victorious campaign, he and the pope jointly invested Ranulf as duke of Apulia (Aug. 1137), and the emperor then retired to Germany. Roger, freed from the utmost danger, recovered ground, sacked Capua and forced Sergius to acknowledge him as overlord of Naples. At Rignano the indomitable Ranulf again utterly defeated the king, but died in April 1139, leaving none to oppose Roger, who subdued the rebels pitilessly.

The death of Anacletus (Jan. 25, 1138) determined Roger to seek the confirmation of his title from Innocent. The latter, invading the kingdom with a large army, was skilfully ambushed at Galuccio on the Garigliano (July 22, 1139), and on July 25 the pope invested him as "Rex Siciliae ducatus Apuliae et principatus Capuae."

Roger, now become one of the greatest kings in Europe, made Sicily the leading maritime power in the Mediterranean. A powerful fleet was built up under several "admirals," or "emirs," of whom the greatest was George of Antioch, formerly in the service of the Muslim prince of El Mehdia. Mainly by him a series of conquests were made on the African coast (1135–53) which reached from Tripoli to Cape Bona. The second crusade (1147–48) gave Roger an opportunity to revive Robert Guiscard's designs on the Greek Empire. George was sent to Corinth at the end of 1147 and despatched an army inland which plundered Thebes. In June 1149 the admiral appeared before Constantinople and defied the Basileus by firing arrows against the palace windows. The attack on the empire had, however, no abiding results. The king died at Palermo on Feb. 26, 1154, and was succeeded by his fourth son William.

Personally Roger was of tall and powerful body, with long fair hair and full beard. With little of Robert Guiscard's personal valour, he yet showed to the full his uncle's audacity, diplomatic skill and determination. It is Roger II.'s distinction to have united all the Norman conquests into one kingdom and to have subjected them to a government scientific, personal and centralized. The principles of this are found in the Assizes of the kingdom of Sicily, promulgated at Ariano in 1140, which enforced an almost absolute royal power. At Palermo Roger drew round him distinguished men of various races, such as the famous Arab geographer Idrisi and the historian Nilus Doxopatrius. He maintained a complete toleration for the several creeds, races and languages of his realm; he was served by men of the most diverse nationalities.

Contemporary authors are: Falco of Benevento, Alexander of Telese, Romuald of Salerno and Hugo Falcandus, all in the *Scrittori e cronisti napoletani*, ed. Del Re, vol. i. *See* also E. Caspar, *Roger II. und die Gründung der normannisch-sicilischen Monarchie* (Innsbruck, 1904). (E. Cu.; X.)

ROGER OF HOVEDEN or HOWDEN (*fl.* 1174–1201), English chronicler, was, to judge from his name and the internal evidence of his work, a native of Howden in the East Riding of Yorkshire. But nothing is known of him before the year 1174. He was then in attendance upon Henry II., by whom he was sent from France on a secret misson to the lords of Galloway. In 1175 he again appears as a negotiator between the king and a number of English religious houses. In 1189, he was a justice of the forests in the shires of Yorkshire, Cumberland and Northumberland. About the year 1192 he began to compile his *Chronica*, a general history of England from 732 to his own time. Up to the year 1192 his narrative adds little to our knowledge. From that time, however, Hoveden is an independent and copious authority. Both on foreign affairs and on questions of domestic policy he is unusually well informed. He is particularly useful on points of constitutional history. His work breaks off abruptly in 1201. Probably his death should be placed in that year.

See W. Stubbs's edition of the *Chronica* (Rolls Series) and the introductions to vols. i. and iv. This edition supersedes that of Sir H. Savile in his *Scriptores post Bedam* (1596).

ROGER OF WENDOVER (d. 1236), English chronicler, was probably a native of Wendover in Buckinghamshire. At some uncertain date he became a monk of St. Albans; afterwards he was appointed prior of the cell of Belvoir, but he forfeited this dignity in the early years of Henry III., having been found guilty of wasting the endowments. His latter years were passed at St. Albans, where he died on May 6, 1236. He is the first of the important chroniclers who worked in the scriptorium of this house. His great work, the *Flores Historiarum*, begins at the creation and extends to 1235. It is of original value from 1202. Some critics have supposed, but on inconclusive evidence, that Wendover copied, up to 1189, an earlier compilation, the work of John de Cella, the twenty-first abbot of St. Albans (1195–1214).

A 13th-century manuscript is in the Bodleian library (Douce mss. 207), a mutilated 14th-century copy in the British Museum (Cotton ms. Otho B. v.). Matthew Paris prepared an edition which forms the first part of that writer's *Chronica Majora* (ed. H. R. Luard, Rolls Series, 7 vols.). The best edition of Wendover is that of H. O. Coxe (4 vols., 1841–42); there is another (from 1154) in the Rolls Series by H. G. Hewlett (3 vols., 1886–89). *See* Luard's prefaces to vols. i., ii., iii. and vii. of the *Chronica Majora;* and the *Monumenta Germaniae Historica, Scriptores,* Band xxviii., pp. 3–20.

ROGERS, HENRY DARWIN (1808–1866), American geologist, was born at Philadelphia on Aug. 1, 1808. At the age of 21 he was chosen professor of chemistry and natural philosophy at Dickinson college, Pennsylvania. After holding this post for three years, he went to Europe and took up the study of geology. Subsequently he was engaged for 22 years in the State surveys of Pennsylvania and New Jersey, his reports on which were published during the years 1836–41. In 1842 he and his brother WILLIAM BARTON ROGERS (1805–82), who had been similarly occupied in Virginia, brought before the Association of American Geologists and Naturalists their conclusions on the physical structure of the Appalachian chains, and on the elevation of great mountain chains. The researches of H. D. Rogers were elaborated in his final *Report on Pennsylvania* (1858), in which he included a general account of the geology of the United States and of the coal-fields of North America and Great Britain. In 1857 he was appointed professor of natural history and geology at Glasgow. One of his later essays (1861) was on the parallel roads of Lochaber (Glen Roy), the origin of which he attributed to a vast inundation. He died at Glasgow on May 29, 1866.

ROGERS, JAMES EDWIN THOROLD (1823–1890), English economist, was born at West Meon, Hampshire, in 1823, and educated at King's college, London, and Magdalen Hall, Oxford. After taking a first-class degree in 1846, he was ordained and was for a few years a curate in Oxford. Subsequently he resigned his orders. He was a good classical scholar and published in 1865 an edition of Aristotle's *Ethics;* but his friendship with Cobden led him to study economics, with the result that in 1859 he was appointed professor of statistics and economic science at King's college, London, a post which he filled till his death. From 1862 he was also Drummond professor of political economy at Oxford. During that period he published (in 1866) the first two volumes of his *History of Agriculture and Prices in England*, dealing with the period 1259–1400, a masterly record upon which his reputation mainly rests. Two more volumes (1401–1582) were published in 1882, a fifth and sixth (1583–1702) in 1887, and he left behind him at his death copious materials for a seventh and eighth. An acquaintance with Cobden and John Bright led Rogers to take an active part in politics: he represented Southwark in parliament from 1880 to 1885, and Bermondsey in 1885–86, as an advanced Liberal. In 1888, on the death of Prof. Bonamy Price, who had succeeded him at Oxford as professor of political economy, he was re-elected to the post. Previously (in 1883) he had been appointed lecturer in political economy at Worcester college, Oxford. His latter years were mainly spent at Oxford, where he died on Oct. 12, 1890. Thorold Rogers did

much to promote the historical study of economics to which he made a solid contribution in his *Six Centuries of Work and Wages* (1885).

His most important publications are:—*Manual of Political Economy* (1868); an edition of Adam Smith's *Wealth of Nations* (1869); *Cobden and Public Opinion* (1873); *The Speeches of J. Bright* (edited) (1868); and *The First Nine Years of the Bank of England* (1887).

See also W. J. Ashley, in *The Political Science Quarterly* (1889); and E. Castelot, in *Nouveau Dictionnaire d'Economie Politique*, supplément.

ROGERS, JOHN (*c.* 1500–1555), English Protestant martyr, born at Aston, near Birmingham, was educated at Pembroke Hall, Cambridge, where he graduated B.A. in 1526. Six years later he was rector of Holy Trinity, Queenhithe, London, and in 1534 went to Antwerp as chaplain to the English merchants. Here he met William Tyndale, under whose influence he abandoned the Roman Catholic faith, and married an Antwerp lady. After Tyndale's death Rogers pushed on with his predecessor's English version of the Old Testament, which he used as far as 2 Chronicles, employing Coverdale's translation (1535) for the remainder and for the Apocrypha. Tyndale's New Testament had been published in 1526. The complete Bible was put out under the pseudonym of Thomas Matthew in 1537; it was printed in Antwerp, and Richard Grafton published the sheets and got leave to sell the edition (1,500 copies) in England. Rogers had little to do with the translation, but he contributed some valuable prefaces and marginal notes. His work was largely used by those who prepared the Great Bible (1539–40), out of which in turn came the Bishop's Bible (1568) and the Authorized Version of 1611. After taking charge of a Protestant congregation in Wittenberg for some years, Rogers returned to England in 1548, where he published a translation of Melanchthon's *Considerations of the Augsburg Interim*. In 1550 he was presented to the crown livings of St. Margaret Moyses and St. Sepulchre in London, and in 1551 was made a prebendary of St. Paul's, where the dean and chapter soon appointed him divinity lecturer.

On the accession of Mary, Rogers preached at Paul's Cross commending the "true doctrine taught in King Edward's days," and warning his hearers against "pestilent Popery, idolatry and superstition." Ten days after (16th August 1553), he was summoned before the council and bidden to keep within his own house. In January 1554 Bonner, the new bishop of London, sent him to Newgate, where he lay with John Hooper, Laurence Saunders, John Bradford and others for a year. On January 22, 1555, Rogers with ten others came before the council at Gardiner's house in Southwark, and held his own in the examination that took place. On the 28th and 29th he came before the commission appointed by Cardinal Pole, and was sentenced to death by Gardiner for heretically denying the Christian character of the Church of Rome and the real presence in the sacrament. He met his death on the 4th of February 1555 at Smithfield. He was the first Protestant martyr of Mary's reign, and his friend Bradford wrote that "he broke the ice valiantly."

ROGERS, JOHN (1627–1665?), English preacher, a Fifth Monarchy man, second son of Nehemiah Rogers, a royalist and Anglican clergyman, was born at Messing, Essex; he studied medicine at King's college, Cambridge. In the quarrel between the army and the parliament Rogers sided with the army, and he was one of the first to join the Fifth Monarchy movement. He approved of the expulsion of the Long Parliament, but the establishment of the Protectorate at once threw the Fifth Monarchy men into antagonism. Rogers addressed a warning letter to Cromwell, and attacked him from the pulpit on Jan. 9, 1654. His house was searched and his papers seized, and Rogers then issued another denunciation against Cromwell, *Mene, Tekel, Perez: a Letter lamenting over Oliver Lord Cromwell.* On March 28, on which day he had proclaimed a fast for the sins of the rulers, he preached a violent sermon against the protector. He was arrested in July. He confronted Cromwell with great courage when brought before him on Feb. 5, 1655, and was imprisoned successively at Windsor and in the Isle of Wight, being released in Jan. 1657. He returned to London, and, being suspected of conspiracy, was again imprisoned by Cromwell in the Tower (Feb. 3–April 16, 1658). On the protector's death and the downfall of Richard Cromwell, the ideals of the Fifth Monarchy men seemed nearer realization, but Rogers was engaged in political controversy with Prynne and became a source of embarrassment to his own faction, which endeavoured to get rid of him by appointing him "to preach the gospel" in Ireland. On the outbreak of Sir George Booth's royalist insurrection, however, he became chaplain in Charles Fairfax's regiment, and served throughout the campaign. He was imprisoned in Dublin in Jan. 1660 by order of the army faction and released subsequently by the parliament. At the Restoration he withdrew to Holland, studied medicine at Leyden and Utrecht, where he obtained his M.D. in 1662. He was admitted to the degree of M.D. at Oxford in 1664, and is supposed to have died soon afterwards.

Besides the above pamphlet, Rogers wrote in 1653 *Ohel or Beth-shemesh, a Tabernacle for the Sun*, in which he attacked the Presbyterians; *Sagrir, or Doomesday drawing nigh*, from his new standpoint as a Fifth Monarchy man, *Challah, the Heavenly Nymph* (1653); *Dod, or Chalhan; the Beloved or the Bridegroom going forth for his Bride* . . . (1653); *Prison-born Morning Beams* (1654); *Jegar Sahadutha* . . . (1657); *Mr. Prynne's Good Old Cause stated and stunted 10 Year ago* . . . (1659); *Διαπολιτεία a Christian Concertation* (1659); *Mr. Harrington's Parallel Unparalleled* (1659); *A Vindication of Sir H. Vane* (1659); *Disputatio Medica Inauguralis* (1662).

Rogers, *Life and Opinions of a Fifth Monarchy Man* (1867), compiled from Rogers's own works; Wood, *Athenae Oxonienses and Fasti; Calendars of State Papers (Domestic)*. *See* also "English Ancestry of Washington," *Harper's Magazine*, xxi. (1891); "John Rogers of Purleigh," *The Nation*, vol. 53 (1891).

ROGERS, JOHN (1829–1904), American sculptor, was born at Salem, Mass., on Oct. 30, 1829. He wanted to become a sculptor, and spent eight months in study at Rome and Paris in 1858–59. Becoming discouraged, he returned to America and obtained employment as a draughtsman in the office of the city surveyor of Chicago; but soon afterwards, owing to the favourable reception of his group of small figures, "The Checker Players," he resumed sculptural work, confining himself to these small figures, known as "Rogers Groups," which had an enormous popular success and were extensively reproduced. In 1863 he became a National Academician. He died at New Haven, Conn., on July 27, 1904.

ROGERS, ROBERT (1727–1795), American frontier soldier, was born at Methuen, Mass., and in 1739 removed to Starktown (now Dunbarton), N.H. During the Seven Years' War he raised and commanded a force of militia, known as Rogers's Rangers, which won wide reputation for its courage and endurance in the campaigns about Lake George. He took part in Wolfe's expedition against Quebec and in the Montreal campaign of 1760. Afterwards he was sent by Gen. Amherst to take possession of the north-western posts, including Detroit. He was again in the West in 1763 during the Pontiac uprising, accompanying Dalyell's expedition and participating in the battle of Bloody Bridge. Soon after he went to England and in 1765 published in London a *Concise Account of North America* and his *Journals* of service in the Seven Years' War. In 1766 was published *Ponteach: A Tragedy*, one of the first American dramas, supposedly also written by Rogers. He further laid before the king a memorial proposing to lead an overland expedition from the Mississippi river to the Pacific ocean. This was refused him but instead he was given command of the north-west post of Michilimackinac. From here in 1766 he sent out on his own initiative, under Captains Tute and Carver, the first English expedition to explore the upper Mississippi and Great Lakes region, but it failed to penetrate to the Pacific as intended. Rogers's ambitions caused him to be tried for treason but he was acquitted. He again went to England to retrieve his fortune but was unsuccessful. During the Revolutionary War he came to America but was regarded as a loyalist spy. He then openly joined the British and organized and commanded the Queen's Rangers which saw service in operations around New York city. Later he organized the King's Rangers, but the command was taken by his brother, James Rogers, and Robert Rogers returned to England, where he lived in obscurity until his death in 1795.

There is a scholarly biography by Allan Nevins of 172 pages in the Caxton Club edition of *Ponteach* (Chicago, 1914). *See* also F. Parkman, *Montcalm and Wolfe* (Boston, 1884).

ROGERS, SAMUEL (1763–1855), English poet, was born at Newington Green, London, on July 30, 1763. His father, Thomas Rogers, was the son of a Stourbridge glass manufacturer, who was also a merchant in Cheapside. Thomas Rogers had a place in the London business, and married Mary Radford, daughter of his father's partner, becoming himself a partner shortly afterwards. On his mother's side Samuel Rogers was connected with the Noncomformist divines Philip and Matthew Henry, and it was in Nonconformist circles at Stoke Newington that he was brought up. He was educated at private schools at Hackney and Stoke Newington. Samuel Rogers entered the banking business in Cornhill, but his delicate health necessitated long holidays, during which he met the literary society of the day in Edinburgh as well as in London. He had already published a volume of verse when his *Pleasures of Memory* was printed in 1792. This poem may be regarded as the last embodiment of the poetic diction of the 18th century. Here is carried to the extremest pitch the theory of elevating and refining familiar themes by abstract treatment and lofty imagery.

In 1793 his father's death gave Rogers the principal share in the banking house in Cornhill, and a considerable income. He left Newington Green in the same year and established himself in chambers in the Temple. In his circle of friends at this time were "Conversation" Sharp and the artists Flaxman, Opie, Martin Shee and Fuseli. He also made the acquaintance of Charles James Fox, with whom he visited the galleries in Paris in 1802, and whose friendship introduced him to Holland House. In 1803 he moved to 22 St. James's Place, where for 50 years he entertained all the celebrities of London. Flaxman and Stothard had a share in the decorations of the house, which Rogers had almost rebuilt, and now proceeded to fill with pictures and other works of art. His collections at his death realized £50,000. An invitation to one of Rogers's breakfasts was a formal entry into literary society, and his dinners were even more select. His social success was due less to his literary position than to his powers as a conversationalist, his educated taste in all matters of art, and no doubt to his sarcastic and bitter wit, for which he excused himself by saying that he had such a small voice that no one listened if he said pleasant things. Above all, he seems to have had a genius for benevolence. "He certainly had the kindest heart and unkindest tongue of any one I ever knew," said Fanny Kemble. He helped the poet Robert Bloomfield, he reconciled Moore with Jeffrey and with Byron, and he relieved Sheridan's difficulties in the last days of his life. Moore, who refused help from all his friends, and would only be under obligations to his publishers, found it possible to accept assistance from Rogers. He procured a pension for H. F. Cary, the translator of Dante, and obtained for Wordsworth his sinecure as distributor of stamps.

Rogers played the part of literary dictator in England over a long period. He made his reputation by *The Pleasures of Memory* when Cowper's fame was still in the making. He became the friend of Wordsworth, Scott and Byron, and lived long enough to give an opinion as to the fitness of Alfred Tennyson for the post of poet laureate. Alexander Dyce, from the time of his first introduction to Rogers, was in the habit of writing down the anecdotes with which his conversation abounded. From the mass of material thus accumulated he made a selection which he arranged under various headings and published in 1856 as *Recollections of the Table-Talk of Samuel Rogers, to which is added Porsoniana.* Rogers himself kept a notebook, in which he entered impressions of the conversation of many of his friends—Charles James Fox, Edmund Burke, Henry Grattan, Richard Porson, John Horne Tooke, Talleyrand, Lord Erskine, Sir Walter Scott, Lord Grenville and the duke of Wellington. They were published by his nephew William Sharpe in 1859 as *Recollections by Samuel Rogers;* and *Reminiscences and Table-Talk of Samuel Rogers, Banker, Poet, and Patron of the Arts, 1763–1855* (1903), by G. H. Powell, is an amalgamation of these two authorities. Rogers held various honorary positions: he was one of the trustees of the National Gallery; and he served on a commission to inquire into the management of the British Museum, and on another for the rebuilding of the houses of parliament.

Rogers's later works are *An Epistle to a Friend* (Richard Sharp) (1798); *The Voyage of Columbus* (1810); *Jacqueline* (1814), a narrative poem, written in the four-accent measure of the newer writers; the reflective poem on *Human Life* (1819) and *Italy* (1822–28). Rogers was in Italy in 1814 and again in 1820, when he visited Byron and Shelley at Pisa. The 1828 edition of *Italy* was not a great success. He enlarged and revised the poem, and commissioned illustrations from J. M. Turner, Thomas Stothard and Samuel Prout. These were engraved on steel in the sumptuous edition of 1830. Rogers followed it up with an equally sumptuous edition of his *Poems* (1838). In 1850, on Wordsworth's death, Rogers was asked to succeed him as poet laureate, but declined the honour. He died in London on Dec. 18, 1855.

See P. W. Clayden, *The Early Life of Samuel Rogers* (1887) and *Rogers and his Contemporaries* (2 vols., 1889); Dyce, *Reminiscences and Table-talk of Samuel Rogers* (1856, ed. Powell, 1903); Roberts, *Samuel Rogers and his Circle* (1910). One of the best accounts of Rogers, containing many examples of his caustic wit, is by Abraham Hayward in the *Edinburgh Review* for July 1856. *See* also the Aldine edition (1857) of his *Poetical Works,* and the *Journals* of Byron and of Moore.

ROGERS, WILLIAM (1819–1896), English clergyman and educational reformer, was born in London on Nov. 24, 1819, and died there on Jan. 19, 1896. Educated at Eton and at Balliol college, Oxford, he entered Durham university in 1842, to study theology, and was ordained in 1843. In 1845 he was appointed to St. Thomas Charterhouse, where he remained for 18 years, throwing himself passionately into the work of education of his poor, degraded and often criminal parishioners. He began by establishing a school for ragamuffins in a blacksmith's abandoned shed, and he gradually extended its scope until schools were provided throughout the parish. In 1863 he became rector of St. Botolph Bishopsgate, a prebendary of St. Paul's, and in 1857 chaplain in ordinary to the Queen. At Bishopsgate Rogers tackled the middle-class schools. He believed in secular education, leaving doctrinal training to parents and clergy. To the cry against "godless education," Rogers replied, "Hang theology; let us begin"; and his nickname of "Hang-theology Rogers" stuck to him for the rest of his life. Rogers reconstructed Edward Alleyn's charity at Dulwich. He founded the Bishopsgate Institute.

ROGIER, CHARLES LATOUR (1800–1885), Belgian statesman, descended from a Belgian family settled in the department of the Nord in France, was born at St. Quentin on Aug. 17, 1800. His father, an officer in the French army, perished in the Russian campaign of 1812; and the family moved to Liége, where the eldest son, Firmin, held a professorship. Charles, after being called to the bar, founded, in collaboration with his lifelong friends, Paul Devaux and Joseph Lebeau, the journal *Mathieu Laensberg* (afterwards *Le Politique*), which by its ardent patriotism and its attacks on the Dutch administration soon acquired a widespread influence. When the insurrection of 1830 broke out at Brussels, Rogier put himself at the head of 150 Liégeois, and inscribing on his banner the motto, "Vaincre ou mourir pour Bruxelles," he obtained arms from a local factory, and marched upon the capital. Here he took his place at once among the leaders of the revolutionary party. His influence saved the town hall from pillage on Sept. 19.

On the 24th a *commission administrative* was formed, of which Rogier became president. The energetic measures of this body and of its successor, the *gouvernement provisoire*, soon freed the greater part of the country from the Dutch troops. Rogier was sent in October to suppress an outbreak among the colliers of Hainaut, and then as delegate of the provisional government to Antwerp, where the citadel still held out for Holland. He arranged an armistice, and reorganized the entire administration of the city. He sat for Liége in the National Congress, voted for the establishment of an hereditary monarchy, and induced the congress to adopt the principle of an elective second chamber. In the long-drawn debates on the bestowal of the crown he ranged himself on the side of Louis Philippe: but when Louis Philippe de-

clined the crown on behalf of his son, Rogier voted with the majority for Leopold of Saxe-Coburg.

In June 1831 he was appointed governor of the province of Antwerp, a post rendered exceptionally difficult by the continued presence of Dutch troops in the citadel. In October 1832 he was made minister of the interior in the Goblet-Devaux cabinet. During his office he carried, in the teeth of opposition, a law that established in Belgium the first railways on the continent of Europe, and thus laid the foundation of her industrial development. Owing to dissensions in the cabinet, he retired in 1834, together with Lebeau, and resumed the governorship of Antwerp. On Lebeau's return to power in 1840, Rogier became minister of public works and education. His education proposals were defeated by the Clerical party, and on the resignation of the ministry in 1841, Rogier gave his support to a compromise measure, which passed into law in 1842. He led the Liberal party in Opposition till 1847, when he formed a cabinet in which he held the ministry of the interior. He carried out a liberal policy which enabled Belgium to escape the general revolutionary movement of 1848.

Rogier retired in Oct. 1852, but was brought back into office by the liberal reaction of 1857. He again became president of the council and minister of the interior in a cabinet of which Frère-Orban was the most conspicuous member. The first important measure passed by the ministry was one for the fortification of Antwerp. In 1860 the fear of French designs on the independence of Belgium led to a movement of reconciliation with Holland, and inspired Rogier to write his poem "La Nouvelle Brabançonne." In 1861 Rogier exchanged the ministry of the interior for that of foreign affairs. He achieved a diplomatic triumph in freeing the navigation of the Scheldt, and thus enabling Antwerp to become the second port on the mainland of Europe. Defeated at Dinant, he sat for Tournai from 1863 till his death. In 1868 Rogier finally retired from power. He continued, however, to take part in public life, and was elected president of the extraordinary session of the chamber of representatives in 1878. From this time his age, his devoted patriotism and the unassuming simplicity of his life made him the idol of all classes. He died at Brussels on May 27, 1885, and was accorded a public funeral.

See T. Juste, *Charles Rogier, 1800–1885, d'après des documents inédits* (Verviers, 1885).

ROHAN, the name of one of the most illustrious of the feudal families of France, derived from that of a small town in Morbihan, Brittany, and claimed connection with the ancient sovereigns of Brittany. Hercule de Rohan, duc de Montbazon (1568–1654) served Henry III. and Henry IV. against the League, and was made by Henry IV. governor of Paris and the Isle of France, and master of the hounds. His grandson, Louis de Rohan-Guéménée, the chevalier de Rohan, conspired with the Dutch against Louis XIV. and was beheaded in Paris in 1674. In the 18th century the Soubise branch of the family furnished several prelates, cardinals and bishops of Strasbourg, among others the famous cardinal de Rohan, the hero of the affair of the diamond necklace. René de Rohan, seigneur of Pontivy and Frontenay, of the Gié branch, commanded the Calvinist army in 1570, and defended Lusignan with great valour when it was besieged by the Catholics (1574–75). His son Henry, the first duke of Rohan (*q.v.*), had an only child, Marguerite de Rohan, married in 1645 to Henri Chabot. The property and titles of Henry de Rohan thus passed to the Chabot family, which under the name of Rohan-Chabot produced some distinguished soldiers and a cardinal archbishop of Besançon.

ROHAN, HENRI, Duc de (1579–1638), French soldier, writer and leader of the Huguenots, was born at the château of Blain, in Brittany, in 1579. His father was René II., count of Rohan (1550–86). Henri appeared at court and in the army at the age of sixteen, and was a special favourite with Henry IV., after whom, failing the house of Condé, he might be said to be the natural chief of the French Protestants. Having served till the peace of Vervins, he travelled for some time. On his return to France he was made duke and peer at the age of twenty-four, and two years later (1603) married Marguerite de Béthune, the duc de Sully's daughter. He fought from time to time in the royal army, and it was not till the decree for the restitution of church property in the south threw the Bearnese and Gascons into open revolt that Rohan appeared as a rebel. His ability and constancy contributed to the happy issue of the war for the Huguenots, and brought about the treaty of Montpellier (1623). Rohan renewed the war when the compact of Montpellier was broken. Again a hollow peace was patched up, but it lasted but a short time, and Rohan undertook a third war (1627–29), the first events of which are recounted in his celebrated *Memoirs*. After the peace he made his way to Venice, where his hosts wished to make him their general-in-chief, a design not executed owing to the peace of Cherasco (1631). At Venice he wrote his *Memoirs;* at Padua, *Le Parfait Capitaine*. Rohan returned to the French service, and was entrusted with the war in the Valtelline (1633). But Rohan was still considered dangerous to France, and was soon again in retirement. At this time he wrote his *Traité du gouvernement des treize cantons*. Rohan fought another Valtelline campaign, but without the success of the first, for the motives of France were now held in suspicion. The unfortunate commander retired to Geneva and thence went to the army of Bernhard of Saxe-Weimar. He received a mortal wound at the battle of Rheinfelden on Feb. 28, 1638, and died at the abbey of Königsfeld, canton Berne, on April 13.

Rohan's *Mémoires sur les choses qui se sont passées en France*, etc., rank amongst the best memoirs of the 16th and 17th centuries. The first three books which deal with the civil wars appeared in 1644; the fourth, containing the narrative of the Valtelline campaigns, not till 1758. His famous book on the history and art of war, *Le Parfait Capitaine*, appeared in 1631 and subsequently in 1637 and 1693 (*see* also Quincy, *Art de la guerre*, Paris, 1741). The *Memoirs* may be conveniently found in the collection of Michaud and Poujoulat, vol. 19.

See Fauvelet de Foix, *Histoire du Duc Henri de Rohan* (1667); Schybergson, *Le Duc de Rohan et la charte du parti protestant en France* (1880); Bühring, *Venedig, Gustaf Adolf, und Rohan* (Halle, 1885); Laugel, *Henri de Rohan, son rôle politique et militaire* (1889); Veraguth, *Herzog Rohan und seine Mission in Graubünden* (Berne, 1894); and Shadwell, *Mountain Warfare*.

ROHAN, LOUIS RENÉ EDOUARD, Cardinal de (1734–1803), prince de Rohan-Guéménée, archbishop of Strasbourg, a cadet of the great family of Rohan, was born at Paris on Sept. 25, 1734. After taking orders, in 1760, he was nominated coadjutor to his uncle, Constantine de Rohan-Rochefort, archbishop of Strasbourg, and he was also consecrated bishop of Canopus. But he preferred the gaiety of Paris to his clerical duties, and had political ambitions. He joined the party opposed to the Austrian alliance, which had been cemented by the marriage of the archduchess Marie Antoinette to the dauphin. This party was headed by the duc d'Aiguillon, who in 1771 sent Prince Louis on a special embassy to Vienna to find out what was being done there with regard to the partition of Poland. Rohan arrived at Vienna in Jan. 1772, and made a great noise with his lavish fêtes. But the empress Maria Theresa was implacably hostile to him; not only did he attempt to thwart her policy, but he spread scandals about her daughter Marie Antoinette, laughed at Theresa, and shocked her ideas of propriety. On the death of Louis XV. in 1774, Rohan was recalled from Vienna, and coldly received at Paris; but in 1777 he was made grand almoner, and in 1778 abbot of St. Vaast. In 1778 he was made a cardinal on the nomination of Stanislaus Poniatowski, king of Poland, and in the following year succeeded his uncle as archbishop of Strasbourg and became abbot of Noirmoutiers and Chaise-Dieu.

In an attempt to procure his reinstatement at court he fell into the hands of the comtesse de Lamotte, the notorious Cagliostro and others, whose actions form part of the "affair of the diamond necklace" (*see* Diamond Necklace). Rohan certainly was led to believe that his attentions to the queen were welcomed, and that his arrangement by which she received the famous necklace was approved. He was the dupe of others, and at the trial in 1786 his acquittal was received with universal enthusiasm, and regarded as a victory over the court and the queen. He was deprived, however, of his office as grand almoner and exiled to his abbey of Chaise-Dieu. He was soon allowed to

return to Strasbourg, and was elected to the states-general. As a prince of the church in Jan. 1791 he refused to take the oath to the constitution, and went to Ettenheim, in the German part of his diocese. He spent what wealth remained to him in providing for the poor clergy of his diocese who had been obliged to leave France; and in 1801 he resigned his nominal rank as archbishop of Strasbourg. On Feb. 17, 1803, he died at Ettenheim.

See the *Mémoires* of his secretary, the abbé Georgel, of the baroness d'Oberkirch, of Beugnot, and of Madame Campan; also J. Munier-Jolain, *Le Cardinal Collier; lettres à . . . de Marie Thérèse* (1918), and other works cited under DIAMOND NECKLACE.

ROHILKHAND, a tract in the United Provinces of India. The name is associated with the Rohilla tribe, but in its historical significance it covers an area almost coincident with the modern division of Bareilly, for which it is a common alternative title. This division has an area of 10,828 sq.m., and comprises the districts of Bareilly, Bijnor, Budaun, Moradabad, Shahjahanpur and Pilibhit. Pop. (1921) 5,198,773. Political control over the State of Rampur is exercised by the commissioner for the division.

The Rohillas trace their ancestry to Sardar Daud Khan, an Afghan adventurer, whose adopted son annexed a large area north of the Ganges and was created a Nawab by the Delhi emperor. He died in 1749, and the family split up into a number of petty chiefs. In 1774 (*see* BIJNOR) the Rohilla power was broken by the confederacy of the British and the nawab of Oudh. The State of Rampur, almost in its present dimensions, was left under the sovereignty of Nawab Faizullah Khan, and the rest of Rohilkhand was annexed to Oudh. The present division was ceded to the Company in 1801.

ROHILLA, a Pushtu word for "mountaineer" applied to a tribe of Afghan marauders, who, towards the beginning of the 18th century, conquered a district of Hindustan, giving it the name of Rohilkhand (Bareilly in the United Provinces). They are chiefly notable for their association with Warren Hastings (*q.v.*) who assisted the Wazir of Oudh in the annexation of their territory in the Rohilla War.

See Charles Hamilton, *History of the Rohilla Afghans* (1787); and Sir J. Strachey, *Hastings and the Rohilla War* (Oxford, 1892).

ROHTAK, a town and district of British India, in the Punjab. The town, which is of great antiquity, became the headquarters of a British district in 1824. Viewed from the sandhills to the south, Rohtak, with its white mosque in the centre, a fort standing out boldly to the east, is striking and picturesque. It has a station on the Southern Punjab railway, 44 m. N.W. of Delhi. Pop. (1921) 25,240. It is an important trade centre, with factories for ginning and pressing cotton, and a speciality in muslin turbans.

The district of Rohtak has an area of 1,797 sq.m. It is situated in the midst of the level tableland between the Jumna and the Sutlej, the northern portions are watered by the Rohtak and Butana branches of the Western Jumna canal; but the greater portion of the central plain is entirely dependent upon the uncertain rainfall. The population in 1921 was 772,272.

ROKITANSKY, CARL (1804–1878), the founder of the Vienna school of pathological anatomy, was born on Feb. 19, 1804, at Königgrätz, Bohemia. He studied medicine at Prague and at Vienna, where he was made professor of pathological anatomy in 1834. In 1847 he became medico-legal anatomist to the city, and from 1863 he advised the ministry of education on all routine matters of medical teaching. He became president of the Imperial Academy of Sciences in 1869. He died in Vienna on July 23, 1878.

Carl Rokitansky's *Handbuch der pathologischen Anatomie* (1842–46, Eng. trans. 1849–52) is said to have been based on 30,000 post-mortem examinations. Four important memoirs (on the anatomy of goitre, cysts, diseases of arteries and defects in the septum of the heart) appeared in the *Denkschriften* of the Vienna Academy of Sciences. Among his remaining papers are three philosophical essays: "Freedom of Inquiry" (1862), "The Independent Value of Knowledge" (1867) and "Solidarity of Animal Life" (1869).

ROLAND [ROLAND DE LA PLATIÈRE], **JEAN MARIE** (1734–1793), French statesman, was born at Thizy on Feb. 18, 1734. Intending to seek his fortune abroad, he went on foot to Nantes, but illness obliged him to give up his project. After working as a clerk, he joined a relative who was inspector of manufactures at Amiens, and himself rose to the position of inspector.

In 1781 he married Manon Jeanne Phlipon (1754–1793), famous in history as Madame Roland. She was the daughter of Gratien Phlipon, a Paris engraver. About the year 1785 the Rolands moved to Lyons. A correspondence sprang up with Brissot and other friends of the Revolution in Paris, and in 1791 the Rolands settled there.

Jean Roland became a member of the Jacobin Club. Madame Roland's salon soon became the rendezvous of Brissot, Pétion, Robespierre and other leaders of the popular movement, above all of Buzot, whom she loved with platonic enthusiasm. In person Madame Roland was attractive though not beautiful; her ideas were clear and far-reaching, her manner calm, and her power of observation extremely acute.

On March 23, 1792, Roland was appointed minister of the interior. As a minister of the crown Roland exhibited a bourgeois brusqueness of manner and a remarkable combination of political prejudice with administrative ability. The decrees against the emigrants and the non-juring clergy still remained under the veto of the king. A letter was penned by Madame Roland and addressed by her husband to Louis. It remained unanswered. Thereupon, in full council and in the king's presence, Roland read his letter aloud. It contained many and terrible truths as to the royal refusal to sanction the decrees and as to the king's position in the State; but it was inconsistent with a minister's position, disrespectful if not insolent in tone. Roland's dismissal followed. He then read the letter to the Assembly; it was ordered to be printed, became the manifesto of disaffection, and was circulated everywhere.

After the insurrection of Aug. 10, Roland was recalled to power, one of his colleagues being Danton, but he was dismayed by the progress of the Revolution. He was above all a provincial, and was soon in opposition to the party of the Mountain. He was hostile to the insurrectional commune of Paris, and proposed transferring the Government to Blois; he attacked Robespierre and his friends. His neglect to seal the iron chest discovered in the Tuileries, which contained the proofs of Louis XVI.'s relations with the enemies of France, led to the accusation that he had destroyed a part of these documents. Finally, in the trial of the king he demanded, with the Girondists, that the sentence should be pronounced by a vote of the whole people, and not simply by the Convention. He resigned office on Jan. 23, 1793, two days after the king's execution.

The Rolands remained in Paris. Once Madame Roland appeared personally in the Assembly to repel the falsehoods of an accuser, and secured acquittal. But violence succeeded violence, and early on the morning of June 1, she was arrested and imprisoned in the Abbaye. Roland himself escaped secretly to Rouen. Released for an hour from the Abbaye, Madame Roland was again arrested and thrown among the horrors of Sainte-Pélagie. Finally, she was transferred to the Conciergerie. In prison she won the affections of the guards, and was allowed the privilege of writing materials and the occasional visits of devoted friends. She there wrote her *Appel à l'impartiale postérité,* those memoirs which display a strange alternation between self-laudation and patriotism, between the trivial and the sublime. On Nov. 8, 1793, she was guillotined. Before her execution, she bowed before the clay statue of Liberty erected in the Place de la Révolution, uttering her famous apostrophe—"O Liberty! what crimes are committed in thy name!" When Roland heard of his wife's condemnation, he wandered some miles from his refuge in Rouen; maddened by despair and grief, he wrote a few words expressive of his horror at those massacres which could only be inspired by the enemies of France, protesting that "from the moment when I learned that they had murdered my wife I would no longer remain in a world stained with enemies." He affixed the paper to his breast, and unsheathing a sword-stick fell upon the weapon, which pierced his heart, on Nov. 10, 1793.

Madame Roland's *Mémoires,* first printed in 1820, have been edited

among others by P. Faugère (1864), by C. A. Dauban (1864), by J. Claretie (1884), and by C. Perroud (1905). Some of her *Lettres inédites* have been published by C. A. Dauban (1867); C. Perroud published a critical edition of her *Lettres* (1900–02), and a new series (1767–80) in 1913–15. *See* also C. A. Dauban, *Étude sur Madame Roland et son temps* (1864); V. Lamy, *Deux femmes célèbres, Madame Roland et Charlotte Corday* (1884); C. Bader, *Madame Roland, d'après des lettres et des manuscrits inédits* (1892); A. J. Lambert, *Le mariage de Madame Roland, trois années de correspondance amoureuse* (1896); Austin Dobson, *Four Frenchwomen* (1890); articles by C. Perroud in the review *La Révolution française* (1896–99); U. Birch, *Madame Roland, a Study in Revolution* (1917).

ROLAND, LEGEND OF. The legend of the French epic hero Roland (transferred to Italian romance as Orlando) is based on authentic history. Charlemagne invaded Spain in 778, and had captured Pamplona, but failed before Saragossa, when the news of a Saxon revolt recalled him to the banks of the Rhine. On his retreat to France through the defiles of the Pyrenees, part of his army was cut off from the main body by the Basques and entirely destroyed. The incident is related in Einhard's *Vita Karoli* (cap. ix.; Pertz. ii. 448), where the names of the leaders are given. "In this battle were slain Eggihard *praepositus* of the royal table; Anselm, count of the palace; and Hruodland, praefect of the Breton march. . . ." The scene of the disaster is fixed by tradition at Roncevaux, on the road from Pamplona to St. Jean Pied de Port. The fiction of the 12 peers may possibly arise from a still earlier tradition. In 636–637, according to the *Chronicles* of Fredegarius (ed. Krusch, p. 159), 12 chiefs, whose names are given, were sent by Dagobert against the Basques. The expedition was successful, but in the valley of Subola, identified with Mauléon, near Roncevaux, the Duke Harembert, with other Frankish chiefs, was slain. Later fights in the same neighbourhood and under similar circumstances are related in 813 (*Vita Hludowici;* Pertz ii. 616), and especially in 824 (Einhard's *Annales;* Pertz. i. 213). These incidents no doubt served to strengthen the tradition of the disaster to Charlemagne's rearguard in 778, the importance of which was certainly magnified in popular story.

The choice of Roland or Hruodland as the hero probably points to the borders of French Brittany as the home of the legend. The exaggeration of a rear-guard action into a national defeat; the substitution of a vast army of Saracens for the border tribe mentioned by Einhard; and the vengeance inflicted by Charlemagne, where in fact the enemy escaped with complete impunity—all are in keeping with the general laws of romance. Charlemagne himself appears as the ancient epic monarch, not as the young man he really was in 778. There is evidence of a continuous tradition dating from the original event and, as Roncevaux lay on the route to Compostella, the many pilgrims who must have passed the site, from the middle of the 9th century onwards, may have helped to spread the story. Whether the actual *cantilena Rollandi* chanted by Taillefer at the battle of Hastings (William of Malmesbury, *De gestis regum angl.* iii. 242, and Wace, *Brut.* ii. 11, 8035 *seq.*) was any part of the existing *Chanson de Roland* cannot be stated, but the choice of the legend on this occasion by the trouvère is proof of its popularity.

The oldest extant forms of the legend are: (*a*) chapters xix.–xxx. of the Latin chronicle, known as the *Pseudo-Turpin,* which purports to be the work of Turpin, archbishop of Reims, who died about 800, but probably dates from the 12th century; (*b*) *Carmen de proditione Guenonis,* a poem in Latin distichs; and (*c*) the *Chanson de Roland,* a French *chanson de geste* of about 4,000 lines, the oldest recension of which is in the Bodleian library, Oxford (ms. Digby, 23). It is in assonanced *tirades,* of unequal length, many of them terminated with the refrain *Aoi.* This ms. was written by an Anglo-Norman scribe about the end of the 12th century, and is a corrupt copy of a text by a French trouvère of the middle of the 11th century. The poem, which was first printed by Francisque Michel (Oxford, 1837) is the finest monument of the heroic age of French epic.

The *Pseudo-Turpin* represents a different recension of the story and is throughout clerical in tone. It was the trouvère of the *Chanson de Roland* who developed the characters into epic types; he invented the heroic friendship of Roland and Oliver, the motives of Ganelon's treachery, and many other details. The famous fight between Roland and the giant Ferragus appears in the *Pseudo-Turpin* (ch. xviii.), but not in the poem. The *Chanson de Roland* contains allusions to many events outside the narrative, some of which refer to *chansons* which are lost. Roland was variously represented by the romancers as the son of Charlemagne's sister Gilles or Berte and the knight Milon d'Anglers. The romantic episode of the reconciliation of the pair with Charlemagne through Roland's childish prattle (*Berte et Milon*) is probably foreign to the original legend. His *enfances,* or youthful exploits, were, according to *Aspremont,* performed in Italy against the giant Eaumont, but in *Girais de Viane* his first taste of battle is under the walls of Vienne, where Oliver, at first his adversary, becomes his brother-in-arms.

In the 12th century the *Chanson de Roland* was modernized by replacing the assonance by rhyme. Several mss. of this rhymed recension, sometimes known as *Roncevaux,* are preserved. The English romances of Charlemagne (*q.v.*) are mostly derived from late and inferior sources. It was in Italy that the Roland legend had its greatest fortune; Charlemagne and Roland appear in the *Paradiso* (canto xviii.) of Dante; the statues of Roland and Oliver appear on the doorway of the cathedral of Verona; and the French *chansons de geste* regularly appeared in a corrupt Italianized French.

BIBLIOGRAPHY.—For a complete bibliography of the editions of the various mss. of the *Chanson de Roland,* of the foreign versions, and of the enormous literature of the subject, *see* Léon Gautier, *Les Epopées françaises* (2nd vol. iii. 1880) and the same author's *Bibliographie des chansons de geste* (1897). *See* also P. Boissonade, *Du Nouveau sur le Chanson de Roland* (1923). Among critical editions of the *Chanson* are those by Wendelin Foerster in the *Altfranz. Bibliotek,* vols. vi. and vii. (Heilbronn, 1883–86), and by E. Stengel *Das altfranzosische Rolandslied* (Leipzig, 1900, etc.). The most popular edition is *La Chanson de Roland* (Tours, 1872, and numerous subsequent editions), by Léon Gautier. L. Petit de Julleville published in 1878 an edition with the old French text, and a modern French translation in assonanced verse. There are English translations in prose by I. Butler (Boston, Mass., 1904); in verse by A. Way and F. Spencer (1895); and "in the original measure" by C. S. Moncrieff (1919). Consult further G. Paris, *Hist. poét. de Charlemagne* (reprint, 1905), and *De Pseudo Turpino* (Paris, 1865); P. Rajna, *Le Origini dell 'epopea francese* (Florence, 1884) and *Le Fonti dell' Orlando Furioso* (2nd ed. Florence, 1900); F. Picco, *Rolando nella storia e nella poesia* (Turin, 1901); G. Paris, "Roncevaux," in *Légendes du moyen âge* (1903), on the topography of the battlefield.

ROLANDSECK, a village in the Prussian Rhine province, situated on the left bank of the Rhine, 8 m. above Bonn, with a station on the railway Cologne-Coblenz. The place consists almost entirely of villas and is a favourite summer resort. Behind it lie the ruins of the castle.

ROLL, something rolled or wound up in a cylindrical form on an axis, or something that moves or is moved along a surface by a turning motion (Lat. *rotulus,* dim. of *rota,* wheel).

Primarily the word is used of a piece of writing material, such as parchment or paper, which is rolled up for the purpose of convenient storage or handling. It was thus the name for any document kept in this form as an official record, and hence for any register, record, catalogue or official list. "The Rolls" was the name of the building where the records of the chancery court, a division of the English High Court of Justice, were kept, the keeper of which was the Master (*q.v.*) of the Rolls, now the title of the third member of the English Supreme Court of Judicature. The word is used in this sense for the list of those admitted as qualified solicitors, whence the phrase "to strike off the rolls" of removal by the court of a solicitor for offences or delinquencies.

In architecture (*q.v.*) a "roll" or "scroll" moulding is one resembling a section of a roll or scroll of parchment with the end overlapping; a "roll and fillet" moulding is a section of a cylindrical moulding with a square fillet running along the centre of the face (*see* LABEL).

ROLLAND, JOHN (*fl.* 1560), Scottish poet, appears to have been a priest of the diocese of Glasgow, and to have been known in Dalkeith in 1555. He is the author of two poems, the *Court of Venus* and a translation of the *Seven Sages.* The former, which was printed by John Ros in 1575, may have been written before 1560. The latter was translated from a Scots prose version.

The *Court of Venus* was edited by Walter Gregor (1884). The *Seven*

Sages was printed in 1578, and reprinted by David Laing (1837).

ROLLAND, ROMAIN (1866–), French man of letters, was born at Clamecy, Nièvre, on Jan. 29, 1866. He was educated at Clamecy, and later in Paris, where he had a distinguished academic career. From 1889–91 he was a member of the French School in Rome, and in 1895 became professor of art history at the Ecole Normale Supérieure. Later he was appointed professor at the Sorbonne, where he introduced the study of the history of music. He produced many critical and historical works, among them *Les origines du théâtre lyrique moderne, Histoire de l'opéra en Europe avant Lulli et Scarlatti* (1895); *Des causes de la décadence de la peinture italienne* (1895); *Le théâtre du peuple* (1901); besides studies on *Millet* (1902); *Beethoven* (1903) and *Michel-Ange* (1906), *Les Tragédies de la foi, Saint Louis, Aërt, Le Triomphe de la raison* (1913). His most famous work, however, is the romance of *Jean-Christophe* (1904–12), the biography of a German musician. It is in three series, *Jean-Christophe, Jean-Christophe à Paris* and *La Fin du Voyage,* and appeared in 10 volumes, the first *L'aube,* in 1904, and the last *La Nouvelle Journée,* in 1912.

When the World War broke out Rolland was in Switzerland, and although his open letter to Hauptmann expressed his horror of the burning of Louvain, he became extremely unpopular in France owing to a series of articles published in the *Journal de Genève* during Sept. and Oct. 1914. These articles were subsequently published in book form under the title *Au-dessus de la mêlée,* of which the ninth edition appeared in 1915. Although his reputation in France suffered from his political views, it increased abroad, and the performances of *Danton* and *Le 14 juillet,* which with *Les Loups* and *Le Jeu de l'amour et de la mort* belong to his *Théâtre de la Revolution* (1909), caused a furore in Berlin. His work *Mahatma Gandhi* (1924) is an impassioned defence of the Indian leader. His later works include: *Colas Breugnon* (1918); *Les précurseurs* (1919); *Clerambault, Pierre et Luce* (1919); *Voyage musical aux pays du passé* (1919); *Liluli* (1919). In 1922 appeared the first volume of a series entitled *L'Ame Enchantée.* To this series belong *Annette et Sylvie* (1922), *L'Été* (1924) and *Mère et Fils* (1927). Rolland received the Nobel prize for literature in 1915.

See Jan Romein, *Romain Rolland* (1918); I. Debran, *M. R. Rolland, initiateur de défaitisme* (1918); W. Kuechler, *Romain Rolland* (1919).

ROLLE DE HAMPOLE, RICHARD (d. 1349), English hermit and author, was born near the end of the 13th century, at Thornton (now Thornton Dale), near Pickering, Yorkshire. His father, William Rolle, was perhaps a dependant of the Neville family. Richard was sent to Oxford at the expense of Thomas de Neville, afterwards archdeacon of Durham. At Oxford he gave himself to the study of religion rather than to the subtleties of scholastic philosophy, for which he professed a strong distaste. At the age of 19 he returned to his father's house, and, making a rough attempt at a hermit's dress, he ran away to follow the religious vocation. At Dalton, near Rotherham, he was recognized by John de Dalton, who had been at Oxford with him. After satisfying himself of Rolle's sanity, Dalton's father provided him with food and shelter and a hermit's dress. Rolle then entered on the contemplative life, passing through the preliminary stages of purification and illumination, which lasted for nearly three years, and then entering the stage of sight, the full revelation of the divine vision. He is very exact in his dates, and attained, he says, the highest stage of his ecstasy four years and three months after the beginning of his conversion.

Richard belonged to no order, though he seems to have desired to form a rule of hermits, but met with much opposition. He finally contented himself with advising those who sought him out. He began also to write the songs and treatises by which he was to exert his widest influence. He settled in Richmondshire, 12 miles from the recluse Margaret Kirkby, whom he had cured of a violent seizure. To her some of his works are dedicated. Finally he removed to Hampole, near Doncaster, where he died on Sept. 29, 1349.

Richard Rolle had a great influence on his own and the next generation. In his exaltation of the spiritual side of religion over its forms, his enthusiastic celebration of the love of Christ, and his assertion of the individualist principle, he represented the best side of the influences that led to the Lollard movement. He was himself a faithful son of the church, and the political activity of the Lollards was quite foreign to his teaching. The popularity of his devotional writings is attested by the numerous existing editions and by the many close imitations of them.

A very full list of his Latin and English works is given (pp. 36–43) in Dr. Carl Horstmann's edition (1895–96) of his works in the Library of Early English Writers.

Richard Rolle's Latin treatises, *De emendatione vitae* and *De incendio amoris,* the latter one of the most interesting of his works, because it is obviously largely autobiographical, were translated (1434–35) by Richard Misyn (ed. R. Harvey, Early English Text Soc., 1896 and by F. M. M. Comper in 1914). The *De emendatione de vitae* was also edited with an introduction, by D. Harford (1913). The *Pricke of Conscience* was edited (1863) by Richard Morris for the Philological Society. His *Commentary on the Psalms* was edited by the Rev. H. R. Bramley (Oxford, 1884). Ten prose treatises by Richard Rolle were edited by G. Perry for the Early English Text Society in 1866, rev. ed. 1921. Partial ed. of his Latin works are Paris (1510), Antwerp (1533), Cologne (1535–36), Paris (1618); and in vol. xxvi. of the "Bibliotheca Patrum Maxima" (Lyons, 1677). The office, which forms the chief authority for Rolle's life, was printed in the *York Breviary,* vol. ii. (Surtees Soc., 1882), and in Canon Perry's edition referred to above. *The Meditatis de passione Domini* was edited in 1917, with introduction, by H. Lindkvist, and the *Officium et Miracula* by R. M. Woolley in 1919. See *Richard Rolle's Version of the Penitential Psalms, with his Commentary* (1928); *The Mirror of Gifts: from the works of Richard Rolle* (ed. H. R. Cross, 1928).

See also Percy Andreae, who collated 18 mss. in the British Museum in his *Handschriften des Pricke of Conscience* (Berlin, 1888); *Studien über Richard Rolle von Hampole unter besonderer Berücksichtigung seiner Psalmencommentare,* by H. Middendorff (Magdeburg, 1888), with a list of mss., sources, etc.; J. Zupitza in *Englische Studien* (Heilbronn, vols. vii. and xii.); A. Hahn, *Quellenuntersuchungen zu Richard Rolle's englischen Schriften* (Halle, 1900); and for his prosody, G. Saintsbury, *Hist. of English Prosody,* vol. i.

ROLLER, one of several birds, especially the common roller (*Coracias garrulus*), so called from its way of occasionally rolling in its flight, after the fashion of a tumbler pigeon. It is widely though not numerously spread over Europe and western Asia in summer, breeding as far N. as the middle of Sweden, but retiring to winter in Africa. It occurs almost every year as a straggler in the British islands. Except the back, scapulars and tertials, which are bright reddish-brown, the plumage of both sexes is blue (of various shades, from pale turquoise to dark ultramarine) tinted in parts with green. The bird is purely insectivorous. *Coracias* forms the type of the family *Coraciidae,* allied to the bee-eaters (*Meropidae*) and king-fishers (*Alcedinidae*) (q.v.). A number of other species exist in Asia and Africa.

ROLLER: *see* CULTIVATING MACHINERY.

ROLLER-SKATING, a pastime which, by the use of small wheels instead of a blade on the skate, has provided some of the pleasures of skating on ice without having ice as the surface (*see* SKATING). Wheeled skates were used on the roads of Holland as far back as the 18th century, but it was the invention of the four-wheeled skate, working on rubber pads, by J. L. Plimpton of New York, in 1863, that made the amusement popular. Still greater advance was made by the Raymond skate with ball and cone bearings. The wheels of rollers were first of turned boxwood, but the wearing of the edges was a fault which has been surmounted by making them of a hard composition or of steel. The floor of the rink on which the skating takes place is either of asphalt or of wood; the latter is nearly always used in newly made rinks. The best floors are of long narrow strips of maple. Roller skating races were popular in some American cities until about 1910, when the motorcycle and the automobile displaced them.

ROLLESTON, THOMAS WILLIAM HAZEN (1857–1920), Irish scholar and author, was born in King's Co., Ireland, in 1857, and died at Hampstead in 1920. He was educated at St. Columba's college and at Trinity college, Dublin. He founded the *Dublin University Review* (1885–86). His works include a *Life of Lessing* (1889); *Lessing and Modern German Literature*

(1900); *Sea Spray*, a book of verse (Dublin, 1909); *Parallel Paths, a study in biology ethics and art* (1908); and two books on Gaelic literature, *The High Deeds of Finn* (1910) and *Myths and Legends of Celtic Race* (1911).

ROLLING MILL, an establishment where metal, especially iron and steel is rolled into plates and bars of various sections. (*See* IRON AND STEEL, *Rolling Mill;* SHEET STEEL; TIN AND TERNE PLATE.)

ROLLOCK, ROBERT (*c.* 1555–1599), the first principal of the university of Edinburgh, son of David Rollock of Powis, near Stirling, received his early education at the school of Stirling from Thomas Buchanan, a nephew of George Buchanan, and, after graduating at St. Andrews, became a regent there in 1580. In 1583 he was appointed by the Edinburgh town council sole regent of the "town's college" ("Academia Jacobi Sexti," afterwards the University of Edinburgh). In 1598 he was translated to the parish church of the Upper Tolbooth, Edinburgh, and then to that of the Grey Friars (then known as the Magdalen Church). He died at Edinburgh on Feb. 8, 1599.

His *Select Works* were edited by W. Gunn for the Wodrow Society (1844–1849).

A *Life* by George Robertson and Henry Charteris was reprinted by the Bannatyne Club in 1826. *See* also the introduction to the *Select Works*, and Sir Alexander Grant's *History of the University of Edinburgh*.

ROLLS-ROYCE LIMITED, a firm of motor-car manufacturers. A car designed by Mr. F. Henry Royce of the Manchester firm of Royce Ltd., was brought to the notice of the late Hon. C. S. Rolls of C. S. Rolls & Co., London, in the latter half of 1903. The success of this car led, in March 1906, to the merging of the Rolls and Royce interests into one company and, in December 1906, a public company was floated with £200,000 capital, under the style of Rolls-Royce Ltd. In this year Mr. Royce designed the 40–50 h.p. side-valve engined chassis—known as the "Silver Ghost"—which was developed from that day until May 1925, when the "Phantom" overhead-valve engined type was introduced. The Manchester works proving too small, the building of new works planned by Mr. Royce was begun at Derby in 1907. These works were opened by Lord Montagu of Beaulieu, and the manufacturing activities transferred thereto in 1908. Meanwhile Mr. Royce devoted himself to aero-engine design, and produced three types of engine, known as the "Hawk," "Falcon" and "Eagle." At the end of the World War, there were Rolls-Royce aero engines in service of an aggregate of over 2,000,000 horse-power. Some of the outstanding events in Rolls-Royce post-war history were Sir John Alcock's non-stop trans-Atlantic flight in a 360 h.p. Rolls-Royce "Eagle VII." engined Vickers "Vimy" bomber in June 1919 (this was the first direct flight across the Atlantic), the introduction in October 1922 of the Rolls-Royce 20 h.p., and the appearance in 1925 of the "Phantom" type 40–50 h.p. chassis. (M. Bu.)

ROMA, a town (pop. 4,000) in the south-east of Queensland, Australia, situated on the main Western railway line 318 m. W. of Brisbane. The town's water-supplies are drawn from artesian wells (depth 1,300 ft., yield *c.* 200,000 gal. daily).

ROMAINS, JULES (1885–), French poet and novelist, was born on Aug. 26, 1885, at St.-Julien-Chapteuil in the Ardèche. He went early to Paris and spent his childhood and adolescence in Montmartre. He entered the École Normale Supérieure in 1906, and graduated in philosophy in 1909. For ten years he taught philosophy in Paris and in the provinces, notably at Nice. His claim to fame is principally based on his position as one of the heads of the unanimist school of writers (Arcos, Vildrac, Duhamel, Chennevière and others).

Jules Romains' work falls into three categories: poems, novels and plays. The most important of his books of verse, *La Vie Unanime* (1908), deals with what may be called the spiritual life inherent in the various groups of humanity. *The Odes et Prières* (1913) and *L'Ode Génoise* (1925) should also be mentioned. Some of his novels, such as *Les Copains* (1913), owe their merit to a sort of Rabelaisian verve and truculent jollity. Others are in a loftier style. *Mort de Quelqu'un* (1910) traces the brief survival of a dead man in the society in which he had lived, and how he gradually fades out of memory. The dramatic works of Jules Romains include farces, the best of which is undoubtedly *Knock* (1925), and also dramatic prose poems, such as *L'Armée dans la Ville* (1911) and *Cromedeyre-le-Vieil* (1920), which give full expression to unanimist doctrines. He has also written two tragedies, *Le Dictateur* (1926) and *Jean le Maufranc* (1927), in which he attempts a dramatic embodiment of the antinomies of modern social consciousness. (G. Ml.)

ROMAN, capital of the department of Roman, Rumania, on the main line from Czernowitz to Galatz, and on the left bank of the river Moldava, 2¼ m. W. of its junction with the Sereth. Pop. (1928) 25,000, about one-third being Jews. Roman has been the seat of a bishop since 1401. Its seminary dates from 1402. There are ancient churches, including a cathedral, built in 1541.

ROMAN ARCHITECTURE. Like the rest of Roman civilization, Roman architecture is a manifestation of the essentially direct and practical Roman mind. It is concerned not with the search for any ideal of beauty but with the solution of everyday problems. Consequently while the elements of Roman architecture are derivative, being Greek, and Etruscan or rather Italic in origin, they are adapted and transformed by the Roman genius in the light of increased technical knowledge to fit altered conditions of life. The influence exerted on Roman architectural forms by the materials and methods of construction used, cannot be overestimated, and the enduring stability of Roman buildings may legitimately be held to be due to the presence of good and durable building material. The discovery of concrete in particular gave to the Roman builders an almost imperishable material which could be moulded into a homogeneous mass exerting no thrust when set, and which thus enabled them to attack and to solve entirely new problems in spatial planning.

Building Materials.—The material employed by the Romans in their earliest buildings was *tufa*, a volcanic rock of varying hardness, some soft enough to be worked with bronze tools. Later other harder volcanic stones were used, *e.g.*, peperino, and the stone from the Alban hills. Under the later republic and the empire the most important stone for building was *travertine* which was quarried mainly at Tibur (Tivoli). This becomes very hard after exposure to air and weathers to a rich golden tone. An example of the use of travertine is the exterior of the Colosseum.

For their concrete the Romans used *pozzolana* of which there are extensive beds at Pozzuoli, near Naples, and also round Rome. This is a fine chocolate red volcanic earth, which when mixed with lime forms an excellent natural hydraulic cement which will set well even under water. With this cement was mixed an aggregate of broken tufa, travertine, brick or even marble, pumice stone being used in vaults after the 1st century A.D. to lighten the weight. Besides its extreme durability this concrete is practically indestructible by fire. It is used in all the great imperial buildings, *e.g.*, Pantheon, baths of Caracalla and basilica of Maxentius. The new forms of architecture which were developed by the use of this material spread all over the Roman empire.

Unburnt bricks faced with stucco were used especially for private houses under the republic. It is to these bricks that reference is made in Augustus' famous saying "that he found Rome of brick and left it of marble." Of these, naturally, very few remain. Under the empire *kiln-baked bricks and tiles* were the most common facing for concrete. They are never used to build a whole wall in the modern manner but merely as a protective skin. These bricks or tiles are almost always used in triangular shapes. Large tiles about 2 ft. square called *bipedales* were employed as bonding courses.

The use made by the Romans of *marble* was mainly decorative. It was applied in slabs to brick and concrete walls, and set in cement. It was used for pavements either in slabs cut and arranged in patterns, or as mosaic. Under the empire a great demand arose for coloured marbles and such stones as porphyry, granite and alabaster, which were imported from various parts of the empire. The abundant use of these marbles is well illustrated by the remains of the Flavian palace on the Palatine and of

Hadrian's villa at Tivoli.

The use of *stucco* over unbaked brick and over coarse stone was prevalent from the earliest times in Greece, Sicily and Italy. It served as a protection from the weather and also as a finish. Later it was used over brick and concrete. It was made of lime, sand and fine marble dust and would take a high polish. Thus it became the usual ground for decoration especially in the interiors of houses. Examples of its use abound at Pompeii, and in Rome in the House of Livia, in Nero's Golden House, etc. Another material the use of which was mainly decorative is *bronze*. Doors, grills, panels of ceilings, etc., were made of it.

Construction.—Walls were built in two ways, either of ordinary masonry or of concrete (faced or unfaced). While there are several examples of early stone walling without courses (cyclopean and polygonal) especially in some of the towns, *e.g.*, Norba, Praeneste, near Rome, most of the stone walls existing are built of squared blocks laid in regular courses as headers and stretchers (*opus quadratum*). The earliest of these walls are of tufa. Later come those of peperino and travertine. The blocks of stone in these walls are fairly large, 2 ft. x 4 ft. or more, and were often held together by iron cramps fixed in lead.

Concrete walls, except below ground, were always faced. They are divided into types according to the kind of facing used. (a) *Opus quadratum, i.e.*, ordinary stone walling, is used as a facing for concrete, especially for important public buildings under the earlier empire, *e.g.*, exterior of the Colosseum. (b) *Opus incertum* is the most common facing for ordinary concrete walls of the 2nd and 1st centuries B.C. The face of the concrete is studded with 3 in. to 4 in. irregularly shaped pieces of stone, usually tufa. (c) *Opus reticulatum* came into vogue in the 1st century B.C. and remained in use until the time of Hadrian. The construction is like that of *opus incertum* but the pieces of stone were pyramid shaped with square bases set diagonally and wedged into the concrete wall. Quoins 9 in. x 3 in. of the same material or of brick were used at the angles. (d) Brick and tile faced concrete (so called *opus testaceum*) is by far the most common material for walling under the empire. Triangular tiles were used with their points turned into the concrete and their long sides showing, thus giving the appearance of a wall built of thin bricks. Bonding courses of *bipedales* were employed at intervals of 2 or 3 feet. (e) Mixed brick and stone facing (so called *opus mixtum*) was popular under the later empire and especially under Diocletian.

The stone arch occurs frequently in Italy from the middle of the 2nd century B.C. onwards, usually in city gates, bridges and aqueducts. The discovery of concrete, however, enormously facilitated the spread of arch construction. Concrete arches were faced with stone or tile voussoirs, and with the latter *bipedales* were used at every 6th or 7th voussoir.

The vaults used by the Romans were simpler geometrical forms, *i.e.*, the barrel vault, the intersecting (groined) barrel vault and the segmental vault. By the 1st century B.C. quite extensive systems of barrel vaulting were employed as in the substructions of the Tabularium in Rome, the temple of Hercules at Tivoli, etc. The later vaults were built up on brick rings about 2 in. apart, joined by brick bonders, forming rectangular compartments which were filled with concrete. Additional layers of concrete were laid above. When set the concrete vault exerted no thrust. The surfaces of the vaults were tile faced or covered with stucco. A fine example of Roman vaulting is the basilica of Maxentius.

The construction of domes naturally follows that of vaults. Here again the fact that the concrete dome was a dead weight without thrust was of the greatest importance in simplifying the problem. Tie ribs of brick were used and sometimes relieving arches as in the case of the Pantheon where the facing bricks are laid horizontally. At the crown of the dome was a brick ring.

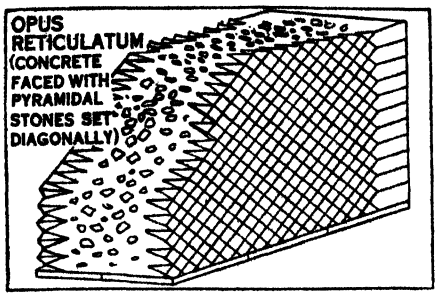
The Orders.—There are five Orders of Roman Architecture, Tuscan, Doric, Ionic, Corinthian and Composite, Tuscan and Composite being modifications of Doric and Corinthian respectively. The rules followed by the Roman builders were elastic; few examples are of the same proportion and there was much licence allowed in execution. It has, however, been usually supposed that some system in which form and detail were definitely standardized was essential for the construction of Roman buildings, built as they were at a high speed by ordinary workmen. Marcus Vitruvius Pollio, the Roman writer on architecture, would at any rate have us believe that imperial architecture was brought under some such rules. But the greater part of Roman architecture is later than Vitruvius, an architect and engineer who lived, and wrote in the time of Augustus. His book (*De Architectura*) is our great authority for the earlier Roman building and construction, but was primarily a handbook for architects and is based for the most part on the works of Greeks of the late 4th century B.C. and the Hellenistic period. The Renaissance exalted Vitruvius to the supreme authority on classical building; but it is none the less certain that there were no hard and fast rules, certain general proportions only being observed. It would be impossible here to treat of the details of the Roman Orders (*see* ORDER). In general the proportion is slenderer than that of the corresponding Greek Order, and there is a tendency towards greater elaboration combined with a decline in the quality of the execution. Columns are often unfluted, but the faces of the entablature left plain in Greek work are covered with decoration.

The Doric Order has almost invariably a base moulding probably taken from the Etruscan Doric or Tuscan column. Examples of Roman Doric are to be found in the Tabularium (78 B.C.) and in the lowest order of the Colosseum (A.D. 79) where it is used in conjunction with the arch. The temple of Hercules at Cori (*c.* 80 B.C.) is the only known Roman Doric temple.

The Ionic Order is used to a limited extent in temples and public buildings, though the number of isolated capitals found suggests that it had a certain vogue in private houses. The Romans seldom used the canted angle volute though in the temple of Saturn the capitals have four canted volutes. Other examples of this Order are the temple of Fortuna Virilis, the second orders of the theatre of Marcellus and the Colosseum, Trajan's forum at Rome and various buildings at Pompeii.

The Corinthian Order was by far the most popular with the Roman builder. It attracted by its richness and by the ease with which it could be used in any position owing to the identity of the four faces of the capital. The columns removed (by Sulla) from the temple of Zeus Olympios at Athens became the model, but the whole Order shows a progressive elaboration in detail with an elimination of plain surfaces combined with inferior workmanship. Examples of this Order are the temples of Mars Ultor and of Castor and Pollux (the latter one of the most beautiful examples in Roman architecture) in Rome, the temple of Vesta at Tivoli, Agrippa's portico to the Pantheon, etc.

The Composite capital is really a Corinthian capital with the tendril at the corner replaced by an Ionic volute. Alternatively it may be regarded as a four-voluted Ionic capital enriched with an acanthus necking. Examples of this capital are to be found on the triumphal arches of Titus and Septimius Severus, the baths of Diocletian, etc.



While the Romans did not abandon the original structural use of the column, its employment as a purely decorative feature became common. It was used in conjunction with the arch; and the skilful combination of these two opposing elements not only exerted a great influence on subsequent architecture but remains the great contribution of Rome to the history of architectural design. The Roman architects themselves never abandoned the traditional idea of supremacy of the Order but its use in the simpler manner of the Greek façade was insufficient to meet the demands of Roman buildings. With the help of the arch the spacing of columns was no longer governed by the load to be carried. This opened up new possibilities in design, and all over Italy and the provinces we see the monumental use of column and arch for triumphal arches from the time of Augustus to that of Constantine, as well as in such buildings as the baths of Caracalla and Diocletian, and the basilica of Maxentius. This naturally led to the development of new details in the shape of pedestals, niches, keystones, etc. Eventually we find arcaded walls without piers, the arch being taken direct on to the column and the entablature run over the arch as an archivolt. Examples of this are in the great Propylaea at Baalbek and in the palace of Diocle-

ROMAN INGENUITY IN THE USE OF THE MATERIALS AT HAND IS SHOWN BY VARIOUS METHODS OF BUILDING ROUGH WALLS OF RUBBLE FACED WITH STONE OR BRICK USED IN VARIOUS WAYS; AT TIMES THE RUBBLE BECOMES ALMOST CONCRETE BECAUSE OF THE SMALL SIZE OF THE STONES AND THE GREAT AMOUNT OF CEMENT MORTAR. CONCRETE, BRICK AND TILE WERE SKILLFULLY COMBINED IN VAULTING. A GENIUS FOR COMPOSING MANY ELEMENTS INTO A MONUMENTAL WHOLE IS SHOWN BY THE PLANS OF THE IMPERIAL FORA AND THE PALATINE HILL AT ROME AS WELL AS THE PALACE OF DIOCLETIAN AT SPALATRO. HOUSES AT POMPEII AND TENEMENTS AT OSTIA SHOW THE ADVANCED LIVING CONDITIONS UNDER THE ROMAN EMPIRE

tian at Spalato.

For buildings of more than one storey the Romans regularly used the Orders above one another. There were four storeys on the Colosseum and seven (we are told) on the Septizonium of Septimius Severus on the Palatine.

Temples and Basilicas.—The Roman temples differed in many important respects from those of the Greeks. For the comparatively low stylobate with its three steps all round, the Romans substituted a high platform or podium with a flight of steps on the entrance façade. Again while Greek temples are isolated from other buildings and almost always face east and west, those of the Romans usually face the forum or are placed at the end of a street to close a vista, and are turned to all points of the compass, their orientation being governed by their relation to other buildings. This results in an increased emphasis on the entrance façade with an increased depth to the portico. The *cella* is wider and the colonnade which surrounds the Greek temple is often reduced to a row of engaged columns or pilasters along the cella walls except on the entrance front. In some cases the cella was vaulted in concrete and might have an apsidal end, *e.g.*, the so called baths of Diana at Nîmes and especially the double temple of Venus in Rome. The best preserved example of a Roman temple now existing is that known as the Maison Carrée at Nîmes. In Rome the most important temples of which remains exist are those of Fortuna Virilis, Mars Ultor, Castor and Pollux, Concord and Antoninus and Faustina. Besides these there are in Italy the temple of Minerva at Assisi and the temples at Pompeii, and in Syria the temples of Bacchus at Baalbek and of the Sun at Palmyra, etc.

The most important circular temples are those of Vesta in the Forum, of Mater Matuta and the Pantheon in Rome, the temple of Vesta at Tivoli and those of Jupiter at Spalato, Rome and Augustus on the Acropolis at Athens, and Venus at Baalbek, which has detached Corinthian columns joined to the cella walls by a segmental architrave. The greatest circular temple and in many respects the most important Roman building is the Pantheon (*q.v.*). This consists of a rotunda 142 ft. 6 in. in diameter surrounded by concrete walls 20 ft. thick, in which are alternate circular and rectangular niches. Light is admitted through a central opening 28 ft. across, at the crown of the dome. In front is a portico which originally belonged to the temple built by Agrippa and was altered from decastyle (ten columns) to octastyle (eight columns) and re-erected when the rotunda was built under Hadrian, A.D. 120–124. The construction of the rotunda and dome is one of the finest examples of Roman concrete work, the whole being strengthened by immense relieving arches and piers of brick set above one another in the thickness of the walls. The interior was lined with precious marbles, the coffers of the dome were decorated with bronze rosettes and the dome itself covered externally with bronze plates. (*See* TEMPLE.)

The Roman basilicas were large covered halls facing the forum, affording protection from the weather and giving space for the holding of courts of justice and for banking and other commercial transactions—all of which activities had in earlier days been carried on in the open market-place. On the forum in Rome are the Basilica Julia on the south side and the Basilica Aemilia on the north side—both of which had a central hall and side aisles. The Basilica Ulpia in Trajan's forum was similar in plan, but had at either end semicircular halls which served as law courts. The fourth and greatest of the basilicas is that begun by Maxentius and finished by Constantine, A.D. 306–310. This huge building covered 7,000 sq.yd. and followed in construction and plan the great hall of the Roman baths. The vaults over the bays on the north side are still to be seen overhanging without support, a striking testimony to the marvellous cohesion and enduring strength of Roman concrete. The basilica at Pompeii is an example of the simpler type general in the provinces.

Theatres and Amphitheatres.—The Roman theatres differed in several respects from the Greek. The auditorium was not excavated and the walls surrounding stage and seating were continuous, the entrance to the orchestra being by vaulted passages. As the chorus played no part in the Roman theatre the orchestra or dancing space was not required and became part of the auditorium. The only theatre in Rome of which any remains exist is that of Marcellus built by Augustus (13 B.C.) but there are numerous examples throughout the Roman empire especially in Asia Minor. The theatre at Orange, France, is the best preserved example. Others of importance are the theatre at Taormina, Sicily, two theatres at Pompeii, the theatre at Ostia, the Odeon of Herodes Atticus at Athens, theatres at Telmessus, Alinde, Aizani, Aspendus in Asia Minor, etc.

The Roman amphitheatre (*q.v.*) is in origin, as its name implies, a double theatre. The largest and most important of all the Roman amphitheatres is the Colosseum (*q.v.*) built by the Emperors Vespasian, Titus and Domitian in A.D. 72–80 on the site of Nero's lake. It is a huge ellipse 62 ft. × 513 ft. covering six acres and shows remarkable skill in planning. It had seating accommodation for about 45,000 spectators, and its 80 entrances were so arranged that the whole building could be cleared in an incredibly short time. The whole is built of concrete, the exterior being faced with travertine and the interior with precious marbles that have long since disappeared. Other important amphitheatres are those at Capua, Pompeii, Pozzuoli, Verona, Pola, Arles, Nîmes, etc.

Baths.—By the end of the republic, baths (*balneae*) had become a recognized feature of Roman life. Under the empire their numbers increased until at the beginning of the 4th century A.D. they numbered 1,000 in Rome alone. They were of the type of the Turkish bath with rooms at different temperatures. Remains of these ordinary establishments are common throughout the empire. The Stabian baths at Pompeii are the best preserved.

The imperial *thermae* were more than baths. They were immense establishments of great magnificence with facilities for every gymnastic exercise, with halls to which resorted philosophers, poets and rhetoricians and those who wished to hear them. The earliest of these *thermae* were those built by Agrippa in 21 B.C. Others were built by Nero, Titus, Trajan, Caracalla, Diocletian and Constantine. The best preserved are the baths of Caracalla, which covered an area of 110 yd. square, and those of Diocletian with accommodation for 3,200 bathers. Parts of the latter are now occupied by the church of S. Maria degli Angeli and by the Museo delle Terme. The remains of these two great establishments with their massive walls and great vaults are among the most impressive examples of Roman concrete construction. The planning of the *thermae* is governed by two main principles, that of axial planning, a distinctive feature in all Roman work, and the grouping of all subsidiary halls and rooms round a great central hall. (*See* BATHS.)

Triumphal Arches and Gateways.—More usual than the triumphal column, as exemplified by those of Trajan and Marcus Aurelius, is the triumphal arch commemorating some important event or campaign. This is most commonly an isolated monument not necessarily spanning a roadway; *e.g.*, the triumphal arches of Septimius Severus at Rome and of Trajan at Ancona are accessible only by flights of steps, while the archway itself is too narrow for ordinary use. The triumphal arch was usually decorated with columns and bas-reliefs of the chief events it commemorated and was frequently surmounted by a group of sculpture. The most important of these arches are the arch of Titus (A.D. 82) commemorating the capture of Jerusalem, the arches of Septimius Severus and Constantine in Rome, and Trajan's arches at Beneventum and Ancona. There are several other triumphal arches in the provinces, notably those of Tiberius at Orange, of Augustus at Susa and Caracalla at Tebesa. Others exist at Rheims, Pola, Timgad, Maktar, etc.

The monumental city gate while sometimes serving a commemorative purpose differs from the arch in being part of the defences of the city and meant to be used. Of these one of the most famous and best preserved is the Porta Nigra at Trèves.

Bridges and Aqueducts.—The bridges and aqueducts of the Romans may be treated as monumental works in spite of their utilitarian character. The most famous examples of Roman aqueducts are the Pont du Gard, Nîmes, and the aqueducts at Tarragona and Segovia in Spain. Those which crossed the Campagna

bringing water to Rome from the hills are also well known and impressive in their decay.

There are not many of the larger Roman bridges now remaining. The best preserved is that built by Augustus and Tiberius at Rimini. The finest is that across the Tagus at Alcantara in Spain.

Tombs.—The larger Roman tombs consisted of an earth mound or tumulus surrounded by a ring of masonry rising usually to a considerable height. Few of these now exist, the most notable being the tomb of Cecilia Metella on the Via Appia and the mausoleum of Hadrian, now the castle of St. Angelo. The smaller tombs, in particular those known as *columbaria* (*q.v.*), are usually underground, though there is sometimes an upper storey, often in the shape of a small temple *in antis*, built of cut brick from which steps lead down to the tomb proper. There is a line of such tombs just outside Rome along the Via Appia and also along the Via Latina. Examples of Roman funeral monuments of various kinds exist along the Street of Tombs at Pompeii and in the provinces, in Syria at Palmyra, Jerusalem and Petra.

Palaces.—By the end of the republican period the Palatine (*q.v.*) hill had become by far the most desirable residential quarter of Rome. It was therefore natural that the Roman emperors from Augustus onwards should choose to live on it, gradually acquiring further property until the whole hill, except that part hallowed by tradition or by the presence of temples, became the imperial residence. Augustus himself bought and enlarged the house known as the House of Livia which still exists. Tiberius built a palace on the north-west side of the hill. Another palace was built on the south-east corner of the hill by Claudius or more probably by Nero. Some rooms of this palace have recently been discovered, though both it and the palace of Tiberius were partially destroyed by fire. The central space was covered by the palace of the Flavians, Domitian with his architect Rabirius being responsible for a magnificent suite of State apartments and for the sunken garden called the *hippodromus*. Hadrian extended the palace towards the forum and the House of the Vestals and finally Septimius Severus raised a huge structure overlooking the Circus Maximus, partly on the top of Hadrian's work and partly on an artificial platform supported on arches and finishing with his Septizonium. Remains of these buildings, often one above the other, cover the Palatine.

Of the famous Golden House of Nero on the site now covered by the baths of Titus, the Colosseum and the basilica of Maxentius, very little remains.

The Villa of Hadrian (*q.v.*) at Tivoli, begun about A.D. 123, was another sumptuous imperial residence with parks and gardens on a large scale. There are remains of great brick and concrete structures and the unevenness of the site necessitated large terraces and flights of steps. All the buildings are Roman in style and method of construction, though with Greek names.

The palace of Diocletian at Spalato (Split), to which he retired on his abdication in A.D. 305, combines a palace with a fortress. It consists of an immense rectangle surrounded by walls guarded by towers on three sides and on the fourth to the south protected by the sea. The palace itself is on the south side with a great gallery 520 ft. long with 51 windows overlooking the sea. (*See* PALACE.)

Private Houses.—In the Roman world there were two types of houses, the *domus* and the *insula*. The word *villa* is used to describe an estate complete with house, grounds and subsidiary buildings. Of Roman villas there are very few remains and our chief authority is Pliny who gives a detailed description of his Laurentine villa. Hadrian's villa at Tivoli, an imperial residence, cannot be treated as typical. The *domus* type of house as exemplified at Pompeii (*q.v.*) has long been regarded as the typical Roman house, though in Rome itself very few remains of the *domus* have come to light, the chief examples being the House of the Vestal Virgins on the forum and that of Livia on the Palatine. The *domus* consisted of suites of rooms grouped round a central hall or *atrium*, to which were often added further suites behind grouped round a colonnaded court or *peristyle*. There are few windows on the street, light being obtained from the *atrium* or *peristyle*. The amount of ground required for such a house while perfectly feasible in a country town such as Pompeii, would have made them beyond the means of all but the richest in a crowded city like Rome. From Latin writers we have long known that there were in Rome great blocks of flats or tenements to which the term *insulae* was applied. Recent excavations at Ostia (*q.v.*) have now revealed the design of these blocks. Planned on three or four floors with strict regard to economy of space they depended for light from the exterior, unlike the *domus* with its central court. Independent apartments had separate entrances with direct access to the street. Since Ostia is a typical town of the 1st and 2nd centuries A.D. and is almost a suburb of Rome itself, it is natural to suppose that *insulae* at Rome would present similar features. (*See* HOUSE.)

Town Planning.—While the Romans have become justly famous for the skilful planning of their towns all over the empire, Rome itself presents a strong contrast with its complete lack of any systematic scheme. For this the natural topography of the site is mainly responsible together with the conditions under which Rome grew into a great city.

The Forum (*q.v.*), the original market place, remained always irregular in plan and was soon far too small for the amount of business transacted in it. The congestion was to some extent relieved by the forums built by Julius Caesar, Augustus, Nero, Vespasian and Trajan. These were all planned on axial lines. Attempts were made to improve the street communications, the most notable being Julius Caesar's widening of the Via Lata, and colonnades and porticoes were built to protect passers-by from the sun and rain. Various emperors also laid down regulations governing the construction and height of buildings. None the less the planning of Rome was a series of expedients without any system, and after each of the fires which successively devastated great parts of the city, Rome grew up again on its old lines, and the evils of its narrow streets, poor drainage and general overcrowding became increasingly difficult to remedy.

The Roman town in the provinces on the other hand is normally planned round a central forum, close to, but separated from, the crossing of the two main roads which ran usually east to west and north to south. Less important roads run at right angles to the main roads. The forum itself is surrounded by a colonnade and facing it are the principal buildings, temples, basilica, senate-house and covered market. The whole is planned in a logical way. The forum at Pompeii may be taken as a typical example.

The layout of a whole town can be most easily seen in some of the towns in north Africa, *e.g.*, Timgad, Tebesa, Thuburbo, where there has been little or no subsequent building to modify the original lines of the plan. (*See* TOWN AND CITY PLANNING. *See* also ARCHITECTURE; PERIODS OF ART.)

ROMAN ARMY. In the long life of the ancient Roman army, the most effective and long-lived military institution known to history, we may distinguish four principal stages. (1) In the earliest age of Rome the army was a national or citizen levy such as we find in the beginnings of all states. (2) This grew into the Republican army of conquest, which gradually subdued Italy and the Mediterranean world. A citizen army of infantry, varying in size with the needs of each year, it eventually developed into a mercenary force with long service and professional organization. This became (3) the Imperial army of defence, which developed from a strictly citizen army into one which represented the provinces as well as Italy, and was a garrison rather than a field army. Lastly, (4) the assaults of the Barbarian horsemen compelled both the creation of a field force distinct from the frontier garrisons and

lic offers to the student the spectacle of large field armies, and though it also reveals a counter tendency to assign special legions to special provinces, that tendency is very feeble. Augustus ended the era of large field armies: he could not afford to leave such weapons for future pretenders to the throne. By keeping the Empire within set frontiers, he developed the counter tendency. That policy exactly suited the military position in his time. The early Roman empire had not to face—like modern empires—the danger of a war with an equal enemy, needing the mobilization of all its national forces. From Augustus till A.D. 250 Rome had no conterminous foe from whom to fear invasion. Parthia, her one and dangerous equal, was far away in the East and little able to strike home. Elsewhere, her frontiers bordered more or less wild barbarians, who might often harass, but could not do serious harm. To meet this there was need, not of a strong army concentrated in one or two cantonments, but of many small garrisons scattered along each frontier, with a few stronger fortresses to act as military centres adjacent to these garrisons.

Accordingly, a system grew up under Augustus and his immediate successors whereby the whole army was distributed along the frontiers or in specially disorderly districts (such as north-west Spain) in permanent garrisons. On the actual frontiers and on the chief roads leading to them were numerous cohorts and *alae* of auxiliaries, garrisoning each its own *castellum* of 3–7 acres in extent. Close behind the frontiers, or even on them, were the 25 legions, each (with a few exceptions of early date) holding its own fortress (*castra stativa* or *hiberna*) of 50–60 acres. Details varied at different times. Sometimes, where no Rhine or Danube helped, and where outside enemies were many, the frontier was further fortified by a continuous wall of wooden palisades (as in part of Germany; *see* LIMES) or of earth or stone (as in Britain, *see* BRITAIN: *Roman*), or the boundary might be guarded by a road patrolled from forts planted along it (as in part of Roman Africa). The result was a long frontier guard covering Britain and Europe from the German ocean to the Black sea, and the upper Euphrates valley, and the edge of the Sahara south of Tunis and Algeria and Morocco, while the wide Empire within saw little of its soldiers.

The following table shows the disposition of the legions about A.D. 120 and for many decades subsequently. It would be impossible, even if space allowed, to add the auxiliaries, as the details of their distribution are too little known. But as the number of auxiliaries in any province was probably rather greater than the number of legionaries, the sizes of the various provincial armies can be calculated roughly. Thus Britain was held probably by 35,000–40,000 men. Each provincial army was commanded either by the governor of the province or (in a few exceptional cases) by the senior *legatus* of the legions stationed there:—

Britain	II.	Augusta (*Isca Silurum*, now Caerleon).
"	VI.	Victrix (*Eburacum*, York).
"	XX.	Valeria Victrix (*Deva*, Chester).
Lower Germany (=lower Rhine)	I.	Minervia (*Bonna*, Bonn).
" "	XXX.	Ulpia Victrix (*Vetera*, Xanten).
Upper Germany	XXII.	Primigenia (*Moguntiăcum*, Mainz).
" "	VIII.	Augusta (*Argentorate*, Strassburg).
Pannonia (Danube to Semlin)	X.	Gemina (*Vindobona*, Vienna).
" "	XIV.	Gemina (*Carnuntum*, Petronell).
" "	I.	Adiutrix (*Brigetio*, near Komorn).
" "	II.	Adiutrix (*Aquincum*, near Budapest).
Upper Moesia (Middle Danube)	IV.	Flavia (*Singidūnum*, Belgrade).
" "	VII.	Claudia (*Viminacium*, Kostolac).
Dacia (now Transylvania)	XIII.	Gemina (*Apulum*, Karlsburg).
Lower Moesia (Lower Danube)	I.	Italica (*Novae*, Sistov).
" "	XI.	Claudia (*Durostorum*, Silistria).
" "	V.	Macedonica (*Troesmis*, Iglitza).
Asia Minor (Cappadocia)	XV.	Apollinaris (*Satala*, Armenian frontier).
" "	XII.	Fulminata (*Melitene*, on upper Euphrates).
Syria	XVI.	Flavia (*Samosata*, on upper Euphrates).
Syria	IV.	Scythica
"	VI.	Ferrata } near Antioch (?).
"	III.	Gallica
Judaea	X.	Fretensis (Jerusalem).
Arabia	III.	Cyrenaica (*Bostra*).
Egypt	II.	Trajana (near Alexandria—a disorderly city).
Africa	III.	Augusta (*Lambaesis*).
Spain	VII.	Gemina (*Legio*, Leon, in north-west Spain).

The total of legionaries may be put at about 180,000 men, the auxiliaries at about 200,000. If we exclude the "household" troops at Rome, the police fleets on the Mediterranean and the local militia in some districts, we may put the regular army of the Empire at about 400,000 men. This army, as will be plain, was framed on much the same ideas as the British army of the 19th century. It was meant not to fight against a first-class foreign power, but to keep the peace and guard the frontiers of dominions threatened by scattered barbarian raids and risings. Field army there was none, nor any need. If special danger threatened or some special area was to be conquered—such as southern Britain (A.D. 43)—detachments (*vexillationes*) were sent by legions and sometimes also by auxiliaries in adjacent provinces, and a field force was formed sufficient for the moment and the work.

Change from the Third Period to the Fourth.—Two principal causes brought gradual change to the Augustan army. In the first place, the *pax Romana* brought such prosperity to many districts that they ceased to provide sufficient recruits. The Romans, like the British in India, had more and more to look to uncivilized regions and even beyond their borders. Hence comes, in the 2nd century and after, a new class of *numeri* or *cunei* or *vexillationes* who used (like the earlier auxiliaries) their national arms and tactics and imported into the army a more and more non-Roman element. This tendency became very marked in the 3rd century and bore serious fruit at its close. And, secondly, the old days of mere frontier defence were over. The barbarians began to beat on the walls of the Empire as early as A.D. 160: about A.D. 250 they here and there got through, and they came henceforward in ever-growing numbers. Moreover, they came on horseback, bringing new tactics for the Roman infantry to face, and they came in masses. We may doubt if any military system could have permanently stayed this series of human tides. But the Empire did what it could. It enlisted barbarians to fight barbarians, and added freely to the non-Roman elements of the army. It increased the relative strength of its cavalry and began to organize a distinct field force.

Fourth Period.—The results are seen in the reforms of Diocletian and Constantine the Great (A.D. 284–*circa* 320). New frontier guards, styled *limitanei* or *riparienses*, were established, and the old army was reorganized in field forces which accompanied or might accompany the emperors in war (*comitatenses*, *palatini*). The importance of the legions dwindled; the chief soldiers were the mercenaries, mostly Germans, enlisted from among the barbarians. New titles now appear, and it becomes plain that in many points the new order is not the old. The details of the system are as complicated as all the administrative machinery of that age. Here it is enough to point out that the significance of such officers and titles as the *dux* and the *comes* (duke, count) lies ahead in the history of the middle ages, and not in the past, the history of the Roman army itself.

War Office, General Staff.—Under the Republic we do not find, and indeed should not expect to find, any central body which was especially entrusted with the development of the army system or military finance or military policy in wars. Even under the Empire, however, there was no such organization. The emperor, as commander-in-chief, and his more or less unofficial advisers doubtless decided questions of policy. But the army was so much a group of provincial armies that much was left to the chief officers in each province. Here, as elsewhere in the Empire, we trace a love if not for Home Rule, as least for Devolution. There was, however, a central finance office in Rome for the special purpose of meeting the bounties (or equivalent) due to discharged soldiers. This was established by Augustus in A.D. 6 with the title *aerarium*

militare, and had, for receipts, the yield of two taxes, a 5% legacy duty and a 1% on sales (or perhaps only on auction-sales). The legacy duty did not touch legacies to near relations or legacies of small amount.

ROMAN ART. Modern archaeology has fully vindicated the significance of the Roman output in the field of art; yet the Romans do not, at the outset, present themselves as belonging to that small group of peoples endowed, as it were, with a spontaneous capacity for art, and the impulse to artistic creation latent in their character hardly began to develop before the 4th century B.C. Up to that time such works of art as were produced in, or imported into, Rome were apparently in the main Etruscan or Graeco-Etruscan; and in Rome, as in Latium, Etruscan artists were commissioned to decorate the temples of wood and terra-cotta which preceded the more sumptuous marble structures of the late republic and the empire. The discovery at Veii in 1917 of a magnificent Apollo in terra-cotta (*see* ETRURIA) of early 5th century style, satisfactorily confirms the tradition that Volca, an artist from Veii, made the cultus statue of the god for the temple of Jupiter Capitolinus and executed statuary for other Roman temples as well, while from considerations of style and technique the celebrated Capitoline Wolf is now assigned to the same cycle of Veientine art. Etruscan art, though originally dependent for many of its motives and for its technique on Greek models, developed an art of portraiture in which we can from the first trace that naturalism and close attention to detail which afterwards blossomed into the realism characteristic of Rome. The same desire for making permanent the memory of their dead, which led the Etruscans to decorate their funeral urns with a lid in the form of the human head, prompted the Romans to produce waxen masks, or *imagines*, which were preserved in the houses of the Roman aristocracy and were carried in funeral processions of members of the family. The Barberini statue illustrates the custom.

In architecture, too, Roman builders learnt much from their Etruscan neighbours, from whom they borrowed the characteristic form of their temples, and perhaps also the prominent use of the arch and vault. But the stream of Etruscan influence was met by a counter-current from the south, where the Greek colonies in Campania provided a natural channel by which Hellenic ideas reached the Latin race, and, at an early date, Roman architects modified the purely Etruscan type of temple under the influence of western Greek models. Greek modellers in terra-cotta came to Rome (first in 496 B.C., to decorate the temple of Ceres Liber and Libera) and worked by the side of the Etruscans. The conquests of the later republic, however, brought the Romans into more direct contact with the art of Greece proper; victorious generals adorned their triumphs with masterpieces of Greek art, and, when Philhellenism became the ruling fashion at Rome, wealthy connoisseurs formed private collections drawn from the Greek provinces, while Greek craftsmen were employed in the decoration of the palaces of the Roman nobles and capitalists. Every empire-builder—Sulla, Pompey, Caesar—dreamed in turn of modelling Rome on the plan of an Hellenistic city. Even portraiture borrowed an Hellenic character in the time of Caesar and Cicero. Yet this period also saw the beginning of the historical, or, more properly, the commemorative method to whose development the empire gave so powerful an impulse. An early example is afforded by the reliefs representing a Roman sacrifice and other episodes from the life of the army, which adorn the front face of an altar believed to have been set up by Cn. Domitius Ahenobarbus shortly before 30 B.C. (Plate II., fig. 11).

Augustus enlisted art, as he did literature, in the service of the new order. The technical dexterity which characterizes all forms of art in this period—silver plate and stucco decoration, as well as sculpture in the round or in relief—is largely due to Greek influence; but the form is filled with a new content, the result of a determination on the part of Augustus to shift the centre of artistic activity from Greece to Rome by associating it with new religious and political ideals. But the Roman spirit, after producing in harmony with that of Greece such brilliant results, triumphed once more under Trajan in that novel "epic in stone" with which the column that bears his name is adorned. Along the path thus marked out, Roman art continued to progress, scarcely disturbed by a brief renaissance of classicism under Hadrian. The historical reliefs which survive from the Antonine period, and more especially the sarcophagi, show that the new leaven was at work, though it soon mingled with new influences which brought about radical changes in the whole domain of plastic art. Colour, rather than form, began to take the highest place in the gamut of artistic values. Painting, as recent discoveries show, continued to be practised with conspicuous success; the sister art of mosaic was carried to a high degree of technical perfection; and in sculpture new conventions, such as the plastic rendering of the iris and pupil of the eye, were dictated by the ever-growing need for contrasts of light and shadow. By the close of the 3rd century a further transformation had taken place, which coincided with the political revolution whereby the absolute monarchy of Diocletian succeeded the principate of Augustus. The portraits of Constantine and his house have dropped all traces of naturalism; they are monumental, both in scale and in conception, and their rigid "frontality" carries us back to the primitive art of the East.

Architecture.—For this branch of the subject *see* ARCHITECTURE; CAPITAL; COLUMN; ORDER; TRIUMPHAL ARCH; here it suffices to note traits which persisted in later Western art. The Etruscans, by modifying the type of the Greek temple, profoundly influenced Roman construction; the Etrusco-Roman temple was not, like the Greek, approached on all sides by a low flight of steps, but raised on a high platform (*podium*) with a staircase in the front; in many instances the cella was square in order to house the divine Etruscan triads (Jupiter, Juno, Minerva; Ceres, Liber, Libera, etc.); and this cella was faced by a deep portico, which often occupied half the platform and thus restored to the outer structure the canonical length of the classic temple. This high *podium* is a first step in the development of building in a vertical direction, whereby, as H. B. Walters remarks, the Romans "paved the way for mediaeval and more particularly Gothic architecture."

The round temple, which originated in the primitive Latin hut, was adopted for the house of the king and for the ancient cults of Vesta and of Hercules. The theme was repeated, with many variations, from the circular temple by the Tiber to those fantastic structures at Baalbek and at Petra which anticipate the innovations of Borromini and the Baroque. For the irregular temple-precincts of the Greeks, the Roman substituted the colonnaded courts, in which—as in the Imperial Fora—the temple was often set against the rear wall (Fora of Augustus, Nerva, Trajan, etc.). This type of enclosure was imitated throughout the Graeco-Roman world—Baalbek (*q.v.*) is a well known instance; from it are derived the forecourts of Christian churches and basilicas, and its inspiration is visible in Bernini's colonnade at St. Peter's.

Another specific achievement of the Roman architect was the application of the arch, the vault and the dome. The rectilinear buildings of the Greeks, with their direct vertical supports, gave place to vaulted structures in which lateral thrust was called into play, a constructional device which was a paramount influence in the Roman architecture of the 17th century. The aesthetic effect of curves was well understood by the Romans; and they were the inventors of those decorative combinations of the Greek orders with the arcade, of which the more famous—the Triumphal Arch and the Arcade order (*see* ORDER) had a far-reaching influence. It is impossible, as Rushforth points out, to overlook the analogy between the Arch of Constantine (to take a typical example) and the decorative portals of mediaeval cathedrals, while, at a later

date, the triumphal arch influenced Baroque façades (fountains of Moses and of Trevi) besides being directly imitated in more modern times. Likewise, the superposed arcades adorned with columns or pilasters of a different order on each tier, formed a system of façade decoration which became almost as popular in the Renaissance as it had been in antiquity.

Republican Sculpture.—The art of the republican period may best be studied in its portraiture, where the simple naturalism of the Etruscans gradually makes way for the careful if uncompromising realism of the Romans. Of republican portraiture we have many fine examples, such as the magnificent head—probably of Brutus—which competent authorities now date back to the 4th century, an early date which would account for its partially Etruscan character (Plate I., fig. 1). Somewhat later are the statue of an orator (*Arringatore*) in Florence, in which the Etruscan manner is beginning to yield to the Roman, and the lovely head of a young man wearing the athlete's cap, in the British Museum (Plate I., fig. 9). The bronze bust of the actor, Norbanus Sorix, in Naples, is an example of the first quality attributable to the age of the dictator Sulla. Numerous examples in stone or marble are provided by the funeral *stelae*, within which busts, clearly imitated from the wax *imagines*, are stiffly aligned (Plate II., fig. 3); while the more purely Hellenic manner fashionable in the 1st century B.C. may be studied in the well known heads of Pompey and of Cicero. Apart from portraiture, examples of republican sculpture, both in the round and in relief, are now slowly emerging from oblivion; we may quote the sepulchral urn, lately acquired by the British Museum, showing a company of knights, preceded by musicians, riding towards a small temple, in front of which a boy leads a sheep to sacrifice (Plate II., fig. 2). Though the relief retains something of the Etruscan style, subject and spirit are distinctly Roman. The fragment at Ny Carlsberg (Plate I., fig. 10), with a group of women looking on at a mule-race, is still more highly Romanized—a crowd being suggested by three or four figures, as in Julio-Claudian art. The well-known slab, in the Museo Mussolini, of Mettius Curtius leaping into the chasm, is presumably copied from an original of republican date, and akin to it is the fine fragment in Munich, recently claimed as republican by C. Weickert, which represents a group of trumpeters and gladiators, one of whom is shown, fallen and crouching, in three-quarters view from the back (Plate I., fig. 11). Again, a circular altar in the Villa Borghese, representing a Roman sacrifice in presence of Hercules and of Venus Genetrix—ancestress of the Julian house—is, according to the same authority, of republican date and commemorates the *ludi Caesaris* of the year 46 B.C. Another notable example of a Roman altar is the altar of Domitius Ahenobarbus, already referred to (Plate II., fig. 11), in which the historical scene of one face is naïvely juxtaposed with the "marriage-procession of Poseidon and Amphitrite" represented on the sides; we thus have here the actual event with all its accessories, told in Roman style, while the naval victories and triumphs of the donor are given in the allegorical Greek manner. The same blend of realism and allegory recurs under Augustus in the *Ara Pacis Augustae*, executed between 13 and 9 B.C. in commemoration of the emperor's pacification of the West. This altar stood in a walled enclosure with two entrances, measuring 11½ by 10½ metres. The walls, with their plinth, were about 6 metres in height, and were decorated internally with a frieze of garlands and bucrania, treated with the utmost truth to nature, and externally with two bands of relief, the lower consisting of scrolls of acanthus varied with other floral motives, the upper showing processions passing across the field from east to west; on the south wall Augustus himself with the great officers of State, the flamens and the imperial family; on the north the senators and a crowd of citizens with their children. On the western face, towards which the processions are directed, the "Sacrifice of Aeneas on his arrival in Latium" (Plate II., fig. 9) symbolizes the link between Rome and the ancient Troy. To the east front (apparently) belongs the beautiful group of the earth goddess (Tellus) and the spirits of air and water, allegorical of prosperity and of the fertility of nature under the new rule. The babes that cling to the Earth Mother and the children that accompany their elders in the processional friezes introduce a human note which enhances the imperial beneficence. The glorification of empire is the keynote of all Augustan decoration.

Imperial Sculpture.—In the portraiture of Augustus and his successors the Hellenistic manner of the late republic is modified by a return to Etruscan naturalism. This portraiture is well represented by the Prima Porta statue of Augustus, in which he is shown in the attitude of a general addressing his army. Here again we find that the ideal mingles with the real; the emperor is not only bareheaded but barefoot, and the decoration on his corselet symbolizes what his rule has done for Rome and the world, while the tiny Cupid at his side, riding a dolphin, indicates the descent of the Julian house from Venus. The colossal bronze head in the British Museum (Plate I., fig. 3), found in 1911 at Meroe, in the Sudan, belongs doubtless to another notable presentment of the emperor in armour, though we have no clue as to the style of the statue. The Augustus of Via Labicana, on the other hand, discovered in 1909, represents the emperor as pontifex maximus heavily draped, with head veiled, and in the act of sacrificing. The head (Plate I., fig. 2) has a poetic quality which we also find in certain portraits of women, as in the admirable head at Ny Carlsberg (Plate I., fig. 4), but which was unknown to earlier art. The portraiture of private individuals also had interesting developments, and not less so that of women; the charming statue from Ostia of a young girl represented as Artemis, is a good example (Plate II., fig. 4).

The art of the Julio-Claudian period, like that of the republic, is slowly emerging into the light. Among notable Julio-Claudian fragments are the relief from Nola, at Budapest, showing a trumpeter giving the signal for a naval attack (Actium?); certain processional and sacrificial scenes in the Villa Medici, of similar character to those of the Ara Pacis, but later in style, and two reliefs discovered in the Corso only three years ago and removed to the new Museo Mussolini, which are attributed to the arch erected to commemorate the conquest of Britain by Claudius in A.D. 44. The more organic relation now attempted between the scenes represented and the background, leads gradually to that pictorial Flavian style best exemplified in the reliefs of the Arch of Titus, which represent the triumph of Titus and the spoils of Jerusalem (Plate III., fig. 2). These are eminently pictorial compositions in respect of depth of focus, and, so far as relief is concerned, the problem of representing form bathed in air and light is here solved. The same effects may be noted in Flavian ornament, as for example in the pilaster from the monument of the Haterii upon which is carved a tall vase, twined with roses that seem swayed by a light breeze. The delicate transitions and the subtle play of light bestow upon the best Flavian portraits the same "illusionistic" quality. New and notable effects were attained by the formal wire-mounted *toupets* of the ladies; these were used to set off the face, which appears as within a niche—a characteristically Roman effect (Plate I., fig. 6).

But even in the Flavian period we find by the side of the pictorial a more architectonic style, as in the friezes of the Flavian Forum Transitorium, which forms, as it were, the link between Flavian and Trajanic art. To the principate of Trajan belong, it is thought, four slabs of a long battle-scene, later walled into the Arch of Constantine (central passage and shorter sides of attics). The composition is fine, the heads of the barbarians full of character, but the atmospheric effects sought by the Flavians are abandoned in these crowded scenes (Plate II., fig. 8). The various episodes were linked together to suggest a continuous whole, a method of composition of which the reliefs of the spiral column put up in Trajan's Forum offer another example. These reliefs, which enfold the column like a strip of embroidery, tell the story of both of Trajan's wars with the Dacians, a formal division between the two narratives being made by a figure of Victory setting up a trophy. Uniform excellence cannot be claimed for the reliefs, yet, considering that the column contains 2,500 figures (arranged, it is said, on 400 slabs), the high level maintained is amazing (Plate III., fig. 4). The sacrificial pageants; Trajan's reception of troops; the opening of the bridge over the Danube; the dramatic scene of "the last water ration within the

ANCIENT ROMAN PORTRAIT SCULPTURE

1. Bronze head of Brutus. An example of the sculpture of the republican period, dating probably from the 4th century, B.C. In the museum of the Palazzo dei Conservatori, Rome
2. Head of the statue of Augustus found in the Via Labicana, Rome, representing the Emperor Augustus as *pontifex maximus*. In the Museo delle Terme, Rome
3. Colossal bronze head of the Emperor Augustus found in 1911 at Meroe in the Sudan. In the British Museum
4. Sculpture of a lady of the Julio-Claudian period. At Ny Carlsberg, Copenhagen
5. Bronze figure of Hadrian found in the Thames. In the British Museum
6. Lady with a high coiffure, characteristic of portraits of women in the Flavian period (latter half of 1st century A.D.). In the Capitoline Museum, Rome
7. Head of Septimius Severus. In the Stettiner Collection, Rome
8. Head of a statue in armour at Barletta. It has been called a portrait of Theodosius, and also of Heraclius, but is more probably that of Valentinian I. (latter half, 4th century)
9. Head of a young man wearing the athlete's cap. Republican period. In the British Museum
10. Fragment of a Roman-Etruscan relief, representing a group of women looking on at a horse-race. At Ny Carlsberg, Copenhagen
11. Relief representing a group of trumpeters and gladiators. Attributed to the Republican period. In the Glyptothek, Munich
12. Head of Constantine the Great. In the museum of the Palazzo dei Conservatori, Rome

ANCIENT ROMAN RELIEFS AND OTHER SCULPTURES

1. Tombstone of late republican date. In the British Museum. 2. Relief from a sepulchral urn, showing a company of knights preceded by musicians, riding toward a small temple. Republican period. In the British Museum. 3. Funeral stele of the republican period. In the British Museum. 4. Statue from Ostia of a young girl represented as Artemis. Imperial period. In the Museo delle Terme, Rome. 5. Mourning woman, a tomb statue of the Antonine period. In the Museo delle Terme, Rome. 6. Roman carrying his ancestral busts. In the Palazzo Barberini, Rome. 7. Antinous as Silvanus. Period of Hadrian (A.D. 117–38). In the Villa Albani, Rome. 8. Relief representing a battle scene, from the Arch of Constantine, Rome; thought to have belonged to the principate of Trajan and later walled into the arch. 9. Relief from the *Ara Pacis Augustae* (altar of peace) erected by the senate 13–9 B.C. in commemoration of the pacification of the West by Augustus. In the Museo delle Terme, Rome. 10. Relief, probably of the period of Trajan, from one of the balustrades. In the Roman Forum. 11. Relief from an altar believed to have been set up by the Consul Domitius Ahenobarbus (about 30 B.C.). In the Louvre

walls of the enemy's capital, Sarmizegetusa," are spirited compositions by a great imaginative artist. The principal character is always the Roman army, and the artist's first intention is to extol its warlike prowess, its courage, its endurance. But the figure of the emperor stands out from the whole and controls the action throughout, thus making manifest in the chief, as in his army, the right of the Roman people.

In the Trajan Column pictorial relief received its death blow; on a carved spiral that mounts in 21 windings up a column of 100 ft. high, precision of outline was imperative and perspectival or atmospheric effects out of the question. We may, however, suppose that the whole was coloured in local tints (brown for the earth, green for the trees, etc.) and that details of armour and horse trappings were added in metal. The column was dedicated in A.D. 113. On the top was a statue of the emperor in gilt bronze, and within the high pedestal, were deposited the golden urns containing Trajan's ashes and those of his consort, Plotina.

In striking contrast to the continuous spiral of the column are the fine reliefs of the arch put up at Benevento (*see* TRIUMPHAL ARCH), in honour of Trajan. The inscription bears the date A.D. 114, but the prominence given in the attica to Hadrian, as well as Hellenizing traits in certain of the sculptures, have led to the supposition that the arch was not finished till after Hadrian's accession. The arrangement of the panels, which summarize Trajan's achievements at home and abroad, is carefully calculated; on the side facing the city the subjects refer to Trajan's policy in Rome; on the side facing the country, to his settlement of the empire. In significance, this arch is the most important monument of Roman commemorative art; each scene, though rounded off and complete in itself, contributing to one dominating idea—the apotheosis of empire. This is consistently worked out from the picturesque relief of the passage way where the beneficent emperor is seen in the midst of grateful citizens, many of whom carry their children shoulder-high, to the grandiose panel of the attica facing towards Rome, where Jupiter offers the thunder-bolt to Trajan as supreme symbol of power, acclaiming him by this act as the *princeps optimus* of the inscription.

With the accession of Hadrian—the "Greekling," as he was called by writers hostile to his policy—a short-lived renaissance of classicism set in, restricted, however, to certain eclectic modifications of Greek statuary which do not fall within our province, and to a change in the relation of background to figures in relief-sculpture. The return to a background, either neutral or with the character of a drop-scene that has no organic connection with the figures, was doubtless responsible for the fact that the historical monuments of this and the following reign often lack the pregnancy of meaning, and vigour of execution, which distinguish those of the Flavio-Trajanic period; mention may be made of three reliefs in the Palazzo dei Conservatori, one of which represents the apotheosis of an empress.

On the other hand, the famous hunting medallions, which were later transferred to the Arch of Constantine are vigorous and interesting compositions, full of the rich and varied incident characteristic of Rome. In portraiture the most important work of this period was the idealized type of Antinous, here represented by the most exquisite of his effigies, which shows him as Silvanus (Plate II., fig. 7) and thus invests the favourite of Hadrian with a divinity expressed in the terms of Roman art, as well as a pathos which belongs to his own time. The inscription on the altar gives us the name of Antonianus of Aphrodisias in Caria, one of a family of sculptors domiciled in Rome since the time of Trajan.

The Antonine Period.—This produced in the Marcus Aurelius of the Capitol a type of equestrian statue which has served as model for all subsequent figures of the kind. The poise must have been more perfect in antiquity before the loss of the barbarian that crouched under the horse's right fore-hoof. Here we may note the different manner in which the Trajanic age and that of Hadrian, and his successor, Antoninus Pius, conceived the figures symbolic of the subject-peoples of the empire. Under Trajan, Roman sculptors had produced the finely realistic statues of Dacian captives which now adorn the Arch of Constantine, while to the period of Antoninus Pius belong the idealized figures, classical in pose and motive, which adorn the Hadrianeum or temple of the deified Hadrian, and of which several are in the Palazzo dei Conservatori.

Under Marcus Aurelius and Commodus, Roman art underwent further transformation. The earliest monument of the time is the base (in the Vatican) of the column (now destroyed) erected in honour of Antoninus Pius and Faustina. The contrast is remarkable between the classicistic representation of the apotheosis of the imperial pair, witnessed by the ideal figures of Roma and the Campus Martius (holding an obelisk), and the vigorous realism of the *decursio*, a ceremony performed by detachments of the praetorian guard on horse and foot, in which, with total disregard of perspective as tending only to obscure the action, the artist brings all the figures into the same plane and disposes them on a few projecting ledges of equal size, a device that reappears on the column of Marcus Aurelius. The reliefs of the Aurelian column hardly suffer by comparison with the column of Trajan. We cannot, it is true, trace, as in the earlier instance, the march of events towards a dramatic climax, nor does the artist attempt to produce an impression of a chronological series of happenings. The figures are smaller and more crowded than those of the earlier column, and there is even less regard for perspective than in Trajanic art. Yet a deeper psychology informs the whole; the note of *humanitas* rings clear in the groups of barbarians with their women and children; or in those scenes which centre in the person of the good and philosophic emperor; the monotony of incident is relieved by the sculptor's power of repeating the same idea in a surprising variety of ways. Many episodes are vividly treated, *e.g.*, the famous scene of the fall of rain, ascribed in Christian tradition to the prayers of the "Thundering" Legion, the strong realism of which is in contrast to the idealism of the Hellenistic Jupiter Pluvius in a scene of the Trajan Column.

Contemporary portraiture also shows the invasion of new principles and a tendency to emphasize the contrast between hair and flesh, the face often showing signs of high polish. In the latter half of the 2nd century the contrast is heightened by a new method of treating the hair, which is rendered as a mass of curls deeply undercut and honey-combed with drill-holes; a fine example is the Commodus of the Palazzo dei Conservatori. The aim of the sculptor is to obtain an ornamental effect by the violent contrast of light and dark. This pictorial influence may be seen at work in all branches of sculpture. The sarcophagi of the Antonine and later periods, with their crowded compositions and deep shadows, attain the same effect. A tendency to isolate figures and groups also makes its appearance in Antonine relief, and is strikingly exemplified in the famous *sarcofagi a colonette*, found both in Italy and in Asia Minor, and decorated with figures placed like statues within niches between columns. We may quote as conspicuous examples the sarcophagus of "Homer and the Muses" at Constantinople (from Sidamaria); the fragment of a similar example in the British Museum (Cat. 3,312); the marriage sarcophagus at Florence in the Riccardi Palace, and the grand sarcophagus at Melfi in Apulia. The Melfi example is adorned by figures symbolic of the soul's ultra-mundane destiny and has a full-length portrait of the deceased girl on the lid (Plate III., fig. 5). Many of the statues inserted into the niches of these sarcophagi are considerable works of art and exhibit the same quality of pathos that informs the remarkable tomb-statue, also of the Antonine period, recently discovered near Rome (Plate II., fig. 5). It represents a mourning woman, closely draped and veiled, with strongly individualized features; the splendid movement of the drapery, with the broken rhythm between the hands, preannounces Gothic sculpture and has little or nothing in common with its Greek prototypes.

Later Sculpture.—Under Septimius Severus and his successors, Roman art drifts steadily in its new direction. The reliefs of his arch at the entrance to the Forum represent the emperor's campaigns in the East in a compromise between bird's-eye perspective and the "continuous" style, which, though in sharp opposition to plastic and perspectival laws, has the magnificently decorative effect of Flemish tapestry. Other examples of the art of the period are the reliefs of the little gateway of the

Argentarii in the Velabrum (Plate III., fig. 8) and the relief now in the Palazzo Sacchetti, on which is carved the presentation of Caracalla to the senate as the destined successor of his father.

The political troubles of the 3rd century, the threatened inroads of barbarism, the imminence of economic ruin did not affect the production of art as seriously as might be supposed, nor did they check the continued "progress along the ascending line" of certain of its manifestations. In the portraiture we first become aware of two different currents: the naturalistic in most imperial effigies, *e.g.*, the bronze statue of Severus in Brussels, and the more monumental which invests with a new spiritual dignity the masterly portrait in the Stettiner collection (Plate I., fig. 7). It is conceived in accordance with the laws of frontality, which are still more operative in the grandiose head of an imperial personage (unidentified) from the middle of the 3rd century, found at Ostia (Terme). If we turn to technical methods, we note that the busts of the second quarter of the 3rd century A.D. are distinguished by the treatment of the hair and beard, which seem to have been closely clipped, and are indicated by a multitude of fine chisel strokes on a roughened surface, a technique practised with wonderful effect in the heads of Maximinus the Thracian (A.D. 235–238) in Berlin; of the emperors Pupienus (A.D. 238) and Philip the Arabian (A.D. 244–249) both in the Vatican; in the remarkable bronze, Balbinus (A.D. 238) of the Vatican library; and in a head of the Capitol (Strong, *Rom. Sc.*, Pl. 127). In these heads the expressiveness is astonishing, the Capitoline head being justly noted for its sly look of craft and cunning. Under Gallienus (A.D. 253–268) there is a momentary return to a greater naturalism, evident in the treatment of hair and beard, and in the emotional look; but in the so-called Probus (A.D. 276–282) of the Capitol, and the Carinus (A.D. 283–285) of the Palazzo dei Conservatori, frontality gets the better of naturalism till it prevails in the portraiture of Constantine (Plate I., fig. 12) and his successors. Organic has been transformed into architectonic structure; the bust (or statue) is no longer a true portrait—a block of marble made to pulsate with the life of the subject represented—but a monument.

In the togate statues of the Constantinian and later period, the deep cutting of the rigid folds contributes to the monumental effect of the figure. Among the finer examples are the two celebrated statues of consuls, in the Conservatori, attributable to the 5th century. By the side of these togate examples a place must be accorded to the statue in armour at Barletta (it has also been called Theodosius and Heraclius, but is more probably Valentinian I.), whose powerful head (Plate I., fig. 8) and splendidly poised body show post-Constantinian art at its best. The narrow bands of relief on the Arch of Constantine, some of which may even date back to the reign of Diocletian, partake of the same monumental character as the single statues of the time. Where the subject permits, as in the reliefs showing Constantine in the Forum and Constantine distributing a dole, the frontality of the central figure and the strict symmetry of the grouping, which imparts an almost geometrical regularity to the main lines of the composition, show that Constantinian reliefs, like the portraits, are calculated for architectonic rather than for plastic effect.

Roman Painting.—The arts whose proper medium is colour enjoyed a popularity with the ancients—Romans and Greeks alike—at least as great as that of sculpture, though, owing to the perishable nature of the material, the record is even more fragmentary. Etruscan painting in Italy reflected, throughout its early history, the phases through which the art passed in Greece. Thus the frescoes which adorn the walls of Etruscan chamber-tombs show an unmistakable analogy with Attic vase-paintings in their neutral background, in the use of conventional flesh-tones, and in the predominant interest shown in line as opposed to colour. This probably was the style of those early wall-paintings at Ardea and Lanuvium, which existed "before the foundation of Rome" (Pliny, *N.H.*, xxxv. 18). It is probably also to an early date that we should refer those wall-paintings "in famous temples," of which Quintilian copied the archaic inscriptions, but the first definite mention of painting in Rome is from the close of the 4th century B.C., when we hear of one Fabius Pictor, who earned his cognomen by decorating the temple of Salus on the Quirinal (302 B.C.). The chief works of specifically Roman painting in republican times (other than the frescoes which adorned the walls of temples) were those exhibited by successful generals on the occasion of a triumph; some idea of these paintings is afforded by the fragment of a fresco in the Museo dei Conservatori, discovered in a sepulchral vault on the Esquiline in 1889, which appears to date from the 3rd century B.C. It represents scenes from a war between the Romans and an enemy who may almost certainly (from their equipment) be identified as Samnites.

We pass from the meagre remains of early Roman painting to the decorative frescoes of Rome, Herculaneum and Pompeii, which introduce us to an art influenced like the contemporary sculpture by Hellenistic models. The scheme of colour is no longer conventional but naturalistic; the picture is concentrated in space, *i.e.*, figures are no longer isolated on a neutral background; difficult effects of linear and aerial perspective are attempted and the modelling of figures is often excellent. It must be premised that this style of wall-decoration was a new thing in the Augustan period. In the Hellenistic age the walls of palaces were veneered with slabs of many-coloured marble (*crustae*); and in humbler dwellings these were imitated in fresco. This "incrustation" style is found in a few houses at Pompeii, such as the Casa di Sallustio, built in the 2nd century B.C.; but before the fall of the republic it had given place to what is known as the "architectural" style, in which columns and other architectural features are introduced in order to give the illusion of outer space, and this illusion is heightened by the landscape backgrounds, which are often enlivened by figures. An example of such decoration is afforded by the "Odyssey landscapes," discovered on the Esquiline in 1849, amongst the remains of a large private house, attributable at the latest to the period of Claudius. The walls of one room were decorated in their upper portion by pilasters treated in perspective, through which the spectator appears to look out on a continuous background of land and sea, diversified by scenes from the voyage of Odysseus. The artist, it appears, has been mainly interested in the landscape which is sketched with great freedom, but he shows no scientific knowledge of perspective, and commits the natural error of placing the horizon too high. It is clearly to such works as these that Vitruvius refers (vii. 5) when describing paintings which "unfold mythical tales in due order, as well as the battles of Troy or the wanderings of Odysseus through landscapes (*topia*)." We should doubtless reckon within the same class those "small scenes from the Homeric cycle within a framework in which blue and gold are predominant" in a room of the beautiful house on the Palatine, identified by Ashby as the *domus transitoria* of Nero, and the numerous examples from the Homeric cycle at Pompeii (*cf.* especially the series in the "House of the Cryptoporticus" in Insula 6, near the newly-explored Via dell' Abbondanza).

The use of landscape in decoration is stated by Pliny (*N.H.*, xxxv., 116) to have become fashionable in Rome in the time of Augustus. He attributes this to a painter named Studius, who decorated walls with "villas, harbours, landscape gardens, groves, woods, hills, fishponds, canals, rivers, shores," and so forth, diversified with figures of "persons on foot or in boats, approaching the villas by land on donkeys or in carriages, as well as fishers and fowlers, hunters and even vintagers," a description which exactly fits the continuous landscape of the yellow frieze in one room of the house of Augustus (the so-called "house of Livia") on the Palatine. Vitruvius, too, in the passage above quoted, speaks of "harbours, capes, shores, springs, straits, temples, groves, mountains, cattle and herdsmen. . . ." Existing paintings—those, for instance, of a columbarium in Villa Doria-Pamfili, recently transferred to the Terme—fully confirm the statements of ancient writers. In the villa of Livia at Prima Porta the walls of a room are painted in imitation of a park; from the villa of Fannius Synistor at Boscoreale we have a variety of landscapes and perspectives; and in the house discovered at Rome in the grounds of the Villa Farnesina by the Tiber—the paintings of which are in the Museo delle Terme—we find a room decorated

with black panels, upon which landscapes are sketched in with brush-strokes of white.

Figure Painting.—In the architectural style figure-painting on a large scale makes a first appearance. Occasionally it forms an integral part of the design. In the larger "Triclinium" at Boscoreale, for instance, groups and single figures—possibly family portraits—are painted in the wall-spaces between pilasters and columns, while in one room of the "Villa of the Mysteries" at Pompeii, a continuous figure-composition is painted against a panelled background. This wall-painting, which represents a Dionysiac initiation, was discovered in 1911, and may be said to surpass in beauty of colouring and composition anything previously known (Plate III., fig. 7). But figures so arranged as to appear to be moving within the room tend to confine the space. This is contrary to the principles of Roman and Pompeian wall-painting, and a commoner method, therefore, is to concentrate the figure-subject, which is usually of a mythological character, into a central panel clearly marked off from the rest of the wall and intended to be seen as through an opening in the wall. In the architectural style these subjects are usually framed in a species of pavilion or *aedicula*, sometimes painted in perspective, which allows a vista of the landscape beyond (Plate III., fig. 6, from the house of the Farnesina in Rome), but this motive gradually loses its importance in the third style and becomes a purely conventional scheme of decoration, though in the fourth or intricate style, which again reverts to true architectural forms, however fantastic and bewildering in their complexity, the figure subjects are plainly conceived as pictures and framed with a simple band of colour. In the later styles figure-subjects without landscape are extremely common, but it has been shown that, *e.g.*, in the triclinium of the Casa dei Vettii, which is decorated with a cycle of mythological paintings, the lighting is carefully calculated with regard to local conditions, so that the conception of an outlook into external space is not given up. Among Pompeian paintings effects of lighting are at times attempted with great success; for instance the groups of a striking composition —a ceremony of benediction—are executed in bold dashes of colour, especially white, according to the principles of modern impressionism. The subjects of these Pompeian frescoes are for the most part taken from Greek mythology, but this only proves that that source of inspiration was as freely drawn upon in the art as in the literature of imperial Rome. Owing to the total loss of Greek originals, the question how far these were imitated in Pompeii (or Rome) is difficult to determine. The well known Medea, possibly influenced by the painting of Timomachus, may equally well be the contemporary version of an older theme. It would probably be correct to say of such a figure, as of the mourning woman (Plate II., fig. 3), that if the framework is still Greek the spirit is Roman. Figure-subjects are also introduced within frames, directly imitated from actual pictures, and placed on stands, or shuttered like triptychs as in the houses of Livia and of the Farnesina at Rome, and in Pompeii.

Examples of ancient painting in Rome are still scarce, partly because much that has been discovered of late years still awaits publication. But the magnificent series of paintings from the house of the Farnesina, which may be as early as Caesar, since they were found on or near the site of his gardens; the paintings of the house of Livia (architectural style); the famous scene of a ritual marriage known, from its former possessor, as the "Nozze Aldobrandini" (library of Vatican); the decorative ceiling panels from the newly-excavated parts of the Golden House; the lovely head of a shepherd piping, in the British Museum (Plate IV., fig. 6), found, it is said, in a tomb near Rome, show that the art of the capital equalled, or even surpassed that of the buried Campanian cities.

Mention must also be made of the combination of ornamental work in plaster with painting which is found at Pompeii and at Rome, and is a feature of tombs of the 2nd century A.D. In the Augustan period we find exquisitely modelled stucco, used to ornament vaulted ceilings in the "Farnesina" house. An example of Julio-Claudian date is provided by the famous hypogeum of a Pythagorean cult, discovered outside the Porta Maggiore in 1917, the ceilings and wall of which are entirely covered with reliefs in stucco; and from the principate of Domitian we have the fine stucco work in the cryptoporticus of this emperor's villa at Castel Gandolfo. Painter and modeller also worked in conjunction, with admirable effect; the results are best seen in the tombs on the Latin Way (Plate IV., fig. 2).

Painting continued to flourish under the later emperors. In a room of the Roman house, under the church of SS. John and Paul, may still be seen what is the largest and best preserved ancient painting so far found in Rome (Plate IV., fig. 10); the picture—remarkable for the freshness of colouring, and the beauty of the flesh-tints—can scarcely be later than the period of Marcus Aurelius. The subject is the meeting of the two divinities (Dionysos and Thetis?) on a sea-girt rock amid a joyous escort of tiny love gods, who guide their light craft over sunlit waters. Another room of the same house has decorative paintings of a mystical and religious character. To the period of the Severi may be referred the paintings, discovered near the Monte Mario, in the tomb of the little girl, Otacilia, which represent a "children's paradise," and those wall-paintings in the hypogeum of the Aurelii, discovered in 1919 near the new Viale Manzoni, which apparently reflect the tenets of an heretical Christian sect. Among the Viale Manzoni pictures the one of a farmhouse and its dependencies (Plate III., fig. 9) shows the persistence of the Roman landscape style; that of the Good Shepherd (Plate IV., fig. 9) and the 12 sheep (symbolic of the Sermon on the Mount) is a pastoral in Virgilian vein, while the heads of the 12 figures identified as the Apostles, recall heads on the column of Marcus Aurelius. Sound Roman traditions were still operative under Aurelian, as we see from the tomb of Trebius Justus, with its picture of the building of a city-wall, and the portraits of the occupant of the tomb and his family, treated in a style of art which persists in the Christian catacombs. The fact that painting was still vigorous in Rome under Constantine is evident from the magnificent figure of Roma found on the site of the old Lateran palace and assigned by Wilpert to a group of the imperial family attended by allegorical figures and divinities.

Portrait Painting.—From the few examples still extant we may assume that portrait-painting was of the same excellence as portrait-sculpture: the group of Terentius Neo (long mistaken for Paquius Proculus) and his wife at Naples, from Pompeii, is characteristic of the Augustan period, to which we may doubtless likewise refer the original of the fine mosaic representing the poet Virgil between two muses. Portraits of poets were a common feature of book-illustration, and the poet Martial (XIV. 186) mentions a portrait of Virgil prefixed to an edition of the *Aeneid*. The celebrated portraits in "encaustic" from the Fayum, give us a series of examples from the Flavian period to the 3rd century. These paintings were executed in wax—the usual technique of portrait painting, in which the colours were mixed with liquefied wax and fixed by heat, whether in a molten state or not is uncertain, though it seems more likely that the pigments were laid on cold and a hot instrument used afterwards. These tablets have been found exclusively in Egypt, where they were inserted into the mummy-case in place of the older plastic masks. Excellent examples of portrait-painting are provided by the medallions on gold glass, which have something of the value of our modern miniatures. One of the finest is in the Museum of Arezzo; it may be attributed to the period of Marcus Aurelius, and represents a bearded man whose delicate features are drawn with the utmost subtlety on a blue ground (flesh on gold, with details in black, drapery silver with violet streaks). Another little masterpiece, later inserted as centrepiece of a cross now at Brescia (Plate IV., fig. 4) represents two ladies and a boy, now identified as Alexander Severus, in the year of his accession (A.D. 221) when he was only 16, with his mother, Mammaea, and his grandmother, Naesa.

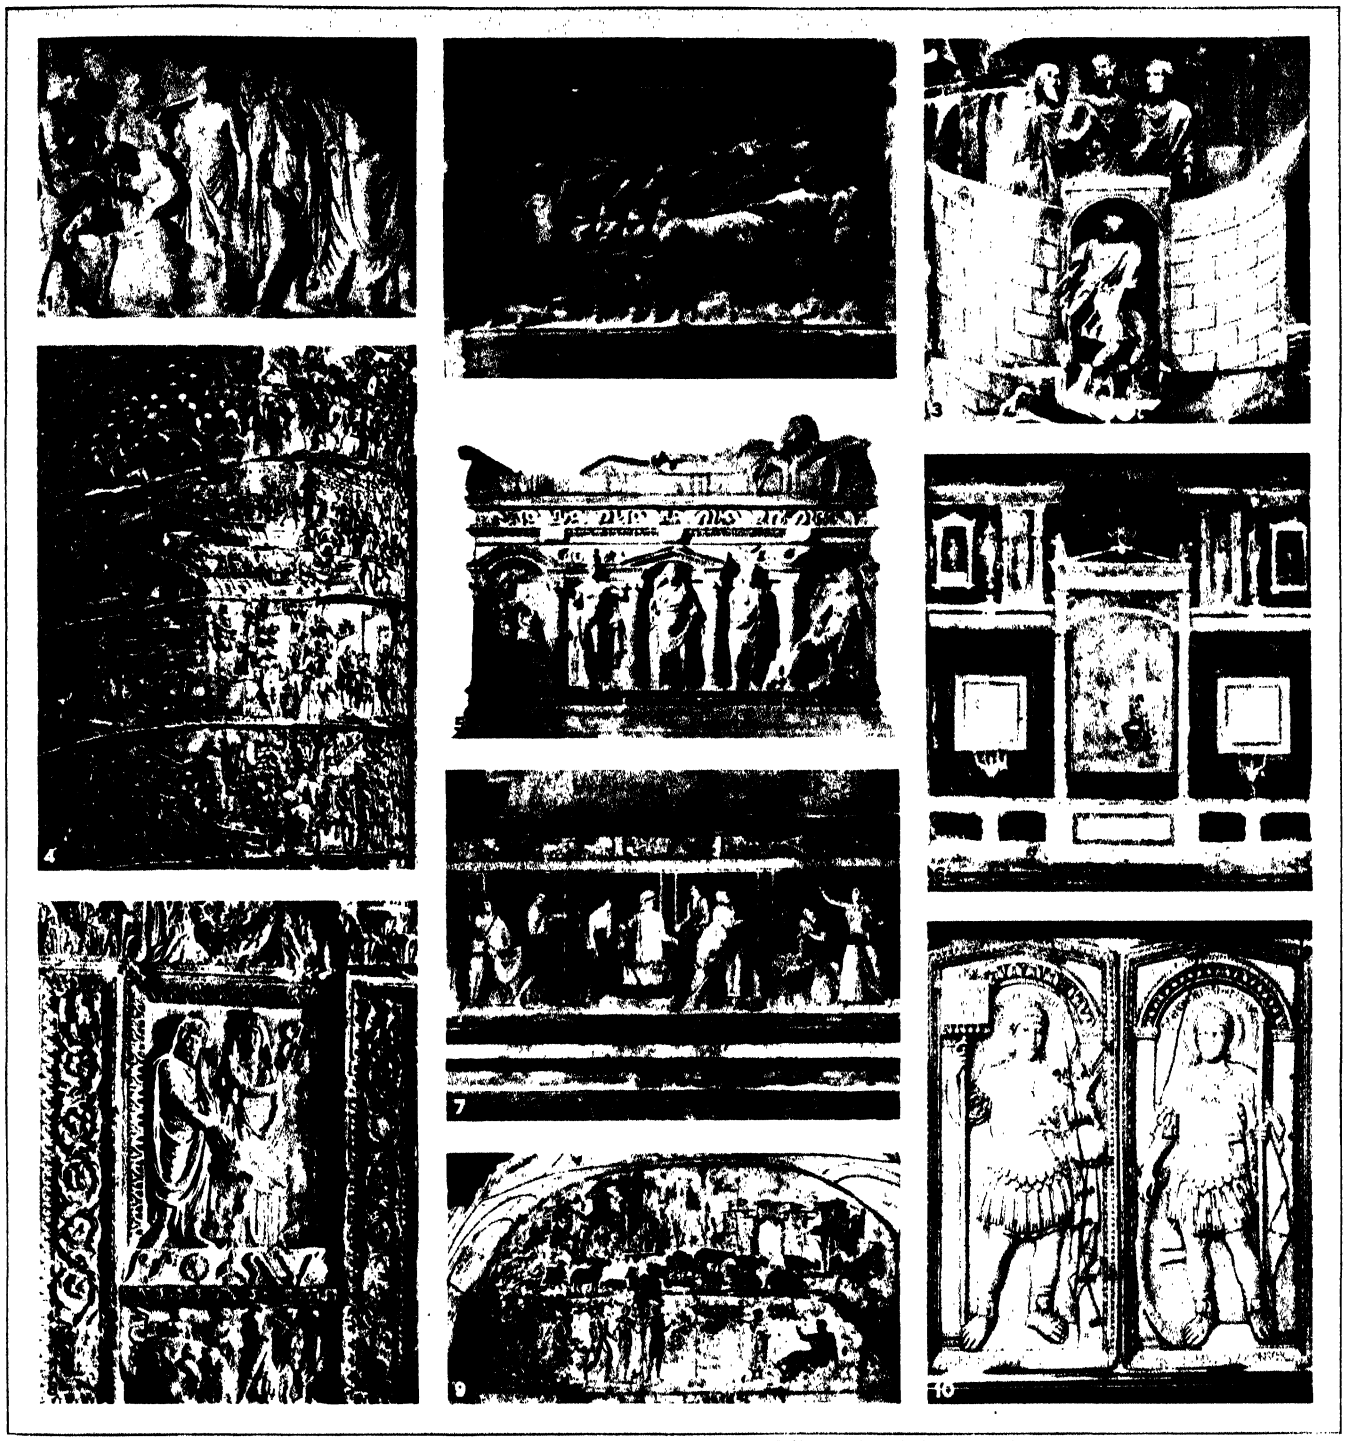
Roman Book-illustration.—*See* ILLUMINATED MANUSCRIPTS. This was a highly-developed branch of art in Rome, as appears from the description of Varro's 15 books of *Imagines*, illustrated with 700 pictures, and from the passage in Martial already referred to. The extant material, however, is mostly later than the period

we are concerned with. But the famous illustrations to a 4th century codex of the *Iliad*, in the Ambrosiana at Milan, reflect, according to Wickhoff, the Romano-Pompeian style, while the illustrations of the Vatican Virgil, No. 3,235, seem to be 4th century copies of pictures of Augustan date. On the other hand, the pictures in the 4th century Virgil (Vat. 3,867), notably the "Assembly of the Gods," are in the contemporary "frontal" style here illustrated by the Junius Bassus panel in *opus sectile* (Plate IV., fig. 11). Roman influence inspires the celebrated Dioscorides of Vienna of the year 512, the style of which is closely akin to that of the Vienna Genesis, and is still vital in the 10th century in the Joshua rotulus of the Vatican, many of whose pictures clearly depend upon Roman historic relief.

MOSAIC

The gaps in the available knowledge of Roman painting can be filled up to a certain extent by what we learn from the remains of the sister art of mosaic, which, being less easily destroyed, have survived in thousands to the present day (*see* MOSAIC). The Roman artists were, generally speaking, alive to the essential differences of principle between the arts, and did not seek to produce the impression of painting, executed with a liquid medium, by the use of solid materials. Amongst the mosaics of Roman date which employ a large number of exceedingly minute cubes, an illusion akin to that of painting seems, it is true, to be the aim, though even here the Roman mosaicist never entirely transcends the limits imposed by his material. The most conspicuous examples of this more naturalistic manner are the pavement in the Lateran museum signed by the Greek Heraclitus, which appears to reproduce the "unswept hall" of Sosos of Pergamum (*see* MOSAIC), and the mosaic of the doves from Hadrian's villa, preserved in the Capitoline museum, inspired by the "Drinking Dove" of the same artist. The former of these contains about 120, the latter as many as 160 cubes to the square inch.

A distinction must be drawn between *opus tessellatum*, consisting of cubes regularly disposed in geometrical patterns, and *opus vermiculatum* in which a picture is produced by means of cubes irregularly placed. The two methods were commonly used in conjunction by the Romans, who recognized that a pavement should emphasize the form of the room to which it belonged by means of a geometrical border, while figure-subjects should be reserved for the central space. The celebrated pavement at Palestrina (Plate IV., fig. 7), with an extensive view of the Nile and its surroundings, is possibly the earliest known Roman picture in mosaic. Though it can scarcely be dated to Sulla's restoration of the Praenestine temple, it cannot be later than the second half of the 1st century, and seems early Augustan both in its Egyptianizing subject and in its landscape motives. Small mosaic-pictures isolated in geometrical pavements were called *emblemata*, and were often transported from the great centres of production to distant provinces, where pavements were prepared for their reception. The subjects of these *emblemata*, like those of the wall-paintings of Pompeii, were taken frequently from Greek mythology, and it is not easy to determine what degree of originality is to be assigned to Roman artists. We note a certain interest in the great figures of literature and philosophy. A subject commonly known as "The Academy of Plato" shows us a group of Greek philosophers engaged in discussion. In provincial pavements it is not uncommon to find portraits of poets or philosophers used to fill ornamental schemes of decoration, as in the famous mosaic at Trier signed by Monnus. The portrait mosaic of Virgil, mentioned on p. 401 discovered in a villa at Sousse in Tunisia (ancient Hadrumetum) shows a marked new interest in Roman literature, while it has also been shown that the mythological scenes depicted by the mosaic-workers of the later imperial period are frequently inspired, not by Greek poetry or even Greek artistic tradition, but by the works of Ovid; and the popularity of the legend of Cupid and Psyche is, doubtless, to be traced to its literary treatment by Apuleius. Besides a well-chosen repertory of geometrical patterns, the mosaic-workers make use of vegetable motives taken from the vine, the olive, the acanthus or the ivy, as well as traditional figures, such as the seasons, the winds, the months and allegorical figures of all kinds, forming elements in a scheme of decoration which, though often of great richness, is never lacking in symmetry and sobriety. Mosaic pavements were a common luxury in the provinces, those of Gaul and of Roman Africa being specially celebrated; and there are fine examples from both Africa and Roman Britain in the British Museum.



Wall and ceiling mosaics from the classical period are rare. What appears to be the earliest example in Italy was identified in 1928 by G. Lugli at the villa of Hadrian. It is a floral-geometric design in black on a white ground of marble tesserae veined with a vitreous blue paste, which adorned the vaulted ceiling of a house of republican date, afterwards transformed by Hadrian into the imperial residence. Another example of the 2nd century A.D., first noted by Ashby (*P.B.S.R.*, iii., 1906, p. 104) is afforded by a circular domed nymphaeum near the Via Tiburtina, which is entirely covered with a mosaic of plain white tesserae. But the destruction, partial or complete, of the imperial thermae and palaces has deprived us of the more elaborate means of passing judgment on the systems of *opus musivum* proper (*see* MOSAIC), *i.e.*, the decoration of vaults and wall-surfaces with mosaics in glass, enamel or precious materials. We can, however, form some idea of these from the decoration of fountains at Pompeii and elsewhere, as well as from the compositions which adorn the walls and apses of early Christian basilicas. The mosaic on blue ground of the god Silvanus, on a fountain niche from Ostia at the Lateran (Plate IV., fig. 8), shows a type of decoration whence derive the apsidal compositions of S. Pudenziana or of SS. Cosma and Damiano. On the other hand, the celebrated groups of Justinian and Theodora with their courts, in S. Vitale at Ravenna, continue the series of those imperial groups of which the families of Maximian and of Constantine Chlorus, painted in a hall of the palace of Aquileia, afforded a noted and celebrated example. The "Roma Barberini" comes, as we have seen, from a similar group in Rome, and the Theodosius, with his sons and officers of State, on the silver plate in Madrid probably reproduced yet another. Further fine and instructive examples of *opus musivum* may be studied at S. Costanza in Rome, built by Constantine early in the 4th century A.D. The mosaics of the cupola were destroyed in the 16th century, but those of the annular vault which surrounds the baptistry, though much restored, show that the decorative schemes of Erotes, vine-patterns, medallions, etc., commonly found in pavements were also used by the *musivarii*.

When employed in the service of Christianity the old pagan themes were invested with a new spiritual meaning, and mosaic became the chief channel through which motives invented by paganism were transmitted to Christian art. The acanthus decoration in green and gold on blue ground in the baptistry of S. John Lateran continues the floral arabesques of the Ara Pacis, and similar scrolls form the background of the *arbor vitae* at St. Clemente (time of Pope Paschal II., 1099–1118), and frame the central group of the apse mosaic at S. Maria Maggiore (time of Nicholas IV., 1288–92). In other mosaics we find the pagan river motive, with pleasure boats floating down stream and boys angling from the bank, to symbolize the river Jordan or the rivers of paradise.

Opus sectile, a marble intarsia of various colours, also deserves to be noted. An interesting example in Palazzo Colonna, possibly as early as the 1st century, represents the "Infancy of Romulus and Remus"; another, attributable to the 4th century, is provided by the magnificent, though sadly scattered remains of the revetments in marble and mosaic of the basilica of Junius Bassus (consul, A.D. 331) on the Esquiline. They are remarkable for brilliancy of colouring and for the magnificent frontal composition of certain of the panels; the one chosen for illustration (Plate IV., fig. 11), which represents the consul himself riding into the circus surrounded by mounted attendants, has the same pictorial quality (the same absence, for instance, of ground line), as the Ravenna mosaics of Justinian and Theodora.

PRECIOUS METALS AND BRONZE FURNITURE

For the history of plate *see* PLATE. Pliny's lament (*N.H.* xxxiii., 154 *sqq.*) that silver chasing was, in his time, a lost art, is mere rhetoric and is amply disposed of by the list he gives in an

ROMAN FRESCOES AND RELIEFS

1. Relief representing an augur taking the auspices. In the Louvre
2. Detail of a relief from the Arch of Titus, in the Roman Forum, showing the emperor returning in triumph from Jerusalem
3. Detail of the column of Marcus Aurelius, Rome
4. Detail from the column of Trajan, Rome, dedicated in A.D. 113. The various episodes in the emperor's life are linked together in a spiral said to include 400 slabs, to represent a continuous whole
5. Sarcophagus at Melfi, in Apulia, Antonine period (2nd century A.D.). A full-length portrait of the deceased girl is on the lid, and the sides are ornamented with figures symbolic of the soul's destiny
6. Wall-painting from the Roman house discovered in the grounds of the Villa Farnesina, Rome; thought to be possibly as early as the 1st century B.C. In the Museo delle Terme, Rome
7. Fresco from the series representing a Dionysiac initiation, discovered in 1911 in the so-called "Villa of the Mysteries" at Pompeii
8. Septimius Severus offering a sacrifice. Relief from the gateway of the Silversmiths (Argentarii), Rome
9. Fresco painting of a farm scene; period of the Severi (about A.D. 200). From the Hypogeum (underground chamber) of the Aurelii discovered in 1919 near the Viale Manzoni, Rome
10. Ivory diptych with double portrait of Honorius, about A.D. 406. In the Treasury of the Cathedral, Aosta

MINOR ARTS OF ANCIENT ROME

1 and 3. Two silver goblets found in 1922 near Copenhagen, probably the work of the 1st century. They are ornamented with scenes from the Homeric cycle. In Copenhagen

2. Stucco reliefs combined with paintings, from one of the tombs on the Latin Way, Rome. From the 1st or 2nd century

4. Portrait medallion on glass, representing two ladies and a boy, now identified as Alexander Severus at the age of 16 (A.D. 221), with his mother and his grandmother. The medallion was later inserted as the centrepiece of a cross. Now at Brescia

5. Cameo of Claudius. In the Royal Collection at Windsor Castle

6. Fresco of the head of a shepherd piping, said to have been found in a tomb near Rome. In the British Museum

7. Mosaic pavement, showing a view of the Nile and its surroundings; believed to be the earliest known Roman picture in mosaic. Second half of the 1st century B.C. In the Palazzo Barberini, Palestrina

8. Mosaic of Silvanus, found in a fountain niche at Ostia. In the Lateran Museum, Rome

9. The Good Shepherd; fresco of the period of the Severi. From the Hypogeum of the Viale Manzoni, Rome (Plate III., fig. 9)

10. Wall-painting in a room of the Roman house discovered under the Church of SS. John and Paul, Rome. The subject is the meeting of two divinities (Dionysos and Thetis?) on a sea-girt rock, surrounded by tiny love-gods. It is the largest and best preserved ancient painting so far discovered in Rome, and is probably not later than the period of Marcus Aurelius (A.D. 161–180)

11. An example of *opus sectile*, a marble intarsia of various colours, from the basilica of the Consul Junius Bassus, Rome. The subject is the consul riding into the circus surrounded by mounted attendants. About A.D. 331

earlier chapter (xxxiii. 139) of the principal ateliers in which such work was produced in his time, as well as by the numerous surviving examples of Roman plate. Of the utmost significance is the famous treasury discovered at Boscoreale (now in the Louvre), which contains pieces ranging from the age of Caesar to that of the Flavians. Many of the subjects are specifically Roman, like those of the pair of cups representing the triumphs of Augustus and Tiberius. A Julio-Claudian cup in Vienna, from Aquileia, shows in the same way as the corselet of the Augustus of Prima Porta, the benefits ensuing from the imperial rule. Other notable 1st century examples may be seen in Naples. Roman plate travelled far and wide over the empire, and excellent examples have been found at Berthouville in Normandy, at Hildesheim in Germany, and even in Denmark. The two goblets found as recently as 1922 near Copenhagen (Plate IV., figs. 1 and 3), reproduce scenes from the Homeric cycle (ransoming of Hector and myth of Philoctetes) so popular among the Romans. The artist, who signs himself Cheirisophos, was probably a Campanian Greek in the service of Roman employers. The gold patera with Dionysiac subjects (from Rennes, in the Cabinet des Médailles) shows the vitality of the art under Septimius Severus, and that it continued to flourish long after is attested by the silver disc of Theodosius at Madrid, and of Valentinian at Geneva.

Bronze furniture, too, was often of great beauty, and among pieces that deserve at least a mention are the *lectica* or litter of Augustan date in the Museo dei Conservatori; the couch with silver inlay in the same collection; the graceful tripod-stand at Naples, the tray of which is wrought with garlands in the style of the Ara Pacis; while the so-called Tensa Capitolina, with its rich bands of decoration and portrait medallions, is a notable example from the 3rd century A.D.

ENGRAVING AND MINOR ARTS

By far the greater part of the ancient gems which exist in the modern collections belong to the Roman period, and the great popularity of gem-engraving amongst the Romans is shown by the enormous number of imitative works, cast in coloured glass paste, which reproduce the subjects represented in more precious materials. In the Roman *intagli* we can trace the various phases of Roman plastic art. A black agate in the Hague museum (Fürtwangler, *Die Antiken Gemmen*, pl. xlvii. 13), supplies a characteristic portrait of the Ciceronian age. The splendid cornelian which has passed from the Tyszkiewicz collection at Boston (inscribed ΠΟΠΙΛ [for Popilius], ΑΛΒΑΝ [for Albanius], the names of two Roman families), which portrays Augustus, in the guise of Poseidon, in a chariot drawn by four hippocamps, should, doubtless, be referred to the victory of Actium. A sardonyx in Florence (Fürtwangler, *op. cit.*, pl. lix. 11) portrays an empress of the Julio-Claudian line as Hera. Flavian portraiture is seen at its best in the aquamarine in the Cabinet des Médailles signed by Euhodos, which represents Julia, the daughter of Titus. Amongst later gems one of the finest is the "Hunt of Commodus" in the Cabinet des Médailles, engraved in a stone popular with Roman artists—the "nicolo," a sardonyx with a bluish-grey upper layer used as background, and a dark brown under layer in which the design is cut. But the masterpieces of Roman gem-cutting are to be found in the great cameos, cut in various materials, including single coloured stones such as amethyst or chalcedony, though the stone most fitted by nature for this branch of art was the sardonyx in its two chief varieties—the Indian, distinguished by the warmth and lustre of its tones, and the Arabian, with a more subdued scale of colour. Two masterpieces survive in the "Grand Camée de France" (cab. des Antiques, Paris), a magnificent Indian sardonyx in five layers representing the apotheosis of the Julio-Claudian house, and the "Gemma Augustea," an Arabian sardonyx which shows Augustus and Roma enthroned, receiving a victorious prince, while in a lower zone are groups of captives and Roman soldiers. Other examples of the first order are the cameo of Augustus from the Strozzi and Blacas collections, now in the British Museum, the cameo of Claudius in the collection at Windsor (Plate IV., fig. 5); the busts of the same emperor and of three members of his family set on cornucopiae, at Vienna.

Engraved gems are not the only examples of Roman work in precious metals. Amongst the portraits of the first dynasty none are finer than the small head of Agrippina the younger in the British Museum in *plasma* (root-of-emerald), and the lovely head of Tiberius in turquoise, acquired by the British Museum during the World War, from a soldier, who found it in Egypt. Vases, again, were carved in precious stones, such as the famous onyx vase at Brunswick (Fürtwangler, *op. cit.*, figs. 185–88) with reliefs relating to the mysteries of Eleusis, and the smaller, but finer, onyx vase in the Berlin museum (Fürtwangler, *op. cit.*, figs. 183–184), representing the lustration or baptism of a prince of the Julian line—a rock surmounted by a small temple recalls one slab of the Ara Pacis, and the work seems of Augustan date.

As mentioned before, coloured glass was used as a substitute for gems, and it is to the school which produced the cameos of the early empire that we owe the vases in white and blue glass of which the Portland vase in the British Museum is a famous example. Pompeii furnishes a second in the amphora, decorated with vintage scenes, in the Naples museum.

We must also class amongst the fine arts that of the die-sinker. Not only are the imperial portraits found on coins worthy of a place beside the works of the sculptor, but in the medallions of the 2nd century A.D. we find figure-subjects, often recalling those of contemporary reliefs, treated with the utmost delicacy and finish. Later lead medals often reproduce landscape motives and actual views; *e.g.*, medal of Diocletian, in Paris, with view of a city, its river and bridge; medal of Constantius Chlorus, found in 1922 near Arras, with the Thames and the port of London; medal of Constantine with the famous gate of Trier. The fine bronze medallion of Valens and Valentinian, enthroned side by side in frontal pose, shows that the art of the medallist was still vital in the 4th century A.D.

Ivory was a favourite material with the Romans, as it had been with the Etruscans. It was worked both in the round and in relief and often used for the adornment of furniture. A head of 1st century date—probably Augustus—in the Stroganoff collection, and another representing a personage of mid 3rd century date, in the British Museum, rank with the best Roman portraiture. The series of consular and other diptychs are discussed in a special article (DIPTYCHS). Among them are masterpieces like the magnificent Symmachorum-Nicomachorum diptych, one leaf of which is in the Victoria and Albert Museum and the other in the Cluny Museum at Paris. Diptychs also largely helped to keep portraiture alive; fine examples of this type are the diptych of Probus at Aosta with the double portrait of Honorius (Plate III., fig. 10); that of Felix, of the year A.D. 428, in Paris and that of Boethius, consul in A.D. 487, in the museum of Brescia.

Of the purely industrial arts it is unnecessary to speak at length. In the last century of the republic a flourishing manufacture of red-glazed pottery was established, with its chief centre at Arretium (Arezzo); the signatures of the vases enable us to distinguish a number of workshops owned by Romans who employed Greek or oriental workmen. The repertory of decorative types reflects the cross-currents of classicism and naturalism which were contending in later Hellenistic art. In the 1st century A.D. the Italian fabrics were gradually driven out of the market by those of Gaul, where the industry took root in the Cevennes and the valleys of the Rhône and the Allier; and before long north-eastern Gaul and the Rhineland became centres of production in the various minor arts, which continued to flourish until the breakdown of the imperial system in the 3rd and 4th centuries A.D. Glass, though made in quantities for the Roman market, was usually of foreign manufacture, probably Syrian. The subject is fully treated in Kisa, *Das Glas im Altertum*.

With only limited space at our disposal, we have confined ourselves in the above section to monuments in Rome, only going outside the capital for examples of exceptional importance. The products of local or provincial art and the special problems which they raise cannot be treated here, though some clue to the literature of the subject will be found in the bibliography. The Museo del Impero Romano affords a well-arranged survey of Roman provincial art; it contains, along with much that is new, most of

the objects from the Exhibition of the Roman Provinces held in the Baths of Diocletian in 1911, an account of which by E. Strong appeared in the 1st volume of the *Journal of Roman Studies.*

SUMMARY

It may be said that as the establishment of the Roman empire gave a political unity to the ancient world, and acceptance of Christianity by its rulers assured the triumph of a universal religion, so the growth of a Graeco-Roman nationality, due to the freedom of intercourse between the subjects of the emperors, led to a unity of culture which found expression in the art of the time. Yet no sooner was the fusion of the elements which contributed to the new culture complete than the process of disruption began, which issued in the final separation of the Eastern from the Western empire. In the first, the oriental factors, which produced a gradual transformation in Graeco-Roman art, definitely triumphed; and the result is seen in Byzantine art. But in the West it was otherwise. The realism native to Italy remained alive in spite of the conventions imposed upon it; the human interest asserted itself against the decorative. Therefore, the Christian art of the West is the true heir of the Roman, and, through the Roman, of the classical tradition. As we have seen, Roman art in its specific aspect was an historical art; and it was for this reason eminently fitted for the service of an historical religion. The earliest Christian art whose remains are preserved is that of the catacombs; but though not devoid of technical merit (on this point *see* A. della Seta, *Religion and Art,* p. 331 *seq.*) this art is dominated by the single idea of deliverance from the grave and its terrors, whether this be conveyed by scriptural types or by representations of paradise and its dwellers. Not until the Church's triumph was complete could she command the services of the highest art and unfold her sacred story on the walls of her basilicas; but, when the time came, the monumental art created by the demands of imperial majesty was ready to pass into the service of Christianity.

It remains to note that the scientific study of ancient Roman art dates from a comparatively recent period. The great artists of the Renaissance, headed by Raphael and Michelangelo, showed no lack of appreciation for such models as the reliefs of Trajan's Column; and Mantegna's "Triumph of Caesar" vividly suggests how great was the influence exerted by Roman historical sculpture upon their choice and treatment of monumental subjects; but their eyes were already fixed on the Greek ideal, however imperfectly represented by the monuments then available. In the 18th century the supremacy of this standard seemed established beyond challenge, and even the vision of the *Magnificenza Romana,* evoked by Piranesi, failed to arouse any response in Winckelmann and the apologists of Greece. The Greek antique, till then only dimly divined behind the copies that filled the palaces and galleries of Italy, was soon to be made more vivid by the recovery of the buried treasures of Herculaneum and Pompeii and the systematic excavation of the extant remains of Hellenic art, which began early in the 19th century and still continues, not unnaturally absorbed the attention of the majority of classical archaeologists. Nevertheless, towards the close of the 19th century, when the main lines of Greek artistic development had been traced and interest aroused in its later offshoots, critics were led to examine more closely the products of the Roman period. In 1893, Alois Riegl entered the lists on behalf of Roman Art with his *Stilfragen,* a series of essays on the history of ornament, in one of which he expressed the opinion that "there was in the antique art of the Roman empire a development along the ascending line and not merely a decadence, as is universally believed." This thesis was taken up two years later by Franz Wickhoff in a preface to the reproduction in facsimile of the illustrated ms. of Genesis in the imperial library at Vienna.

In the year following the English translation (by E. Strong) of Wickhoff's work, Riegl published the first (which, by reason of his untimely death, remained the only) volume of his *Late Roman Industrial Art* (new ed., 1927) in which he endeavoured to show that the later transformations of Roman art in the 2nd and succeeding centuries after Christ continue to mark a definite advance. The fecundity of the leading ideas put forward by Wickhoff and Riegl remains unimpaired, as Koch points out, in spite of the attacks of Josef Strzygowski, who for 30 years and more has never ceased to dispute the originality of Roman art and to insist that Roman artistic achievement, whether of the imperial or early Christian period, was at all times dependant on the Hellenistic East. By thus shifting the ground of controversy from the Mediterranean to the oriental area, Strzygowski, again to quote Koch, has immeasurably broadened the archaeological horizon; but the net result of the long conflict, so far as our enquiry is concerned, has been to bring out more clearly the essential characteristics of Roman art in the pre-Christian period, and its high significance in the formation of the art of the Christian West. The case for Roman art is stated anew by G. McN. Rushforth in the chapter "Roman Art and Architecture," contributed to the *Legacy of Rome* (1923) and by Herbert Koch in the admirable monograph, *Römische Kunst* (1925), already quoted. It will be seen from what has been said above that there is a new and growing interest in the post-Constantinian periods of Roman art, down to Justinian and later. Of this we have the proof, not only in Riegl's book quoted above, but also in Delbrueck's magnificent publication of late Roman monuments—done by care of the German Institute—and in all the newer histories of ancient art—Rodenwaldt's for instance.

Instituts* (with its *Denkmäler*). (H. S. J.; E. So.)

ROMAN CATHOLIC CHURCH. The word *church* has etymologically many meanings. It might be used correctly of any gathering or assembly, secular or religious; actually it is commonly employed either to denote those who are united in a definite religious aim, or to signify the building in which they come together for united worship. In this article we are dealing with the word in a strict theological sense. By it we mean the visible body or organization which Christ Himself set up to perpetuate for all time the authoritative teaching of the truths which He came on earth to reveal to mankind. In this sense there can be only one Church, divinely constituted, divinely protected, in order that it may accomplish its mission. A more technical definition would be as follows: "The Church instituted by Jesus Christ is the visible society of men who, having received baptism, are united in the profession of the same faith and in one communion, and are seeking the same spiritual end under the authority of the Roman Pontiff, the successor of St. Peter, and of the bishops who are in union with him." To this Church Christ the Founder has given the right and duty to guard, teach and maintain the doctrine which He taught, and to preach it to the whole world without let or hindrance on the part of any human power. From the very nature of this one Church it is clear that men are bound to submit to its authority as soon as they become clearly aware of its existence and of its divine claims to their allegiance. Such submission is necessary for salvation.

In this living organism, the Church, we may distinguish the *body* and the *soul*. The body is the visible union of the Faithful, and their external government and organization; while the soul denotes all those invisible elements which give life to the body, rendering it capable of attaining the supernatural end for which alone it exists, namely sanctifying grace, the infused virtues, the gifts of the Holy Spirit and the like. As sanctifying grace is essentially necessary for salvation, no one can be saved who does not belong to the *soul* of the Church, and who does not, at least implicitly, desire and intend to belong also to its body. Such desire and intention are found in the sincere will to observe all the divine precepts and to take all means necessary for salvation. They are necessarily included in a real act of love of God and perfect sorrow for sin.

The Church, as we have said, has the right and duty of teaching all without exception. To those who by baptism have become its subjects the Church proposes its doctrine and expects from them obedience to its teaching. Those who are not baptized are bound not by the authority of the Church, but by the divine law, to seek, and when found, to accept the truth which God has revealed.

To sum up, Catholics believe that there is in the world a society which is both supernatural and visible, which is holy and universal; that this society was established by Jesus Christ Himself, while He sojourned on this earth; and that He called this society His Church. They believe, furthermore, that the unity of the Church is founded upon the Apostolic See of Rome; and that all men are strictly bound by divine law to enter into the unity of this Church so soon as they become really aware of its existence and fully conscious of its divine claim upon them. (F. Bo.)

ORGANISATION

The Catholic Church is governed by a hierarchy of bishops with the pope as bishop of Rome at the head. Under him patriarchs, archbishops and other greater prelates are possessed of various local jurisdictions over the bishops of their respective provinces. The Church teaches that the origin of all this varied jurisdiction must be sought in the authority given by our Lord Himself, and recorded for us in the Gospels. Just as no man, not even an Apostle or the Chief of the Apostles, could institute a Sacrament, so it was not in the power of man alone to originate the fundamental organization of the Church. Christ Himself before He ascended into heaven left the Church an organized body, with a system of rule that could indeed be developed indefinitely to meet the constant changes which must inevitably occur as the centuries passed, but which in its fundamental principles must remain unchanged to the end of the world. As we study the Gospels we find that all authority over this Church was left by Christ in the hands of a body of 12 chosen disciples, afterwards called the Apostles, over whom as a chief he placed one

of themselves in the person of St. Peter. The essential and unchangeable organisation of the Church is, therefore, according to Catholic doctrine, that the organisation instituted by Christ must be perpetuated; that there must always be the College of the Apostles ruling the Church, and that above all there must be the heir of St. Peter, governing all as the Good Shepherd in Christ's place in virtue of the great Petrine texts Matt. xvi. 16–19; Luke xxii. 32 and most of all, John xxi. 15–17. (*See* PAPACY and POPE.) The great scarcity of documentary evidence for the history of the Church, from the close of the Apostolic age to the beginning of the 3rd century, makes it impossible to trace in anything like accurate detail the steps by which the system of episcopal government, each bishop ruling in his own diocese and limited as to his personal jurisdiction to that diocese, followed and took the place of government by the Apostles themselves. We can see the beginning of it in the Pastoral Epistles of St. Paul, in the cases of Timothy and Titus, but no more than the beginnings. But at the beginning of the 3rd century, when first we can get a clear idea from surviving documents of the actual system by which the Church was being governed, we are confronted with the change as an accomplished fact. The Apostles themselves have long since passed away, but the Apostolic College remains in the College of Bishops. No single bishop is in himself an Apostle in the full sense, for each is limited to a local jurisdiction. But the whole body of the bishops is the successor, as a body, of the whole body of the Apostles, and by them, as a body, the whole of the powers granted by Christ to his Apostles are preserved and exercised. Over them, as their primate or chief, there is one of their own number, the bishop of Rome, acting as such in virtue of the claim that he is the successor of St. Peter, as being the bishop of the see in which St. Peter died and to which he left his privileges. No other bishop claims in the same way to be the successor of any other apostle. No apostle, except St. Peter alone, left a successor behind him. The bishop of Rome alone lays claim to being in his own person possessed of the full Apostolic power and to be in virtue of his succession to St. Peter the Universal Shepherd of all Christ's sheep. Naturally in those difficult times of persecution, the government of the Church was far less centralized than it afterwards became, for communications were always dangerous and often impossible, but the primacy of the bishop of Rome was everywhere acknowledged as well as claimed, and although its extent and the method of its exercise had to be developed and defined as the years went on and the needs of the Church required, it has always been based upon our Lord's grant to St. Peter and draws its sanction and authority from that grant and from nothing else.

As the Apostles, with the exception of St. Peter, were all equal, so also were the bishops among themselves. But it was found at an early date that some further organisation was needed, and neighbouring bishops were grouped together under the authority, generally, of the bishop of the metropolitan town. The organisation of the Church has always, for obvious reasons of convenience, tended to follow to a considerable extent the secular arrangements of the locality. The earliest time at which we can get any clear idea of the organisation of the period is that of the Council of Nicaea, A.D. 325, the sixth Canon of which runs as follows: "Let the ancient custom continue in force which subsists in Egypt, Libya and Pentapolis, by which the bishop of Alexandria possesses authority over all these, since the like custom subsists also with the Roman bishop. In like manner also their privileges should be preserved to the churches, as to Antioch and the other provinces." The Council does not create but recognises these privileges which it says were already ancient, but it justifies this exercise of authority by one bishop over another by referring it to the example of the primacy of the Roman See. In these earlier times the bishops of the three great Sees of Rome, Alexandria and Antioch were regarded as all sharing in the Petrine prerogative, Alexandria as having been founded by St. Mark, acting as the direct representative of St. Peter; Antioch as having been actually the temporary seat of his authority. While Rome was always held as the immediate superior of both Alexandria and Antioch it was through the Bishops of these places and not directly that Roman authority was at first exercised in the East. These three bishops were at the head of the Hierarchy of the Church and later on were given the title of "Patriarch." The bishop of Rome, who as head of the whole Church acquired later on the exclusive title of "Pope," was also the sole Patriarch of the West, while Alexandria and Antioch governed most of the East. In the 5th century two other bishops attained to the Patriarchal rank, Constantinople as being the seat of the empire and civil capital of the world, and Jerusalem as the cradle of the Church. Under these was a complicated and ever varying system of jurisdictions of exarchs, metropolitans and archbishops. To trace the historical changes of these jurisdictions would be quite beyond the possibilities of such an article as this, but the principle by which alone the whole system of subordination of one bishop to another can be justified in view of the essential equality of all, can only be found in the special grant by our Lord of the Primacy to St. Peter and the delegation of some share in that primacy to the rest of the Hierarchy.

This principle, which as we have seen was recognized even at Nicaea, is nowadays symbolized and expressed by the practice of sending the "Pallium" by the pope to every archbishop in possession of jurisdiction. The Pallium comes from the tomb of St. Peter, where a supply is kept in readiness, and symbolises and conveys such share in the Petrine primacy as belongs to the particular office. Till an archbishop has received his Pallium from the pope, he cannot exercise any archiepiscopal jurisdiction, though he is possessed as soon as he is fully appointed of all the jurisdiction which belongs to him as bishop of his own diocese. At the present time the number of Catholics in the world is roughly estimated at 300,000,000, all and each of whom are immediately subject to the Pope as the Universal Shepherd (John xxi., 15–17) and who are also governed by some 1,500 archbishops and bishops, each in his own diocese.

1. **The Primacy.**—As the pope has the care of the whole Church, that is of many million Catholics spread throughout the world, there is need for an extensive and detailed organisation at Rome adequate to cope with the varied questions that arise. This organisation is called the Curia. (*See* the special article CURIA ROMANA for details.)

i. **Cardinals.**—At the head of the *Curia* is the College of Cardinals, numbering 70 in all when the College is complete, who form the supreme Senate of the Church and the immediate advisers of the Pope. Historically they are the occupants of the six "suburban" sees, known as cardinal bishops; the incumbents of the principal parishes of Rome, known as cardinal priests; and seven who are the successors of the seven deacons who were responsible in early times for the more secular details of administration, and who are known as cardinal deacons. But these ranks are distinct from the orders of the Church and the cardinal priests are always bishops; about half of their number being the occupants of various important sees and non-resident in Rome; while the cardinal deacons are nowadays always priests.

ii. **Secretary of State.**—The cardinal secretary is, so to speak, the prime minister of the Pope. It is his office to deal with all political affairs, and especially all diplomatic relations with the separate countries and governments. From his department depend the nunciatures and delegations which represent the Holy See abroad, and it is with him that the ambassadors from foreign countries to the Holy See do their business.

iii. **Congregations.**—The causes which come to Rome for solution are referred for solution to a number of permanent *Congregations* each with a cardinal at its head, and with other cardinals as members and a number of other priests, specially learned in the particular subject involved, as assessors and advisers. There are eleven such *Congregations* of which the principal are:

1. *The Holy Office;* dealing with all questions of faith and morals.
2. *Consistorial;* dealing with the appointment of Bishops and other dignitaries except in countries subject to the *Propaganda;* the erection and division of dioceses and the reports

made by Bishops concerning the state of their diocese.

3. *Sacramental Discipline;* dealing with legislation concerning the Sacraments and questions as to their validity; especially the validity of marriages and ordinations.
4. *The Council;* dealing with matters connected with the summoning and management of councils; regulations as to parish priests, benefices and ecclesiastical property. It also deals with dispensations other than those from religious.
5. *Affairs of Religious;* dealing with all disputes between bishops and religious orders. Also it grants dispensations to religious, and deals with their internal disputes.
6. *de Propaganda Fide.* This is the great missionary organization of the Church. It has jurisdiction over all missionary countries, even over some where episcopal hierarchies have already been established.

iv. **Offices.**—The ordinary and routine business of the Church is carried on by the *Offices.* These have not now very great importance. They are:

(1) The *Chancery,* which sends out those important papal communications known as "Bulls." This is nowadays almost its sole duty.
(2) The *Dataria,* which deals with benefices the appointment of which is reserved to the Holy See.
(3) The *Apostolic Camera,* which formerly was of great importance as having control of the affairs of the Papal States, now has the care of the property of the Holy See.
(4) The *Office of Briefs* sent to princes, and *of Latin letters.*

v. **The Tribunals** which control the judicial functions of the primacy. These are:

(1) The *Sacred Penitentiary,* handling matters of conscience.
(2) The *Sacred Rota,* which was formerly the chief court for the Papal States. It is now the court which hears all appeals which are made from the courts of the bishops to the Holy See, and consists of ten judges who generally sit in threes, or more if the case is very important.
(3) The *Apostolic Segnatura.* This is the Supreme Court of Appeal and consists of six cardinals with assistants. An appeal lies from the *Sacred Rota* to the *Segnatura.*

2. **Archbishops, Metropolitans and Patriarchs.**—Besides their own episcopal jurisdiction over their own diocese, these greater prelates, whatever their title, have a provincial jurisdiction over their "suffragan" bishops. This jurisdiction is one strictly limited by law, the presumption being always in favour of the bishop and against the archbishop. It is attached to the office and therefore is "ordinary" jurisdiction, and affects the suffragan bishops immediately and the faithful of their dioceses through them. The extent of this jurisdiction varies very much in different localities, and is now everywhere less extensive than in former years. It is the archbishop's duty to summon his comprovincials to the Provincial Synod, which need now only be done once every twenty years, and in that Synod he presides of right, though his vote counts for no more than that of any other bishop. If the suffragan bishop has neglected to carry out the canonical visitation of his diocese, the archbishop may visit, after obtaining permission from Rome, and has full power of redressing abuses. When any one of the suffragan Sees becomes vacant it is generally the duty of the archbishop to see that the Cathedral Chapter elects a vicar capitular to carry on the administration of the diocese during the vacancy. An appeal lies from the Court of any one of the suffragan bishops to that of the archbishop, and where the rights of the bishop are involved he may hear cases from that bishop's diocese as a Court of first instance. Appeals from his own diocesan court, which formerly had to be taken to the Holy See, are now heard by some one bishop selected by the archbishop for that purpose once for all, and approved by the Holy See. The archbishop has always the right of pontificating in any church in his province, and may bless the people, grant 100 days indulgence, and have the cross carried before him in the church. He may not, however, except when he holds a visitation, perform any other acts which imply jurisdiction.

3. **Bishops.**—The bishop and the diocese form the most essential part of the Church's organisation, being of Divine institution under the primacy of the pope. A Bishop is nominated under different conditions in different parts of the world, but even after he has been thus canonically nominated he has no power until that nomination has been confirmed by the Holy See. Once this confirmation has been given and has been communicated to his Cathedral Chapter he has full possession of all episcopal jurisdiction, though he can do no acts involving the power of order, such as ordaining clergy or confirming children, until he has been consecrated. His jurisdiction is "ordinary," limited by restrictions imposed by the Holy See, but independent of his people and even of his clergy. In certain important matters he is bound to seek the advice of his Cathedral Chapter, though he is not usually bound to follow it. He is bound to make a visit *ad limina* to the Holy See at stated intervals to report on the state of his diocese. His authority over his diocese is fourfold: (1) *Teaching,* with authority over all schools, and the right of superintending all the publications of the faithful and especially of the clergy within his diocese. (2) *Legislative,* in which his power is strictly limited by the *jus commune* and by all existing laws which have wider scope than the bounds of his own diocese. He can dispense from all diocesan laws. (3) *Judicial.* He is judge of first instance in all cases which belong to the ecclesiastical tribunal. *In foro interno* he can reserve to himself the absolution from certain sins. He can enforce his sentences of ecclesiastics by suspending them from their functions. (4) *Administrative.* The Bishop can nominate, subject to any local rights of patronage, to all benefices in his diocese. He can oblige ecclesiastics to undertake special work, though he cannot force the cure of souls upon them if they are unwilling. He has authority over all ecclesiastical property, and none can be alienated or sold without his consent. But in nothing is his power unlimited, he is always subject to the precepts of Canon Law.

4. **Organisation of a Diocese.** (1) **The Cathedral Chapter.**—In the general regulations of his diocese the bishop must conform to the general laws of the Church and must not do anything which would impair the general unity of Church government. He has as his constitutional council, to assist him in the work of government, the canons of his Cathedral Chapter. The cathedral itself is the Church in which he has his seat (*καθέδρα*), and this he cannot choose at will, the pope reserving to himself the right of erecting a church to be a cathedral, as well as of instituting a chapter. Generally of course, the bishop finds both already established and in existence. The appointment of individual canons is generally in the hands of the bishop, though the appointment of dignitaries in the chapter is often reserved to the Holy See. As the chapter constitutes the diocesan senate the bishop is bound to convene it, and to ask its consent or advice in important matters. In some matters, which touch diocesan rights, or affect diocesan property, its consent is necessary and the bishop cannot validly act without it. In other matters, though the advice of the chapter must be asked, the bishop is not bound to act upon the counsel tendered. When the see is vacant by the death or resignation of the bishop, the chapter succeeds to his ordinary jurisdiction, but not to any jurisdiction that was personal to himself. Within eight days after the vacancy the chapter must elect a "vicar capitular," to whom the whole administration of the diocese immediately passes. In the United States of America and elsewhere, where Cathedral Chapters have not as yet been constituted, a body of "diocesan consultors" has generally to be appointed by the bishop, and he is bound to ask the advice of these consultors on important matters, though they have not the power of vetoing his action.

5. **The Vicar General.**—The bishop generally appoints one or more priests to assist him, deputing to them with a certain universality of power all his own jurisdiction within the diocese, so that the vicar general is his *alter ego,* and no appeal lies from the one to the other. By virtue of this general mandate the vicar general exercises "ordinary" jurisdiction throughout the diocese in the bishop's name. This jurisdiction however, being dependent on that of the bishop, ceases at the bishop's death, or with the cessation of the bishop's own jurisdiction. The office of a vicar general ceases also with his own death or resignation, or with the

withdrawal of his vicarial mandate, which last however can only be taken from him for a grave cause, allowing of an appeal to the Holy See.

6. **The Diocesan Chancery.**—This is the office through which the ordinary and routine work of the diocese is carried on. At its head is the chancellor. His duties are to carry on the official correspondence of the diocese and to see that records are duly kept. He can be removed by the bishop, but by the vicar capitular during a vacancy only with the consent of the whole chapter.

7. **The Parish.**—Where the full organisation of the Church is in force, the diocese is subdivided into parishes covering the whole ground. Each parish should have its own church, and is under its own pastor having care of souls, and irremovable except for grave cause. But where the full organisation is not in force, there are *quasi-parishes*, with pastors who do not possess the full rights of parish priests. The full parish system has not yet been introduced either in England or the United States, though certain mission districts or *quasi-parishes* have pastors who are not removable at the will of the bishop. The bishop can alter the boundaries of parishes, erect new ones, or join two together where there is just cause for so doing. He is bound however first to ask the counsel of the chapter, though he is not bound to follow it.

The pastor of a properly constituted parish has "ordinary" jurisdiction. His rights within the parish are regulated by canon law, and include the faculties of preaching, celebrating Mass, hearing confessions and administering the sacraments, though he can delegate this authority. Where the parish is too large to be administered by one priest, assistant priests are sent by the bishop to help him. These assistants are appointed by the bishop (though in some places the parish priest has the right of nomination) and are removable by him but only for just cause. Their jurisdiction is "delegated" and they receive their faculties from the bishop.

If the parish priest is ill or incapacitated for any reason, the bishop must send a coadjutor to fill his place, and in like manner will appoint an administrator of the parish during a vacancy.

8. **Vicars Apostolic.**—In districts where the ordinary hierarchy of the Church has not yet been established and there are no proper dioceses erected, the Holy See governs directly by means of a delegate who has received episcopal consecration to a titular see, and who has the title of vicar apostolic, or prefect apostolic. The main difference between the two is that the vicar apostolic is bound to make the visit *ad limina* at certain intervals while the prefect apostolic is not. They are not diocesan bishops and therefore have no cathedral and no chapter, and all their powers are "delegated" and not "ordinary." Otherwise they enjoy as a rule all the powers that bishops have by canon law in their own dioceses. They have no vicar general, though they can give special faculties to individual priests to enable them to assist in the rule of the district, and as they have no chapters they are bound to nominate three or more of their leading priests to act as counsellors. There are at the present time vicariates apostolic, prefectures apostolic and "missions." In addition there are vicariates apostolic of Uniat Greco-Bulgar rite; and four vicars apostolic of the Syro-Malabar rite in India.

The Uniate Churches of the East.—All that has been written so far on the local organisation of the Catholic Church applies only to the Western Church and the Latin rite, which include the vast majority of Catholics. But there are also a number of so-called Uniate Churches in full communion with the Holy See, but organized separately. These do not represent, as is often thought, any sort of compromise or intermediate position between Western Catholicism and the various schismatic or heretical churches of the east. All the Uniate Churches accept the full Catholic faith and are in matters of doctrine absolutely at one with Rome. They all accept in its fulness the primacy of the Holy See and are subject to its supreme jurisdiction. In each case the Uniate Church is made up of those faithful ones who have refused to follow the great body of their fellow countrymen into heresy or schism, and they retain their old privileges and represent the church of that district or country as it would have been had the schism never occurred. In no case, however, has the succession from the ancient hierarchy been preserved, but a new hierarchy has been instituted from Rome, with the old titles and privileges, and with the preservation of the ancient rite. The object aimed at by Rome in instituting a Uniate Church is not the Latinizing of the ancient rites, but the union of hearts in the one faith, and under the one primacy of the Holy See.

Religion in the East has always been far more a matter of nationality than it has in the West. It has been found impossible therefore to carry out the strict system of territorial jurisdiction which obtains everywhere in the West. In the East the churches are distinguished rather by nationality, by language, and by rite than by locality, and in consequence there is a system of interpenetrating jurisdictions which make it very difficult to explain clearly the plan on which the various Uniate Churches are organized. There are, for instance, at present seven patriarchs of Antioch, of whom three are schismatic, but four are in communion with the Holy See: the Latin patriarch, whose position is merely titular, originating during the Crusades and who resides in Rome; the Melchite patriarch, the Syrian patriarch and the Maronite patriarch. These last three each have jurisdiction over the Catholics of their own rite only.

The Uniates in Europe are more or less directly subject to the general system of the Catholic Church. Those in Asia and Africa, however, since the rights of the patriarchates have been preserved, enjoy greater autonomy, being ruled by the Holy See mainly through their respective patriarchs.

Exact statistics of the various Uniate Churches have always been very difficult to obtain, and the task is now harder than ever on account of the political changes which have followed on the War in Eastern Europe and in Asia. The total number of their adherents is probably somewhere about five millions, of whom the greater part belong to the Ruthenian Church. Their organisation too is very varied, some being under the local Latin bishops, some under a hierarchy of their own independent of the local Latin hierarchy; and some under the sole jurisdiction of their own patriarchs. The clearest way to exhibit this complicated system of jurisdiction is probably by a classification according to the rite employed.

1. **Catholics of the Byzantine Rite in Europe.**—These are to be found for the most part in the territory which at one time belonged to the Turkish empire in Europe at the time of its greatest extension, and which later belonged to Austria-Hungary. They use the Byzantine Liturgy.

a. *The Ruthenian Church.*—This is by far the most important of the Uniate Churches and is said to number between three and four millions. It is however but a fragment of the great body that gave in its adhesion to Rome in 1596, at the Synod of Brest in Lithuania; an adhesion which later on was completed in 1700 and 1702, after a bitter resistance, by the submission of the dioceses of Lemberg and Luzk. The larger part of these Catholics were in Russian territory and were forced to unite with the Orthodox Church of that country in successive persecutions in 1795, 1839 and 1875. At the present time Galicia and Hungary hold the greater number of these Uniates. In Galicia they have an independent hierarchy under the archbishop of Lemberg, with two suffragan sees at Przemysl and Stanislawov. In Hungary there are two bishoprics of the Ruthenian rite, but they are under the Latin archbishop of Gran. In Yugoslavia the Ruthenian bishop of Koros is under the Latin Archbishop of Agram. The liturgical language of these churches is Old Slavonic.

b. *The Rumanian Church.*—The Catholics of the Byzantine rite in Rumania, who number about 1,000,000, have their own organisation under an archbishop at Agaras, with three suffragan sees.

c. *Russia.*—The Uniate Ruthenian Church in Russia was finally extinguished by Alexander II. who put an end to the only diocese which still survived, that of Chiem, and forced all its adherents to join the Orthodox Church. There is at present no organisation for any Catholics other than those of the Latin rite existing in Russia, and those Russians who desire to live in union

with the Holy See have for the most part been obliged to accept the Latin rite for their own protection. But it is very difficult to obtain really trustworthy information as to what is the exact state of affairs on this point under the Soviet Government.

d. In *European Turkey* and in *Greece*, Catholics of the Byzantine rite are only found in small and scattered communities, who are under prelates known as "Ordinaries." In *Bulgaria* they are now under the Latin hierarchy, though formerly they had two vicars apostolic of their own.

e. In *Italy, Southern Italy* and in *Sicily* there are considerable numbers of Catholics who belong to the Byzantine rite, the descendants of a more numerous body who have been there since the 8th century. At the present time they number altogether between 50,000 and 60,000. They have no bishop of their own with territorial jurisdiction, but are under the Latin hierarchy. For the purpose of ordination however a titular archbishop resident in Naples is appointed by the Pope to ordain their priests. They have also a college of their own in Rome for the education of the clergy, St. Atanasio dei Greci, in the Via Babuino.

2. **Catholics of the Armenian Rite.**—These have never been very numerous. Before the war their numbers were estimated at 1,000,000; but in common with the rest of their nation they suffered much from Turkish persecution during the war and in the years which immediately followed. Their patriarch has the title of the patriarch of Cilicia. He has under him two archbishops, of Mardin in Iraq and of Sebaste and some twelve suffragan bishops. He has also jurisdiction over the archbishoprics of his own rite of Ispahan, and of Aleppo and the bishopric of Alexandria in Egypt. There is a well known Catholic Armenian monastery belonging to the Mechitarist monks at Venice, and another at Vienna, from both of which a great deal of good literary work has been done.

3. **Catholics of the Coptic Rite.**—There is a Catholic Coptic patriarch at Alexandria, with two suffragan sees at Hermopolis and Thebes. The number of Catholic Copts is not large, but is increasing. The patriarchate was founded by Leo XIII. in 1895. The Coptic liturgy is used.

4. **The Four Uniate Patriarchates of Antioch.** a. *The Melchite Patriarchate.*—The patriarch has jurisdiction over all the Uniates of Greek nationality in the Turkish empire. Under him are six archbishoprics and seven bishoprics. They are of the Byzantine rite, and the liturgical language is Arabic. There is a large seminary for the priests of this rite at Jerusalem in the Church of St. Anne, under the charge of the White Fathers of Cardinal Lavigerie. The patriarch draws his title from Antioch, but his residence is at the monastery of Ain-Traz in the Lebanon.

b. *The Maronite Patriarchate.*—The Maronites have their centre in the Lebanon. They are some 300,000 in number of whom only about 70,000 reside outside of the mountainous districts of Syria. The exact origins of this body are a matter of much controversy, but they are certainly the oldest of the Uniate Churches, even if their claim never to have been in schism or heresy cannot be substantiated. The Patriarch resides in the Lebanon and has under him ten bishops. The rite is Syrian, and Syriac is the liturgical language. But the original rite has been conformed to the Western practices much more than is the case with other Eastern Uniate rites.

c. *The Syrian Patriarchate.*—The patriarch resides at Mardin in Iraq, and has nothing directly to do with Antioch. He has jurisdiction over about 200,000 people, a secession from the Jacobite heresy. They suffered very much from Turkish persecution in the war and are consequently less numerous than they were. There are 3 bishoprics in Syria, and four in Iraq.

d. *The Latin Patriarchate* of Antioch is purely titular, and the patriarch, who is generally an Italian, resides at Rome.

5. **Catholics of the Chaldean Rite.**—These are under a patriarch, whose title is drawn from Babylon. He resides at Mosul, which is his own diocese, and has eight suffragan bishops in Iraq besides three in Persia, which last are under the archbishop of Urmia. This body also suffered very much from the Turkish persecution. Its numbers were formerly estimated at 50,000.

6. **Christians of St. Thomas** (Malabar coast).—For these Christians the claim is made that they come down directly from the mission of the apostle St. Thomas, and his tomb is venerated at Mylapur. In any case they are an extremely ancient body, whose history goes back to the early centuries. They are of the Syrian rite, and are governed, since 1895, by four bishops. Before that date they were under two Latin vicars apostolic. They number about 250,000 in all. (A. S. Ba.)

For bibliography referring to Catholic organization *see* Papacy, and Canon Law.

HISTORY OF THE CHURCH

In this section of the article attention is specially directed to the activity of the Roman Catholic Church as an organized society in relation to the human society of the State.

Thus considered the subject is conveniently divided into five sections. 1. The period to 313, of open war. 2. The period from 313 to the middle of the 8th century, of uneasy alliance with the State encroaching on the Church. 3. The period from the 8th to the 11th century. This is chaotic, and the relations of Church and State are variable, but generally the State as represented mainly by the petty nobles of Europe, has practical control. 4. The period from the 11th to the 16th century: during this there is again an alliance, but the Church is the dominant partner. Both the alliance and the dominance however weaken steadily. 5. The period down to our own time, mainly of rebellion of State against the Church, and of fluctuating alliances of the Church with different States.

A. **The First Period.**—As space forbids detailed treatment we must carefully expound the principles to be used in judging facts elsewhere more fully disclosed. Christianity was always unique; like the Jews, Christians were theocratic; but they were not confined to one nation. Pagans usually conceived of external religion as the business of the State. Thus the Jews were persecuted because they would not admit this secular authority in religion. This refusal the Christians maintained; they were ready "to honour the king," to obey the State in all secular matters, but religion was entirely outside secular control. Moreover they had none of the Jewish exclusiveness, but from the first were so active amongst the Gentiles that these very soon outnumbered the Jewish Christians. Thus the Christian Church was always a kingdom which refused authority in its own sphere to any other power, and was yet a kingdom that knew no boundaries. It was this that rendered inevitable conflict with pagan States, and difficulties with Christian States.

In this period three achievements are of importance. First the Church freed herself from Jewish prejudices, which many of her first members showed, and which would have hampered her expansion. Then she established her own independence of secular control in religion. Finally she developed the fundamental organisation inherent in her constitution as a true society, and necessary for her mission to preach Christ's teaching and to supply to men those means of eternal salvation which Christ had instituted. To sum up and to repeat the principles without which Christian history cannot be understood: the business of the Church is to help men to be eternally saved; this work is all-important, and in its performance of this supreme task the Church can recognise no earthly superior.

In the destruction of Jewish separatism the chief agents were the Apostles S. Peter and S. Paul. Others co-operated, and,—for some force must be allowed to the tradition attesting this,—even preached in parts so remote that they were beyond the practical control of the central authority. But S. Peter was undoubtedly the leader who first realized that the Church was to include all peoples, and S. Paul was the most active preacher to the civilised pagans of the Greco-Roman world. Christ intended the society of His followers to be world-wide. But after Pentecost the Apostles at first confined their preaching to the Jews. St. Peter, however, received into the Church a Roman, Cornelius, and his household. Shortly afterwards St. Paul began his missions to the pagans, and met with fair success. The presence of this Gentile element led to a dispute on the obligatory force of the Jewish law. This dispute was settled against the Judaisers by a Council

at Jerusalem in accordance with St. Peter's decision fully accepted by the others for whom St. James spoke.

This increased the hostility of the Jewish leaders. Their opposition led to the first contact between the Church and the State. At Thessalonica, for example, the Jews renewed against the Christians the accusation of their priests against Christ that His teaching was treasonable because it recognised another king than Caesar. At first indeed the State took no action conceiving of the whole affair as merely a strife about some Jewish rites. But the Jews were in disfavour themselves, and gradually this disfavour was directed towards the Christians, to the pagans merely the outcasts of the outcast Jews. The first attack upon the Church was made to find scapegoats for the imperial misdeeds. But the persecution was renewed at intervals during the next three centuries. For convenience this almost persistent attack has been divided into ten persecutions, but actually there was one long struggle of varying degrees of bitterness. The test imposed upon Christians that they should worship the gods and the Emperor shows the true nature of the conflict. The pagan world could not allow the Christian "imperium in imperio." Christians on the other hand could not accept secular control of religion, and must either reject it unto death or cease to be members of the Christian society. Sometimes the imperial authorities tried to permit Christians to live unmolested, but always the persecution was renewed. Even under the most favourable Emperors, even under Gallienus (260–270) who recognised Christianity as a lawful religion, there were martyrs. Hence we can say that under the pagan Empire Christians knew little peace. As long as a temporal ruler could claim authority over religion the Church would always be in danger.

The final grim struggle came under Diocletian. That very able man tried to re-organise the Empire that he might save it. By 300 Christianity had many adherents, and Diocletian was persuaded that the decadence he was fighting was partly due to this. Hence he began in 303 to publish a number of edicts which led to the most bitter of the persecutions. The effort to destroy Christianity continued under his successors, who divided the imperial authority between them. Only in Gaul was there comparative peace under Constantius Chlorus. When his son Constantine fought for the empire, he relied somewhat on Christian help. His success in 323 led to the enforcement of his own Edict of Milan of 313. By this Christianity was given peace, a peace never afterwards openly broken, save under Julian the Apostate (361–363) who reverted to paganism. With peace came victory. Gradually paganism died out. The open war had been won by the Church.

During the struggle the Church in her reaction to successive crises had shown clearly that she was an organised society. The duty of unity between Christians was always recognised. Only by official membership of the Church could salvation be secured, and such membership depended upon the authorities of the Church. She was the Body of Christ, mystically but really; and only by union with that Body could a man be united to Christ. We can see this in numerous passages of the New Testament, especially in St. John's Gospel and in the Epistles of St. Paul; the same doctrine is prominent in the works of St. Irenaeus, in the Pastor of Hermas, in the writings of Tertullian, and perhaps most clearly in the works of St. Cyprian. It is evidently assumed in the practice of excommunication, the refusal of membership to great sinners, in the importance of Baptism, in the practice of Penance. This unity, moreover, was universal. By councils, by letters, by mutual prayer, the union of all Christian communities was constantly expressed.

The central authority inevitably acompanying this unity was always found in the pre-eminence of the Roman Church. The details of this authority may be difficult to ascertain from the evidence. But from the various controversies, especially from those in which the Roman authority was questioned, it seems plain to the writer that the community of Rome was the leading one of the Christian Church, and that only by union with it could a man be truly a member of the Church itself; and, further, that from Apostolic days, each community was ruled by priests, and that among the priests at least mere convenience caused one to be recognised as leader. This one was shortly called the Bishop, and to him the fullness of the priesthood was soon reserved. Thus the leader or bishop of the Roman community was the leader of the Church as a whole.

The heresies and difficulties of the first three centuries made even clearer the duty of unity, and the authority of the Roman bishop. By 300 it is perfectly certain that there was established a hierarchy of bishops, priests and deacons to rule individual communities. Unless we also recognise that these individual communities were also united to each other by the bond of their common union with Rome, we cannot understand such controversies as the Montanist, the Quattuor-Deciman, the Novatian, or the discussion on re-baptism, nor can we hope to understand later history and the steady development of Roman authority. We may disbelieve in this unity and in its corollary the authority of Rome, but as historians we must admit that these doctrines were believed from the beginning.

B. **The Second Period.**—We cannot treat fully of the peace thus established. So far the Church had resisted successfully an openly hostile State which expressly attacked the Christian Revelation. Now the attack was subtler. As gradually paganism was destroyed, and ultimately made illegal, the temporal rulers, being themselves Christian and accepting the basic Christian principle that God had revealed Himself, tried to intervene in doctrinal disputes. Though the rulers of the Church always saw in this attempt disloyalty to Christ, this was not realised so clearly by everybody. Consequently the State was able to make the effort, with at times apparent chance of success.

During this period certain developments occurred. Since much of the Imperial effort to assert authority consisted in supporting faulty expressions of Christian doctrine, the Church's resistance led to a clearer understanding and a more definite expression of those doctrines. Thereby moreover the authority of the Church as the sole authentic exponent of Revelation became more manifest. The great heresies of the period may be divided into three groups. There is first the group which led to discussion of the Trinity and the Incarnation. These heresies are obviously akin. Arius in trying to simplify the doctrine of the Trinity destroyed it, by denying true divinity to the Second Person. The refutation of this error led naturally to discussion of the Third Person. Once the doctrine of the Trinity was safeguarded discussion easily arose on the Incarnation of the Second Person. Re-action against denial of any true divinity to Christ led easily to a virtual denial of true humanity. When these heresies, despite State support, were all refuted, not only did the doctrines attacked stand out the clearer, but there was inevitably a surer recognition of the majesty of the Church, founded by the Incarnate God, His Mystical Body, which spoke in His name and by his authority.

In the West two heresies contributed to the Church's development as we are studying it. Donatism focussed attention on the Church's very organisation and on her Sacraments, whereby she fulfills her work of sanctification. Its refutation,—though here the State played a more beneficent part—brought out very clearly the essential unity of the Church under the authority of the Pope. Then the Pelagian and kindred controversies caused the better understanding of the life of grace within the soul to foster which the Church was founded. Thus these two heresies helped to clarify men's ideas on the Church as a society independent in her own sphere; and on the work that was hers to do.

Against each heresy the authority of Rome was ultimately decisive. Though St. Athanasius, St. Cyril, St. Augustine, St. Sophronius and others were often the most active champions against error, though on rare occasions the Pope himself was over-cautious or hesitant, ultimately the rejection of heresy was due to the leadership of Rome and to veneration for the unsullied faith of that Church.

Further the State being Christian paid great respect to the rulers of the Church. These therefore began to acquire a temporal authority they had not before enjoyed. By actual law they were at times even temporal magistrates in their own cities. Thus as they always exercised spiritual authority, and as sometimes

temporal authority was added to this, the bishops in many cities won a traditional position which when Imperial authority declined in regular efficiency made the bishops the chief rulers of their own districts. Great bishops increased the force of this tradition. The most notable example outside Rome is St. Ambrose at Milan. But it was at Rome that the development was most marked. By founding Constantinople and making it the centre of government Constantine could not destroy the tradition of centuries whereby Rome was ruler of the world. Gradually within the city the secular authority of the bishop, as a kind of Imperial representative, became paramount. He organised taxation, social works, administered law, even at times entered into treaties with the barbarians who invaded Italy, acted as spokesman of the people to the Emperor and of the Emperor to the people, and occasionally even had to provide for the military protection of the city. The majority of the popes were as worthy of their high position as could reasonably be desired. Two however were specially eminent, St. Leo the Great (440–461) and St. Gregory the Great (590–604).

As the Empire weakened under the pressure of new dangers and owing to the inevitable decay that besets all human institutions, especially after the disappearance from 475 of a separate Western Empire, this temporal authority of the Church was gradually greatly increased. The Imperial power weakened in the West, and the people, in their desperate needs arising from the chaos consequent upon the barbarian invasions, looked more and more for help to their immediate guides and rulers. This was peculiarly so in Rome. The theological disputes not only widened the breach between East and West but increased the veneration of the West for the Papacy. The popes, by now manifestly the rulers of the Christian Church, joined in their persons the majesty of the Christian Kingdom and the glamour of the old Roman Imperial traditions.

From the 5th century the coming of the barbarians which affected mainly the West, contributed greatly to the development of this ecclesiastical power. Of these barbarian tribes the majority were converted to Arianism. Hence they never established any alliance with the Christian Church. But the Franks who had conquered Gaul, were converted to Christianity, and from the 5th century close relations existed between them and the Holy See. The Lombards who were the last to occupy Italy were difficult to convert and to civilise. They did not as their predecessors the Goths had done, pay even nominal respect to the Empire. From their coming in the 6th century they were a ceaseless anxiety to the people of Italy and a danger to Roman civilisation.

Meanwhile in the East a new enemy had appeared in Mohammedanism. In Africa the Mohammedans established themselves and from there advanced against Southern Italy, Spain and threatened even Gaul. The centre of the Empire Constantinople was itself disturbed by them, and by other Eastern enemies. Thus Europe at the opening of the 8th century was in a desperate plight. Roman civilisation was not indeed destroyed, but it was weakened and in danger. A new and terrible enemy was threatening it and threatening also the Christianity which alone could save traditional culture. The Empire was only nominally one; in the West its authority was nowhere more than nominal, and over the greater part of the West it has disappeared entirely. But at the same time the essential unity of the Church was more clearly recognised, Papal authority had been put beyond question, fundamental Christian doctrine had been clearly expressed and heresies averted. Thus, especially in the West, the one hope lay in this power of the Church; she alone exercised universal authority, she alone was capable of transmitting to the anxious future the civilised traditions of the past, in her the glory of Christianity was joined to the splendour of Roman tradition.

The 8th century saw the inevitable happen. One last heresy came to sunder East and West. The emperor Leo the Isaurian in extreme reaction against the excessive veneration of images in the East, went too far and rejected all such veneration. This error was naturally condemned by Rome. At the same time the Lombard troubles were increasing and the emperors were doing nothing to help. But among the Franks, the old allies of the Papacy, had appeared a family of marked ability, which controlled the nominal rulers. In 732 one of this family, Charles Martel, overthrew the Saracens at Poitiers in France; this victory saved Christian Europe. Thus the Franks already devoted to the Holy See, were under the leadership of this family of Pippin showing themselves to be the military saviours of Christendom. Moreover they were helping the Englishman St. Boniface to widen the boundaries of Christendom by his evangelisation of the Teutons. By 752 Pippin, the son of Charles Martel, was so powerful that it seemed absurd to refuse him royal authority. Before making the change however the Franks applied to Pope Zachary for sanction. This was due to their veneration for Rome and their desire to secure the security of religious authorisation for their new ruler. In return for Zachary's support, Pippin came to Italy and reduced the Lombards to order. He also recognised the Pope as temporal ruler of the lands around Rome which he had saved by force of arms. This Frankish intervention was continued by Pippin's son Charlemagne. At length in 800 the Pope Leo III., accepting facts, crowned Charlemagne successor in the West to the old Roman emperors. Thus came into being the Holy Roman empire. It was a mere recognition of the fact that in the West the Eastern Emperors no longer exercised real authority, and had by their heresies forfeited even respect, whereas the Franks were the effective rulers of the West and had by their services to Christendom deserved well of the Christian people.

Before discussing the consequent changes in the relations of Church and State we must summarise. After defeating the attempt of the State to stop belief in Christ, the Church had had to defeat the State in its effort to interpret that belief. This conflict combined with political and social difficulties did not indeed lead as yet to a final religious breach of East from West—for the Iconoclast controversy came to an end—but it prepared the way for such a breach, and resulted in actual political division. Meanwhile the officials of the Church, especially the pope, had by force of circumstances acquired temporal power. New states were being formed in the West. Of these the chief was the Frankish kingdom. This kingdom had always shown great veneration for Rome mainly as the repository of Christian and Imperial traditions. Finally the Roman empire and its traditions were saved in the West by the transference of imperial authority to the Franks, the actual rulers of the West. However altered, the Empire was still an empire, and a Roman empire.

One other point must be mentioned. When the Vandals were destroying Roman civilisation in Africa pagans saw in this a punishment for desertion of the gods. To answer them the great St. Augustine composed *The City of God.* In this work he expounded Christian theocratic teaching. The book itself, and later elaborations of it, produced a conception of the Church which can be summarised: Men are destined for supernatural life in eternity; those who have attained to this and those who are in possession of sanctifying grace, which enables them to merit this salvation, form the city of God; on earth these citizens are grouped into the Church, the city of God on earth, ruled by Christ through his Vicar; the work and interests of this City are paramount, transcending in importance all earthly welfare. With this conception the Holy Roman Empire came into being.

C. **Third Period.**—The exact relations between pope and emperor after the establishment of the Empire are of slight importance. The Empire as such ceased to be of importance shortly after its founder's death, and did not recover for a century. Only the tradition endured as an ideal. In its inception the Empire was intended to be the continuation of the old Roman empire, and the Protector and co-ruler of the Christian world with the papacy. The Christian Civitas of S. Augustine was to have a temporal ruler and a spiritual, each to govern his own affairs, each with a certain divine sanction, and the temporal was to give the spiritual that protection it needed in this turbulent world. The further relations of the two were left ill-defined. Naturally during the lifetime of Charlemagne his great personality made him the dominant partner in practice. But in theory there was no subordination of the Church.

His descendants declined in power. During the next two centuries Western Europe broke up into three great sections. First

there were the true Franks, the inhabitants of ancient Gaul, who formed the Western part of the empire. After many vicissitudes this section came under the rule of the family of Hugh Capet, and the Carolingian line disappeared. For all practical purposes this change removed France from the empire. Secondly there was the Eastern section of the empire. Though this included the Rhine basin, and therefore was partly Roman in tradition, its boundaries had been extended to the east. Hence it also included many peoples who were alien to that tradition and had only recently been converted. This section too passed from the Carolingian line. But by a freak of fate, through the greatness of its Saxon rulers and their successful intervention in Italy this least Roman part of the empire became the centre of it. Thirdly there was the Italian section. This was perhaps more Roman even than southern France, but it never established its permanent independence of the German Emperors. In addition there was a fourth section of little general importance. Between France and Germany there stood the varying Middle Kingdom, chiefly a buffer and disputed State. England and Spain were outside the empire, but recognised the universal authority of the Papacy.

But these great divisions do not represent effective centres of authority. Under the Saxon kings the German monarchy was reasonably strong. But even they were compelled to assert their authority especially on the borders of Germany, and in Italy, where they had but the shadow of power save when they visited it at the head of an army. Real power was localized, and individual nobles, lay or spiritual established themselves as the effective rulers of a district, paying a respect to central authority that varied with circumstances. Rome itself fell into the hands of the nobles whose large estates outside Rome gave them pre-eminence within. Feudalism was beginning, and feudalism is roughly a system which identifies ownership of land with rule over it. The Pope therefore was often but the creature of the most powerful noble. This break-up of society, and destruction of effective central power resulted in loss of civilisation, in a constant appeal to immediate force, in ineffective law, and in an alarming moral decadence.

The trouble was aggravated by the activities of the Scandinavian pirates who from the 9th to the 11th centuries were an almost annual source of disturbance.

We must realize that nevertheless the Church remained the most vigorous influence for civilisation in Western Europe. It was this that enabled her later to establish so strong a power. Churchmen were often as bad as their lay fellow-Christians, and therefore more reprehensible. But the actual machinery of government in the Church preserved better than any other institution the traditions of unity and of central authority. Moreover it was Christian teaching that gave rise to all efforts at reform. Sometimes it led to what may seem to us excessive asceticism, but this was at least better than the excessive self-indulgence prevalent, and was perhaps a necessary counter-balance. Monasticism which had developed steadily since its re-organization by St. Benedict in the 6th century, afforded a shelter to those anxious to live in peace. At frequent intervals mainly from the monasteries, reforms were started which became very influential. The greatest of these movements was that of Cluny, founded in the 10th century. This movement owing to the influence of one of the Cluniac abbots, S. Odo, affected a temporary reform at Rome itself. But there were other revivals. In Germany the influence of S. Bruno of Cologne and the ability of the Saxon emperors led to a reform, ultimately of great importance. The Normans, the Scandinavians, the Slavs were all converted during this period. Finally especially in the 9th century certain great popes preserved the splendid traditions of the papacy. The most notable was St. Nicholas (858–867). As even lesser popes did not neglect their work the recollection of these great periods helped to keep for the papacy a dignity that its actual subservience to the nobles might have lost. It remained the central authority of Europe, and the hope of all who were working for reform.

Meanwhile the breach between East and West had grown wider. The ambitions of Photius led to a temporary schism, and though this was healed, there remained an ever-growing difference in outlook and in interests. This caused the papacy to concentrate on the West, and led the Western peoples gradually to identify themselves with the Church, and later facilitated the creation of the papal monarchy.

In spite however of the good work undoubtedly done by the Church the general tone even of churchmen was low. Immorality was rife even in monasteries; the clergy were often amazingly ignorant; such learning as there was consisted too much in the slavish retention of past thought; law was almost non-existent effectively; and peace was almost entirely dependent upon the direct use of force. The Church was riddled with pluralism, simony and nepotism; clerical celibacy was an almost forgotten ideal; many of the higher clergy were merely rough warriors or ambitious schemers, the creatures of their lay backers. In such circumstances civilisation, culture and peaceful industry were almost impossible. The crowning evil was that the very class that should have raised the moral standards by their teaching and example was so entirely under lay control, that little could be expected of it. The separatism of political power, and the use of direct force made lay rulers all important in the choice of ecclesiastical authorities. Until this power was broken, no reform could attain success. Once lay support was withdrawn reformers became powerless. We see this at Rome where Alberic's death led to the cessation of Cluniac influence, and in England where St. Dunstan, so influential under Edgar, became so powerless under Ethelred that he had to bribe that king to refrain from arbitrary violence against the see of Rochester.

This was the state of affairs when there arrived in Rome the men who were to end it. The papacy under Benedict IX. had reached its lowest degradation. Germany was then ruled by a good and capable king, Henry III. He invaded Italy to assert his Imperial authority, and to end the scandals in the papacy. By high-handed action he ousted all claimants and began to appoint German Popes. This effort of 1046 like earlier ones would have failed, had it continued to depend upon Imperial support. But the third German pope was St. Leo IX. He was a man of remarkable ability, who, helped by the young monk Hildebrand, began the formation of a party of reform in Rome itself. This party, subsequently led by Hildebrand, was able to free the papacy from dependence upon any individual power, and by full use of its spiritual authority, to enable it to assert its active control over Europe so effectively that it began the great revival of the 12th century.

During this third period then the Church, more and more confined in practice to the West, had in spite of the political chaos and the consequent moral decadence, maintained its unity, and the papacy, in spite of its dependence, had maintained its authority. Once this papal power fell into the hands of a man of genius it was capable of leading Europe, and of re-establishing the old traditions of civilisation.

D. **The Fourth Period.**—This is the most important of our periods, for during it the status of the Church as a society is definitely established. Protestantism did not affect the Catholic doctrine on the constitution of the Church; this owed nothing of its development to the attacks of the Reformers. The chief modern development, the definition of papal infallibility, was an answer rather to mediaeval errors.

St. Leo showed at once that he was not content with imperial nomination; he therefore insisted on election. But apart from this his pontificate and that of Victor II. were spent mainly in promoting definitely clerical reforms. By Victor's death there was at Rome a strong party of zealous reformers under the leadership of Hildebrand. Further, the movement towards reform directed by Rome had spread throughout Europe; allies had been found who though helpful would not be domineering; the Roman nobles had been suppressed, and papal temporal authority in Rome restored; finally papal finances had been reorganised. All this was mainly the work of Hildebrand. The Eastern Church also had at last broken from communion with Rome. This lamentable defection still further confirmed the identification of the Latin patriarchate with the Church, which so encouraged the formation of the Christian kingdom.

During the reign of Stephen IX. (X.) attention was expressly directed to the evil of lay control over Churchmen. In this control Cardinal Humbert in his book against simony found the main source of the prevalent evils. The minority of the new German king, Henry IV., and the consequent intrigues taught the same lesson. The systematic government of the Church would tend to keep the reform active, providing bad appointments did not take place. But such appointments would certainly be made if lay control continued since there could be no guarantee against bad or weak lay rulers.

The work already accomplished had started the necessary reforms within the Church. But these, especially clerical celibacy and the suppression of simony, were being bitterly resisted. As the young Henry grew older he chose the worst advisers, and fostered the evils that Hildebrand and his friends were determined to destroy. In 1073 Hildebrand himself was forced to become pope. He chose the title Gregory VII. After warning Henry he solemnly excommunicated him. This act, unprecedented for centuries, startled Europe. That the emperor designate, the temporal ruler of the Christian kingdom, should be expelled from that kingdom, forced men to ask which was the true authority over the Church. This was the issue at stake; the investiture difficulty was merely a practical presentation of the problem. In addition to the power of ruling a ruler must have jurisdiction, *i.e.*, must have subjects assigned to him. Though nobody thought that a lay ruler could ordain or consecrate, the practice of lay investiture suggested that he was the source of jurisdiction. Thus this practice gave lay rulers practically the right to appoint spiritual authorities, and this rendered numerous bad appointments inevitable. To combat this evil, which led to so many others, St. Gregory condemned lay investiture, and when Henry persisted in it excommunicated him. The struggle continued with varying fortunes till 1122 when by the Concordat of Worms the papacy under Calixtus II. secured the victory.

This Concordat is usually called a compromise. On the question of investiture itself it is indeed a compromise, but on the wider issues at stake the struggle had ended in a papal victory. The object of the Hildebrandine movement had been the reform of European society through the reform of clerical life. This end was reached: we have but to compare the Europe of Benedict IX. with that of St. Bernard to see this. Abuses indeed remained; as long as men are men the cockle will grow with the wheat. But the general tone of Europe was incomparably higher. Again though in the concordat the papacy had modified some extreme claims, it had lost no right that it had actually possessed; but the emperor had lost much. The papacy was free; never again did an emperor successfully make and unmake popes as Henry III. had done. Though also the popes recognized the emperor's right to homage from clerics and allowed him therefore a supervision of elections even in Germany this was merely a supervision.

The real weakness of the concordat is that in that age of personal influence little value was attached to any document. A written decision would not necessarily be effective. Consequently the concordat was no secure guarantee for the future. Moreover though the empire claimed universal rule, its effective power was at best over Germany and Italy. Elsewhere in Europe therefore the concordat had no value at all, save as a precedent for similar difficulties.

Thus after defeating the State in its open effort to control the souls of men the Church led by the papacy had prevented the State from direct intervention in religious matters; later temporal rulers had been able to usurp a practical disciplinary control over ecclesiastical authorities. At length the papacy had asserted itself, used its universal authority, manifested the unity of the Church and vindicated its supreme power over the souls of men. Christendom is one society, and in that society the spiritual authority is paramount because of its greater dignity, and the far greater importance of its work. In any difficulties between spiritual and temporal rulers the spiritual must be the judges, for without treason to Christ they may not permit anything earthly however important to interfere with the work of salvation. If therefore the rulers of the Church—even mistakenly—judge that this work is hampered by some temporal policy, loyal Christians must abide by the decision. Before this these truths had been believed and taught, but they had never been given so clear a practical expression as during the investiture struggle.

After the concordat there was a short interlude. The papacy consolidated its position under the influence of St. Bernard. Frederic Barbarossa however on coming to the Imperial throne began a reaction. In his desire to re-establish fully the Imperial authority he wished to abolish the recently asserted clerical independence. Moreover papal temporal power had been extended. Various feudal claims had been made, and some were recognized. The Countess Matilda of Tuscany had left her great possessions to the papacy, and it was at least tenable that the bequest was lawful. On these bases there had been growing at Rome a tendency hardly expressed, to claim feudal authority over all princes, even over the emperor. This papal tendency, and the actual papal temporal power, was obviously even more opposed to Barbarossa's ambitions than clerical independence. Consequently there is in the ensuing struggle much justice on the Imperial side. But Frederic's appointment of an anti-Pope and his excessive claims justified the vigour of Alexander III.'s resistance to him. In 1177 the Peace of Venice settled the dispute roughly in favour of the Church. The independence of the papacy in its rule of the Church had again been vindicated, and the claims to feudal authority though left in abeyance had not been finally abandoned.

The early death of Frederic's son Henry VI. saved the papacy from a severe struggle, and the election of Innocent III. brought the papacy to its maximum power. Innocent, a man of high ideals and of great ability, was the guardian of Frederic II., Henry's youthful son. The pope secured for his ward his Sicilian inheritance. But he definitely excluded him for some time from the empire, which he rightly declared was not hereditary. He further declared that the papacy was even temporarily the superior power: the popes had founded the empire in the West; they made a king emperor by crowning him; therefore they had the responsibility of seeing that the emperor designate was worthy, before they could conscientiously give to him the authority that was in their keeping. Innocent therefore claimed a right of veto, which was almost equivalent to the right to appoint. This claim fortune and his own ability enabled him to make good. The situation of Henry III.'s days was almost exactly reversed. Elsewhere also Innocent claimed a right of supervision over princes even in temporal affairs. This, though it goes beyond St. Gregory's explicit claims, is consistent with them, and even their logical sequel. Any temporal action may affect the spiritual destinies of men and may therefore come within the province of the supreme spiritual authority.

On Innocent's death new troubles arose. Frederick II. no longer a minor showed himself able, ambitious, and unscrupulous. The main source of dispute was his revival of Barbarossa's schemes despite his oaths against such revival. But as the conflict progressed, he apparently claimed even supreme spiritual authority; he certainly arrogated some spiritual supremacy. Gregory IX. the first pope to oppose him was succeeded by Innocent IV. Innocent's methods were deplorable, and the bitterness of the struggle alienated sympathy from both parties. Ultimately Frederic's death enabled the papacy to secure a Pyrrhic victory. The subsequent extinction of the Hohenstaufen family (that of Barbarossa), though the papacy was probably not responsible for the crime, made the empire no longer a serious rival to the papacy for universal rule. However, the long bitter struggle, its ferocity, its intrigues, the financial exactions necessary for its maintenance had cost the papacy much of its prestige. The Italian successes of Charles of Anjou, the rising power of French nationalism, and the growing French influence at Rome itself indicated where the next difficulty was to be. When there was under the empire some shadow of universal temporal authority, Innocent III.'s solution of the problem of the relations between Church and State might have been made practicable. But the formation of nations made a new solution necessary.

The new difficulty first became acute under Boniface VIII. His hostility to the French, his tactlessness, the reasonable claim of

the French king that the clergy should support financially the Government whereby they benefited must not blind us to the extreme claims at least suggested by the French. The French court wished not merely to obtain temporal freedom of action but to secure control of spiritual authority and to use this control in their own interests. The attempt failed. The death of Boniface, and the comparative subservience of subsequent popes to France, did not undo the real work of Boniface himself. He had saved the spiritual authority of the papacy, and at the very end of its temporal dominance had clearly defined the meaning of that spiritual authority. The bull "Unam Sanctam" declared that subjection to the Roman Pontiff was of absolute necessity for every man who desired salvation. The body of the bull elaborated this doctrine and made it plain that where spiritual welfare was concerned temporal interests must not only be set aside, but temporal authority must even be used to further that spiritual welfare. This declaration was necessary in view of the extreme statements of French legists, as Dubois, and in view of the practical actions of Philip IV. of France, which had tended to obscure the papal spiritual supremacy by the attack on its temporal influence. This temporal hegemony was gone. During the 14th century the popes resident at Avignon under French influence steadily lost their former prestige.

This became clear when Gregory XI.'s death at Rome permitted an election free from French influence. An Italian, Urban VI., was elected. Shortly afterwards the French party declaring the election invalid chose Clement VII. Clement was certainly an anti-pope; whatever personal faults Urban had, his election had been valid. The chief cause of the schism is undoubtedly to be found in the extreme nationalism of the French cardinals. This unhappy division lasted from 1378 to 1417. During it the various theories of Church government and of the relations of Church and State that had been formulated during the 14th century crystallised into the Conciliar theory. The old Imperial ideas had been maintained by Dante and others, and had received heterodox development from such men as Marsiglio of Padua, and the extreme Spirituals among the Franciscans. They had all involved some subordination of the papacy, or at least some check upon its power. In a desperate effort to end the scandal of the schism a few theologians developed this idea into the Conciliar theory of Church government. According to this the pope was not absolute but dependent on a General Council. Though the theory was merely the result of desperation thanks to the emperor Sigismund and the reasonably good co-operation of the Roman pope, Gregory XII., the Conciliar party succeeded in gathering the Council of Constance. Here after Gregory had resigned and the anti-popes had been deposed, Martin V. was elected. He rejected the Conciliar theory and though it was maintained for a time by a few, it steadily declined.

During the next century the licence of the pagan Renaissance, and the general decadence of morals still further harmed the reputation of the papacy. Many of the popes themselves were too affected by the general materialism. But save by the Hussites in Bohemia their spiritual authority was not seriously questioned. The most significant feature of this century from our point of view is the extension of the policy of individual arrangements between the papacy and the nations. Martin V. himself at Constance had followed this policy. The two Pragmatic Sanctions of Bourges and of Mainz though not concordats and though rejected ultimately, represent the same tendency. The constant political work into which the papacy was drawn caused further loss of prestige. But at the same time this very political activity testifies to the survival of the papal spiritual authority. Its mere temporal power could never have given it so great an importance.

Thus by the beginning of the 16th century extreme solutions of the problem of reconciling the universal authority of the Papacy over the Church with national sovereignty seemed to have been set aside. The Conciliar theory had left its marks, but had been itself destroyed, extreme nationalism had been beaten in Bohemia, the more extensive claims of the papacy to a right of interference in national affairs had been checked by anti-papal legislation in different countries, and by individual concordats. The solution of the problem might have seemed to be merely a matter of time. At this moment however the rise of Luther and the coincidence of other unexpected events led to the revolt from Christian unity of a large part of Europe, and postponed the solution.

E. **The Fifth Period.**—At the opening of the 16th century there occurred a coincidence of events that defied anticipation. The abuses that undoubtedly existed within the Church had occupied the minds of right-thinking men for many years; slowly, but surely, they were being checked. Unfortunately they were still so patent as to give occasion to rebellion. But the rebellion when it came was almost fortuitous. Genius defies all laws, and the greatest Protestant leader had genius. Luther might have been as unsuccessful as many of his predecessors but for his amazing popular appeal. His robust vigour, his deep knowledge of human nature, his eloquence and intellectual energy, make him one of the great figures of history. The Catholic will naturally judge that these gifts were abused, but no sane historian can deny their existence. To discuss his motives would lead one into controversy. Leaving them aside, we must record that in the early 16th century he led a revolt against the Church. This revolt, so successful thanks to his ability, gave immense help to other malcontents. At the same time another event occurred, which was beyond anticipation. Henry VIII. of England, enjoying the absolute authority bequeathed him by his father, found motives for questioning the authority of Rome. Again there can be no short uncontroversial discussion of these motives, but all must admit that merely personal desires went to their making.

These two revolts found allies in those tendencies to rebellion that would otherwise have been leaderless. The abuses of ecclesiasticism, the adventurous impulses of the Renaissance, the ease with which ideas could be spread thanks to the discovery of printing, the loss of prestige which the papacy had suffered, all now combined against the Church. The Reformation had come.

From the Catholic point of view, the notable feature of the Reformation is that it postponed a general solution of the problem of the Church's relations with political states. The problem had become acute with the disappearance of even the ideal of political unity. The 14th and 15th centuries had seen the removal of extreme solutions. The Reformation diverted nationalism from the path of reconciliation, and forced the papacy to stress its universal authority. Naturally the revolt against the papacy where it was successful led to a nationalist conception of religion. There were indeed further extremists whose religion was entirely personal but generally in Protestant countries nationalism prevailed.

Meanwhile in Catholic countries the movement for reform which had existed before Protestantism, acquired new vigour, but was given a narrower orientation. Hence it is usually known—very inaccurately—as the Counter-Reformation. To call it this is to concentrate merely on one of its activities. However, once Protestantism had appeared, Catholic saints and reformers devoted themselves mainly to its refutation and defeat. The Society of Jesus, which was founded with no reference to the Reformation, and which maintained a remarkable activity in every direction, gave special attention to the fight against Protestantism. The Council of Trent which represented a movement older than Protestantism, and which initiated many reforms, was largely busied with Catholic defence against the Reformers. The unity of the Church had to be asserted vigorously, a stricter uniformity, even in non-essentials, had to be imposed to safeguard that unity. Though this was necessary it had the casual effect of re-arousing the extreme nationalism which had seemed in the preceding century to be disappearing.

Outside the Church the Protestant countries regarded loyal subjects of the Catholic Church as traitors to the new States which claimed absolute sovereignty even in religion. Also these new States naturally considered the Catholic States as enemies to their own national existence. Hence arose the wars and persecutions which make the history of the period so melancholy. But at least this atmosphere of strife roused Catholic fervour, and the 16th century is crowded with great saints. Gradually this increased fervour and the political superiority of the Catholic States checked

the revolt. It would be unfair to stress the part played by war and intrigue. After the first blows, violence did not succeed notably in affecting the religious situation.

Thus by the end of the 16th century the movement had come to an end. Northern Europe had broken away from Catholic unity, and southern Europe had remained loyal. The relations of the papacy with Protestant States can be dismissed shortly. They were openly hostile, and the papacy at first, pursuant of its mediaeval traditions, encouraged Catholic princes to use force against its enemies. But as the futility of this became manifest the papacy was content to preserve the balance of power. The growth of Gallicanism made the popes even ready to favour Protestant States; these were already lost, but France was still Catholic, and its Catholicity was threatened by Gallicanism.

Towards Catholic princes it had already been clear that the papacy was adopting an individual policy, and negotiating separately with each State on non-essential points. Meanwhile even in these countries the spread of the Reformation and the growth of despotic monarchy revived the moribund nationalism. During the 17th and 18th centuries this assumed various forms. As monarchs were despotic and as the theory of the Divine Right of Kings established itself nationalism usually became tinged with Regalism, but always there remained at the basis the theory that though the pope was the ruler of the Church he was not absolute, but was subject to general councils. In France this spirit was known as Gallicanism, in Germany as Febronianism, in Austria as Josephism, in Italy and more generally as Regalism. There were shades of difference between them. Sometimes the views expressed might be almost orthodox; but from the Catholic point of view all were fundamentally vitiated by the tendency, always latent, usually manifest, to limit papal authority over the Church. In the 18th century these theories were very widespread, but they did not succeed in destroying fundamental Catholicism. For the history of the Catholic Church in England *see* the section IN ENGLAND AND SCOTLAND below.

The most mighty opponent within the Church of this nationalism was undoubtedly the Society of Jesus. The views of their great writers Suarez and Blessed Robert Bellarmine on political science did not meet with the approval even of Catholic kings. One of their writers, Mariana, whose views were repudiated by the Society itself, went so far as to advocate the assassination of tyrants who were manifestly oppressive and who could not be otherwise removed. Much of the difficulty between the Jesuits and their fellow-Catholics was due to this strong anti-nationalism. This is evident from many of the Catholic pamphlets against the Society published during this time. In the 18th century Regalism won a great victory, securing the suppression of the Society in 1773. This suppression was demanded by the enemies of the Church, and its actual accomplishment by the papacy can be defended only on the plea that the part must be sacrificed to save the whole. Still it seemed a victory for the infidels and their half-allies, the nationalists, in the struggle against the universal authority of the pope. How events might have turned out it is impossible to say. The French Revolution, though it had its causes in the past, was an unexpected and catastrophic event, and it was followed by the career of Napoleon, who, like Luther, was unforeseen, since genius knows no laws. Europe was thus thrown into the melting pot, and the nineteenth century saw the disappearance of many of the old tendencies, and the amazing recovery of the papacy.

Meanwhile the great geographical discoveries of the 16th century had begun to have their effect. By them immense lands were either discovered or opened up where Christ was not known. Missionary activity began to win to the Church new peoples far removed from the petty intrigues of Europe. Once more the Jesuits were the pioneers. St. Francis Xavier's work in Japan was followed up and a great Christian Church sprung into existence there. A persecution, whose length and severity recalled the days of the Roman Empire, almost destroyed this Church. In India, Xavier and others began the task of conversion. In China, Ricci and Schall are, perhaps, the most notable names. In North America, B. Isaac Jogues and in South America, Anchieta and Ruiz da Montoya are the chief leaders. In South America there was established successfully the great Mission of Paraguay, one of the most striking achievements of the age. In both Americas the colonisation by white men gave to the Church new districts which in size and wealth far exceeded Europe. Thus the Church under the Papacy found itself occupied with the whole world and no longer merely with Europe. This extension of the papal interests coincided with the entire disappearance from Europe of political unity. Moreover in these new lands there was little question of the Papacy's activities being other than religious. Finally when, shortly after the establishment of the United States, the Church, under the leadership of Bishop Carroll and others, began to advance in that great country, the change in the papal outlook was completed. Where before the main attention of the popes had been focussed on Western Europe, with an occasional distraction to the Eastern Church, where before they had consequently become involved in the political struggles—often so mean—that went on in Europe, from the opening years of the 19th century their attention was being more and more called to genuinely universal problems, their rule was truly world-wide.

The French Revolution and the Napoleonic crisis swept away the benevolent despotism of the previous century. However much it might be maintained for a time by the political skill of Metternich, the thing itself was doomed already even at the Congress of Vienna which seemed to be restoring it. The Revolutionaries had attacked both the old social order and the Church with such exaggerated violence as to win for both friends where before men had been indifferent. The very persecutions as usual brought the best to the front, and the Church began to win good opinions even from non-Catholics. Napoleon's violence against the pope continued this rehabilitation of the Church in the eyes of her former enemies. Especially in England, where the humanitarian infidelity of the 18th century had re-acted against religious persecution, the respect shown to the Holy See in its sufferings was remarkable, and the welcome accorded to the refugee clergy of France equally wonderful. The Catholic Church in this country began to be active once more and agitation for the full repeal of the penal laws set in. Elsewhere the opposition to the Revolution and to Napoleon had produced similar results. Thus when Consalvi represented the papacy at Vienna, though he was unable to secure the restoration of ecclesiastical States in Germany, he was able to win for the papacy respect for its own territories and able also to confirm the rising influence of the Church.

However nationalism was not yet dead. In Austria indeed Josephism had gone, but there remained weighing on the Church the deadening influence of State privileges and protection. In Germany Protestant Prussia was becoming the leader, and gradually extended its authority over the Catholic States. The opposition of the Church to the attempt to Prussianize all Germany led to that attack on the Church known as the Kulturkampf. This attack was made in the name of Culture against the supposedly reactionary ignorance of the Church. It is more fairly described as a war between the traditional culture of Europe maintained by the most traditional body in Europe and the new methods which in their attempt to extend learning were forgetting what had been already learnt. However until the World War the authority of Prussia was able to hamper the work of the Catholic Church in Germany.

In England after the Emancipation of 1829 the Church was left in peace and slowly made headway. The restoration of the hierarchy in 1850 and the brilliant and painstaking leadership of this hierarchy have since enabled the Church not only to increase her numbers but also to wield an influence greater than those numbers warranted. This is true also of the United States. Of course one reason for this in both countries is that, though a comparatively small body, the Catholic Church in each country is united and disciplined.

In France Gallicanism continued a steadily failing existence. It was from Gallican France that came the book which did so much at the beginning of the 19th century to help the revival of papal prestige—*Du Pape*, by Joseph de Maistre. The Revolution moreover had increased the infidelity of the previous century and

against this Christianity was engaged in a war to the death, a war not yet ended. Gallicanism thus could not stand. The somewhat sciolistic but brilliant controversy of Louis Veuillot, the revival of the Jesuits who soon became extremely influential again, the desperate pass to which the Church was brought at the time of the Commune, all helped to make the decree of papal infallibility the effective death-blow to Gallicanism. The subsequent repudiation of the Concordat with the French Government made the Church in France more vigorous than ever. At the same time the French Catholics have shown themselves generally too anti-republican on political grounds to be as politically effective as they might have been. However there are signs that this inactivity is ending. The recent affair of the *Action Française* is too fresh for any historical judgment to be passed upon it.

Turning to the papacy itself we find that at the opening of the century the papacy re-adopted even more fully the policy of Concordats. Throughout the century it has shown itself willing to make any possible concessions to national desires, in order to secure circumstances favourable to the spiritual activity of the Church. Especially was this notable in Russia, where the heretical Government was allowed an extraordinary control over clerical appointments and discipline. The development of the supposed hostility between science and religion which was a feature of the 19th century led those blind to the signs of the times to regard Catholicism and the papacy as out-of-date, obscurantist, and doomed. The spirit which animated so many led them to conceive of themselves as the ultimate judges of everything; dazzled by the advances in mechanical and scientific knowledge, they lost their heads and decided that everything old was wrong and the new only was right. This was merely a passing phase. Throughout the century the papacy was steadily gaining. The decree of papal infallibility came at the right moment. However much some of the finer minds might wonder about its opportunism, the courageous and clear declaration of the doctrine inherent from the beginning in the Catholic conception of the Church and of the papacy was needed. The papacy had disentangled itself from the sordid politics of Europe. It stood outside the scheming warring States of the Continent and made its moral appeal to the world as a whole. This was always its true position, sometimes unfortunately obscured. The decree made clear that it was and is in virtue of its spiritual authority—because only by union with it could a man secure membership of the Church, only by submission to it could a man avoid error on matters concerning the Christian Revelation—that the papacy has commanded the obedience of men and has attained to its great position. All this was clearly brought out by the decree, just at the moment when its world-wide authority so evidently not based on mere political position or scheming made such a manifestation desirable.

Almost as a commentary upon this fact, the very year of the decree saw Italian nationalism under the House of Savoy forcibly deprive the papacy of its temporal authority.[1] Yet this deprivation in no way lessened its authority. Rather it has from then onwards increased its prestige so much that during the War even those who did not recognize its claims seemed to expect it by some kind of inspiration to decide a practical problem insoluble in default of evidence. Many States who reject its claims have followed this up by securing representation to it, since they must admit its actual authority.

The Christian Church had begun by defeating the open attack of the State on revealed religion. It had then combated successfully the attempt of the State to control that Revelation. Then its organisation had fallen under the practical control of the State, and had been therefore hampered in its work for salvation. Freed from this dependence, it had worked in uneasy alliance with the State which still preserved some sense of complete political unity. As that disappeared, the Church found herself under the necessity of coping with many States that she might be free to carry out her duties arising from Revelation. This problem is still with us.

(H. HN.)

[1]Since this was written the Lateran Treaty between the Holy See and Italy, constituting the Vatican City State, was signed and ratified. (*See* ITALY, HISTORY and PIUS XI.) (Ed. E.B.)

IN ENGLAND AND SCOTLAND

The separation between the English Catholics who acknowledged the pope and the English State again became an accomplished fact by the Acts of Supremacy and Uniformity which were enacted before anything else in the first parliament of Elizabeth (1559). The former, which did not call the Queen supreme head but "Governess" of the Church in England, was followed immediately by the Act of Uniformity which prescribed the use in public worship of the Second Prayer Book of Edward VI. This was to come into force on June 24, 1559. The Oath of Supremacy was tendered to all the surviving bishops, 14 in number, to many of the beneficed clergy, and to certain laymen who held important offices. The bishops with the exception of Kitchin of Llandaff, refused the oath, and were deprived of their sees. They were put under "various degrees of restraint, ranging from mere surveillance to hard captivity in prison." As the years went on they died in the different abodes assigned to them, the two last being Watson of Lincoln (1584) and Goldwell of St. Asaph's (1585), the latter having long before effected his escape to Rome.

We are partly left to guesswork as to how many of the lower clergy had the Oath of Supremacy tendered to them, and as to how many refused it. It is supposed that some 6,000 took it, but it is not clear how many of the minority of from 2,000 to 3,000 refused it. At least 200 refused, and it is credibly held that some 500 others evaded it in one way or another. Anyhow a majority took it and a minority refused it. With the laity in general, attendance at Sunday service in the parish church was made the test, and many who still adhered to the pope appear to have thought that they could still safely be present at the legal service as an Act of civil obedience. When the question was asked in Rome this way of acting was condemned and the cleavage thus accentuated.

It became a vital matter for Elizabeth's government to fill up the sees of the deprived bishops. Canterbury was vacant by the death of Cardinal Pole, and hence to the primatial see an incumbent was appointed as early as the 1st of August 1559 in the person of Dr. Matthew Parker. This prelate, once consecrated, then proceeded to consecrate in turn the bishops named by the crown. At first, doubtless, many of the laity, estimated variously at anything between 90% and 50%, held to the old religion, but the pressure on them was steady, and conformity with the Establishment went on with increasing momentum as the supply of Marian priests died out.

Catholic worship never completely ceased in Protestant England, but it was evident that once the Marian priests who would still perform it became extinct, it could go on no longer unless some means were taken to keep it up. William Allen (1532–1594), afterwards cardinal, was the first to work for colleges or seminaries abroad to train priests for the English mission. He succeeded in establishing Douay college in 1568, which so flourished that it was not long before it contained 150 students. Through stress of war it had to be moved to Reims for a time but returned to Douay as soon as it was feasible. At Reims and Douay respectively a translation of the New and Old Testaments was made for the use of English Catholics, and this, though with subsequent revision, is still in use at the present day. In 1575 the English college in Rome was founded by Gregory XIII., and colleges followed in Valladolid, Seville, and other places. In this a supply of clergy, known as the seminary priests, was provided for the needs of the English Catholics. The early years of Elizabeth's reign up to 1571 were spent in the exercise of moderate pressure to ensure conformity with the Establishment, and in fruitless efforts to reconcile Elizabeth with the Holy See; such hopes died slowly in the minds of the pope, the king of Spain and the English Catholics: even the Council of Trent put aside the proposal to excommunicate the English Queen. But before 1571 there was a new pope St. Pius V., and holding compromise impossible, he issued on the 25th of February (1570) the Bull *Regnans in excelsis*, both excommunicating and deposing Elizabeth. There was a formidable rival for the English throne in Mary Queen of Scots, and after her capture and imprisonment, many Catholic nobles took part in the insurrection in her favour

known as the "Rising of the North." This was suppressed, and Northumberland, Norfolk and about 900 others were executed. It was probably the unjustified hopes for the success of their enterprise which led to the publication of the bull of deposition, which was unknown and disapproved by both the imperial and Spanish rulers. It failed to shake the throne of Elizabeth, but led to bitter persecution of the Catholics. It emphasized the opposition between Catholicism and the English State, though indirectly welding the Catholics into a much reduced but solid body of "recusants." The parliament of 1571 legislated against Rome, making it high treason to declare the queen a heretic or schismatic, or to bring into England any papal letter: forfeiture of goods was incurred by absence beyond the seas without licence. The execution of Mary Queen of Scots in 1587 also brought to a head Spain's attempt by the Armada to win a final victory over England in the war gradually provoked by mutual aggression. Soon the tale of those who suffered death through the laws, which made treason and profession of Catholic faith and rites practically the same, grew longer: the "Elizabethan martyrs" began to appear. The total number who endured the extreme penalty was in all 189, of whom 128 were priests, 58 laymen, and 3 women. As to the body of the laity the large minority of the early years of the reign sank to anything between 120,000 and a third of the population: there were on the mission 300 seminary priests, 50 Marian priests and 16 Jesuits.

More peaceful times were hoped for through the accession of James I., but these hopes were doomed to disappointment. James may not have been very hostile to the religion of his baptism, but his training had been Calvinist, and the Puritan party was gradually waxing stronger. One outcome of the loss of hope among Catholics was the murderous Gunpowder Plot devised by a few of them, but the only result was a new Penal Code and the execution of several who were charged with complicity in the plot. A new oath of allegiance was framed, calling on those who took it to swear that the deposing power of the Pope was "impious, heretical and damnable." Some Catholics thought they could in conscience do this, while others held the contrary. Hence arose much controversy among them. The oath was condemned by Paul V., but even this did not end the dispute for many, among them George Blackwell the archpriest, who had governed the recusant clergy since 1598 and considered that the condemnation only represented the Pope's private opinion, and hence did not bind in conscience. Blackwell was superseded by Birkhead as archpriest, and he was followed by Harrison. But the clergy had long been petitioning to be ruled by a bishop, and in 1623 Dr. William Bishop was appointed and consecrated as titular bishop of Chalcedon.

Again towards the end of James' reign there seemed prospect of indulgence on account of the negotiations in progress for the marriage of Prince Charles with the Infanta of Spain. For some years there had been but few executions for religion, but fines and penal exactions had brought in £36,000 a year to the king, and the prisons were full of recusants. The first step towards the marriage treaty was the release of all these. But the marriage was never arranged. Partly from hostility to any indulgence to Catholics which was necessarily involved in the settlement, parliament was averse to the match, and at last James had to draw back. The penal laws were enforced anew, and things were soon almost as bad as ever. But then another matrimonial scheme raised the question once more. This was the plan to marry Prince Charles to Henrietta Maria of France. Concessions to the Catholics at least equal to those promised to the Spaniards were demanded by Richelieu. Still, the marriage seemed desirable both to James I. and to Louis XIII., so a secret understanding was signed that ample indulgence should be given to the main body, as well as full liberty to the princess to practise her religion. Hence the marriage took place. But meanwhile James was dead, and Prince Charles was king.

The new monarch at once found himself in considerable difficulty. Promises had been made to France, and on the other hand parliament, ever stronger and more Puritan, called for the execution of the penal laws. Charles took the path of least resistance, put the laws in force, and declared that the treaty with France had only been a device to obtain the pope's consent to a dispensation for the marriage. All that France could do was to secure a Catholic court, in great part foreign, for Queen Henrietta Maria.

In 1632 the Holy See sent a trusty envoy, Gregorio Panzani, to report on the state of religion in England. This report, still extant, affords an interesting view of the position. Panzani estimates the Catholics at 150,000, and the priests at 800. He names the Catholic peers, beginning with the Marquis of Worcester, 13 in number, but hazards the guess that many more strive to be reconciled to the Church on their death-beds. He describes the stately services at the Queen's chapel, notes the adoption of many rites by the High Church divines, and laments the growth of Puritanism. He favours the naming of a resident bishop, but Charles I. was opposed to this. Hence the Catholics had no bishop in England for the next 30 years, Dr. Smith, Bishop's successor, having retired to France. Shifty towards Catholics, Charles was not less so towards the bulk of the nation, and at last Civil War broke out. Catholics were mainly on the royalist side. They recognized the Puritans as their bitterest enemies, yet there was hostility to them in the royal camp as well, and a disinclination to accept their aid if coupled with freedom for themselves. But, when the royalist cause was losing, these scruples were flung away, and the king had no more faithful servants than these recusant gentry and their dependents. The sieges of Raglan and Wardour Castle held for the king are but instances of tenacious fidelity. But at last the king's cause ended in defeat, and the royalists could do no more. Parliament was supreme, and worked its will both on the monarch and on his followers. When bloodshed was over on the battlefield it did not cease on the scaffold, so that not a few priests suffered death in the parliamentary period, and are reckoned by their fellow Catholics as martyrs. The policy of Oliver Cromwell as protector was not in general one of persecution, but the fanaticism of his followers was irrepressible.

With the Restoration came an earnest of greater tranquillity. Charles II.'s court in exile had been in part Catholic, and he seems to have been convinced in his heart that that was the true religion. But he was quite alive to the need, if he was to be king, of dissembling his sentiments. But he married Catherine of Braganza with the rites of her faith, while the free exercise of her religion was guaranteed. Hence the queen always had a staff of priests at her court, where the services were splendid and almost public. As the reign advanced opposition grew stronger, being in part stimulated by the reception into the Church of several notable people, chief amongst whom was James, duke of York, the king's brother. Again, an attempt to strengthen the royal position by an alliance with Louis XIV., and the acceptance of a subsidy from him led to a strong contrary current of opinion. Charles bent to the storm, and new legislation to debar the Catholic peers from sitting in the House of Lords was passed (Test Act). Finally, the efforts of the Protestant party centred on the proposal to exclude the Duke of York from the royal succession. Charles set himself with courage and still greater skill to defeat this, but at first without much success. The popular imagination was inflamed by the so-called Titus Oates plot. Oates, whose former record was of the worst, deposed on oath to the existence of a plot among Catholics to seize the king, subvert the Protestant religion, and set up their own in its place. Public opinion was maddened and the perjured wretch gained general credence. Many persons were charged with sharing these treasonable designs, and a considerable number, both priests and laymen, were brought to the scaffold, the most illustrious being Lord Stafford and Oliver Plunket, archbishop of Armagh. Though Charles believed these victims to be innocent, he did not, perhaps could not, interfere to save them. Yet, while they went to their death, the king had won. Alive to the least sign of a turn in the tide, he dissolved parliament, but found the new one again hostile. He dissolved again, and by this time finding himself in the full flood of reaction in his favour, governed for the last two years of his reign without any other. He went on to take vengeance on his enemies of whom some were executed and others escaped to

the Continent. There was no longer any chance of an Exclusion bill. Charles died Feb. 6, 1685, being received into the Catholic Church on his death-bed.

James II. was proclaimed in absolute peace, and the subsequent rebellions of Argyle and Monmouth seemed but to strengthen the loyalty of the majority. Yet the king strangely misjudged the strength of the Protestant opposition to anything Catholic, and acted as though he could safely disregard it. An envoy was despatched to ask for the cardinal's hat for Reginald d'Este, and that Leyburn might be made vicar-apostolic. The latter petition alone was granted, and Leyburn was consecrated at Whitehall by d'Adda, the papal envoy; he was also given a pension of £1.000 a year. The king pushed on with his policy, but the penal laws were still in force, and repeal in parliament was hopeless. So James acted by himself, and issued two successive Declarations of Indulgence, in which he granted toleration to Catholics and all dissenters on the strength of the royal dispensing power. The legality of this was tried in a test case against Sir Edward Hales, a Catholic who held a commission in the army. A majority of the judges affirmed the legality of the dispensation, but resistance was not overcome. The Anglican clergy were ordered to read the Declaration of Indulgence in Church, but many declined to do so. Thereupon seven bishops who had petitioned against it were sent to the Tower. After three weeks they were tried in Westminster hall before their peers, and acquitted amid scenes of the greatest enthusiasm.

The king's action now drove the Protestant party to take extreme steps. An invitation was sent through seven Whig statesmen to the prince of Orange to come and deliver the land from danger to the Protestant Succession. On Nov. 5, 1688, William landed in Torbay. Opposition was useless, as the main body of the army and the bulk of the people could not be relied upon, and seven weeks later James fled to France.

The Revolution meant a victory for nearly all the religious elements which were in opposition to Catholicism. Latitudinarians, Puritans, and others shared in this, and the Act of Toleration favoured them all. But it expressly excluded Catholics from any advantage from its provisions. There were Anglicans who looked with disfavour on the new régime, and the non-jurors conscientiously refused to swear allegiance, and forfeited their benefices. It was not that William of Orange had any sympathy with persecution, but his throne was none too secure, and his hand was forced by his Whig supporters. There was no more shedding of blood for religion, but new penal laws in 1700 applied in a more comprehensive way than the savage statutes of the past the dull pressure, financial, social and religious, which threatened to crush all life out of the Catholics.

John Leyburn, the vicar-apostolic appointed in 1685, had his vicariate divided in 1688 into four, and retaining the London district saw Bishops Giffard, Smith and Ellis appointed for the Midlands, North and West respectively. This four-fold arrangement lasted till 1840, though each district usually had a coadjutor bishop as well. Controversy with non-Catholics was carried on at first almost single-handed by John Gother (1633–1704); though an indirect influence was wielded by John Dryden, the poet (1631–1700). But other champions appeared later, foremost among whom was Bishop Challoner (1691–1781) as well as the mathematician, Bishop Walmesley (1722–1792), Alban Butler, author of the *Lives of the Saints*, and his nephew, Charles Butler, the well known lawyer. But the main body settled down to a life of isolation from their fellow countrymen, striving to lead a life of solid piety, and to escape notice and the danger of persecution. Not a few conformed to the Established Church, worn out with the struggle, and shrinkage prevailed in all directions. A Government return made at the beginning of William's reign, gives only about 30,000 Catholics for the whole country, but few would be inclined to accept the enumeration as complete. A return made to the House of Lords in 1780 gives 70,000, and this appears the lowest reliable figure ever reached. The first step to civil liberty was the Relief Act of 1778, which removed the disabilities inflicted in William's reign, leaving unrepealed the Elizabethan laws whose sanguinary penalties it was not intended to enforce. But even this limited measure stirred up much opposition, and the Gordon riots of 1780 were a direct consequence of it.

In order to further the attainment of a still greater amount of freedom, a number of leading laymen formed in 1782 the "Catholic committee." Unfortunately they did not take the bishops into their confidence, and domestic differences arose within the fold. A new bill was drafted for presentation to parliament, but the new oath of allegiance which went with it proved unacceptable. All the same, most of the leading statesmen of England were now anxious to grant more ample concessions, so that at last, after the oath had been amended, and the offensive term "Protesting Catholic Dissenters" deleted, the bill became law on June 10, 1791.

Two new influences now came into play in favour of progress. The one was the residence in England of several thousand French priests with their bishops, who had fled from the Revolution. They were most generously treated both by the Government and by private individuals, while they, by their blameless lives and self-denying services, created the best of impressions. Many a still-existing Catholic flock in various parts of England owes its origin to them. The other influence was the growing strength of the Irish demand for religious liberty. Yet the demands made in the early years of the 19th century to obtain full emancipation all ended in failure. The "Catholic committee" was succeeded by a "Catholic board" of similar character, and a Government veto on episcopal appointments proposed. This was hotly opposed by Bishop Milner and the Irish bishops, and the internal dissensions thereupon broke out anew. The final impetus which led to success came mainly from Ireland. Daniel O'Connell founded the "Catholic Association" "to gain civil liberty for Catholics," and, as soon as this Society seemed strong enough to win, he himself stood for parliament in the vacant constituency of Clare. He was, of course, triumphantly returned, but could not legally take his seat. The prime minister, Wellington and his colleagues, even if averse to emancipation, would not face the prospect of civil war in Ireland, combined with the force of liberal opinion in England, and threatened to resign. At last the king reluctantly yielded. The Emancipation Act passed through both Houses, and received the royal assent in 1829. After vexatious delays O'Connell was able to take his seat in the Commons. Meanwhile the duke of Norfolk and other peers took the oath and their seats in the Lords. Some few restrictions on complete religious equality were suffered to remain.

The next important movement in advance was the change from the missionary status of government by vicars-apostolic to the normal government by territorial bishops. The agitation for this was an old one, but it only acquired sufficient driving force to win after 1830. A temporary half-way measure was the division of the four districts into eight, made by Gregory XVI. in 1840, but other developments were to follow, and at length after much discussion and consultation, an ecclesiastical hierarchy was ordered by Pius IX., on Sept. 29, 1850. It comprised an archdiocese of Westminster and twelve episcopal sees. Nicholas Wiseman (1802–1865), a Roman scholar of wide repute, son of an Irish merchant in Seville, and descended from an old Essex family of recusants, became the first archbishop, and was made cardinal. In the course of the next year or two the other sees were filled as well as circumstances allowed. Moreover, the new dioceses were gradually organized, and provincial councils were held at Oscott in 1853, 1855 and 1859, and at Ware in 1873. Following on the Irish Famine of 1847, immigration on a large scale from Ireland led to a phenomenal increase in the number of the flock, and provided new energy and vigour for the work of the Church. For whereas in 1814 the bishops returned their people as about 160.000 in all, and in 1837 as about 400,000, in 1851 the census pointed to not less than 800,000.

The "Oxford Movement" (1833–1845) proved to be a powerful help in providing many cultured leaders and preachers for the advancement of the Church. At first, confined to the Church of England, it found an issue for many of its most illustrious supporters in submission to the Holy See. Such was the case with

John Henry Newman, Ward, Oakeley, Faber, Coffin, Coleridge, Lockhart, Brownlow, Northcote and a host of others. Beginning with it, a stream of converts, clerical and lay, has flowed from the Established Church, now greater now less, but never interrupted even to the present time. It was an accession small in numbers compared with the influx from Ireland, but important on account of the learning, influence and character of its members.

At Wiseman's death, one of the chief Oxford converts, Henry Edward Manning, was chosen to succeed him, and he governed the see for 27 years (1865–1892), being made cardinal in 1875. It is not solely for his life-long struggle to provide a Catholic education for the poor, nor for his foundation of the Oblates of St. Charles, nor his attempt to found a Catholic university, but for his championship of social reform and justice for the workers that Manning won a remarkable position of trust and veneration as one of the leading men in the England of his day. Herbert Vaughan, bishop of Salford, founder of the Mill Hill Missionary college, was next called to the see of Westminster and the cardinalate (1892–1903). He obtained a reversal of the policy of the Holy See forbidding Catholics to attend the universities of Oxford and Cambridge, and was a party to the arrangement by which the elementary schools, while provided by the contributions of the faithful, were to enjoy full maintenance by the State, according to Balfour's school act of 1902. He also built a noble Cathedral at Westminster designed for him by J. F. Bentley, which has taken a place in the life of London that has fully justified his courageous forecast. In 1903 he was followed by Bishop Francis Bourne of Southwark, who was raised to the cardinalate in 1911. Much progress has been made since. Three archbishoprics have been established, namely, at Liverpool, Birmingham and Cardiff, while the number of diocesan sees has also been increased. The number of converts from other religious bodies, which was about 7,000 in Vaughan's time, has risen to about 12,000 a year. There has been a notable multiplication of churches, schools, clergy, institutions and religious houses. Moreover, though thoroughly reliable figures cannot be had, because of the lack of a government census of religions, there is every reason to believe from conversion, difference of birth-rate and emigration, that the number of Catholics has greatly increased. From what can be gathered from baptisms, schools and private enumeration it should seem that the total is now at least 2,500,000. As one factor in the situation, Catholic infant baptisms average one tenth of the births in England. The number of priests exceeds 4,000.

IN IRELAND

George Browne, an Augustinian of Blackfriars, London, was appointed by Henry VIII., to the see of Dublin without any reference to the pope (1534). Acts drawn up by the Privy Council for the royal supremacy, against the authority of the bishop of Rome, for the first fruits to the king, etc., were passed by the Dublin parliament (1536), but other acts against the power of the pope and the tax of the twentieth on benefices were passed only when the votes of the ecclesiastical proctors were withdrawn. Browne, impeded by dissensions in the Council of Ireland and by opposition from the clergy, was a failure as a reformer. But he burned shrines within the Pale and the staff of Jesus (St. Patrick's Crozier) in Dublin. On the sole ground that the religious houses were addicted to "superstitious ceremonies" and the "pestiferous doctrines of the Romish Pontiff" they were suppressed (1539). Leases and grants of the temporalities and spiritualities were made to obedient lords and officials, many of whose descendants owe their titles and lands to these confiscations. The plate, jewels, and ornaments were reserved for Henry. There were about 556 religious houses, many possessed of immense wealth derived from grants. In Dublin alone the annual revenue amounted to £2,600 (about £40,000 in 1914 value). In all cases the surrender was made to appear voluntary, small pensions were granted to the heads of the houses but the other members were sent adrift penniless. The Irish princes now made their surrender to Henry, renouncing the Pope's jurisdiction by oath, and in return received back their lands and titles. To make Henry's position more secure, parliament (1541) conferred on him the title "king of Ireland" in the presence of two archbishops, twelve bishops, Anglo-Norman earls, lords, and barons, and some Irish noblemen. Though it is beyond question that the majority of the Irish bishops temporised and accepted the Supremacy, yet their action had practically no effect on the clergy and people. Under Edward VI. the "Order of Communion" (1548), attached to the Latin Liturgy, the First Book of Common Prayer (1551), and the Second Book (1552) were introduced, but the bishops as a body refused to use them as they were subversive of the mass. The priests abstained from the churches, and celebrated mass and preached to the people in private. The reform then depended mainly on Browne, Staples of Meath, and the new married bishops. Deputy Sentleger arrived in Dublin (Nov. 1553) with instructions from Queen Mary to restore the old religion, but to grant liberty of worship to all. The Reform bishops who submitted were continued in their sees, but the married ones were deprived of theirs (1554). Mary renounced the title "Head of the Church in Ireland" but she was confirmed by Pope Paul IV. as queen of Ireland. There was, however, no restoration of religious houses (except the Hospitallers, Kilmainham), or persecution of Protestants.

Though the Dublin parliament (1560) under Elizabeth was dissolved "by reason of its aversion to the Protestant religion," yet the Acts credited to it restored the royal supremacy and enjoined the use of the Book of Common Prayer. Offending clergy were threatened with deprivation and perpetual imprisonment, and the laity were to be fined twelve pence (12/– in 1914 value) for non-attendance at Protestant service. With the exception of Curwen of Dublin, and probably two or three others, it cannot be proved that the bishops were disloyal to their trust, and the people clung tenaciously to their religion. Even in the Pale the Government did not press matters to extremes, for the chief gentlemen were still Catholics, and Elizabeth required them for her attacks against Shane O'Neill and other chiefs. The coming of Father Wolf, S.J. as papal envoy to Ireland to organise the Church, the deputation to Rome and Spain for help, the Bull of Excommunication of Elizabeth (1570), and the landing of James Fitzmaurice, cousin of the earl of Desmond at Dingle (1579) served to harden Elizabeth. From 1580 the persecution was carried on with great bitterness, and many bishops, priests, and laymen were thrown into prison where they died in chains or were hanged, not for treason, as was ingeniously made to appear, but for their religion. The churches were allowed to go into ruins by Elizabeth's lessees; some English clergy, chiefly of "bad note," took charge of the cures, and Trinity college was founded (1595) as a bulwark of Protestantism. With the failure of the Spanish expedition at Kinsale (1601) the Catholic cause was in a parlous condition.

The expected toleration from James I. was not forthcoming. Nay more, all priests were ordered to leave the country (1605). A Star Chamber imposed such heavy fines on conscientious Catholics that the Catholic noblemen petitioned against these acts of intolerance, but many of them were thrown into prison. They were afterwards granted toleration in return for their support against the northern chiefs and for their approval of the confiscation of Ulster. The plantation of English and Scottish settlers drove the Catholic population out of the north (1609). Thousands of acres were appropriated for the support of Protestant schools and of Trinity college, Protestant bishops were urged to

suppress popery, and inquisitions were set up in every part of the country. In spite of all, about a thousand priests were known to be carrying on their pastoral work, but Catholics were forbidden to teach school and Catholic parents to send their children abroad.

In the opening years of Charles I. the persecution was less violent. Chapels were opened in the large cities, the Jesuits opened a Catholic university in Back lane, Dublin, the "Graces" were granted for a subsidy, and fines for non-attendance at church were not to be levied. But the persecution broke out again (1629), and the troops destroyed altars and imprisoned priests. The war of 1641 saw the Ulster lands restored to their former owners, but the wild stories of Protestant massacres are without any solid foundation. The agreement of the Anglo-Irish of the Pale with Ormond (1646), abolishing the oath of Supremacy, removing statutory and educational disabilities, and opening all civil and military offices to Catholics, did not satisfy the majority of the Supreme Council of the Catholic Confederates, including the Papal Legate, Rinuccini, and so Owen Roe O'Neill continued the war.

The situation was now obscured by the arrival of Cromwell to crush both Catholics and Royalists. Wholesale slaughter filled his ten months in Ireland, Drogheda and Wexford suffering most. Priests were shipped abroad, and later in crowds to the Island of Aran, and the Catholic people were transplanted to Connaught. The soldiers were paid the arrears of their pay by grants of farms or estates. Under the Restoration of Charles II. (1660) the clergy returned, the Holy See filled many vacant Sees, and the Catholics as a body enjoyed comparative calm. Consequent, however, on the infamous story of the Popish Plot bishops were ordered to depart the country within a month (1678). After the accession of James II. (1685) a Dublin Parliament granted liberty of conscience to all (1689), but the battles of the Boyne, Aughrim, and Limerick put an end to James's hopes. The Treaty of Limerick, ratified by William and Mary (1692), granting freedom of religion to Catholics as enjoyed under Charles II., was rejected by the Dublin parliament embittered by the bigotry of the Protestant bishop of Meath, and Catholics were excluded from parliament. Lord Capel brought over with him a bill to secure the Protestant settlement by a system of penal laws framed to uproot the Catholic religion, to drive Catholics out of all offices of power and emolument, and to bestow the lands and offices on the Protestant minority, a sixth of the population. (*See* IRELAND.) Returns of names and abodes of all priests were made by the revenue officers (1697). The accession of Queen Anne (1702) led to a still more violent persecution, priests as a body refused to take the Oath of Abjuration, wholesale arrests were made and spies employed to track them down (1709). Under George II. (1727–60) persecution began to abate, but at the suggestion of Primate Boulter Catholics were deprived of the vote at parliamentary and municipal elections. Barristers and solicitors were not admitted to practice unless they had taken oaths that no Catholic could take, mixed marriages were null and void, and the priest celebrating such was guilty of felony (the death penalty was decreed later). At this time there were about 3,000 priests in Ireland.

The first Catholic committee (1757), composed of noblemen, doctors and merchants, presented an address of loyalty to the king, signed by 400 members, which brought the first official recognition of the Catholic body. Another address to George III. (1760) on his accession was signed by 600. Relief bills were passed in 1771, 1774 and 1778 permitting Catholics to acquire leases of land, inherit and bequeath property provided they took an oath that the Pope could not depose princes or exercise any civil authority in these realms. Catholics found no difficulty in taking this oath. In 1782 other penal laws were repealed. The spread of democratic ideas was softening the bigotry bequeathed by the 16th and 17th centuries. Men like Grattan and Edmund Burke advocated equal rights for Catholics and Protestants, whilst Wolfe Tone, a Republican, favoured a more forward policy in a union of Catholics and Dissenters. The first club of the United Irishmen, composed chiefly of Presbyterians, was formed in Belfast (1791). Their petition that the penal laws be repealed was rejected by Parliament. A Relief bill, however, permitting Catholics to vote—for Protestants—was passed (1793). Pitt's promise of State aid for Catholic clergy alarmed Protestants. It was his deliberate intention to play off Catholic against Protestant in the hope of securing the Union of the English and Irish parliaments. The country resorted to secret societies which were condemned by the bishops, and the rebellion (1798) was suppressed with wanton cruelty. The Union was ultimately carried (1800). With the promised State pay for the clergy a veto in the appointment of Catholic bishops was sought by English ministers. After bitter controversy both were refused by the bishops who declared that the oath of allegiance was sufficient guarantee of their loyalty. Daniel O'Connell, a young lawyer, put new heart into the people and opened their minds to the power of the vote. Elections at Waterford and elsewhere were won for candidates favouring Emancipation. O'Connell was elected for Clare but refused to take the anti-Catholic oath (1828). The Emancipation Act was carried by Peel (1829). It had two great defects: the 40/– freeholder was disfranchised, and severe regulations against Jesuits and other religious bodies were inserted in it. And twenty years afterwards nine-tenths of all offices of emolument and power were still in the hands of the dominant minority. With richly-endowed schools Protestants now opened a campaign of proselytism and vilification of Catholic doctrine, but bishops like Drs. Doyle and McHale strongly opposed them. After a veritable war Catholic tithes for the support of Protestant worship were abolished (1838). To remove the legal insecurity surrounding Catholic donations for religious purposes a body styled the "Commissioners of Charitable Bequests" was set up (1844). As to education; Maynooth college was founded (1795) for the education of Catholic clergy and endowed by Parliament with £8,000 a year (£40,000 in 1914 value), commuted in 1869 to a capital sum of £370,000. National primary schools for Protestants and Catholics were opened in 1831. The intermediate school system was introduced (1878) and, by prizes, exhibitions and result fees, gave indirect financial assistance which was of immense help to schools such as those of the Christian Brothers depending on private resources. The Queen's colleges (1845) were condemned at the Synod of Thurles (1850). A Catholic university founded in 1850, with Dr. Newman as rector, was a failure through want of a charter and funds. The Royal university (1879) pleased no one, and finally the Irish Universities Act (1908) established two universities, Belfast and Dublin, leaving Trinity college with its status and endowments. (M. V. R.)

UNITED STATES

Whatever may be the final verdict of history in regard to the very ancient and fascinating Celtic tales of ocean wanderings in which St. Brendan and his companions figure so prominently, many historians of the Catholic Church in the New World have accepted some of these legends as an initial page in their chronicles. A well-documented study of the *Navigatio Brendani* and the Land of Promise with an exhaustive bibliography was published in the *Catholic Historical Review* (Jan. 1921, pp. 395–477), by Prof. Joseph Dunn, head of the Celtic department of the Catholic University of America. The historical link between the alleged pre-Columbian discoveries of the New World and the mediaeval Church in Greenland is found in the Norse Sagas. The Norse Church in mediaeval America attracted the attention of scholars owing to the publication (1893) of the documents from the Vatican archives pertaining to the diocese of Gardar in Greenland. This first Catholic diocese in the New World was established about 1125, and had resident bishops until 1377. After this date until 1492, few of the incumbents of the see resided in Greenland. The letter of Pope Alexander VI. (1493) appointing the last bishop says that "on account of the freezing of the sea no ship is supposed to have touched there during the past eighty years" (*cf.* "The Norse Church in Medieval America," in the *Cath. Hist. Rev.*, July, 1925: bibliography).

Of the three principal colonizing nations—Spain, France and England—the two former were Catholic and the third began its voyages of discovery under a Catholic king, Henry VII. The first

attempt to set up Church organization in the newly-discovered continent was the appointment in 1493 of Rt. Rev. Bernard Boyl, or Buil, as vicar-apostolic of the "Indies." Bishop-elect Boyl accompanied Columbus on his second voyage. His labours were of short duration and of no permanent value. In 1504, Pope Julius II. appointed three bishops to Hispaniola (Haiti), but the Spanish crown refused to confirm their election and the sees were suppressed. Seven years later the permanent dioceses of San Domingo and Conception (Haiti) and San Juan (Porto Rico) were established. The see of Santiago de Cuba, erected in 1522, was the ecclesiastical centre of the Spanish missions on the mainland until 1545, when the three provinces or archbishoprics—Lima, Mexico City and San Domingo—were erected by Pope Paul III. In 1565, the parish of St. Augustine, the first within the confines of the present United States, was founded as part of the diocese of Santiago. Thus, three-quarters of a century after the discovery by Columbus, the regular canonical life of the Church was well established. Out of the archdiocese of Mexico City grew later the suffragan Mexican sees of Guadalajara, Durango, Linares and Sonora which ruled the south-western portion of the United States until the middle of the 19th century. One of the heroic chapters in American history is that on the Franciscan, Dominican and Jesuit missions of the South-west and in California (*cf.* Engelhardt's *Missions and Missionaries of California*, San Francisco, 1908). The former Mexican Church is now represented within the United States by 14 dioceses (*cf.* "Diocesan Organization of the Spanish Colonies," in the *Cath. Hist. Rev.*, July, 1918).

The French explorers and colonizers of the 16th and 17th centuries were, with few exceptions, Catholics and were ably supported by missionary groups; among them were the Récollets, Jesuits, Sulpicians, Capuchins and the secular clergy. New France was erected into a vicariate-apostolic in 1658, with Bishop Laval at its head. The see of Quebec (1674) had spiritual jurisdiction over all the vast province of France in North America, including the wide-spreading valley of the Mississippi, together with Louisiana. Seven of the 15 ecclesiastical provinces which now constitute the American Church were eventually erected in this former French territory, and there are at present about 50 dioceses in this same region (*cf.* Rothensteiner, *History of the Archdiocese of St. Louis* [*1673–1928*], St. Louis, 1928).

In the English colonies along the Atlantic coast, Catholicism was generally legally proscribed. The exceptions were: Maryland, from its foundation by the Catholic Calverts in 1634 until the Puritan uprising of 1650; Rhode Island, presumably from its settlement by Roger Williams in 1636 and historically from the charter of 1663; and Pennsylvania, founded by Penn in 1682, where there is evidence of Catholics from its earliest settlement. Thus, according to Catholic historians, Maryland has the distinction of being the first English settlement where religious freedom was part of the common law (*cf.* Russell, *Maryland, Land of Sanctuary*, Balto., 1907). From 1634 to 1773, Jesuits, of English and American origin, ministered to the Catholics in Maryland, Pennsylvania and northern Virginia. After the suppression of the Society of Jesus (1773), the legal Corporation of the Roman Catholic Clergy continued to carry on missionary work, with Father John Lewis as superior. In 1784, Father John Carroll, who had won national reputation through his part in the commission to Canada (1776), was appointed prefect-apostolic of the Church in the United States. Six years later he became the first bishop of Baltimore, with jurisdiction over the entire Church in the new Republic. There were at this time (1790) 25 priests and about 30,000 Catholics in the United States. In 1808, Baltimore became a province or archdiocese with suffragan sees at Boston, New York, Philadelphia and Bardstown (Ky.). Ten years later, Archbishop Maréchal reported to the Holy See that there were 52 priests and about 100,000 Catholics in the United States (*cf.* Guilday, *Life and Times of John Carroll*, New York, 1922).

There is hardly any parallel in the history of Catholicism to the rapid growth of the Church in the United States during the 100 years from the death of Archbishop Maréchal (1828) to the present. This growth has given rise to serious discussion among Catholic writers. Some hold the increase from 25,000 in 1785 to be about 25,000,000 in 1929 to warrant the stand that there has been no leakage; others, basing their study upon the same figures (immigration, statistics, census reports, etc.) hold that there has been a considerable loss (*cf.* Canevin, *An historical and statistical Examination into the Progress and Population of the Catholic Church in the United States from 1780 to 1920*). The growth of the Catholic Church in the United States is due primarily to immigration, natural increase and conversions. The statistics generally accepted by Catholic writers, based upon the estimates made by John Gilmary Shea in 1891 and continued to 1920, are as follows:—

1790	40,000
1820	243,000
1830	337,620
1840	661,254
1850	1,767,841
1860	3,392,980
1870	4,901,980
1880	7,026,820
1890	10,419,668
1900	13,537,697
1910	18,483,320
1920	22,733,254

This computation would apparently support the claim that there are in the neighbourhood of 25,000,000 Catholics in the United States at the present day (1929), although the *Official Catholic Directory* for 1928 gives the total Catholic population as 19,689,049.

The question of loss and gain in the Church has been recently studied by Shaughnessy, in his *Has the Immigrant Lost the Faith?* (1925), which covers the period 1790–1920.

Racial Composition.—Racially, the Church in the United States is made up of groups from every nation in the world, with the English-speaking peoples in the majority. Up to the middle of the 19th century, the Irish and the Germans furnished the greater quota of its adherents. Later the French-Canadians, Italians, Mexicans, Poles, Lithuanians, Slovaks, Hungarians and others added notably to the number. There is also an appreciable percentage of Oriental Catholics—Greeks (Uniates), Syrians, Armenians, etc.

External Relations.—This almost unprecedented growth of a religious organization which had been subject to legal and political disabilities since the 16th century was bound to give rise to misunderstandings in a country so largely composed of Protestants. Since the rise of the American Republic several organized politico-religious movements were instituted for the purpose either of hindering the exercise of the franchise on the part of American Catholic citizens or of keeping Catholic Americans out of offices of public trust. Chief among these were the American Protestant Association (1829), the Native-American party (1837–44), the Know-Nothings (1855–61), the American Protective Association (1896), and recently the Ku Klux Klan. Being under the protection of the Constitution, and enjoying the advantages of the common law, Catholicism has not met with any official governmental opposition. All such outbursts of political or religious anti-Catholicism were but temporary or local and did not represent the more general attitude of American citizens. These anti-Catholic movements never became national and were due to conditions in which political, social and industrial problems were closely intermingled. The political theory of an inherent antagonism between Catholicism and Americanism has given rise to many interesting studies. Among these are: the *Catholic Builders of the Nation* (Boston, 1923); Kinsman, *Americanism and Catholicism* (1924); McNamara, *American Democracy and Catholic Doctrine* (1927); Shuster, *Catholic Spirit in America* (1927); Ryan, *The Catholic Church and the Citizen* (1928); Williams, *Catholicism and the Modern Mind* (1928). Many writers on this alleged incompatibility between Catholicism and republican institutions fail to give due allowance to the racial and economic adjustments involved in these sectional antagonisms to the Church.

Internal Development.—The internal development of the

Church in the United States has been of a uniform nature. Its doctrinal history offers little of importance. The Church discipline in vogue is similar to that of the other churches of Catholicism. Unity of doctrine, of moral law and of liturgical observance is preserved by an intimate union with the see of Rome. The universal canonical legislation of the Church as reorganized in the New Code of Canon Law (1918), the legislation by papal rescript, the decisions in contentious cases by the apostolic delegation at Washington, D.C. and a certain number of customs and practices which have grown up in the American Church during the past century and a half of its organized life form the basis for its domestic relations. Every five years each American bishop is expected to pay a visit to Rome (*ad limina Apostolorum*) and to make a report of the spiritual condition of his diocese. A system of diocesan synods provides for local unity among the bishops, clergy and laity. Each province is convened into provincial councils from time to time, and at greater intervals a national or plenary council is held. Three such councils have been held (1852, 1866, 1884) at Baltimore. It is of interest to note that a Graduate School of Canon Law exists at the Catholic University of America.

Education.—An outstanding factor in the internal development of the Church in the United States has been in the field of education (*cf.* Burns, *Catholic School System in the United States*, New York, 1907–12). According to the *Official Catholic Directory* for 1928, there are 7,061 parochial or elementary schools in which 2,281,837 boys and girls receive secular and religious instruction. The principal outlay involved in the parochial school system amounts to over $70,000,000 annually. Catholics at the same time contribute their proportionate share to the maintenance of the public schools. There are 225 high schools, colleges and universities for boys, and 729 academies for girls. This system of secondary education is crowned by the Catholic University of America, at Washington, established (1887) by Pope Leo XIII. and the American hierarchy and endowed with the privileges of the old pontifical universities of Europe. The purpose of the founders of this central institution was to carry the graduates of the Catholic colleges into higher scholarship, and thus prepare teachers for the entire Catholic educational system as well as leaders in the world of science and literature. The Catholic Sisters college, founded as an integral part of the Catholic University of America (1914), gives to the religious women teaching in the Catholic schools equal opportunities for higher training. There are ten Catholic universities in charge of the Society of Jesus, three under the Vincentians, three under the Holy Cross Fathers, and one each under the Benedictines, Holy Ghost Fathers and the Brothers of Mary. The National Catholic School of Social Service for Women (Washington) sends out each year trained workers for social study and research (*cf. Official Catholic Year Book for 1928*, pp. 426–431).

Between the years 1920 and 1928 the enrolment in Catholic secondary schools increased 60%. There are 32% more lay than religious instructors in Catholic universities and colleges for men. The education of the clergy is provided for by 136 seminaries, in which there are 14,432 students. *A Directory of Catholic Schools and Colleges* for the United States has been printed (1926), as well as a *Directory of Catholic Charities* (1926). There are 351 orphan asylums with 51,961 inmates. Other charitable institutions number over 2,000 and include every form of private and public charity.

Administration.—The actual government of the Church in the United States is represented (1929) by the apostolic delegate at Washington, four cardinals (Boston, New York, Philadelphia and Chicago); 15 archbishops (Baltimore, Boston, Chicago, Cincinnati, Dubuque, Milwaukee, New Orleans, New York, Oregon City, Philadelphia, St. Louis, St. Paul, San Antonio, San Francisco and Santa Fe); 103 bishops; 18,370 diocesan clergymen, under the sole and immediate direction of their bishops; 7,403 members of religious orders, subject to episcopal supervision—in all 25,773 clergymen. There are 11,699 churches with resident priests, and 6,175 mission churches—in all 18,293 churches, to which must be added several thousand chapels. Several hundred daily, weekly, bi-weekly and monthly publications are printed in English and foreign languages. There exist also several literary and academic reviews, published monthly and quarterly, of a high order of merit. *A Catholic Press Directory* was published in 1928.

National Development.—Students of the social and intellectual forces of Catholicism in the United States are giving considerable attention to the recent development of the Church along national lines. The change in the immigration policy of the country has rendered this development possible, since it permits the racial elements to be more easily assimilated to national ideals. Many agencies are at work effecting this general evolution. Among them are the Catholic Educational Assn., the National Conference of Catholic Charities, the Catholic Hospital Assn., the International Catholic Guild of Nurses, the Catholic Near East Welfare Assn., the Central Bureau of the Central-Verein, the American Catholic Philosophical Assn. and the American Catholic Historical Association. All these organizations are aided by the central bureaux of the National Catholic Welfare Conference at Washington. National organization is also being effected through such societies as the Holy Name Society, the Knights of Columbus, the Daughters of Isabella and the Catholic Daughters of America, the International Catholic Truth Society and the International Federation of Catholic Alumnae.

An annual meeting of the American hierarchy is held in September at the Catholic University of America, Washington, for the discussion of mooted points in Church discipline and progress. The national Catholic welfare conference is directed by an administrative committee of bishops, who report annually at the aforesaid meeting. A recent development is the creation of the home and foreign missionary board.

Mission Work.—Missionary work has been begun by American priests and sisters in foreign fields. The Catholic Foreign Mission Society of America (Maryknoll, N.Y.), and the Dominicans and the Foreign Mission Sisters of St. Dominic, have stations in China. The Holy Cross Fathers maintain missions in India. The Catholic Students Mission Crusade is an active participant in these projects. There is a bureau for Catholic Indian missions at Washington, and a national board for mission work among the coloured people, with headquarters in New York city. In social and educational welfare work the Knights of Columbus, with a membership approaching 1,000,000 men, has occupied a position of leadership.

Authorities.—The chief foreign source-collections for the history of the Church in the United States are in Rome (Vatican archives and archives of propaganda), Paris, London (Westminster archives), Seville (Archivo general de Indias), Mexico City (national archives), and Quebec (archiepiscopal archives). Transcripts of these documents are in the Shea collection at Georgetown university, in the archives of the Dominican House of Studies (Washington), and in the Guilday transcripts at the Catholic University of America. Every episcopal see has its own archives, and considerable material exists at the headquarters of the religious orders and congregations, particularly in Rome. The Catholic archives of America at Notre Dame university are particularly rich in unpublished material. Printed sources will be found in the quarterly *Records* and *Reviews* of the Catholic historical societies in the United States (*cf.* Guilday, "Catholic Historical Societies in the United States [1884–1928]," in *Off. Cath. Year Books*, 639–644). The *Catholic Historical Review* (1915–1921) contains bibliographical references for all phases of American Catholic history. Ecclesiastical legislation will be found in the *Acta et Decreta* of the Third Plenary Council of Baltimore. The new code of canon law has been analysed for American purposes in a supplementary volume of the *Catholic Encyclopedia* (1918).

The literature of American Catholic history of general and special nature is large in extent. Shea's four volumes on the *History of the Catholic Church in the United States* (New York, 1886–92) is still the standard work. The *Catholic Encyclopedia* contains articles on practically every noteworthy aspect of American Catholic history and is especially valuable for biographical sketches. *The Lives of the Deceased Bishops*, in two volumes, by R. F. Clarke (New York, 1872), is generally trustworthy, though inadequate. Statistics are given annually in

the *Official Catholic Directory* (New York). The extended bibliographies of American Church history, found in Guilday's *Life of Archbishop Carroll* (1922) and his *Life and Times of Bishop England* (1927), as well as in O'Daniel's *Life of Bishop Fenwick* (1925), give a list of provincial, diocesan and corporative histories. *See* also T. O'Gorman, *A History of the Roman Catholic Church in the United States* (1895); The Catholic University of America's *Studies in Church History* (7 vols., 1922–28); *American Catholic Historical Researches;* Jesuit Relations (73 vols., 1896–1901), edited by R. G. Thwaites, and the condensation in two volumes by Edna Kenton (1925). *See* also the article in the *Catholic Historical Review*, Vol. 7, p. 470–7 (1927) on "Catholic Historical Scholarship in the United States"; W. Gleeson, *History of the Catholic Church in California* (1871–72); F. N. Blanchet, *Historical Sketches of the Catholic Church in Oregon* (1884); E. V. O'Hara, *Catholic History of Oregon* (1916); L. Palladino, *Indian and White in the Northwest* (1894); P. J. DeSmet, *Western Missions and Missionaries* (1863); Chittenden and Richardson, *Life, Letters and Travels of Pierre De Smet* (4 vols., 1905). (P. Gu.)

LEGAL POSITION

The Roman Catholic religion has never been contrary to the common law of England, but for a time was made illegal by statute. These statutory prohibitions have gradually been removed, and therewith the common law legality of the religion has revived. The penal statutes were numerous during the reigns of Henry VIII., Edward VI. (some relief being given during Mary's reign), Elizabeth, the Stuart monarchs and throughout the 17th century. The details of the illegality were many and confused, but in the aggregate they amounted to absolute proscription. Not only the saying but the hearing of Mass, and whether in public or private, was prohibited—a prohibition which lasted until 1791; and the law had heavy penalties attaching to breach of it. And not only were adherents of the old religion forbidden their own worship, but they were forced under pain of "recusancy" to attend the Protestant parish church. Among the detailed prohibitions may be cited the early law—3 and 4 Ed. VI. *c.* 10—which forbade any one to possess a missal or other like book of devotion under pain of a fine, or for a third offence imprisonment at the king's will; and the Act of 35 Elizabeth *c.* 2, which forbade popish recusants leaving or even travelling beyond five miles from their accustomed place of abode, under pain of forfeiting all their lands to the queen.

Further instances of legislation against the religion (connected with the dynasty) are to be found in the latter part of the 17th century in the Bill of Rights and the Act of Settlement, providing for a succession of Protestant sovereigns, who would join in communion with the Church of England and make declarations against Transubstantiation. Even as late as 1715 an Act (1 Geo. I. *c.* 50) was passed "for appointing commissioners to enquire of the estates of certain traitors, and of popish recusants, and of estates given to superstitious uses in order to raise money out of them severally for the use of the public."

But thereafter legislation was mostly of an ameliorative character, and the present legal position of Roman Catholics may be gauged from a summary of that legislation.

The Relief Act, 1791, was passed to "relieve, upon conditions, and under restrictions, the persons therein described from certain penalties and disabilities to which papists or persons professing the popish religion, are by law subject." It allowed such persons, on taking an oath of undivided allegiance to George the Third and his Hanoverian successors and of abjuration of a right to murder heretics, etc., to move out of their five-mile limit; to live in London and Westminster; to stay away from the Protestant church; to say and hear Mass (but not in a building with a steeple or bell); to educate in the popish religion (but not to teach in endowed colleges, or to receive the child of a Protestant father in a school kept by a Roman Catholic, or to establish a Roman Catholic school); to join a religious order (but not to wear its habit out of doors or to found or endow an order); to be exempt (if in holy orders) from serving on juries; and to be protected from brawlers. The declaration against Transubstantiation, which had been imposed by an Act of 1672 upon peers and civil and military officers, was abolished.

In 1829 this carefully restricted freedom again to practise the proscribed religion was extended by the statute commonly known as the Catholic Emancipation Act (10 Geo. IV., *c.* 7). It further disestablished oaths and declarations against Transubstantiation, the invocation of saints and the sacrifice of the mass, by making such oaths and declarations no longer a qualification for membership of parliament or the holding of any office, franchise or civil right, except offices in or connected with the Established churches, or in any educational institution in regard to which such oaths obtained. But a new oath, against any attempt to subvert the Protestant religion, was imposed upon Members of Parliament, naval, military and municipal officers and electors. Priests were forbidden to sit in the House of Commons, but all civil and military offices were thrown open to Catholics, except the regency of the kingdom, the lord chancellorship, the lord-lieutenancy of Ireland and the high commissionership of the Church of Scotland. Also they could not present to livings in the Church of England. Many other restrictions upon religious liberty were maintained. Judicial and municipal officers were forbidden to attend in their insignia any public worship, except in a building of the Established Church; priests and monks were prohibited from conducting ceremonies or wearing habits save in their churches or private houses. Jesuits and all other male persons under religious vows already in the country were to register themselves—they did so for many years—and the entry into the country of those not already there was forbidden, with the exception of those of them who, being natural born British subjects, had left the country temporarily, and of others who might get a licence from a Protestant secretary of State to come into the country for a period not exceeding six months. To admit a person into a religious order was made a misdemeanour; the admitted person was to be banished for life, and transported for life if he had not gone within three months after the sentence of banishment. An attempt (apparently the only attempt) to enforce this law against religious orders was made as late as 1902, but the magistrate refused a summons and was upheld by the High Court: *R.* v. *Kennedy;* 86 Law Times Rep. 753. In 1898 parliament had declined to pass a bill for repealing the law, but it has now been repealed by the Roman Catholic Relief Act, 1926.

Further relief was granted in the Act of 1832—2 and 3 Will. IV. *c.* 115—which in respect to schools, places of worship, education and charitable purposes, placed Catholics upon the same footing as Protestant dissenters—*i.e.*, brought them within the Toleration Act, 1688, which had given Protestant dissenters liberty of public worship in their own registered buildings.

In 1844 a fresh advance was made, in the Act 7 and 8 Vic. *c.* 102, which repealed a whole series of penal Acts, some of which had already become obsolete or anachronistic, such as the 5 and 6 Ed. VI. *c.* 1, which made it an offence to be present at any religious service except that prescribed by the Act; the 1 Eliz. *c.* 1, which forfeited all a man's possessions if he taught the spiritual authority of the Popes, and the 1 Eliz. *c.* 2, which made attendance at the parish church on Sunday compulsory. Roman Catholics were also exempted from the obligation to attend a service of thanksgiving on Guy Fawkes day, and they were permitted to send their children "to be popishly bred beyond the Seas," and, even though converts, they were permitted (what had been prohibited to converts by 25 Car. 11, *c.* 2) to "breed up" their children in the popish religion. There was also repealed the statute of 1688 which had made it an offence punishable by three months' imprisonment, forfeiture, and payment of treble value of the articles seized, for any papist or suspected papist who refused to subscribe the declaration against Transubstantiation and the invocation of saints, to possess arms or ammunition or a horse worth more than £5. But even this enabling Act retained the prohibition of 1 Jac. I., *c.* 4 against Catholics keeping schools. The purport of the Act nevertheless was to emphasize and round off the work of the Acts of 1829 and 1832, and restore the legality of the Roman Catholic religion.

The restoration was not however complete. The tangled mass of penal legislation was not cleared away even by the Act of 1844; there was indeed a set-back in the Ecclesiastical Titles Act, 1851, which forbade Catholic bishops assuming territorial titles from places in the United Kingdom; but that Act was repealed in 1867.

In 1860 some further relief was granted in the Roman Catholic Charities Act, which ordained that charitable gifts for Catholic purposes should not be invalidated because they included a purpose deemed to be superstitious or otherwise unlawful, but that the illegal part of the disposition might be separated by the Chancery Court and given to a lawful Catholic purpose.

The Promissory Oaths Acts 1867 and 1871 gave further relief by abolishing the oaths still imposed upon Catholics (the sovereign's coronation declaration against Transubstantiation was changed to a mere declaration of Protestantism in 1910).

Disabilities still remained however, and in 1926 yet another repeal Act was passed, the Roman Catholic Relief Act, 1926 (which however does not apply to Northern Ireland). The enactments repealed by this latest legislation are, in addition to the repeal of the law against religious orders already referred to, as follows:—The Act of 1549, forbidding the possession of Catholic liturgies and books of devotion and statues, is repealed. The Religious Houses Act, 1559, which declared religious orders to be superstitious, and gifts for their benefit therefore voidable, as being for a superstitious use is also revoked. So is the Act of 1715, above referred to, for appointing commissioners to raise money out of recusants' estates. Then the Relief Act of 1791 was made more fully relieving by removing from it the section which forbade steeples and bells in Catholic churches and prohibited a priest from officiating at funerals in (presumably Protestant) churches or church-yards, or from exercising any rights or ceremonies or wearing the habits of an order out of doors or in a private house where more than five persons in addition to the household were assembled, or from exercising his functions at all unless he had first taken the oath of allegiance and abjuration (a similar prohibition in the Act of 1829 being also removed). From the Act of 1791 was also eliminated the section which prohibited the establishment or endowment of a religious order or school or college by Roman Catholics.

What must be regarded as further relief from the penal laws was made in a judicial decision, and so would more accurately be described as the removal of a misunderstanding of the law. It related to bequests for masses for the testator's soul, and the decision may be classed with the measures of legislative relief since, until 1919, when the decision was given, it had been assumed (after ineffectual attempts to obtain legal sanction for such bequests) that they were unlawful. The decision was given by the House of Lords in the case of *Bourne* v. *Keane* (Law Rep. [1919] App. Cas. 815). It overruled the leading case of *West* v. *Shuttleworth* (decided in 1835) and other cases following that decision, which had proceeded on the assumption that bequests for masses for the dead were now illegal because the Chantries Act of 1547 had confiscated gifts for such masses in existence at that time. It was held by the House of Lords in *Bourne* v. *Keane* that this was a wrong interpretation of the Chantries Act, that that Act did not govern subsequent bequests, and that with the repeal of the statutes which had made the Catholic religion illegal, the old common law legality of masses for the dead revived.

Subject to the Protestantism of the Crown and the lord chancellorship and of the provisions of the law for preventing Roman Catholics interfering in the management of the Church of England, as by nominating to benefices, it may now be said, with some confidence (but the maze of anti-Catholic legislation and the piecemeal nature and intricacies of the repeals make absolute confidence appear rash) that full liberty is now restored to the Catholic religion, and equality also, except as regards the incidents attaching to the Protestant Establishment, which has inherited the old-time property and privileges of the Catholic Church. And whenever new legislation is passed in which the interests of religion are affected (as in education, guardianship of children, chaplaincies or poor law) the Roman Catholic religion receives equal treatment with other denominations. (E. E. W.)

ROMANCE, originally a composition written in "Romance" language, *i.e.*, in one of the phases on which the Latin tongue entered after or during the dark ages. For some centuries by far the larger number of these compositions were narrative fictions in prose or verse; and since the *special* "Romance" language of France—the earliest so-called—was the original vehicle of nearly all such fictions, the use of the term for them became more and more accepted in a limited sense. Yet for a long time there was no definite connotation of *fiction* attached to it, but only of narrative story; and the French version of William of Tyre's *History of the Crusades,* a very serious chronicle written towards the close of the 12th century, bears the name of *Roman d'Éracle* simply because the name of the emperor Heraclius occurs in the first line. But if the explanation of the name "Romance" is quite simple, certain and authentic, the same is by no means the case with its definition, or even with the origin of the thing to which that name came mostly to be applied. For some centuries an abstraction has been formed from the concrete examples. "Romance," "romanticism," "the romantic character," "the romantic spirit," have been used to express sometimes a quality regarded in itself, but much more frequently a difference from the supposed "classical" character and spirit. The following article will deal chiefly with the matter of Romance, excluding or merely referring to accounts of such individual romances as are noticed elsewhere. But it will not be possible to conclude without some reference to the vaguer and more contentious signification.

Romance in antiquity.—Speculations on the origin of the peculiar kind of story which we recognize rather than define under the name of romance have been numerous and sometimes confident; but a wary and well-informed criticism will be slow to accept most of them. It is certain that many of its characteristics are present in the *Odyssey;* and it is a most remarkable fact that these characteristics are singled out for reprehension—or at least for comparative disapproval—by the author of the treatise *On the Sublime.* The absence of central plot, and the prolongation rather than evolution of the story; the intermixture of the supernatural; the presence and indeed prominence of love-affairs; the juxtaposition of tragic and almost farcical incident; the variety of adventure arranged rather in the fashion of a panorama than otherwise: all these things are in the *Odyssey,* and they are all, in varying degrees and measures, characteristic of romance. Nor are they absent from the few specimens of ancient prose fiction which we possess. If the *Satyricon* of Petronius was ever more than a mass of fragments, it was certainly a romance, though one much mixed with satire, criticism and other things; and the various Greek survivals from Longus to Eustathius always and rightly receive the name. But two things were still wanting which were to be all-powerful in the romances proper—chivalry and religion. They could not yet be included, for chivalry did not exist; and such religion as did exist lent itself but ill to the purpose except by providing myths for ornament and perhaps pattern.

The "Saint's Life."—A possible origin of the new romance into which these elements entered (though it was some time before that of chivalry definitely emerged) has been seen by one of the least hazardous of the speculations above referred to in the hagiology or "Saint's Life," which arose at an early though uncertain period, developed itself pretty rapidly, and spreading over all Christendom (which by degrees meant all Europe and parts of Asia) provided centuries with their chief supply of what may be called interesting literature. If the author of *On the Sublime* was actually Longinus, the minister of Zenobia, there is no doubt that examples both sacred and profane of the kind of "fiction" ("imitation" or "representation") which he deprecated were mustering and multiplying close to, perhaps in, his own time. The Alexander legend of the pseudo-Callisthenes is supposed to have seen the light in Egypt as early as A.D. 200, and the first Greek version of that "Vision of Saint Paul," which is the ancestor of all the large family of legends of the life after death, is pretty

certainly as old as the 4th century and may be as old as the 3rd. The development of the Alexandreid was to some extent checked or confined to narrow channels as long as something like traditional and continuous study of the classics was kept up. But hagiology was entirely free from criticism; its subjects were immensely numerous; and in the very nature of the case it allowed the tendencies and the folklore of three continents and of most of their countries to mingle with it. Especially the comparative sobriety of classical literature became affected with the Eastern appetite for marvel and unhesitating acceptation of it; and the extraordinary beauty of many of the central stories invited and necessitated embroidery, continuation, episode. Later, no doubt, the adult romance directly reacted on the original saint's life, as in the legends of St. Mary Magdalene most of all, of St. Eustace, and of many others. But there can be very little doubt that if the romance itself did not spring from the saint's life it was fostered thereby.

The Gathering of Matter.—Proceeding a little further in the cautious quest—not for the definite origins which are usually delusive, but for the tendencies which avail themselves of opportunities and the opportunities which lend themselves to tendencies—we may notice two things very important to the subject. The one is that as Graeco-Roman civilization began to spread north and east it met, to appearance which approaches certainty, matter which lent itself gladly to "romantic" treatment. That such matter was abundant in the literature and folk-lore of the East we know: that it was even more abundant in the literatures and folk-lore of the North, if we cannot strictly be said to *know*, we may be reasonably sure. On the other hand, as the various barbarian nations (using the word in the wide Greek sense), at least those of the North, became educated to literature, to "grammar," by classical examples, they found not a few passages in these examples which were either almost romances already or which lent themselves, with readiness that was almost insistence, to romantic treatment. Apollonius Rhodius had made almost a complete romance of the story of Jason and Medea. Virgil had imitated him by making almost a complete romance of the story of Aeneas and Dido: and Ovid, who for that very reason was to become the most popular author of the middle ages early and late, had gone some way towards romancing a great body of mythology. We do not know exactly who first applied to the legendary tale of Troy the methods which the pseudo-Callisthenes and "Julius Valerius" applied to the historical wars of Alexander, but there is every reason to believe that it was done fairly early. In short, during the late classical or semi-classical times and the whole of the dark ages, things were making for romance in almost every direction.

It would and did follow from this that the thing evolved itself in so many different places and in so many different forms that only a person of extraordinary temerity would put his finger on any given work and say, "This is the first romance," even putting aside the extreme chronological uncertainty of most of the documents that could be selected for such a position. Except by the most meteoric flights of "higher" criticism we cannot attain to any opinion as to the age and first developed form of such a story as that of Weland and Beadohild (referred to in the *Complaint of Deor*), which has strong romantic possibilities and must be almost of the oldest. The much more complicated Volsung and Nibelung story, though we may explore to some extent the existence backwards of its Norse and German forms, baffles us beyond certain points in each case; yet this, with the exception of the religious element, is romance almost achieved. And the origin of the great type of the romance that *is* achieved—that has all elements present and brings them to absolute perfection—the Arthurian legend, despite the immense labours that have been spent upon it and the valuable additions to particular knowledge which have resulted from some of them, is, still more than its own Grail, a quest unachieved, probably a thing unachievable. The longest and the widest inquiries, provided only that they be conducted in any spirit save that which determines to attain certainty and therefore concludes that certainty has been attained, will probably acquiesce most resignedly in the dictum that romance "grew"—that its birthplace is as unknown as the grave of its greatest representative figure.

But when it has "grown" to a certain stage we can find it, and in a way localize it, and more definitely still analyse and comprehend its characteristics from their concrete expressions.

CLASSES OF SOURCE

Approaching these concrete expressions, then, without at first putting forward excessively hard and fast requirements in regard to the validation of the claims, we find existing in Europe about the 11th century (the time is designedly left loose) divers classes of what we should now call imaginative or fictitious literature, nearly all (the exceptions are Scandinavian and Old English) in verse. These are: (i.) The saints' lives; (ii.) the Norse sagas, roughly so-called; (iii.) the French *chansons de geste;* (iv.) the Old English and Old German stories of various kinds; (v.) perhaps the beginning of the Arthurian cycle; (vi.) various stories more or less based on classical legend or history from the tales of Alexander and of Troy down to things like *Apollonius of Tyre*, which have no classical authority of either kind, but strongly resemble the Greek romances, and which were, as in the case named, pretty certainly derived from members of the class; (vii.) certain fragments of Eastern story making their way first, it may be, through Spain by pilgrimages, latterly by the crusades.

Now, without attempting to fence off too rigidly the classical from the romantic, it may be laid down that these various classes possess that romantic character, to which we are, by a process of netting and tracking, slowly making our way, in rather different degrees, and a short examination of the difference will forward us not a little in the hunt.

With i. (the saints' lives) we have least to do: because by the time that romance in the full sense comes largely and clearly into view, it has for the most part separated itself off—the legend of St. Eustace has become the romance of Sir Isumbras, and so forth. But the influence which it may, as has been said, have originally given must have been continually re-exerted; the romantic-dynamic suggestion of such stories as those of St. Mary of Egypt, of St. Margaret and the Dragon, of St. Dorothea, and of scores of others, is quite unmistakable. Still, in actual result, it works rather more on drama than on narrative romance, and produces the miracle plays.

In ii. (the sagas), while a large part of their matter and even not a little of their form are strongly romantic, differences of handling and still more of temper have made some demur to their inclusion under romance, while their final ousting in their own literatures by versions of the all-conquering French romance itself is an argument on the same side. But the Volsung story, for instance, is full of what may be called "undistilled" romance—the wine is there, but it has to be passed through the still—and even in the most domestic sagas proper this characteristic is largely present.

It is somewhat less so in iii. (the *chansons de geste*), at least in the apparently older ones, though here again the comparative absence of romantic characteristics has been rather exaggerated, in consequence of the habit of paying disproportionate and even exclusive attention to the *Chanson de Roland*. There is more, that is, of romance in *Aliscans* and others of the older class, while *Amis and Amiles*, which must be of this class in time, is almost a complete romance, blending war, love and religion—*salus, venus, virtus*—in full degree.

The other four classes, the miscellaneous stories from classical, Eastern and European sources, having less corporate or national character, lend themselves with greater ease to the conditions of romantic development; but even so in different degrees. The classical stories have to drop most of their original character and allow something very different to be superinduced before they become thoroughly romantic. The greatest success of all in this way is the story of *Troilus and Cressida*. For before its development through the successive hands of Benoît de Sainte-More, Boccaccio (for we may drop Guido of the Columns as a mere middleman between Benoît and Boccaccio) and Chaucer, it has next to no classical authority of any kind except the mere names. In the

various Alexandreids the element of the marvellous—the Eastern element, that is to say—similarly overpowers the classical. As for the Eastern stories themselves, they are particularly difficult of certain unravelment. The large moral division—such as *Barlaam and Josaphat*, the *Seven Wise Masters* in its various forms, etc., comes short of the strictly romantic. We do not know how much of East and how much of West there is in such things as *Flore et Blanchefleur* or even in *Huon of Bordeaux* itself. Contrariwise we ought to know, more certainly than apparently is known yet, what is the date and history of such a thing as that story of Zumurrud and Ali Shahr, which may be found partly in Lane and fully in the complete translations of the *Arabian Nights*, though not in the commoner editions, and which is evidently either copied from, or capable of serving as model to, a Western *roman d'aventures* itself.

We come, however, much closer to the actual norm itself—closer, in fact, than in any other place save one—in the various stories, English, French, and to a less extent German,[1] which gradually received in a loose kind of way the technical French term just used, a term not to be translated without danger. Nearly all these stories were drawn, by the astonishing centripetal tendency which made France the home of all romance between the 11th and the 13th centuries, into French forms; and in most cases no older ones survive. But it is hardly possible to doubt that in such a case, for instance, as *Havelok*, an original story of English or Scandinavian origin got itself into existence before, and perhaps long before, the French version was retransferred to English, and so in other cases. If, once more, we take our existing English *Havelok* and its sister *King Horn*, we see that the latter is a *more* romanced form than the former. *Havelok* is more like a *chanson de geste*—the love interest in it is very slight; while in *King Horn* it is much stronger, and the increased strength is shown by the heroine being in some forms promoted into the title. If these two be studied side by side the process of transforming the mere story into the full romance is to no small extent seen in actual operation. But neither exhibits in any considerable degree the element of the marvellous, or the religious element, and the love interest itself is, even in *Horn*, simple and not very dramatically or passionately worked out. In the later *roman d'aventures*, of which the 13th century was so prolific (such as, to give one example out of many, *Amadas and Idoine*), these elements appear fully, and so they do in the great Auchinleck collection in English, which, though dating well within the 14th century, evidently represents the meditation and adaptation of French examples for many years earlier.

The last of our divisions, however, exhibits the whole body of romantic elements as nothing else does. It is not our business in this place to deal with the Arthurian legend generally as regards origin, contents, etc., nor, in the present division of this actual article, to look at it except for a special purpose and in connection with and contradistinctive to the other groups just surveyed. Here, however, we at last find all the elements of romance, thoroughly mixed and thoroughly at home, with the result not merely that the actual story becomes immensely popular and widely spread; not only that it receives the greatest actual development of any romantic theme; but that, in a curious fashion, it attracts to itself great numbers of practically independent stories—in not a few cases probably quite independent at first—which seem afraid to present themselves without some tacking on (it may be of the loosest and most accidental description) to the great *polycentric* cycle, the stages of which gather round Merlin, the Round Table, the Grail and the Guinevere-Lancelot-Mordred catastrophe. All the elements, let it be repeated, are here present: war, love and religion; the characteristic extension of subject in desultory adventure-chronicles; the typical rather than individual character (though the strong individuality of some of the unknown or half-known contributors sometimes surmounts this); the admixture of the marvellous, not merely though mainly as part of the religious element; the presence of the chivalrous ideal. The strong dramatic interest of the central story is rather superadded to than definitely evolved from these elements; but they are still present, just as, though more powerfully than, in the weakest of miscellaneous *romans d'aventures*.

[1] Italian romance seems to have modelled itself early on French, and it is doubtful, rich as is the late crop of Spanish romances, whether we have any that deserve the name strictly and are really early.

TYPES OF STORY, INCIDENT AND PERSONAGES

A further step in the logical and historical exploration of romance may be taken by regarding the character-and-story classes round which it groups itself, and which from the intense community of mediaeval literature—the habit of mediaeval writers not so much to plagiarize from one another as to take up each after each the materials and the instruments which were not the property of any—is here especially observable. Prominent above everything is the world-old motive of the quest; which, world-old as it is, here acquires a predominance that it has never held before or since. The object takes pretty various, though not quite infinitely various, forms, from the rights of the disinherited heir and the hand or the favour of the heroine, to individual things which may themselves vary from the Holy Grail to so many hairs of a sultan's beard. It may be a friendly knight who is lost in adventure, or a felon knight who has to be punished for his trespasses; a spell of some kind to be laid; a monster to be exterminated; an injured virgin or lady, or an infirm potentate, to be succoured or avenged; an evil custom to be put an end to; or simply some definite adventure or exploit to be achieved. But quest of some sort there must certainly be if (as in *Sir Launfal*, for instance) it is but the recovery of a love forfeited by misbehaviour or mishap. It is almost a *sine qua non*—the present writer, thinking over scores, nay hundreds, of romances, cannot at the moment remember one where it is wanting in some form or another.

It will be observed that this at once provides the amplest opportunity for the desultory concatenation or congregation of incident and episode which is of the very essence of romance. Often, nay generally, the conditions, localities and other circumstances of the quest are half known, or all but unknown, to the knight, and he is sometimes intentionally led astray, always liable to be incidentally called off by interim adventures. In many (perhaps most) cases the love interest is directly connected with the quest, though it may be in the way of hindrance as well as of furtherance or reward. The war interest always is so connected; and the religious interest commonly—almost universally in fact—is an inseparable accident. But everything leads up to, involves, eventuates in the fighting. The quest, if not always a directly warlike one, always involves war; and the endless battles have at all times, since they ceased to be the great attraction, continued to be the great obloquy of romance. It is possible no doubt that reports of tournaments and single combats with lance and sword, mace and battle-axe, may be as tedious to some people as reports of football matches certainly are to others. It is certain that the former were as satisfactory in former times to their own admirers as the latter are now. In fact the variety of incident is almost as remarkable as the sameness. And the same may be said, with even greater confidence, of the adventures between the fights in castle and church and monastery, in homestead or hermitage. The actual stories are not much more alike than those who have read large numbers of modern novels critically know to be the case with them. But the absence, save in rare cases, of the element of character, and the very small presence of that of conversation, show up the sameness that exists in the earlier case.

The same deficiency in individual character-drawing, and in the conversation which is one of its principal instruments, brings out in somewhat unfair relief some other cases of apparent sameness—the "common forms" of story and of character itself. The disinherited heir, the unfaithful or wronged wife, the wicked stepmother, the jealous or wrongly suspected lover, are just as universal in modern fiction as they are in mediaeval—for the simple reason that they are common if not universal in nature. But the skeleton is more obvious because it is less clothed with flesh and garments over the flesh; the texture of the canvas shows more because it is less worked upon. Some of these common forms, however, are more peculiar to mediaeval times; and some, though not many, allow excursions into abnormalities which, until

recently, were tabooed to the modern novelist. Among the former the wickedness of the steward is remarkable, and of course not difficult to account for. The steward or seneschal of romance, with some honourable exceptions, is as wicked as the baronet of a novel, but here the explanation is not metaphysical. He was constantly left in charge in the absence of his lord and so was exposed to temptation. The extreme and almost Ephesian consolableness of the romance widow can be equally rationalized—and in fact is so in the stories themselves—by the danger of the fief being resumed or usurped in the absence of a male tenant who can maintain authority and discharge duties. While such themes as the usually ignorant incest of son with mother or the more deliberate passion of father for daughter come mostly from very popular early examples—the legend of St. Gregory of the Rock or the story of Apollonius of Tyre.

Characters of Romance Proper.—The last point brings us naturally to another of considerable importance—the singular *purity* of the romances as a whole, if not entirely in atmosphere and situation, yet in language and in external treatment. It suited the purposes of the Protestant controversialists of the Renaissance, such as our own Ascham, to throw discredit upon work so intimately connected with Catholic ceremony and belief as the *Morte d'Arthur;* and it is certain that the knights of romance did not even take the benefit of that liberal doctrine of the *Cursor Mundi* which regards even illicit love as not mortal unless it be "with spouse or *sib.*" But if in the romances such love is portrayed freely, and with a certain sympathy, it is never spoken of lightly and is always punished; nor are the pictures of it ever coarsely drawn. In a very wide reading of romance the present writer does not remember more than two or three passages of romance proper (that is to say before the latter part of the 15th century) which could be called obscene by any fair judge. And the term would have to be somewhat strained in reference even to these.

The contrast with the companion divisions of *fabliaux* and farces is quite extraordinary; and nearly as sharp as that between Greek tragedy on the one hand and Greek comedy or satiric play on the other. It is brought out for the merely English reader in Chaucer of course, but in him it might have been studied. In the immense *corpus* of known or unknown French and English writers (the Germans are not quite so particular) it comes out with no possibility of deliberation and with unmistakable force.

The history of the forms in which romance presents itself follows a sufficiently normal and probable course. The oldest are always—save in the single case of part of the Arthurian division, in which we probably possess none of the *actually* oldest, and in some of the division of Antiquity which had a long line of predecessors in the learned languages—the shortest. They become lengthened in a way continued and exemplified to the present moment by the tendency of writers to add sequels and episodes to their own stories, and made still more natural by the fact that these poems were in all or almost all cases *recited.* "Go on" is the most natural and not the least common as well as the most complimentary form of "Bravo!" and the reciter never seems to have said "no" to the compliment. In not a few cases—*Huon of Bordeaux, Ogier the Dane, Guy of Warwick,* are conspicuous examples—we possess the same story in various stages; and can see how poems, perhaps originally like *King Horn* of not more than a couple of thousand lines or even shorter in the 13th century, grew to thirty, forty, fifty thousand in the 15th. The transference of the story itself from verse to prose is also—save in some particular and still controverted instances—regularly traceable and part of a larger and natural literary movement. While, also naturally enough, the pieces become in time fuller of conversation (though not as yet often of conversation that advances the story or heightens its interest), of descriptive detail, etc. And in some groups (notably that of the remarkable *Amadis* division) a very great enlargement of the proportion and degradation of the character of the marvellous element appears—the wonders being no longer mystical, and indeed being magical only in the lower sense.

CHARACTERISTIC EXAMPLES

And so we come to the particular characteristics of the kind or kinds demonstrated in individual examples. Of these the English reader possesses a matchless although a late instance in the *Morte d'Arthur* of Malory, a book which is at once a *corpus* and a pattern of romance in gross and in detail. The fact that it is not, as has been too often hastily or ignorantly asserted, a mere compilation, but the last of a singular series of rehandlings and redactions—conducted with extraordinary though for the most part indistinctly traceable instinct of genius—makes it to some extent transcend any single example of older date and more isolated composition. But it displays all the best as well as some of the less good characteristics of most if not all. Of the commonest kind—the almost pure *roman d'aventures* itself—the Gareth-Beaumains episode (for which we have no direct original, French or English, though *Lybius Disconus* and *Ipomedon* come near to it in different ways) will give a fair example; while its presentation of the later chapters of the Grail story, and the intertwisted plot and continuing catastrophe of the love of Lancelot and Guinevere, altogether transcend the usual scope of romance pure and simple, and introduce almost the highest possibilities of the romantic novel. The way in which Malory or his immediate authorities have extruded the tedious wars round the "Rock of the Saxons," have dropped the awkward episode of the false Guinevere, and have restrained the uninteresting exuberance of the continental wars and the preliminary struggles with the minor kings, keeps the reader from contact with the duller sides of romance only. Of the real variety which rewards a persistent reader of the class at large it would be impossible to present even a miniature hand-index here; but something may be done by sample, which will not be *mere* sample, but an integral part of the exposition. No arbitrary separation need be made between French and English; because of the intimate connection between the two. As specially and symptomatically noteworthy the famous pair—perhaps the most famous of all—*Guy of Warwick* and *Bevis of Hampton,* should *not* be taken. For, with the exception of the separation of Guy and Felise in the first, and some things in the character of Josiane in the second, both are somewhat spiritless concoctions of stock matter. Far more striking than anything in either, though not consummately supported by their context, are the bold opening of *Blancandin et l'orgueilleuse d'amour,* where the hero begins by kissing a specially proud and prudish lady; and the fine scenes of fight with a supernatural foe at a grave to be found in *Amadas et Idoine.* Reputation and value coincide more nearly in the charming fairy story of *Parthenopex de Blois* and the Christian-Saracen love romance of *Flore* (Florice and other forms) *et Blanchefleur.* Few romances in either language, or in German, exhibit the pure adventure story better than Chrestien de Troyes's *Chevalier au Lyon,* especially in its English form of *Ywain and Gawain;* while the above-mentioned *Lybius Disconus* (*Le Beau Déconnu*) makes a good pair with this. For originality of form and phrase as well as of spirit, if not exactly of incident, *Gawain and the Green Knight* stands alone; but another Gawain story (in French this time), *Le Chevalieur aux deux épées,* though of much less force and fire, exceeds it in length without sameness of adventure. Only the poorest romances—those ridiculed by Chaucer in *Sir Thopas*—which form a small minority, lack striking individual touches, such as the picture of the tree covered with torches and carrying on its summit a heavenly child, which illuminates the huge expanse of *Durmart le Gallois.* The various forms of the *Seven Wise Masters* in different European languages show the attitude of the Western to the Eastern fiction interestingly. The beautiful romance of *Emarè* is about the best of several treatments of one of the exceptional subjects classed above—the unnatural love of father for daughter, while if we turn to German stories we find not merely in the German variants of Arthurian themes, but in others a double portion of the mystical element. French themes are constantly worked up afresh—as indeed they are all over Europe—but the Germans have the advantage of drawing upon not merely Scandinavian traditions like those which they wrought into the *Nibelungen Lied* and

Gudrun, but others of their own. And both in these and in their dealings with French they sometimes show an amount of story-telling power which is rare in French and English. No handling of the Tristan and Iseult story can compare with Gottfried's; while the famous *Der arme Heinrich* of Hartmann von Aue (the original of Longfellow's *Golden Legend*) is one of the greatest triumphs and most charming examples of romance, displaying in almost the highest degree possible for a story of little complexity all the best characteristics of the thing.

What, then, are these characteristics? The account has now been brought to a point where a reasoned résumé of it will give as definite an answer as can be given.

Even yet we may with advantage interpose a consideration of the answer that *was* given to this question universally (with a few dissidents) from the Renaissance to nearly the end of the 18th century and not infrequently since; while it is not impossible that, in the well-attested revolutions of critical thought and taste, it may be given again. This is that romance on the whole, and with some flashes of better things at times, is a jumble of incoherent and mostly ill-told stories, combining sameness with extravagance, outraging probability and the laws of imitative form, childish as a rule in its appeal to adventure and to the supernatural, immoral in its ethics, barbarous in its aesthetics, destitute of any philosophy, representing at its very best (though the ages of its lowest appreciation were hardly able even to consider this) a necessary stage in the education of half-civilized peoples, and embodying some interesting legends, much curious folk-lore and a certain amount of distorted historical evidence. On the other hand, for the last hundred years and more, there have been some who have seen in romance almost the highest and certainly the most charming form of fictitious creation, the link between poetry and religion, the literary embodiment of men's dreams and desires, the appointed nepenthe of more sophisticated ages as it was the appointed pastime of the less sophisticated. Between these opposites there is of course room for many middle positions, but few of these will be occupied safely and inexpugnably by those who do not take heed of the following conclusions.

Romance, beyond all question, enmeshes and retains for us a vast amount of story-material to which we find little corresponding in ancient literature. It lays the foundation of modern prose fiction in such a fashion that the mere working out and building up of certain features leads to, and in fact involves the whole structure of the modern novel (*q.v.*). It antiquates (by a sort of gradual "taking for granted") the classical assumption that love is an inferior motive, and that women, though they "may be good sometimes" are scarcely fit for the position of principal-personages. It helps to institute and ensure a new unity—the unity of interest. It admits of the most extensive variety. It gives a scope to the imagination which exceeds that of any known older literary form. At its best it embodies the new or Christian morality, if not in a Pharisaic yet in a Christian fashion, and it establishes a concordat between religion and art in more ways than this. Incapable of exacter definition, inclining (a danger doubtless as well as an advantage) towards the vague, it is nevertheless comprehensible for all its vagueness, and, informal as it is, possesses its own form of beauty—and that a precious one. These characteristics were, if perceived at all by its enemies in the period above referred to, taken at their worst; they were perceived by its champions at the turn of the tide and perhaps exaggerated. From both attitudes emerged that distinction between the "classic" and the "romantic" which was referred to at the beginning of this article as requiring notice before we conclude. The crudest, but it must be remembered the most intentionally crude (for Goethe knew the limitations of his saying), is that "Classicism is health; Romanticism is disease." In a less question-begging proposition of single terms, classicism might be said to be method and romanticism energy. But in fact sharp distinctions of the kind do much more harm than good. It is true that the one tends to order, lucidity, proportion; the other to freedom, to fancy, to caprice. But the attempt to reimpose these qualities as absolutely distinguishing marks and labels on particular works is almost certain to lead to mistake and disaster, and there is more than mere irony in the person who defines romance as "Something which was written between an unknown period of the Dark Ages and the Renaissance, and which has been imitated since the later part of the 18th century." What that something really is is not well to be known except by reading more or less considerable sections of it—by exploring it like one of its own forbidden countries. But something of a sketch-map of that country has been attempted here.

To illustrate and reinforce the above, *see* in the first place articles on the different national literatures, especially French and Icelandic; as also the following:—

Classical or Pseudo-Classical Subjects.—APOLLONIUS OF TYRE; LONGUS; HELIODORUS; APULEIUS; TROY; THEBES; CAESAR, JULIUS; ALEXANDER THE GREAT; HERCULES; JASON; OEDIPUS; VIRGIL.

Arthurian Romance.—ARTHURIAN LEGEND; and the articles on romance writers such as Malory, Wolfram von Eschenbach, Chrétien de Troyes, Gottfried of Strasbourg, etc.

French Romance.—CHARLEMAGNE; GUILLAUME D'ORANGE; DOON DE MAYENCE; OGIER THE DANE; ROLAND; RENAUD DE MONTAUBAN (*Quatre fils Aymon*); HUON OF BORDEAUX; GIRART DE ROUSSILLON; MACAIRE; PARTONOPEUS DE BLOIS; ROBERT THE DEVIL; FLORE AND BLANCHEFLEUR; RAOUL DE CAMBRAI; GUILLAUME DE PALERME; BENOÎT DE SAINTE-MORE, etc.

Anglo-Norman, Anglo-Danish, English Romance.—BEVIS OF HAMPTON; HORN; HAVELOK; GUY OF WARWICK; ROBIN HOOD; MAID MARIAN.

German.—NIBELUNGENLIED; ORTNIT; DIETRICH OF BERN; WOLFDIETRICH; HELDENBUCH; WALTHARIUS; GUDRUN; HILDEBRAND, LAY OF; RUODLIEB.

Northern.—SIGURD; WAYLAND; HAMLET; EDDA.

Spanish.—AMADIS DE GAULA.

Various.—REYNARD; ROMAN DE LA ROSE; GRISELDA and kindred stories; GENEVIEVE OF BRABANT; GESTA ROMANORUM; BARLAAM AND JOSAPHAT; SEVEN WISE MASTERS; MAELDUNE, VOYAGE OF.

BIBLIOGRAPHY.—The first modern composition of importance on romance (putting aside the dealings of Italian critics in the 16th century with the question of romantic *v.* classical unity) is the very remarkable dialogue *De la Lecture des vieux romans* written by Chapelain in mid-17th century (ed. Feillet, 1870), which is a surprising and thoroughgoing defence of its subjects. But for long afterwards there was little save unintelligent and mostly quite ignorant depreciation. The sequence of really important serious works almost begins with Hurd's *Letters on Chivalry and Romance* (1762). In succession to this may be consulted on the *general* subject (which alone can be here regarded) the dissertations of Percy, Warton and Ritson; Sir Walter Scott, "Essay on Romance" in the supplement to the *Encyclopædia Britannica* (1816–24); Dunlop, *History of Fiction* (1816, usefully supplemented and completed by its 4th edition, 1888, with very large additions by H. Wilson); C. L. B. Wolff, *Allgemeine Geschichte des Romans* (Jena, 1841–50); H. L. D. Ward, *Catalogue of Romances in the British Museum* (vol. i. 1883, vol. ii. 1893) (the most valuable single contribution to the knowledge of the subject); G. Saintsbury, *The Flourishing of Romance and the Rise of Allegory* (1897), and its companion volumes in *Periods of European Literature* [W. P. Ker, *The Dark Ages* (1904); F. J. Snell, *The Fourteenth Century* (1899); G. Gregory Smith, *The Transition Period* (1900); D. Hannay, *The Later Renaissance* (1898)]; W. P. Ker, *Epic and Romance* (1897).

(G. SA.)

ROMANCE LANGUAGES. The name given to the seven groups of languages, viz., Portuguese, Spanish, Provençal (including Catalan), French, Italian, the Rhaeto-Romanic idioms and Rumanian.

They are called "romance" (from post-classical Latin *romanice*, derived from Latin *romanus*) because their basis is the Latin which was spoken in the Imperium Romanum. They are sometimes called "daughter languages" (*langues filles*) of Latin, though in no sense daughters, but Latin itself in the transformed state it has reached in the various countries in which it was spoken. The word Neo. Latin has been used for "Romance" by some scholars.

The comparative method systematically used by F. Diez (1794–1876) in his *Grammatik der romanischen Sprachen*, of which the first volume appeared in 1836, demonstrated conclusively that each of the above-mentioned languages was directly evolved from Vulgar or Popular Latin.

Within a few years of the appearance of Diez's studies new tendencies began to be felt, tendencies which Diez had himself approved but for lack of opportunity had not embodied. First, chiefly under the impulse of Paul Meyer (1840–1917) the documents preserved in the archives were taken into account; next came the study of the *patois* instigated by Gaston Paris (1839–1903) keenly pursued by investigators such as abbé Rous-

selot (1846–1924) and Gilliéron (1854–1926), and yielding fresh materials for phonetic and lexicographical research; finally, the study of semantics began simultaneously in different countries.

W. Meyer-Luebke, availing himself of the philological material now accessible in recorded dialect and patois, completely revised Diez's grammar and compiled a new *Grammatik der romanischen Sprachen* (4 vols. 1890–1902) on a much broader basis. This achievement marks the close of this period of romance philology.

The opening of the latest period is distinguished by the use of "linguistic geography" initiated by the appearance of the *Atlas historique de la France* by Gilliéron and Edmont, containing 2,319 maps, 1,920 for France proper (1902–1910) and 399 for Corsica (1914). Similar surveys have been attempted in other countries, but few have attained successful completion. Alone worthy of mention as regards romance languages are Weigand, *Linguisticher Atlas des dacorumänischen Sprachgebietes* (Leipzig, 1909), containing 67 maps only and none of the Bánat; Ch. Guerlin de Guer, *Atlas dialectologique de la Normandie* (1903), comprising 123 maps but unfinished; Griera, *Atlas linguistique de Catalunya*, which is to form 10 volumes (2,000 maps) vols. i., ii., and iii., with 586 maps having so far appeared (Barcelona, 1923–24).

POPULAR LATIN

With Latin, as with all languages, there existed from the outset divergences between the written and spoken idioms affecting the vocabulary and various portions of the grammar.

The name Popular Latin, especially applied to the spoken language with all its individual and dialectical idiosyncrasies, was also termed *inconditus, cotidianus, usualis, vulgaris, plebeius, proletarius* and *rusticus*, as opposed to the written language from which it was progressively differentiated by the operation of social influences and the growth of literature. Thus the contact of Latin with Greek, and particularly Greek philosophy, science and art, resulted in the coinage of learned terms, *e.g., epistola, grammatica, schola, stylus, poeta, poesis, poema, papyrus, paragraphus, heros, aer, aether, encaustum, podagra, sarcophagus, horologium*. These were Greek words with Latin endings. In formation they were contrary to the genius of the native Latin which enriched its word-stock by its traditional system of composition and derivation, especially by means of suffixes, destined to play such an important rôle in the romance languages. Till the end of the 1st century A.D. however, the classical language withstood the assaults of Popular Latin which it dominated in some degree by the prestige of its literary masterpieces, by the exigencies of the administration which compelled all officials to employ the higher language, and by the influence of the schools in which teaching was given in the *sermo urbanus*. But, with the passing of the golden age, the written language became even more artificial. When in A.D. 212 Caracalla conferred by edict the dignity of Roman citizenship upon all free-born inhabitants of the Empire, he introduced into Rome, according to the picturesque phrase of Isidore of Seville (Origines, ii. 31) *"vitia et verborum et morum"* (sins of speech and morality) and thenceforth the evolution of Popular Latin in all provinces, as far as we can trace, proceeded to all intents unchecked conformably with its inherent character. Two fresh historical factors next intervened, hastening the downfall of classical Latin, the religious revolution and the invasions of the Barbarians. Of the Christian propagandists the vast majority belonged to the lower classes; among the most zealous were many slaves and women, the language they used was essentially popular and even the educated among them found that to carry out their evangelisation efficiently they must resort to the vulgar tongue. The greatest of the Fathers of the Church, notwithstanding he had been a professor of rhetoric, wrote without hesitating: "Non timemus ferulas grammaticorum, dum tamen ad veritatem solidam et certiorem perveniamus. Melius est quod reprehendant nos grammatici quam non intelligant populi." (S. Augustinus, *Enarrationes in Psalmos*, 138, 20.) "We don't fear the schoolmaster's cane if only we can arrive at a sure and more weighty truth. It were better to be reproved by the pedants than to be not understood by the people." Pope Gregory the Great appeals to Almighty God against the tyranny of the declensions: "Casus servare contemno quia indignum vehementer esistimo ut verba coelestis oraculi restringam sub regulis Donati." (*Praefatio*, Job, 1. 6.) "I refuse the slavery of the declensions because I think strongly that it is not fitting that I should force the words of the Divine Message into the rules of Donatus."

The anarchy which ensued when the Roman empire was overthrown proved eminently favourable to the growth of dialects and special idioms. Vulgar Latin and pre-literary Romance was a spoken language, but can in some measure be reconstituted from the information derived from the treatises composed by grammarians, the Latin Bible, the early Latin manuscripts, inscriptions, collection of formulae of the laws of the Barbarians, divers glossaries, literary, historical and technical texts ranging from the 4th to the 8th century, and the coins and charters of the Merovingian and Carolingian epochs. Thus the *Appendix Probi* (most probably of the 3rd century) contains remarks on declension, conjugation, orthography and the meaning of words. It is a kind of manual of "don'ts," interesting from the philological standpoint precisely on account of the forms quoted as mistakes to be avoided. The mention *porphireticum marmor* ñ *purpureticum marmur* attests the popular pronunciation of *ph*, in which Vulgar Latin dropped the aspiration, and the confusion of *ŏ* and *ŭ; speculum* ñ *speclum* shows the dropping in popular pronunciation of the posttonic vowel in proparoxytones; *pecten* ñ *pectinis* instances a nominative formed by popular analogy. *The Glossary of Reichenau* (the ms. dates from the 8th century) translates certain words of the Vulgate no longer understood by words which, although given Latin case or verb inflexions, belonged in fact to a dialect of Northwestern France. Thus in the sentence "Sed et serpens erat callidior" (Genesis iii., 1) *callidior* is rendered by *vitiosior*. This means that *callidus* had ceased to be intelligible (*callidus* has in fact totally vanished from the romance languages), and that *vitiosus* had taken its place in Vulgar Latin (*vitiosus* survives indeed in Italian *vezzoso*, Spanish and Portuguese *vicioso*, and is represented in Old French by *voisos*).

The material is both scarce and scanty, despite the richness and variety of the dialects spoken in all parts of the Roman empire. Reconstruction must in many cases resort to the comparative method. Thus, take the name for "finch" in various romance languages, *pincione* in Tuscan, *pintsuni* in Sicilian, *pinson* in French, *pinsó* in Catalan, *pinsón* in Spanish; comparison of these differing forms shows that all are derived from a common prototype which can be reconstituted as *pincionem*. Again if we take the words for "to advance," *avanzare* in Italian, *avaunzer* in the Engadine dialect, *vantsá* in Frioulan, *avansar* in Provençal and Catalan, *avancer* in French, there can be do doubt as to the legitimacy of our reconstituting a prototype verb *abantiare* formed from the Latin *ante*.

General Characteristics of the Romance Languages.—After an evolutionary process occupying some three centuries Popular Latin had taken on an individual character according to the different regions of the Romanic world in which it was spoken, and the dawn of "romance" may be regarded as coincident with the 8th century.

1. Vocabulary.—The Romance languages retained only negligible traces of the idioms originally spoken in their various territories before the advent of Latin. In French not more than fifty words can be traced back to Celtic; in Spanish the number of Iberian terms is no greater; in Northern Italian there are but infinitesimal relics of Osco-Umbrian and Celtic; in Southern Italian and Sicilian a few traces of Greek. As regards the Rhetic and Rumanian words which are ascribed to the primitive tongues of the Dacians, Thracians and Illyrians, the identification rests on practically indemonstrable hypotheses. The most important additions to the vocabularies of the romance languages come, for the occidental portion, from Germanic, Greek and Arabic, and, for the oriental portion, from Slavonic. The Germanic contribution embraces terms dealing with war, military art, costume, rural life and parts of the body, a few abstract terms and a great quantity of proper names. It is peculiarly important in French by reason of the Frankish invasion of Gaul and the influence exerted by the Merovingian and Carolingian kings who

were of Germanic origin. The Greek element during the middle ages, was of only slight importance, and was restricted to terms brought back by the Crusaders in the 11th and 12th centuries, or incorporated as a result of the commercial relations between Orient and Occident. The influx of Greek words was accelerated in the 14th century and with the 19th century became very abundant. The Arabic element is particularly important in Spanish, Portuguese and Provençal; many terms have percolated into Italian, and about three hundred are extant in Modern French. Finally at various periods other languages have supplied contributions, and there has been a continuous interpenetration between the different romance languages themselves. All romance languages contain (*a*) popular words, *i.e.*, derived by slow evolution from Popular Latin: (*b*) words of learned formation, *i.e.*, borrowed direct from ancient or modern languages. In some cases the same original word has yielded two derivatives belonging to *a* or *b* respectively.

2. Phonetics.—The general law applying to all romance languages is that the incidence of the tonic accent remains as in Popular Latin. All popular words are therefore stressed at the same point as they were eighteen centuries ago; as in some romance languages the vowels have persisted much as they were during the imperial epoch, a modern Italian or Spaniard pronounces some words almost exactly as did a subject of Marcus Aurelius or Commodus. The atonic or intertonic vowels have weakened, or in some of the romance languages disappeared (except *a*). Proparoxytones have tended to become paroxytones, but many have survived in Italian and Rumanian, a few in Spanish; a small number existing in Old French were gradually eliminated during the middle ages. French and Portuguese have evolved nasal vowels unknown in Latin; the *ü* sound, also unknown in Latin, is found in French, Provençal, and the Northern Italian and Engadine dialects. Initial consonants have, in general, suffered no change. In Spanish, however, *b* has developed into an intermediary sound between *b* and *v*, whilst *c* + *e* or *i* is pronounced like English voiceless *th* and *j* has become a velar fricative. In French *c* + *a* has given rise to the sound *ch*, (*e.g.*, campum > champ) and *g* + *a* to the sound *j* (*e.g.*, gaudia > joie); *h* has totally disappeared. The intervocalic consonants have proved less resistant; *b* has passed to *v* in all romance languages (even when orthographed *b* as in Spanish and Gascon, it is pronounced with the intermediary sound). Final *m* and *n* have disappeared apart from some rare exceptions (Sp. *quien*, F. *rien*) and *ns* has been reduced to *s*, processes of which signs are already visible in classical Latin. (Rumanian offers many peculiarities: *see* RUMANIAN LANGUAGE AND LITERATURE.)

3. Morphology.—The following features set forth the double character which prevailed in the evolution of the romance languages (*a*) the modification of the declension and conjugation system, (*b*) the development of the analytical tendencies of romance as opposed to the synthetic character of classical Latin.

The neuter has disappeared from all romance languages; a few relics of it still survived in the mediaeval period. The term "neuter" used in Rumanian to designate the third declension applies to substantives conforming to the masculine declension in the singular and to the feminine declension in the plural, *e.g.*, *un cutit* (a knife), *niste cutite* (knives). The two-case system of declension (nominative and accusative) characterising the early period of some romance languages (French, Provençal and perhaps Rhaeto-Romanic) has disappeared (*see* RUMANIAN LANGUAGE AND LITERATURE); substantives and adjectives now possess only a single case in the singular and in the plural. More numerous traces of declension are preserved by the personal and relative pronouns. The definite article and personal pronoun of the third person are in all romance languages derived from *ille* (or *illi*), *illa*. The cardinal numbers 1 to 10 correspond in all romance languages to the Latin cardinals, but from 11 onwards there are varied divergences. A noteworthy feature of French is the use of 20 as multiplier. The synthetic comparatives and superlatives have mostly been ousted by *magis* or *plus* preceding the positive, *e.g.*, *grandior*, *grandissimus*, replaced by *magis* or *plus grandis*. The tense paradigms have been profoundly modified; the future and conditional of occidental romance languages are derived from new Vulgar Latin creations which substitute for the synthetic classical *amabo*, *amarem*, forms made up of infinitive + (*h*)*abeo* (*amare* + [*h*]*abeo*) for the future, and of infinitive + (*h*)*abebam* (*amare* + [*h*]*abebam*) for the conditional. In Italian, however, the prototype of the conditional was infinitive + (*h*)*abui* (*amare* + [*h*]*abui*). In Rumanian and the Rhetic idioms the future and conditional are periphrastic. Romance languages have further evolved a new perfect and pluperfect based on Latin (*h*)*abui* and (*h*)*abebam* + past participle: (*h*)*abui* + *amatum* and (*h*)*abebam* + *amatum*. The imperative either perpetuates the Latin forms (somewhat curtailed), as in Italian, or replaces the plural by indicative or subjunctive forms. The infinitives in *-are* and *-ire* have evolved regularly; but those in *-ēre* and *-ĕre* have suffered varying fates in the different romance languages. As to past participles, most striking is the extension of forms in *-ūtus* at the expense of those in *-ītus* and *-ŭtus*. In the personal flexions of the various tenses analogy has worked many changes; *e.g.*, in Italian and Rumanian the second person singular of all tenses ends in *-i*. Romance retains no vestige of the deponent verbs, all of which have been assimilated to active verbs, *e.g.*, *nasci* has become *nascere*. Romance has substituted for the synthetic tenses of the passive voice, a periphrasis compounded from the different forms of *essĕre* (Vulgar Latin for *esse*) or of *stare* + past participle.

4. Syntax.—Evolution has been towards a more rational and logical word-order and stricter connection both of clauses and of words. Many new syntactical features are closely correlated with the modifications mentioned in **2** and **3**. There has been constant action and reaction between phonetics, morphology and syntax. If the structure of the Romance sentence is compared with that of the Latin sentence the salient innovations observable are (*a*) the normal constructional order subject, verb, complement, replacing the elaborate artifices of classical Latin which had gradually disappeared in Vulgar Latin; (*b*) the substitution of the relative clause of the Vulgar Latin type, *credo quod* (or *quem* or *quatenus*) for the infinitive construction *e.g.*, *credo quod illum verum est* for *credo illud verum esse;* (*c*) increase in use and number of prepositions which in Vulgar Latin perform the functions of the lost genitive, dative and ablative cases; (*d*) creation of a definite article (from *ille*, *illa*) and an indefinite article (from *unus*, *una*); (*e*) increase in number of tenses permitting greater precision in expression of the past (past anterior, past imperfect and past conditional); (*f*) ingenious devices for formation of adverbs and prepositions more adequately expressing the shades of abstract thought, *e.g.*, French, *en*, *ens*, *dans*, *dedans*, corresponding respectively to *in*, *intus*, *de* + *intus*, *de* + *de* + *intus;* (*g*) complexity of certain interrogative forms best exemplified by the French equivalent for the Latin *Quid est?: Qu'est-ce que c'est que cela?* the etymological counterpart of which would be: *Quid est ecchoc quod ecchoc est quod ecce illac?* (Example quoted from the *Dictionnaire Général*).

ROMAN DE LA ROSE, a French poem of which the first part was written about 1230 by Guillaume de Lorris (*q.v.*), and which was completed about 40 years later by Jean de Meun (*q.v.*). Guillaume de Lorris wrote an allegory, which is an artistic presentment of the love philosophy of the troubadours. In a dream the Lover visits a park to which he is admitted by Idleness. In the park he finds Pleasure, Delight, Cupid and other personages, and at length the Rose. Welcome grants him permission to kiss the Rose, but he is driven away by Danger, Shame, Scandal, and especially by Jealousy, who entrenches the Rose and imprisons Welcome, leaving the Lover disconsolate. The story, thus left incomplete, was finished in 19,000 lines by Jean

de Meun, who allows the Lover to win the Rose, but only after a long siege and much discourse from Reason, the Friend, Nature and Genius. In the second part, however, the story is entirely subsidiary to picturesque and poetic digressions, and to violent satire in the manner of the fabliaux against the abuse of power, against women, against popular superstition, and against the celibacy of the clergy. The length of the work and its heterogeneous character proved no bar to its enormous popularity in the middle ages, attested by the 200 mss. of it which have survived.

The *Romaunt of the Rose* was translated into English by Chaucer (*see* the prologue to the *Legende of Good Women*), but the version which has come down to us (*see* an edition by Dr. Max Kaluza, Chaucer Society, 1891), is generally admitted to be by another hand. For a list of books on the authorship of the English translation *see* G. Körting, *Grundriss der engl. Lit.* (Münster, 1905, 4th ed. p. 184). Three editions of the *Roman de la Rose* were printed at Lyons between 1473 and 1490; two by Antoine Verard (Paris, 1490? and 1496?), by Jean du Pré (Paris, 1493?), by Nicholas Desprez for Jean Petit (Paris), by Michel le Noir (Paris, 1509 and 1519). In 1503 Jean Molinet produced a prose version. Marot modernized the text (1526), and his corrections were followed in subsequent editions. There is a modern English version by F. S. Ellis (3 vols., 1900).

ROMAN-DUTCH LAW. The term Roman-Dutch law describes the system of law which existed in the province of Holland (*see* HOLLAND) from the 15th to the 19th centuries. This system, introduced by the Dutch into their colonies, was retained in those of them which passed to the British Crown at the end of the 18th and the beginning of the 19th centuries. These were the maritime districts of Ceylon, the Cape of Good Hope, and the settlements upon the coast of South America now comprised within the colony of British Guiana. In a secondary sense therefore Roman-Dutch law is the original common law of these countries. In Ceylon this system has been extended to the Kandyan Provinces (annexed in 1815), while in South Africa it was carried forward with the expanding range of white settlement into the Republics and Natal. To-day it is in force in the whole of British Africa south of the Zambesi, as well as in the Mandated Territory, known as the Protectorate of South-West Africa.

In British Guiana on the other hand the Roman-Dutch law having been found unsuited to the existing conditions of the colony has by the local Civil Law of British Guiana Ordinance 1916, taking effect from Jan. 1, 1917, been to a very great extent replaced by the common law of England. When it is said that Roman-Dutch law forms the common law of British South Africa and Ceylon, this must be understood with a reservation in favour of native law and custom, so far as these are recognized, and with the qualification that the general law of these countries, as will be seen, has in many respects departed from its original type.

Historical Development.—It does not fall within the scope of this article to investigate the historical sources of the old Dutch law. It is enough to say that in the 15th and 16th centuries the Roman law was "received" *in subsidium* in the province of Holland, as it was sooner or later in the Netherlands generally, as well as in Germany. General and local customs, based ultimately upon Germanic tribal law (Frankish, Frisian, Saxon), afforced by privileges and by-laws (*keuren*), and affected, doubtless, by an earlier "infiltration" of Roman law, held their ground. Hence resulted the mixed system for which Simon van Leeuwen in 1652 invented the term "Roman-Dutch law." This remained in force until superseded in 1809 by the Code Napoléon, which in 1838 gave place to the existing Dutch civil code. The old law was abrogated in the Dutch colonies also, so that to-day the Roman-Dutch law is no longer in force outside the British empire. (*See* ROMAN LAW.)

We have spoken of two elements in the Roman-Dutch system, Roman law and Germanic custom. To these must be added a third, viz., legislative acts of the Burgundian and Spanish periods. Such were the Great Privilege of Mary of Burgundy of 1476; the Placaat of the emperor Charles V. of 1529, requiring immovable property to be transferred before the local court; the Perpetual Edict of the same monarch of 1540, relating to clandestine marriages and other matters; the Maritime Laws of Charles V. of 1551 and of Philip II. of 1563; the Codes of Criminal and Civil Procedure of Philip II. of 1570 and 1580; the Political Ordinance of the States of Holland of 1580; the Placaat on Intestate Succession of 1599. There was much legislation in the 17th and 18th centuries, but it had little effect upon the general character of the legal system. Apart from legislation we derive our knowledge of the Roman-Dutch law from collections of decided cases, from collections of opinions, commonly termed *consultatien* or *advijsen*, and from a rich juristic literature.

Systematization.—The first attempt to reduce the Roman-Dutch civil law to system was made by Hugo de Groot (Grotius) in his *Introduction to the Jurisprudence of Holland* (*Inleiding tot de Hollandsche Rechts-geleertheyd*), written while he was a prisoner in Loevestein in 1619–20, published in 1631. This short treatise, a masterpiece of condensed exposition, remains to this day a legal classic. But after Grotius honor must be assigned to Johannes Voet (1647–1713), professor at Utrecht and Leyden, whose *Commentarius ad Pandectas* (1698–1704) more than any work of the old law is in use to-day. In the 18th century the most famous name is Cornelis van Bijnkershoek, for 20 years president of the Supreme Court (1673–1743). Towards the end of the century Dionysius Godefridus Van der Keessel, professor at Leyden, lectured on the *jus hodiernum*, of which he published a summary in *Theses selectae juris Hollandici et Zelandici* (1800). Copies of the lectures themselves, commonly known as Van der Keessel's *Dictata*, circulate in ms., and these have been cited in judgments of the South African Courts. A younger contemporary of Van der Keessel was Joannes van der Linden, the author of a popular textbook, *Regtsgeleerd, Practicaal en Koopmans Handboek*. These two names conclude the list of the contemporary writers on the old Dutch law.

The Dutch carried to their colonies the law of the home country, just as the English took with them their common law, and subject to the same necessary adaptation to local conditions. In practice the law of the province of Holland was followed. Hence the extension to the colonial empire of the Roman-Dutch system of law. This was supplemented by local ordinances of the governors in council, and in the East Indies by laws made by the governor-general in council established at Batavia. These were collected by Van Diemen in 1642 and by Van der Parra in 1766. The supreme direction of the East India company was exercised by the Council of XVII. and of the West India company by the Council of X. The ultimate legislative authority was vested in the States General.

In the British Empire.—When the Dutch colonies passed to the British Crown, the old law was in principle retained, but during the century and more which has since elapsed it has undergone profound modifications due partly to changed social and economic conditions, partly to the incursion of rules and institutions derived from English law. In commercial matters, in particular, English influences have been predominant. This was so even in the South African republics, and after annexation their law was brought into closer harmony with that of the neighbouring colonies.

The South Africa Act 1909 provided (sec. 135) for the continuance of all laws in force in the several colonies at the establishment of the Union until repealed by the Union parliament, or by the provincial councils within the sphere assigned to them. But since this Act took effect on May 31, 1910, the Union parliament and the appellate division of the Supreme Court of South Africa (which hears appeals not only from the Union, but also from Southern Rhodesia and the Mandated Territory) have been active in consolidating, amending and explaining the law, and will continue to introduce uniformity in place of diversity. Many of the rules of the old law have already been pronounced to be obsolete by disuse.

But, except where the field is occupied by statute or invaded by English law, the law of South Africa (and in a less degree the law of Ceylon) retains the character of a Roman law system. In many departments of the law the texts of the *Corpus Juris* are still cited as authoritative. The approach to them is through the writings of the Dutch jurists, Grotius, van Leeuwen, Voet, van der Keessel, van der Linden and the rest. The influence of English

law has been profound, most of all in British Guiana, where its victory has been complete, less in Ceylon, least in South Africa. But at some points the Roman-Dutch law has offered a stubborn resistance. Thus, it is now settled for both South Africa and Ceylon that "consideration" is not necessary to the validity of a contract. South Africa (but not Ceylon) retains almost unchanged the old law of community of goods with its consequences in the proprietary relations of the spouses.

Upon a general view it must be said that a system of law, which can draw at the same time upon the treasures of the Roman and of the English law has great elements of strength, particularly in a virile and progressive community. But the need to resort to law-books of by-gone centuries is a serious inconvenience.

ROMAN EMPIRE, LATER. The reign of Constantine the Great forms the most deep-reaching division in the history of Europe. The external continuity is not broken, but the principles which guided society in the Greek and Roman world are replaced by a new order of ideas. Emperor-worship, which expressed a belief in the ideal of the earthly empire of Rome, gives way to Christianity; this is the outward sign that a mental transformation, which we can trace for 300 years before in visible processes of decay and growth, had reached a crisis.

Besides the adoption of Christianity, Constantine's reign is marked by an event only second in importance, the shifting of the centre of gravity of the empire from the west to the east by making Byzantium a second capital, a second Rome. The foundation of Constantinople (*q.v.*) determined the subsequent history of the State; it established permanently the division between the eastern and western parts of the empire—a principle already introduced—and soon exhibited, though not immediately, the preponderance of the eastern half. The eastern provinces were the richest and most resourceful, and only needed a Rome in their midst to proclaim this fact; and further, it was eastward that the empire fronted, for here was the one great civilized State with which it was in constant antagonism. Byzantium was refounded on the model of Rome, had its own senate, and presently a *praefectus urbi*. But its character was different in two ways: it was Christian and it was Greek. From its foundation New Rome had a Christian stamp; it had no history as the capital of a pagan empire. There was, however, no intention of depressing Rome to a secondary rank in political importance; this was brought about by the force of circumstances.

The Christian Roman empire, from the first to the last Constantine, endured for 1,130 years, and during that long period, which witnessed the births of all the great modern nations of Europe, experienced many vicissitudes of decline and revival. In the 5th century it lost all its western provinces through the expansion of the Teutons; but in the 6th asserted something of its ancient power and won back some of its losses. In the 7th it was brought very low through the expansion of the Saracens and of the Slavs, but in consequence of internal reforms and prudent government in the 8th century was able before the end of the 9th to initiate a new brilliant period of power and conquest. From the middle of the 11th century a decline began; besides the perpetual dangers on the eastern and northern frontiers, the empire was menaced by the political aggression of the Normans and the commercial aggression of Venice; then its capital was taken and its dominions dismembered by Franks and Venetians in 1204. It survived the blow for 250 years, as a shadow of its former self.

During this long life its chief political rôle was that of acting as a defender of Europe against the great Powers of western Asia. While it had to resist a continuous succession of dangerous enemies on its northern frontier in Europe—German, Slavonic, Finnic and Tatar peoples—it always considered that its front was towards the east, and that its gravest task was to face the Powers which successively inherited the dominion of Cyrus and Darius. From this point of view we might divide the external history of the empire into four great periods, each marked by a struggle with a different Asiatic power: (1) with Persia, ending *c.* 630 with the triumph of Rome; (2) with the Saracens, who ceased to be formidable in the 11th century; (3) with the Seljuk Turks, in the 11th and 12th centuries; (4) with the Ottoman Turks, in which the Roman power went down.

Mediaeval historians, concentrating their interest on the rising States of western Europe, often fail to recognize the position held by the later empire and its European prestige. Up to the middle of the 11th century it was in actual strength the first Power in Europe, except in the lifetime of Charles the Great, and under the Comneni it was still a power of the first rank. But its political strength does not express the fullness of its importance. As the heir of antiquity it was confessedly superior in civilization, and it was supreme in commerce. Throughout the whole period (to 1204) Constantinople was the first city in the world. The influence which the empire exerted upon its neighbours, especially the Slavonic peoples, is the second great rôle which it fulfilled for Europe—a rôle on which perhaps the most speaking commentary is the doctrine that the Russian Tsar was the heir of the Roman Caesar.

HISTORICAL SKETCH

Diocletian's artificial experiment of two Augusti and two Caesars had been proved a failure, leading to 20 years of disastrous civil wars; and when Constantine the Great (*q.v.*) destroyed his last rival and restored domestic peace, he ruled for the rest of his life with undivided sway. But he had three sons, and this led to a new partition of the empire after his death, and to more domestic wars, Constans first annexing the share of Constantine II. (340) and becoming sole ruler of the west, to be in turn destroyed by Constantius II., who in 350 remained sole sovereign of the empire. Having no children, he was succeeded by his cousin, Julian the Apostate (*q.v.*). This period was marked by wars against the Germans, who were pressing on the Rhine and Danish frontiers, and against Persia. Julian lost his life in the eastern struggle, which was then terminated by a disadvantageous peace. But the German danger grew graver, and the battle of Adrianople, in which the Visigoths, who had crossed the Danube in consequence of the coming of the Huns (*see* GOTHS and HUNS), won a great victory, and the emperor Valens perished (378), announced that the question between Roman and Teuton had entered on a new stage. Theodosius the Great saved the situation for the time by his Gothic pacification. The efforts of a series of exceptionally able and hard-working rulers preserved the empire intact throughout the 4th century, but the dangers which they weathered were fatal to their weaker successors. On the death of Theodosius the decisive moment came for the expansion of the Germans, and they took the tide at the flood. There were three elements in the situation. Besides the Teutonic peoples beyond the frontier there were dependent people who had settled within the empire (as Visigoths in Moesia, Vandals in Pannonia), and further there were the semi-Romanized Germans in the service of the empire, some of whom had risen to leading positions (like Merobaudes and Stilicho). A Germanization of the empire, or part of it, in some shape was inevitable, but, if the rulers of the 5th century had been men of the same stamp as the rulers of the 4th, the process might have assumed a different form. The sons

of Theodosius were both incapable; and in their reigns the future of the State which was divided between them was decided. The dualism between the east (under Arcadius) and the west (under Honorius) developed under the rule of these brothers into antagonism verging on hostility. The German danger was averted in the east, but it led in a few years to the loss of many of the western provinces, and at the end of 90 years the immediate authority of the Roman emperor did not extend west of the Adriatic. The reign of Honorius saw the abandonment of Britain, the establishment of the Visigothic kingdom in Aquitaine, the occupation of a great part of Spain by Vandals and Sueves (Suebi). Under Valentinian III. the Vandals founded their kingdom in north Africa, the Visigoths shared Spain with the Sueves, the Burgundian kingdom was founded in south-east Gaul. The last Roman possession in Gaul passed to the Franks in 486 (*see* GOTHS; VANDALS; FRANKS). It is significant that the chief defenders of the empire against the Germans who were dismembering it were men of German race, Stilicho, who defended Italy against Alaric, Aëtius, whose great work was to protect the imperial possessions in Gaul, and Ricimer. It was also a German, Fravitta, who played a decisive part in suppressing a formidable Gothic movement which menaced the throne of Arcadius in 399–400. It was characteristic of this transformation of Europe that the Germans, who were imbued with a profound reverence for the empire and its prestige, founded their kingdoms on Roman soil in the first instance as "federates" of the emperor, on the basis of formal contracts, defining their relations to the native provincials; they seized their dominions not as conquerors, but as subjects. The double position of Alaric himself, as both king of the Visigoths and a *magister militum* of the empire, is significant of the situation.

The development of events was complicated by the sudden growth of the transient empire of the Huns (*q.v.*) in central Europe, forming a third great power, which, reaching from the Rhine to the Caucasus, from the Danube to the Baltic, might be compared in the extent of its nominal supremacy, but in nothing else, to the empires of Rome and Persia. The Huns, whose first appearance had precipitated the Germans on the empire, now retarded for some years the process of German expansion, while they failed in their own attacks upon the empire. On Attila's death (453) his realm collapsed, and his German vassals (Ostrogoths, etc.) founded important kingdoms on its ruins.

After the death of Valentinian III., the worst of his house, the Theodosian dynasty expired in the west, and the authority of the western emperors who succeeded him in rapid succession reached little beyond Italy. For most of this period of 20 years the general Ricimer, of German birth, held the scales of power in that peninsula, setting up and pulling down emperors. After his death the western throne was no longer tenable. First there was a usurpation; the general Orestes set up his child-son Romulus Augustulus against the legitimate Augustus, Julius Nepos, who was acknowledged by the eastern emperor; but this temporary Government was overthrown (476) by a Germanic military revolution headed by Odoacer, who appropriated part of the soil to his German soldiers and founded an Italian kingdom under the nominal supremacy of the emperor at Constantinople, who, however unwilling, recognized his position (after the death of Nepos).

The escape of the eastern provinces from the fate of the western illustrates the fact that the strength of the empire lay in the east. These provinces were more populous and presented greater obstacles to the invaders, who followed the line of least resistance. But it was of immense importance that throughout this period the empire was able to preserve a practically unbroken peace with its great eastern rival. The struggle with Persia, terminated in 364 by the peace of Jovian, was not renewed till the beginning of the 6th century. It was of greater importance that the rulers pursued a discreet and moderate policy, both in financial administration and in foreign affairs; and the result was that at the end of 100 years the diminished empire was strong and consolidated. Theodosius II. was a weak prince, but his Government was ably conducted by Anthemius, by his sister Pulcheria and by the eunuch Chrysaphius. His reign was important for the Armenian question. Theodosius I. had committed the error of consenting to a division of this buffer State in the Roman and Persian spheres of influence, Persia having much the larger. The Sassanid Government tried to suppress the use of the Greek language. But the Government of Theodosius II. officially supported the enterprise of translating the Bible into Armenian (Mesrob had just invented the Armenian alphabet), and this initiated the production of an abundant literature of translations from the Greek, which secured the perpetual connection of Armenia with European culture, and not with Oriental. This reign is also distinguished by the building of the great land walls of Constantinople, by the foundation of a university there and by the collection of the imperial laws in the Codex Theodosianus, which is a mine of material for the social condition of the empire. It reveals to us the decline of municipal liberty, the decay of the middle classes in the West, the evils of the oppressive fiscal system and an appalling paralysis of Roman administration which had once been so efficient; it shows how the best-intentioned emperors were unable to control the governors and check their corruption; and discloses a disorganization which facilitated the dismemberment of the empire by the barbarians.

In the reign of Zeno it seemed probable that an Ostrogothic kingdom would be established in the Balkan peninsula, but the danger was diverted to Italy (*see* GOTHS). The kingdom which Theodoric founded there was, in its constitutional aspect, a continuation of Odoacer's régime. He, like Odoacer and Alaric, held the double position of a German king and a Roman official. He was *magister militum* as well as *rex*. His powers were defined by capitulations which were arranged with the emperor Anastasius and loyally observed. The right of legislation was reserved to the emperor, and Theodoric never claimed it; but for all practical purposes he was independent.

Justinian.—In the 6th century the emperor Justinian, whose talents were equal to his ambitions, found himself, through the financial prudence of his predecessors, in a position to undertake the reconquest of some of the lost western provinces. The Vandal power had declined, and Africa was won back in one campaign by Belisarius in 533. The conquest of Italy was far more difficult. Begun by Belisarius in 535, it was not completed till 554, by Narses. A portion of southern Spain was also won from the Visigoths, so that the Romans again commanded the western straits. Justinian, possessed by large ideas and intoxicated with the majesty of Rome, aspired to be a great conqueror, a great lawgiver, a great pontiff, a great diplomatist, a great builder, and in each of these spheres his reign holds a conspicuous place in the annals of the empire. His legal work alone, or the building of Santa Sophia, was enough to ensure him immortal fame. But deep shadows balance the splendour. The reconquest of Africa was thoroughly justified and advantageous, but Italy was bought at a ruinous cost. In the first place, the Persian empire was at this time ruled by one of its greatest kings, Chosroes I. (*q.v.*), who was far from peacefully inclined. Justinian was engaged in a long Persian and a long Gothic war at the same time, and the State was unequal to the strain. In the second place, it was all-important for his western policy to secure the goodwill of the Italian provincials and the Roman bishop, and for this purpose he involved himself in an ecclesiastical policy (*see* below) which caused the final alienation of the Syrian and Egyptian provinces. The reconquest of the West was purchased by the disunion of the East. Thirdly, the enormous expenses of the Italian and Persian wars, augmented by architectural undertakings, caused a policy of financial oppression which hung as a cloud over all the brilliance of his reign, and led to the decline which ensued upon his death. Nor is it to be forgotten that he had at the same time to fulfil the task of protecting the Danube against the Germans, Slavs and Bulgarians, who constantly threatened the Illyrian provinces. He spared no expense in building forts and walls. Justinian's name will always be associated with that of the gifted Theodora, an actress of doubtful fame in her early life, who shared his throne. Their mosaic portraits are preserved in the contemporary church of San Vitale at Ravenna. She possessed great political influence, and the fact that she was a heretic (monophysite), while Justinian was devoted to orthodoxy, did

not mar their harmony, but only facilitated the policy of extending secret favour to the heretics who were publicly condemned, and enabled the left hand to act without the knowledge of the right. The events of the half-century after Justinian's death exhibited the weakness to which his grandiose policy had reduced the empire. It was attacked on the west, on the north and on the east, and at all points was unequal to coping with its enemies. (1) Italy fell a victim to the Lombards (*q.v.*), and in a few years more than half of the peninsula had passed under their sway. (2) The Avars, a Hunnic people who had advanced from the Caspian, took possession of Pannonia and Dacia, and formed an empire, consisting of Slavonic and Bulgarian subjects, which endured for about 60 years. Their chief occupation was to invade the Illyrian peninsula and extort tribute and ransoms from the emperors. So far as the Avars themselves were concerned, these incursions had no permanent significance, but the Slavs who overran the provinces did more than devastate. These years saw the beginning of the Slavonic settlements which changed the ethnical character of the peninsula, and thus mark the commencement of a new period. Slavs occupied Moesia and a large part of Macedonia, even close to Thessalonica, which they besieged; they penetrated southward into Greece and made large settlements in the Peloponnesus (*see* GREECE, *History*, "Roman period," *ad fin.*). They occupied the north-western provinces, which became Croatia and Servia, as well as Dalmatia (except some of the coast towns). In the northern part of the peninsula the Slavonic element remained dominant, but in Greece it was assimilated to the Greek (after the 9th century) and has left little record of itself except in place names. (3) The empire was simultaneously engaged in the perennial strife with Persia. A short interval of peace was secured when the emperor Maurice assisted Chosroes II. to dethrone a usurper, but after Maurice's death (602) the final and mortal struggle began (*see* PERSIA, *History*, section. "The Sassanian Empire"). Throughout the incompetent reign of Phocas the eastern provinces were overrun by the Persians, as the Illyrian were overrun by the Slavs. The unpopular rule of this cruel usurper was terminated in 610 by the intervention of the governor of Africa, whose son Heraclius sailed to Constantinople and, welcomed by an influential party, met with little resistance. Phocas, murderer of Maurice, was murdered by the people, and the victor was crowned emperor to find himself in presence of a desperate situation. Antioch, Damascus and many other great cities were captured by the Persians; and in 614 Jerusalem was destroyed and the Holy Cross, along with the patriarch, carried off to Ctesiphon. This event produced a profound sensation in Christendom. In 616 Egypt was conquered. The army had fallen into utter disorder under Phocas, and Heraclius so deeply despaired of saving Constantinople that he thought of transferring the imperial capital to Carthage. But the extreme gravity of the situation seems to have wrought a moral change among his subjects; the patriarch Sergius was the mouthpiece of a widespread patriotic feeling, and it was largely through his influence that Heraclius performed the task of creating a capable army. His efforts were rewarded in a series of brilliant campaigns (622–628), which, in the emphasis laid on the contrast between Christianity and fire-worship and on the object of recovering the Cross, had the character of crusades Heraclius recovered his provinces and held Persia at his mercy (decisive battle at Nineveh, end of 627).

This war is remarkable for the attempt of the Persians to take Constantinople (626) in conjunction with the Avars and Slavs. Soon afterwards the Avar power began to decay, and the Slavs and Bulgarians shook off their yoke. It seemed as if the Roman Government would now be able to regain the control in the Illyrian lands which it had almost entirely lost. It seems probable that Heraclius came to terms with the Slavs—Croatians and Servians—in the north-west; their position was regularized, as vassals of the empire. But fate allowed no breathing-time to do more; the darkest hour had hardly passed when a new storm-cloud, from an unexpected quarter, overspread the heavens.

At this point we have to note that the Hellenic element in the State had definitely gained the upper hand before the end of the 6th century, so that henceforward the empire might be described as Greek. Justinian's mother-tongue was Latin, and he was devoted to the Latin traditions of Rome, but even he found it necessary to publish his later laws in Greek and from his reign Greek was the official language.

Rise of Islam.—With the rise of Islam (*see* CALIPHATE; MOHAMMED) two universal religions, for the first time, stood face to face, each aspiring to win the universe The struggle, therefore, which then began was not only a new phase of the strife between Europe and Asia, but was one in which the religious element was fundamental. Fire-worship was only a national religion and did not present the danger of Islam. The creation of the political power of the Mohammedans was so sudden that it took the world by surprise. Bostra, the fortress of Roman Arabia, fell into their hands in 634, and before the death of Heraclius in 641 they had conquered Syria and all Egypt, except Alexandria, which opened its gates to them in 643. The religious alienation of the Syrian and Egyptian peoples from Constantinople, expressing as it did a national sentiment antagonistic to the Greeks, was an important political factor in the Mohammedan (as in the previous Persian) conquest. Thus the Mohammedans definitely cut the empire short in the East, as the Germans had cut it short in the West; Egypt was never recovered, Syria only for short periods and partially, while the integrity of Asia Minor was constantly menaced and Cilicia occupied for many generations. By their conquest of Persia the Caliphs succeeded to the position of the Sassanids; this led to the conquest of Armenia (*c.* 654); while, in the West, Africa was occupied in 647 (though the conquest was not completed till the capture of Carthage and other strong places in 698). Thus within 20 years from the first attack the empire was girt about by the new aggressive power from the precincts of the Caucasus to the western Mediterranean.

Fortunately Constans II., grandson of Heraclius, was a man of eminent ability and firmness. The State owed to him the preservation of Asia Minor, and the creation of a powerful fleet (*see* below) which protected the Aegean coasts and islands against the naval power which the Mohammedans created. He was responsible for completing a new, efficient military organization, which determined the lines of the administrative reforms of Leo III. (*see* below). In his last years he turned his eyes to Italy and Africa He dreamed of restoring Old Rome as the centre of the empire. But he did not succeed in recovering south Italy from the Lombards (Duchy of Beneventum), and having visited Rome he took up his residence in Syracuse, where he was assassinated, having lost two fleets which he sent against the Arabs of Africa The strain lasted for another 50 years. Constantinople sustained two great sieges (673–677 and 717–718) which stand out as crises, for, if in either case the enemy had been successful, the empire was doomed.

The Heraclian dynasty, which had fallen on evil times and rendered inestimable services to the empire, came to an end in anarchy, which was terminated by the elevation of the Syrian (commonly called Isaurian) Leo. III., whose reign opens a new period. His reforming hand was active in every sphere of government, but the ill-fame which he won by his iconoclastic policy obscured in the memory of posterity the capital importance of his work. His provincial organization was revolutionary, and his legislation departed from the Roman tradition (*see* below). From his reign to the middle of the 10th century the continuous warfare by land with the Caliphs consisted of marauding expeditions of each power into the other's territory, captures of fortresses, guerilla fighting, but no great conquests or decisive battles The efficiency of the army was carefully maintained, but the neglect of the navy led to the losses of Crete (conquered by Muslim adventurers from Spain 826) and Sicily (conquered by the Saracens of Africa). Panormus was taken in 832, Syracuse in 878 (*see* SICILY) The Africans also made temporary conquests, including Bari, in south Italy. This period saw the loss of the exarchate of Ravenna to the Lombards (750), the expansion of the Frankish power under Pippin and Charlemagne in Italy, and in close connection therewith the loss of Old Rome.

The iconoclast emperors pursued a moderate foreign policy, consolidating the empire within its contracted limits; but under

the "Macedonian" dynasty, which was of Armenian descent, it again expanded and became the strongest power in Europe. The 9th century also witnessed a revival of learning and culture which had been in eclipse for 200 years. The reign of Basil I. was marked by an energetic policy in south Italy, where his forces co-operated with the western emperor Louis II. The Saracens were expelled from their strongholds, Bari was recovered, Calabria saved, and the new province (Theme) of Longibardia formed. This secured the entrance to the Adriatic, and the increase of dominion here at the expense of the Lombards was a compensation for the loss of Sicily. Leo VI. did much for reorganizing the navy, but his reign was not fortunate; Saracen pirates plundered freely in the Aegean and, under the able renegade Leo of Tripolis, captured Thessalonica and carried off countless captives (904). But a great tide of success began 50 years later. Nicephorus Phocas won back Crete (961) as general of Romanus II., and then as emperor recovered Cilicia and North Syria (with Antioch) 968. Cyprus was also recovered. The tide flowed on under his equally able successor, John Zimisces (of Armenian race) and under Basil II.; these reigns mark the decisive victory of the empire in the long struggle with the Saracens, whose empire had been broken up into separate States. The eastern frontier was strengthened by the active policy of Basil II. in Armenia, which was more fully incorporated in the empire under Constantine IX.

Basil II.—The reign of Basil II. marks the culmination of the power of the Eastern empire, for it also witnessed the triumphant conclusion of another conflict which had lasted almost as long. In the reign of Constantine IV. the Bulgarians (*see* BULGARIA) had founded a kingdom in Lower Moesia, reducing the Slavonic tribes who had occupied the country, but less than two centuries sufficed to assimilate the conquerors to the conquered, and to give Bulgaria the character of a Slavonic State. The reign of Constantine V. was marked by continuous war with this enemy, and Nicephorus I. lost his life in a Bulgarian campaign. This disaster was followed up by Prince Krum, who besieged Constantinople in 815. His death was followed by a long peace. Prince Boris was converted to Christianity (reign of Michael III.); a metropolitan see of Bulgaria was founded, dependent on the patriarch of Constantinople; and the civilization of the Bulgarians, and beginnings of their literature, were entirely under Byzantine influence. The conversion was contemporary with the work of the two missionaries Cyril and Methodius, who (while the field of their personal activity was in Great Moravia and Pannonia) laid the south-eastern Slavs under a deep debt by inventing the Glagolitic (*q.v.*), *not* the so-called "Cyrillic" alphabet (based on Greek cursive) and translating parts of the Scriptures into Slavonic (the dialect of the Slavs of Macedonia). The most brilliant period of the old Bulgarian kingdom was the reign of Simeon (893–927), who extended the realm westward to the shores of the Adriatic and took the title "Tsar (*ie.*, Caesar) of Bulgaria and autocrator of the Romans." The aggression against the empire which marked his ambitious reign ceased under his successor Peter, who married a daughter of Romanus I., and the Bulgarian Patriarchate founded by Simeon was recognized at Byzantium. But the Byzantine rulers only waited for a favourable time to reduce this formidable Slavonic State. At length Zimisces subjugated eastern Bulgaria and recovered the Danube frontier. But while Basil II. was engaged in contending with rivals, the heroic Samuel (of the Shishmanid family) restored the Bulgarian power and reduced the Servians. After a long and arduous war of 14 years Basil (called the "Bulgar-slayer") subdued all Bulgaria western and eastern (1018). He treated the conquered people with moderation, leaving them their political institutions and their autonomous church, and to the nobility their privileges. Some Bulgarian noble families and members of the royal house were incorporated in the Greek nobility; there was Shishmanid blood in the families of Comnenus and Ducas. Greek domination was now established in the peninsula for more than 150 years. The Slavs of Greece had in the middle of the 9th century been brought under the control of the Government.

In the reign of Basil II. the Russian question also was settled. The Dnieper and Dniester gave the Russians access to the Euxine, and the empire was exposed to their maritime attacks (Constantinople was in extreme danger in 860 and 941). In 945 a commercial treaty was concluded, and the visit of the princess Olga to Byzantium (towards the end of the reign of the learned emperor Constantine VII., Porphyrogennetos) and her baptism seemed a pledge of peace. But Olga's conversion had no results. Sviatoslav occupied Bulgaria and threatened the empire, but was decisively defeated by Zimisces (971), and this was virtually the end of the struggle. In 988 Prince Vladimir captured Cherson, but restored it to the emperor Basil, who gave him his sister Anna in marriage, and he accepted Christianity for himself and his people. After this conversion and alliance, Byzantium had little to fear from Kiev, which came under its influence. One hostile expedition (1043) indeed is recorded, but it was a failure. Much about the same time that the Russians had founded their State, the Magyars (*see* HUNGARY; the Greeks called them Turks) migrated westward and occupied the regions between the Dnieper and the Danube, while beyond them, pressing on their heels, were another new people, the Petchenegs (*q.v.*). The policy of Byzantium was to make use of the Magyars as a check on the Bulgarians, and so we find the Romans (under Leo. VI.) and the Magyars co-operating against the tsar Simeon. But Simeon played the same game more effectively by using the Petchenegs against the Magyars, and the result was that the Magyars before the end of the 9th century were forced to move westward into their present country, and their place was taken by the Petchenegs. From their new seats the Magyars could invade the empire and threatened the coast towns of Dalmatia. The conquest of Bulgaria made the Petchenegs immediate neighbours of the empire, and during the 11th century the depredations of these irreclaimable savages, who filtered into the Balkan peninsula, constantly preoccupied the Government. In 1064 they were driven from the Dniester regions into Little Walachia by the Cumans, a people of the same ethnical group as themselves. They were crushingly defeated by Alexius Comnenus in 1091, and disappear from history.

The Seljuk Turks.—In the Macedonian period a grave domestic question troubled the Government. This was the growth of the large estates of the rich nobles of Asia Minor, at the expense of small properties, to an excess which was politically and economically dangerous. The legislation against the evil began under Romanus I. and was directed to the defence of the poor against the rich, and to protecting the military organization which was based on holdings of land to which the obligation of military service was attached. There was also danger in the excessive influence of rich and powerful families, from which the great military officers were drawn, and which were extensively related by alliances among themselves. The danger was realized in the struggle which Basil II. had to sustain with the families of Sclerus and Phocas. Various kinds of legislation were attempted. Under Romanus I. alienation of property to the large landowners was forbidden. Nicephorus Phocas, whose sympathies were with the aristocracy to which he belonged, holding that there had been enough legislation in favour of the poor, sought to meet the difficulty of maintaining a supply of military lands in the future by forbidding further acquisitions of estates by the church. Basil II. returned to the policy of Romanus, but with much greater severity, resorting to confiscation of some of the immense private estates; and he endeavoured to keep down the aristocrats of Asia Minor by very heavy taxation. Through the recovery of the Balkan provinces he gained in Europe a certain political counterpoise to the influence of Asia Minor, which had been preponderant since the 7th century. Asia Minor meant the army, and opposition to its influence expressed itself in the 11th century in a fatal anti-military policy, which is largely responsible for the conquests of a new enemy, the Seljuk Turks, who now entered into the inheritance of the Caliphs (*see* CALIPHATE *ad fin.* and SELJUKS). Constantinople was haunted by the dread of a military usurpation. An attempt of the military hero George Maniaces (who had made a remarkable effort to recover Sicily) to wrest the crown from Constantine IX. had failed; and when Isaac Comnenus, who represented the military aristocrats of Asia Minor, ascended the

throne, he found himself soon compelled to abdicate, in face of the opposition. The reign of Constantine X., of the rival family of Ducas, marked the culmination of this antagonism. The senate was filled with men of the lower classes, and the military budget was ruthlessly cut down. This policy reduced the army and stopped the supply of officers, since there was no longer hope of a profitable career. The emperor thought to meet dangers from external enemies by diplomacy. The successes of the Seljuks (after the fall of the great Armenian fortress of Ani in 1064) at length awoke the Government from its dream of security. The general Romanus Diogenes was proclaimed emperor. He had to create an army and to train it; he did not spare himself, but it was too late. He was defeated and captured by Alp Arslan on the decisive field of Manzikert (1071). Released by the sultan, who honoured his bravery, he was deposed in favour of Michael Ducas, and falling into the hands of his enemies, was blinded. The east and centre of Asia Minor were thus lost; the Seljuk kingdom of Rûm was founded; Nicaea was captured by the Turks in 1080. The provinces which escaped the Seljuk occupation were thoroughly disorganized, a prey to foreign and native adventurers and usurpers (*see* SELJUKS).

Thus in the '70s of the 11th century the empire seemed through incompetence and frivolity to have been brought to the verge of dissolution. The disorder was terminated by the accession of the extraordinarily able statesman Alexius Comnenus (1081), who effected a reconciliation with the rival family of Ducas, established a strong Government and founded a dynasty. He had to deal with three great dangers—the Seljuks, the Petchenegs (*see* above), and in the west the Normans. The Normans had wrested from East Rome its possessions in south Italy (1041–71)—succeeding where German emperors had failed—and throughout the Comnenian period the empire was threatened by their projects of conquest beyond the Adriatic, projects which aimed at Constantinople itself.

Four great attempts against the empire were made by the Normans; they were unsuccessful, but they heralded the Western conquest of 1204. (1) Expedition of Robert Guiscard, 1081–85, repelled by Alexius with help of Venice; (2) Bohemond's expedition, 1105–07, foiled by the able strategy of Alexius; (3) the invasion of Greece by Roger of Sicily, 1147; Venice supported Manuel Comnenus, and the Normans were driven from Corfù, 1149; (4) the expedition of William II. of Sicily, 1185, who succeeded in capturing Thessalonica; the invaders were defeated at Demetritsa, but they gained the islands of Cephallenia and Zacynthus.

The First Crusade.—The two most important events in the reign of Alexius were the prices which he paid for help against his enemies. (1) He was obliged (1084) to grant to Venice (*q.v.*) in return for her naval aid against the Normans, commercial privileges which practically made the empire commercially dependent on the republic. (2) He sought auxiliary forces in western Europe to help him against the Seljuks; the answer of the pope and Latin Christendom was the First Crusade—a succour very different from that which he desired. Through his tact and discretion, the State was safely steered through the dangers with which the disorderly hosts of barbarous allies menaced it, and the immediate results were salutary; large parts of Asia Minor, including Nicaea, were restored to the empire, which was thus greatly strengthened in the East while the Turks were weakened (*see* CRUSADES). But for this help Byzantium might not have recovered the transient strength and brilliance which it displayed under Manuel. In Asia Minor the crusaders kept the terms of their agreement to restore to the emperor what had belonged to him; but on capturing Antioch (1098) they permitted the Norman Bohemond to retain it, in flagrant violation of their oaths; for to Antioch if to any place the emperor had a right, as it had been his a few years before. This was in itself sufficient to cause a breach between Byzantium and the Latin kingdom of Jerusalem (founded 1099). But otherwise the new political situation created by the Crusade was dangerous, ultimately fatal, to the empire. For its lands and seas became a highway from western Europe to the Latin colonies in Syria; the Byzantine Government was forced to take precautions to protect itself against the crusading expeditions which travelled to the Holy Land; and these precautions were regarded by the western Powers as a hindrance to the sacred objects of the crusades. The bitter religious antagonism between the Greek and Latin Christians increased the mutual distrust and the danger.

The history of the new relations between East and West dating from the First Crusade is closely connected with the history of the futile attempts at bringing about a reunion between the Greek and Latin Churches, which had severed communion in 1054. To heal the hurtful schism and bring the Greek Church again under the domination of Rome was a principal object of papal policy from Gregory VII. forward. The popes alternated between two methods for attaining this, as circumstances dictated: namely, a peaceful agreement—the policy of union; or an armed occupation of the empire by some western power (the Normans)—the policy of conquest. Their views varied according to the vicissitudes of their political situation and their struggles with the western emperors. The eastern emperors were also constantly preoccupied with the idea of reconciliation, constantly negotiating with a view to union; but they did not care about it for its own sake, but only for political advantages which it might bring, and their subjects were bitterly opposed to it. Manuel Comnenus during the first part of his reign was the close friend and ally of the western emperor Conrad III., but after Conrad's death he formed the ambitious plan of realizing in Europe a sovereignty like that of Justinian, and hoped to compass it in conjunction with Rome, the enemy of the Hohenstaufen. His forward policy carried war into Italy; he seized Ancona. But his strength was unequal to such designs. His Latin sympathies, no less than his financial extravagance, made him highly unpopular at home; and the national lack of sympathy with his Western policy was exhibited—after the revolution which overthrew his son Alexius and raised his cousin Andronicus I. to the throne—by the awful massacre of the Latin residents at Constantinople in 1182, for which the expedition of William of Sicily (*see* above) and the massacre of the people of Thessalonica was the revenge. The short reign of the wicked and brilliant Andronicus was in all respects a reaction, prudent, economical and popular. His fall was due to the aristocracy against whom his policy was directed, and the reign of Isaac Angelus undid his efforts and completed the ruin of the State. Oppressive taxation caused a revolt of the Bulgarian and Walachian population in the European provinces; the work of Zimisces and Basil was undone, and a new Bulgarian kingdom was founded by John Asen—a decisive blow to the Greek predominance which the Macedonian emperors seemed to have established.

Dismemberment of the Empire.—In the fatal year 1204 the perils with which the eastward expansion of western Christendom (the Crusades and the commercial predominance and ambitions of Venice) had long menaced the empire, culminated in its conquest and partition. It was due to a series of accidents that the cloud burst at this moment, but the conditions of such a catastrophe had long been present. Isaac Angelus was dethroned by his brother Alexius III., and his son escaped (1201) to the west, where arrangements were being made for a new crusade, which Venice undertook to transport to the Holy Land. The prince persuaded Philip of Swabia (who had married his sister) and Boniface of Montferrat to divert the expedition to Byzantium, in order to restore his father and himself to the throne, promising to furnish help to the Crusade and to reconcile the Greek Church with Rome; Venice agreed to the plan; but Pope Innocent III., the enemy of Philip, forbade it. Isaac and his son, Alexius IV., were restored without difficulty in 1203, and the crusading forces were prepared to proceed to Palestine, if Alexius had performed his promises. But the manner of this restoration, under Latin auspices, was intensely unpopular; he was not unwilling, but he was unable, to fulfil his pledges; and a few months later he was overthrown in favour of one who, if an upstart, was a patriot, Alexius V. Then the Crusaders, who were waiting encamped outside the city, resolved to carry out the design which the Normans had repeatedly attempted, and put an end to the Greek empire. The leaders of the Fourth Crusade must be acquitted of having

formed this plan deliberately before they started; it was not conceived before 1204. They first arranged how they would divide the empire amongst themselves (March); then they captured the city, which had to endure the worst barbarities of war. In partitioning the empire, which was now to become the spoil of the conquerors, the guiding mind was the Venetian leader, the blind doge, Henry Dandolo. He looked to the interests of Venice from the narrowest point of view, and in founding the new Latin empire, which was to replace the Greek, it was his aim that it should be feeble, so as to present no obstacles to Venetian policy. The Latin empire of Romania was a feudal State like the kingdom of Jerusalem; the emperor was suzerain of all the princes who established themselves on Greek territory; under his own immediate rule were Constantinople, southern Thrace, the Bithynian coast, and some islands in the Aegean. But he was hampered from the beginning by dependence on Venice, want of financial resources, and want of a fleet; the feudal princes, occupied with their separate interests, gave him little support in his conflict with Greeks and Bulgarians; at the end of ten years the worthless fabric began rapidly to decline, and the efforts of the popes, for whom it was the means of realizing Roman supremacy in the East, were unavailing to save it from the extinction to which it was doomed in its cradle.

Three Greek States emerged from the ruin of the Roman empire. A member of the Comnenian house had founded an independent State at Trebizond, and this empire survived till 1461, when it was conquered by the Ottomans. A relation of the Angeli maintained in Europe an independent Greek State known as the Despotate of Epirus. But the true representative of the imperial line was Theodore Lascaris, who collected the Byzantine aristocracy at Nicaea and was elected emperor in 1206. He and his successors advanced surely and rapidly against the Latin empire, both in Europe and Asia. It was a question whether Constantinople would fall to the Walacho-Bulgarians or to the Greeks. But an astute diplomat and general, the emperor Michael Palaeologus, captured it in 1261. His object was to recover all the lost territory from the Latins, but he was menaced by a great danger through Charles of Anjou, who had overthrown the rule of the Hohenstaufen in the two Sicilies, and determined to restore the Latin kingdom of Romania. To avert this peril, Michael negotiated with Pope Gregory X.; he was ready to make every concession, and a formal union of the Churches was actually brought about at the Council of Lyons in 1274. The emperor had the utmost difficulty in carrying through this policy in face of clerical opposition; it aroused disgust and bitterness among his subjects; and it was undone by his successor. Meanwhile the pope had with difficulty bridled Charles of Anjou; but in Martin IV. he found a more pliable instrument, and in 1282 he made vast preparations for an expedition against the Greek empire. It was saved by the Sicilian Vespers (*see* SICILY), to be the prey of other Powers.

The Ottoman Turks.—The end of the 13th century saw the rise of the Ottoman power in Asia and the Servian in Europe. The empire was assisted by a band of Spanish mercenaries (the Catalan Grand Company; *see* GREECE, *History,* "Byzantine Period") against the advance of the Ottoman Turks in Asia Minor; they distinguished themselves by saving Philadelphia (1304). In 1326 Brusa (Prusa) became the Ottoman capital, while on the other side the Servians (crushing the Bulgarians in 1330) were gradually closing in on Byzantium. Under Stephen Dušan (1331–55) Servia attained the height of her power. The enemies were strengthened by the domestic struggles within the empire, first between Andronicus II. and his son, then between John VI. and the usurper Cantacuzenus. But before the fate of Byzantium was settled the two enemies on its flanks came face to face. In 1389 the Servian power was crushed on the field of Kossovo by the Ottomans (who had crossed the Hellespont in 1360 and taken Philippopolis in 1363). Sultan Bayezid I. won Philadelphia, the last Asiatic possession of the empire, and conquered Trnovo, the Bulgarian capital, in 1393. Constantinople was now surrounded. The Ottoman power was momentarily eclipsed, and the career of conquest checked, by the Mongol invasion of Timur and the great defeat which it sustained in the battle of Angora (1402). Mohammed I. found it necessary to ally himself with the emperor Manuel. But the pause was brief. Murad II. took Adrianople, and tried (1422) to take Constantinople.

It was small compensation that during this time the Palaeologi had been successful against the Franks in Greece. The situation was desperate. The Turks were in possession of the Balkan peninsula, threatening Hungary; there was no chance of rescue, except from western Europe. John VI. and Manuel had both visited the West in search of help. The jeopardy of the empire was the opportunity of Rome, and the union of the Churches became the pressing question. It was taken up earnestly by Pope Eugenius IV., and the result was the Decree of Union at the Council of Florence in 1439. The emperor and the higher clergy were really in earnest, but the people and the monks did not accept it, and the last agony of Byzantium was marked by ecclesiastical quarrels. Eugenius IV. preached a crusade for the rescue of the empire, and in 1443 an army of Hungarians and Poles, led by the Hungarian king, won a victory over Murad, which was more than avenged in the next year on the memorable field of Varna. The end came nine years later under Murad's successor, Mohammed II. An army of about 150,000 blockaded the city by land and sea, and Mohammed began the siege on the 7th of April. The emperor Constantine XI., Palaeologus, on whom the task of the forlorn defence devolved (and whose position was all the more difficult because he was alienated from his subjects, having embraced the Latin rite), can have had little more than 8,000 men at his disposal; he received no help from the Western powers; but an experienced Genoese soldier of fortune, John Justiniani, arrived with two vessels and 400 cuirassiers and aided the emperor with his courage and advice. The resident foreigners, both Venetians and Genoese, loyally shared in the labours of the defence. The final storm of the land walls took place on the night of the 29th of May. All looked to Justiniani for salvation, and when he, severely wounded, retired from the wall to have his wound looked to, a panic ensued. The enemy seized the moment, and the Janissaries in a final charge rushed the stockade which had been constructed to replace a portion of the wall destroyed by the Turkish cannon. This decided the fate of the city. Constantine fell fighting heroically. Soon after sunrise (May 30) the Mohammedan army entered Constantinople (Stambul = *'s τὴν πόλιν*, "the city"), which was in their eyes the capital of Christendom.

The ultimate responsibility for this disaster is generally imputed to the political adventurers who dismembered the empire in 1204. It may indeed be said that at that time the Byzantine State seemed already stricken with paralysis and verging on dissolution, and it was menaced by the re-arisen power of Bulgaria. But more than once before (in the 7th century and in the 11th) it had recovered its strength when it was weak and in dire peril; and, considering what the emperors of Nicaea and Michael VIII. accomplished, it seems probable that, if there had been no Fourth Crusade, it might have so revived and consolidated its forces in the course of the 13th century, as to be able to cope successfully with the first advances of the Ottomans. The true statement is that the Fourth Crusade was only an incident (not in itself decisive) in a world-movement which doomed the Eastern empire to extinction—namely, the eastward movement of western Europe which began in the 11th century with the rise of the Normans and the First Crusade. Henceforward the empire was a middle State, pressed between expanding forces on the east and on the west, and its ultimate disappearance was inevitable.

CHURCH AND STATE

In making the State Christian, Constantine made the Church a State institution, and therefore under imperial control. Caesaropapism was the logical consequence. The *sacerdotium* was united with the *imperium* in the person of the monarch as in the pagan State. The Church acquiesced, and yet did not acquiesce, in this theory. When a heretical emperor sought to impose his views, champions of ecclesiastical freedom never failed to come forward. At the very beginning Athanasius fought for the independence of the Church against the emperor Constantius. But the political principle which Constantine had taken for granted, and which was

an indispensable condition of his adoption of Christianity, was fully recognized under Theodosius I., and, notwithstanding protests from time to time, was permanent. It is significant that Constantinople, which had become a second Rome politically, with its senate and capitol, became then a second Rome ecclesiastically, and that the elevation of the see of Constantinople to patriarchal rank next to the Roman see was due to Theodosius (381), who gave a permanent form to the dualism of the empire. The patriarch became a State minister for religion. The character of the Church as a State institution is expressed above all in the synods. The general councils are not only summoned by the emperor, but are presided over by him or by his lay deputies. The order of the proceedings is modelled on that of the senate. The emperor or his representative not only keeps order but conducts the deliberations and intervenes in the theological debates. It has been erroneously thought that at the Council of Chalcedon (451) the legate of Pope Leo presided; but the acts of that assembly teach us otherwise; the privilege which the Roman legates possessed was that of voting first (the right of the *princeps senatus*). The first general council at which a churchman presided was the seventh (at Nicaea, 787), at which the emperor (or empress) deputed, not a layman, but the patriarch Tarasius to preside. The resolutions of these ecclesiastical State-councils did not become the law of the empire till they were confirmed by imperial edicts.

The emperors, in their capacity as heads of the Church, did not confine themselves to controlling it by controlling the councils. They soon began to issue edicts dealing with theology, by virtue of their own authority. It has been said that the council of Chalcedon closed an epoch of "parliamentary constitutionalism"; a general council was not summoned again for more than 100 years, though the empire during that period was seething with religious disunion and unrest. The usurper Basiliscus in his short reign set an example which his successors were not slow to follow. He issued an edict quashing the decision of Chalcedon. Zeno's *Henōtikon* issued a few years later was the second and more famous example of a method which Justinian largely used, and of which the *Ecthesis* of Heraclius, the *Type* of Constans II. and the iconoclastic edicts of Leo III. are well-known instances. It was a question of political expediency (determined by the circumstances, the intensity and nature of the opposition, etc.) whether an emperor supported his policy or not by an ecclesiastical council.

The emperor was always able to control the election of the patriarch, and through him he directed the Church. .Sometimes emperor and patriarch collided; but in general the patriarchs were docile instruments, and when they were refractory they could be deposed. There were several means of resistance open to a patriarch, though he rarely availed himself of them. His participation in the ceremony of coronation was indispensable, and he could refuse to crown a new emperor except on certain conditions, and thus dictate a policy (instances in 812, Michael I.; 969, John Zimisces). There was the power of excommunication (Leo VI. was excommunicated on account of his fourth marriage). Another means of resistance for the Church was to invoke the support of the bishop of Rome, who embodied the principle of ecclesiastical independence and whose see admittedly enjoyed precedence and primacy over all the sees in Christendom. Up to the end of the 8th century he was a subject of the emperor, and some emperors exerted their ecclesiastical control over Rome by drastic measures (Justinian and Constans II.). But after the conquest of Italy by Charles the Great, the pope was outside the Byzantine domination; after the coronation of Charles in 800 he was associated with a rival empire; and when ecclesiastical controversies arose in the East, the party in opposition was always ready to appeal to him as the highest authority in Christendom. Under the iconoclastic emperors the image-worshippers looked to him as the guardian of orthodoxy.

Theological Controversies.—As to the ecclesiastical controversies which form a leading feature of Byzantine history, their political significance alone concerns us. After the determination of the Arian controversy in 381 new questions (as to the union of the divine and human elements in the person of Christ: one or two natures?) arose, and it may seem surprising that such points of abstruse theology should have awakened universal interest and led to serious consequences. The secret was that they masked national feelings; hence their political importance and the attention which the Government was forced to bestow on them. The reviving sense of nationality (anti-Greek) in Syria and in Egypt found expression in the 5th century in passionate monophysitism (the doctrine of one nature): theology was the only sphere in which such feelings could be uttered. The alienation and dissension which thus began had fatal consequences, smoothing the way for the Saracen conquests of those lands; the inhabitants were not unwilling to be severed politically from the empire. This ultimate danger was at first hardly visible. What immediately troubled the emperors in the first half of the 5th century was the preponderant position which the see of Alexandria occupied, threatening the higher authority of Constantinople. The Council of Chalcedon, called by Marcian, an able statesman, was as much for the purpose of ending the domination of Alexandria as of settling the theological question. The former object was effected, but the theological decision of the council was fatal; it only sealed and promoted the disunion. The recalcitrant spirit of Syria and Egypt forced Zeno, 30 years later, to issue his Henōtikon, affirming the decisions of previous councils but pointedly ignoring Chalcedon. This statesman-like document secured peace in the East for a generation. Rome refused to accept the Henōtikon, and when Justinian resolved to restore imperial supremacy in the Western kingdoms, conciliation with Rome became a matter of political importance. For the sake of this project, the unity of the East was sacrificed. The doctrine of Chalcedon was reasserted, the Henōtikon set aside; New Rome and Old Rome were again hand in hand. This meant the final alienation of Egypt and Syria. The national instinct which had been alive in the 5th century grew into strong national sentiment in the 6th. One of the chief anxieties of Justinian's long and busy reign was to repair the mischief. Deeply interested himself in matters of dogma, and prepared to assert to its fullest extent his authority as head of the church, he has been called "the passionate theologian on the throne"; but in his chief ecclesiastical measures political considerations were predominant. His wife Theodora was a monophysite, and he permitted her to extend her protection to the heretics. He sought new formulae for the purpose of reconciliation, but nothing short of repudiation of the Chalcedon acts would have been enough. The last great efforts for union were made when the Saracens invaded and conquered the dissident provinces. A new formula of union was discovered (One Will and One Energy). This doctrine of monotheletism would never have been heard of but for political exigencies. The Egyptians and Syrians would perhaps have accepted this compromise; but it was repudiated by the fanatical adherents of Chalcedon. Heraclius sought to impose the doctrine by an edict (Ecthesis, 638), but the storm, especially in Italy and Africa, was so great that ten years later an edict known as the Type was issued by Constans forbidding all disputation about the number of wills and energies. Constans was a strong ruler, and maintained the Type in spite of orthodox opposition throughout his reign. But the expediency of this policy passed when the Saracens were inexpugnably settled in their conquests, and in his successor's reign it was more worth while to effect a reconciliation with Rome and the West. This was the cause of the 6th Ecumenical Council which condemned monotheletism (680–681).

Image-worship.—In the Hellenic parts of the empire devotion to orthodoxy served as a chrysalis for the national sentiment which was to burst its shell in the 10th century. For the Greeks Christianity had been in a certain way continuous with paganism. It might be said that the old deities and heroes who had protected their cities were still their guardians, under the new form of saints (sometimes imaginary) and archangels, and performed for them the same kind of miracles. Pagan idolatry was replaced by Christian image-worship, which by the Christians of many parts of Asia Minor, as well as by the Mohammedans, was regarded as simply polytheism. Thus in the great iconoclastic controversy, which distracted the empire for nearly 120 years, was involved, as in the monophysitic, the antagonism between different racial elements and geographical sections. Leo III., whose services as a

great deliverer and reformer were obscured in the memory of posterity by the ill-fame which he won as an iconoclast, was a native of Commagene. His first edict against the veneration of pictures evoked riots in the capital and a revolt in Greece. The opposition was everywhere voiced by the monks, and it is not to be overlooked that for many monks the painting of sacred pictures was their means of existence. Leo's son Constantine V. pursued the same policy with greater rigour, meeting the monastic resistance by systematic persecution, and in his reign a general council condemned image-worship (753). Iconoclasm was supported by the army, *i.e.*, Asia Minor, and a considerable portion of the episcopate, but it was not destined to triumph. When the Athenian Irene, wife of Leo IV., came to power after her husband's death, as regent for her son, Constantine VI., she secured the restoration of the worship of icons. The Iconoclastic Council was reversed by the 7th Ecumenical Council of 787. The iconoclastic party, however, was not yet defeated, and (after the neutral reign of Nicephorus I.) came again to the helm in the reigns of the Armenian Leo V. and the first two Phrygian emperors, Michael II. and Theophilus. But the empire was weary of the struggle, and on the death of Theophilus, who had been rigorous in enforcing his policy, icon-worship was finally restored by his widow Theodora (843), and the question was never reopened. This was a triumph for the Greek element in the empire; the "Sunday of orthodoxy" on which iconoclasm was formally condemned is still a great day in the Greek Church.

The ablest champions who wielded their pens for the cause of icons, defending by theological arguments practices which really had their roots in polytheism, were in the early stage John of Damascus and in the later Theodore (abbot of the monastery of Studium at Constantinople). The writings of the iconoclasts were destroyed by the triumphant party, so that we know their case only from the works of their antagonists.

Schism Between the Greek and Latin Churches.—In this struggle the Greeks and Latins were of one mind; the image-worshippers had the support of the Roman see. When the pope resisted him, Leo III. confiscated the papal estates in Sicily and Calabria; and the diocese of Illyricum was withdrawn from the control of Rome and submitted to the patriarch of Constantinople. But when iconoclasm was defeated, there was no question of restoring Illyricum, nor could there be, for political reasons; since the iconoclastic schism had, with other causes, led to the detachment of the papacy from the empire and its association with the Frankish power. By the foundation of the rival Roman empire in 800 the pope had definitely become a subject of another State. No sooner had the iconoclastic struggle terminated than differences and disputes arose between the Greek and Latin Churches which finally led to an abiding schism, and helped to foster the national self-consciousness of the Greeks. A strife over the patriarchal chair between Ignatius (deposed by Michael III. and supported by Rome) and Photius, the learned statesman who succeeded him, strained the relations with Rome, but a graver cause of discord was the papal attempt to win Bulgaria, whose sovereign, Boris, had been baptized under the auspices of Michael III. (*c.* 865), and was inclined to play Old Rome against New Rome. Photius stood out as the champion of the Greeks against the claim of the Roman see, and his patriarchate, though it did not lead to a final breach, marks the definite emancipation of the Greeks from the spiritual headship of Rome. This is the significance of his encyclic letter (867), which formulated a number of differences in rite and doctrine between the Greek and Latin Churches, differences so small that they need never have proved a barrier to union, if on one side there had been no question of papal supremacy, and if the Greek attitude had not been the expression of a tenacious nationality. There was a reconciliation about 900, but the Churches were really estranged, and the open and ultimate breach which came in 1054, when the influence of the Cluny movement was dominant at Rome (Leo IX. was pope and Michael Cerularius patriarch), sealed a disunion which had long existed. Subsequent plans of reunion were entertained by the emperors merely for political reasons, to obtain Western support against their foes, or to avert (through papal influence) the aggressive designs of Western princes. They were doomed to futility because they were not seriously meant, and the Greek population was entirely out of sympathy with these political machinations of their emperors. The Union of Lyons (1274) was soon repudiated, and the last attempt, the Union of Florence in 1439, was equally hollow (though it permanently secured the union of the Rumanians and of the Ruthenians). Part of the historical significance of the relations between the Greek and Latin Churches lies in the fact that they illustrated and promoted by way of challenge the persistence of Greek national self-consciousness.

The emperors legislated against paganism and against heresy, not merely under ecclesiastical pressure, but because they thought religious uniformity politically desirable. Theodosius the Great, a Spaniard, with no sympathy for Hellenic culture, set himself the task of systematically eradicating pagan institutions and customs. Though his persecution accomplished much, paganism was far from being extinct either in the East or in the West in the 5th century. Not only did heathen cults survive in many remote districts, but the old gods had many worshippers among the higher classes at Rome, Constantinople, Antioch, Alexandria and Athens. The most distinguished Greek literati of that period were non-Christian. Justinian, who united theological enthusiasm with belief in the ideal of uniformity and, like Theodosius, was out of sympathy with Hellenism ("Hellene" now came to mean "pagan"), persecuted polytheism more earnestly and severely than his predecessors. His measures created a panic among the higher classes at Byzantium, of whom many, as he suspected, were addicted to the ancient religion. He instituted a regular inquisition, exacted oaths of orthodoxy from all officials and teachers, and closed the philosophical schools of Athens. Missionaries (and it is remarkable that he employed monophysite heretics) were sent to abolish the old heathen worship which survived in many parts of Asia Minor where Christianity had hardly penetrated. By the end of the 6th century formal paganism had practically disappeared.

In Asia Minor, especially in the east, there were many dissident communities which asserted independence of the Church of Constantinople and of all ecclesiastical traditions, founding their doctrines directly on the Bible. Most important of these heretics were the Paulicians (*q.v.*), a dualistic sect whom the Church regarded as Manichaeans.

THE MACHINERY OF GOVERNMENT

The Autocracy and Its Constitutional Forms.—With Diocletian the Principate of Augustus had become undisguisedly an absolute monarchy, and this constitution prevailed to the end. There is virtually no constitutional history in the proper sense of the term in the later Roman empire, for there was neither evolution nor revolution. The monarchical system remained in all its essential points unchanged, and presents a remarkable example of an autocracy of immense duration which perfectly satisfied the ideas of its subjects. No attempt was made to alter it—to introduce, for instance, a limited monarchy or a republican Government; all revolts and conspiracies were aimed at the policies of particular autocrats, not at autocracy itself; generally they only represented sectional antagonisms and personal ambitions. The emperors inherited a deeply rooted instinct of legality as a tradition from Old Rome; and this respect for law which marked their acts, along with the generally good administration of justice, was a palladium of the monarchy. They were supreme in legislation, as well as in the administrative and judicial spheres; but they were on the whole moderate in wielding legislation as an instrument of policy.

There were, however, recognized constitutional principles which it would have been impossible for the emperor to override.

(1) The elective principle, inherited from the republic, was never changed. A new emperor had to be elected by the senate and acclaimed by the people. The succession never became automatic. But even Augustus had indirectly introduced the dynastic principle. Theodosius the Great, by causing his two sons, Arcadius and Honorius, to be elected Augusti in their infancy, practically elevated the dynastic idea into a constitutional principle; hence-

forward it was regarded as in the regular course that the son born to a reigning sovereign should in his infancy be elected Augustus. Thus the election, though always an indispensable form, was only a reality when a dynasty came to an end.

(2) When the position of Christianity was assured by the failure of Julian's reaction, it was evident that profession of that religion would henceforward be a necessary qualification for election to the throne. This was formally and constitutionally recognized when the coronation of the emperor by the patriarch was introduced in 457, or perhaps in 450.

(3) The sovereignty of the emperor was personal and *not territorial*. In this respect it always retained the character which it had inherited as the offspring of a Roman magistracy. Hence no Roman territory could be granted by the emperor to another power. For instance, the Western emperor Conrad III. could promise to hand over Italy to Manuel Comnenus as the dowry of his wife, but it would have been constitutionally illegal for Manuel to have made such a promise to any foreign prince; an Eastern emperor had no right to dispose of the territory of the State. Tendencies towards a territorial conception begin indeed to appear (partly under Western influence) in the time of the Palaeologi, especially in the custom of bestowing appanages on imperial princes.

(4) While the senate of Rome generally lost its importance and at last became a mere municipal body, the new senate of Constantine preserved its position as an organ of the State till the fall of Constantinople. For the imperial elections it was constitutionally indispensable, and it was able sometimes to play a decisive part when the throne was vacant—its only opportunity for independent action. The abolition, under Diocletian's system, of the senatorial provinces deprived the senate of the chief administrative function which it exercised under the Principate; it had no legislative powers; and it lost most of its judicial functions. It was, however, still a judicial court; it tried, for instance, political crimes. In composition it differed from the senate of the Principate. The senators in the 4th century were chiefly functionaries in the public service, divided into the three ascending ranks of *clarissimi, spectabiles, illustres*. The majority of the members of the senatorial order lived in the provinces, forming a provincial aristocracy, and did not sit in the senate. Then the two lower ranks ceased to have a right to sit in the senate, which was confined to the *illustres* and men of higher rank (patricians). The senatorial order must therefore be distinguished from the senate in a narrower sense; the latter finally consisted mainly of high ministers of State and the chief officials of the palace. It would be a grave mistake to underrate the importance of this body, through an irrelevant contrast with the senate of the republic or even of the Principate. Its composition ensured to it great influence as a consultative assembly; and its political weight was increased by the fact that the inner council of imperial advisers was practically a committee of the senate. The importance of the senate is illustrated by the fact that in the 11th century Constantine X., in order to carry out a revolutionary, anti-military policy, found it necessary to alter the composition of the senate by introducing a number of new men from the lower classes.

(5) The memory of the power which had once belonged to the *populus Romanus* lingered in the part which the inhabitants of New Rome, and their representatives, played in acclaiming newly elected emperors, and in such ceremonies as coronations. In the 6th century the factions ("demes") of the circus, Blues and Greens, appear as political parties, distract the city by their quarrels, and break out in serious riots. On one occasion they shook the throne ("Nika" revolt, 532). The emperors finally quelled this element of disturbance by giving the factions a new organization, under "demarchs" and "democrats," and assigning them a definite quasi-political *locus standi* in the public ceremonies in the palace and the capital. The duty of providing *panem et circenses* was inherited from Old Rome; but the free distribution of bread cannot be traced beyond the 6th century (had the loss of the Egyptian granary to do with its cessation?), while the spectacles of the hippodrome lasted till the end. Outside the capital the people took little interest in politics, except when theology was concerned; and it may be said generally that it was mainly in the ecclesiastical sphere that public opinion among the masses, voiced by the clergy and monks, was an influence which made itself felt.

The court ceremonial of Constantinople, which forms such a marked contrast to the ostentatiously simple establishments of Augustus and the Antonines, had in its origin a certain constitutional significance. It was introduced by Aurelian and Diocletian, not, we must suppose, from any personal love of display, but rather to dissociate the emperor from the army, at a time when the State had been shaken to its foundations by the predominance of the military element and the dependence of the emperor on the soldiers. It was the object of Diocletian to make him independent of all, with no more particular relation to the army than to any other element in the State; the royal court and the inaccessibility of the ruler were calculated to promote this object. The etiquette and ceremonies were greatly elaborated by Justinian, and were diligently maintained and developed. The public functions, which included processions through the streets to various sanctuaries of the city on the great feast-days of the Church, supplied entertainment of which the populace never wearied; and it did not escape the wit of the rulers that the splendid functions and solemn etiquette of the court were an effective means of impressing the imagination of foreigners, who constantly resorted to Constantinople from neighbouring kingdoms and dependencies, with the majesty and power of the Basileus.

The imperial *dignity* was collegial. There could be two or more emperors (*imperatores*, *βασιλεῖς*) at the same time; edicts were issued, public acts performed, in their joint names. Through the period of dualism, in the 4th and 5th centuries, when the administration of the Eastern provinces was generally separate from that of the Western, the imperial *authority* was also collegial. But after this period the system of divided authority came to an end and was never renewed. There was frequently more than one emperor, not only in the case of a father and his sons, or of two brothers, but also in the case of a minority, when a regent is elected emperor (Romanus I.; *cf.* Nicephorus II. and John Zimisces). But one colleague always exercised the sole authority, was the real monarch, the "great" or the "first" Basileus; the other or others were only sleeping partners. Under the Comneni a new nomenclature was introduced; a brother, *e.g.*, who before could have become the formal colleague of the ruler, received the title of *Sebastocrator* (Sebastos was the Greek equivalent of Augustus).

Legislation.—The history of the legislation of the Eastern empire is distinguished by three epochs associated with the names of (1) Justinian, (2) Leo III., (3) Basil I. and Leo VI.

For (1) the Justinianean legislation, *see* JUSTINIAN.

(2) Justinian's reign was followed by a period in which juristic studies decayed. The 7th century, in which social order was profoundly disturbed, is a blank in legal history, and it would seem that the law of Justinian, though it had been rendered into Greek, almost ceased to be studied or understood. Practice at least was modified by principles in accord with the public opinion of Christian society and influenced by ecclesiastical canons. In a synod held at Constantinople in the reign of Justinian II. numerous rules were enacted, differing from the existing laws and based on ecclesiastical doctrine and Mosaic principles, and these were sanctioned as laws of the realm by the emperor. Thus Church influence and the decline of Roman tradition, in a State which had become predominantly Greek, determined the character of the ensuing legislative epoch under the auspices of Leo III., whose law book (A.D. 740), written in Greek, marks a new era and reflects the changed ideas of the community. Entitled a "Brief Selection of Laws" and generally known as the *Ecloga*, it may be described as a Christian law book. In regard to the *patria potestas* increased facilities are given for emancipation from paternal control when the son comes to years of discretion, and the paternal is to a certain extent replaced by a *parental* control over minors. The law of guardianship is considerably modified. The laws of marriage are transformed under the influence of the Christian

conception of matrimony; the institution of *concubinatus* is abolished. Impediments to marriage on account of consanguinity and of spiritual relationship are multiplied. While Justinian regarded marriage as a contract, and therefore, like any other contract, dissoluble at the pleasure of the parties, Leo III. accepted the Church view that it was an indissoluble bond. Ecclesiastical influence is written large in the criminal law, of which a prominent feature is the substitution of mutilation of various kinds for the capital penalty. Death is retained for some crimes, such as murder and high treason; other offences were punished by amputation (of hand, nose, etc.). This system (justified by the passage in the New Testament, "If thine eye offend thee," etc.), though to modern notions barbaric, seemed a step in the direction of leniency; and it may be observed that the tendency to avoid capital punishment increased, and we are told that in the reign of John Comnenus it was never inflicted. (The same spirit, it may be noted, is apparent in the usual, though by no means invariable, practice of Byzantine emperors to render dethroned rivals or members of a deposed dynasty innocuous by depriving them of eyesight or forcing them to take monastic orders, instead of putting them to death.) The Church, which had its own system of penalties, exercised a great influence on the actual operation of criminal law, especially through the privilege of asylum (recognized by Justinian, but with many reserves and restrictions), which was granted to Christian churches and is admitted without exceptions in the *Ecloga*.

(3) The last period of legislative activity under Basil I. and Leo VI. represents a reaction, in a certain measure, against the *Ecloga* and a return to Justinian. The *Ecloga* had met practical needs, but the Isaurian and Phrygian emperors had done nothing to revive legal study. To do so was the aim of Basil, and the revival could only be based on Justinianean law books or their Greek representatives. These books were now treated somewhat as Justinian and his lawyers had treated their own predecessors. A handbook of extracts from the Institutes, Digest and Code was issued in 879 (ὁ πρόχειρος νόμος, "the law as it is"), to fulfil somewhat the same function as the Institutes. Then a collection of all the laws of the empire was prepared by means of two commissions, and completed under Leo VI. It was entitled the *Basilika*. In many points (in civil, but not in criminal, law) the principles of the *Ecloga* are set aside in favour of the older jurisprudence. Thus the Justinianean ordinances on the subject of divorce were revived, and there remained henceforward a contradiction between the civil and the canon law.

After this there was no legislation on a grand scale; but there was a great revival of legal study under Constantine IX., who founded a new law-school, and there were many learned specialists who wrote important commentaries, such as John Xiphilin (11th century), Theodore Balsamon (12th century), Harmenopulos (14th century). The civil code of Moldavia (published 1816–17) is a codification of Byzantine law; and modern Greece, although in framing its code it took the Napoleonic for its model, professes theoretically to base its civic law on the edicts of the emperors as contained in the *Hexabiblos* of Harmenopulos.

Administration.—Three principles underlay the administrative reform of Diocletian: the separation of civil from military functions; the formation of small provincial units; and the scalar structure which depended on the interposition of the vicar of a diocese and the praetorian prefect between the provincial governor and the emperor. This system lasted unchanged for three and a half centuries. The few unimportant alterations that were made were in harmony with its spirit, until the reign of Justinian, who introduced certain reforms that pointed in a new direction. We find him combining some of the small provinces into large units, undermining the scalar system by doing away with some of the dioceses and vicars, and placing in some cases military and civil authority in the same hands. The chief aim of Diocletian in his general reform had been to secure central control over the provincial Governments; the object of Justinian in these particular reforms was to remedy corruption and oppression. These changes, some of which were soon cancelled, would hardly in themselves have led to a radical change; but they prepared the way for an administrative revolution, brought about by stress of external necessities. In the 7th century all the energies of the empire, girt about by active enemies, were centred on war and defence; everything had to give way to military exigencies; and a new system was gradually introduced which led ultimately to the abolition of the old. The change began in Italy and Africa, at the end of the 6th century, where operations against the Lombards and the Berbers were impeded by the friction between the two co-ordinate military and civil authorities (masters of soldiers, and praetorian prefects). The military governors were made supreme with the title of *exarchs*, "viceroys"; the civil authority was subordinated to them in case of collision, otherwise remaining unaltered. The change is an index of the dangerous crisis through which these provinces were passing. In the East similar circumstances led to similar results. The Saracen danger hanging imminent over Asia Minor imposed a policy of the same kind. And so before the end of the 7th century we find the empire divided into six great military provinces, three in Europe and three in Asia: (1) Exarchate of *Africa*, (2) Exarchate of *Italy*, (3) Strategia of *Thrace*, (4) County of *Opsikion* (=*obsequium*), including Bithynia, Honorias, Paphlagonia, parts of Hellespontus and Phrygia, (5) Strategia of the *Anatolikoi*, most of west and central Asia Minor, (6) Strategia of the *Armeniakoi*, eastern Asia Minor. In addition to these there was a naval circumscription, (7) the Strategia of the *Karabisianoi* (from κάραβος, a vessel), including the southern coastland of Asia Minor, and the Aegean (*see* below under *Navy*).

The lands of the old prefecture of Illyricum were not included in the system, because this part of the empire was then regarded as a lost position. On the contrary, here military powers were committed to the prefect of Illyricum, whose actual sphere extended little beyond Thessalonica, which was surrounded by Slavonic tribes.

The Eastern changes, perhaps initiated by Heraclius, but probably due mainly to Constans II., did not interfere with the civil administration, except in so far as its heads were subordinated to the military commanders. But Leo III., who as a great administrative reformer ranks with Augustus and Diocletian, did away with the old system altogether. (1) Reversing Diocletian's principle, he combined military and civil powers in the same hands. The *strategos* or military commander became also a civil governor; his higher officers (turmarchs) were likewise civil functionaries. (2) The scalar principle disappeared, including both the vicars and the praetorian prefect of the East (some of whose functions were merged in those of the prefect of the city); no authority interposed between the strategoi and the emperor. (3) The new provinces, which were called *themes* (the name marks their military origin: *thĕma*=corps), resembled in size the provinces of Augustus, each including several of the Diocletian divisions. This third and last provincial reform has, like its predecessors, its own history. The list of themes in the 11th century is very different from that of the 8th. The changes were in one direction—the reduction of large provinces by cutting off parts to form smaller themes, a repetition of the process which reduced the provinces of Augustus. Hence the themes came to vary greatly in size and importance. Leo himself began the process by breaking up the Anatolic command into two themes (Anatolic and Thracesian). The principle of splitting up was carried out systematically by Leo VI. (who was also responsible for a new ecclesiastical division of the empire).

Imperial Officials.—In the central administration, the general principles seem to have remained unchanged; the heads of the great administrative bureaux in Constantinople retain the *palatine* character which belonged to most of them from the beginning. But there were many changes in these offices, in their nomenclature and the delimitation of their functions. There are great differences between the administrative corps in the 5th, in the 10th and in the 15th centuries. We can hardly be wrong in conjecturing that, along with his provincial reform, Leo III. made a rearrangement of the central bureaux; the abolition of the praetorian prefecture of the East entailed, in itself, modifications. But minor changes were continually being made, and we may note the fol-

lowing tendencies: (1) Increase in the number of ministers directly responsible to the emperor, (*a*) subordinate offices in the bureaux being raised to the rank of independent ministries; (*b*) new offices being created and old ones becoming merely titular. (2) Changes in nomenclature; substitution of Greek for Latin titles. (3) Changes in the relative importance and rank of the high officials, both civil and military.

The prefect of the city (ἔπαρχος) controlled the police organization and administration of justice in the capital; he was vice-president of the imperial court of justice, and, when the office of prefect of the East was abolished, he inherited the functions of that dignitary as judge of appeals from the provinces. But the *praefectus vigilum*, commander of the city guards, who was subordinate to him, became an independent officer, entitled drungary of the watch, and in the 11th century superseded him as vice-president of the imperial court. We are told that in the last years of the empire the prefect of the city had no functions at all; but his office survives in the *Shehr-imaneti*, "city prefecture," of the Ottomans, in whose organization there are many traces of Byzantine influence.

Instead of the quaestor of the sacred palace, whose duty was to draft the imperial laws and rescripts, we find in the 9th century a quaestor who possesses certain judicial and police functions and is far lower in the hierarchy of rank. It has been supposed that the later quaestor really inherited the duties of another officer, the *quaesitor*, who was instituted by Justinian. In the latest period the quaestor, if he still existed as a name, had no functions.

The master of offices, who supervised the bureaux in the palace and was master of court ceremonies, also performed many functions of a minister of foreign affairs, was head of the imperial post (*cursus*), and of the corps of *agentes in rebus* or imperial messengers. This ministry disappeared, probably in the 8th century, but the title was retained as a dignity at all events till the end of the 9th. The most important functions, pertaining to foreign affairs, were henceforward performed by the logothete of the post (λογοθέτης τοῦ δρόμου). In the 12th century this minister was virtually the chancellor of the empire; his title was changed to that of great logothete by Andronicus II.

The two financial ministers, *comes sacrarum largitionum* and *comes rei privatae*, continued to the end under the titles λογοθέτης τοῦ γενικοῦ (general logothete) and ὁ ἐπὶ τοῦ ἰδικοῦ (Anastasius added a third, the count of the sacred patrimony, but he was afterwards suppressed). But in the 9th century we find both these ministers inferior in rank to the *sacellarius*, or private purse-keeper of the emperor. Besides these there was a fourth important financial department, that of the military treasury, under a logothete.

The employment of eunuchs as high ministers of State was a feature of the Byzantine empire from the end of the 4th century. It is laid down as a principle (A.D. 900) that all offices are open to them, except the prefecture of the city, the quaestorship, and the military posts which were held by "domestics." There were then eight high posts which could only be held by eunuchs, of which the chief were the *parakoimōmenos* and the *protovestiarios* (master of the wardrobe).

An emperor who had not the brains or energy to direct the affairs of the State himself, necessarily committed the task of guiding the helm to some particular minister or court dignitary who had gained his confidence. Such a position of power was outside the constitution, and was not associated with any particular office; it might be held by an ecclesiastic or a eunuch; it had been held by the eunuchs Eutropius and Chrysaphius in the reigns of Arcadius and Theodosius II. respectively. In later times, such a first minister came to be denoted by a technical term, ὁ παραδυναστεύων. This was the position, for instance, of Stylianus, the father-in-law of Leo VI. Most of the emperors between Basil II. and Alexius Comnenus were under the influence of such ministers.

The orders of rank (which must be distinguished from titles of office) were considerably increased in later times. In the 4th and 7th centuries there were the three great classes of the *illustres*, *spectabiles* and *clarissimi*; and above the *illustres* a small, higher class of patricians. In the 9th century we find an entirely different system; the number of classes being largely augmented, and the nomenclature different. Instead of epithets, like *illustres*, the names are titles which had designated offices; "patrician" alone survives. The highest rank is now (1) the *magistroi*; then come the patricians in two classes: (2) proconsular patricians, (3) respectable patricians; below these (4) *protospatharioi*, (5) *dishypatoi* (= *bis consules*), (6) *spatharokandidatoi*, (7) *spatharioi*, and other lower ranks. Particular ranks do not seem now to have been inalienably attached to particular offices. The *strategos* of the Anatolic theme, *e.g.*, might be a patrician or only a protospathar. Whoever was promoted to one of these ranks received its insignia from the emperor's hand, and had to pay fixed fees to various officials, especially to the palace eunuchs.

In the provinces ordinary justice was administered by judges (κριταί) who were distinct from the governors of the themes, and inherited their functions from the old provincial governors of Diocletian's system. In Constantinople higher and lower courts of justice sat regularly and frequently. The higher tribunals were those of the prefect and the quaestor, before whom different kinds of cases came. Appeals reached the emperor through the bureau of petitions (τῶν δεησέων); he might deal with the case immediately; or might refer it to the imperial court of appeal, of which he was president; or else to the special court of the Twelve Divine Judges (θεῖοι δικασταί), which was instituted by Justinian.

Fiscal System.—While the administration of justice was one of the best features of the Eastern empire, its fiscal system, likewise inherited from the early empire, was one of its worst. If the Government had been acquainted with the principles of public economy, which have not been studied till comparatively recent times, a larger revenue might have been raised without injuring the prosperity of the inhabitants. Taxes were injudiciously imposed and oppressively collected. The commerce of the empire was one of its great sources of strength, but the Government looked on the merchants as a class from which the utmost should be extorted. The chief source of revenue was the land. The main burdens which fell upon the landed proprietors throughout the whole period were the land tax proper and the *annona*. The land tax (*capitatio terrena*=the old *tributum* of the imperial, *stipendium* of the senatorial provinces) was based, not on the yearly produce, but on the capital of the proprietor, the character and value of the land being taken into account. In later times this seems to have become the καπνικόν, or hearth tax. The *annona* was an additional impost for supporting the army and imperial officials; it was originally paid in produce. The province was divided into fiscal districts, and the total revenue to be derived from each was entered in a book of assessment. The assessment was in early times revised every 15 years (the "indiction" period), but subsequently such revisions seem to have been very irregular. The collection of the taxes was managed through the curial system, while it lasted (till 7th century?). The decurions, or municipal councillors, of the chief town in each district were responsible for collecting and delivering the whole amount, and had to make good the sums owed by defaulters. This system of collective responsibility pressed very heavily on the decurions, and helped to cause their decay in the Western provinces. After the abolition of the curial organization, the principle of collective responsibility remained in the form of the ἐπιβολή or additional charge; that is, if a property was left without an owner, the taxes for which it was liable became an extra charge on the other members of the district. The taxes were collected by *praktores*, who were under the general logothete. The peasant proprietors were also liable to burdens of other kinds, of which the most important was the furnishing of horses, vehicles, postboys, etc., for the State post (*see* ANGARIA).

The history of landed property and agrarian conditions in the Eastern empire still awaits a thorough examination. It may be noted that individual hereditary proprietorship was always the rule (on Crown and monastic lands as well as in other cases), and that the commonly supposed extensive existence of communities possessing land in common is based on erroneous inter-

pretation of documents. When imperial lands were granted to monasteries or as fiefs to individuals, the position and rights of the peasant proprietors on the estates were not changed, but in many cases the imposts were paid to the new master instead of to the fisc. In the 4th, 5th and 6th centuries the cultivators were attached to the soil (*coloni, ascripticii; see* SERFDOM), in the interests of the fiscus; it has been supposed, on insufficient grounds, that this serfdom was abolished for a time by Leo III., though it is probable that the condition of the peasants was largely changed by the invasions of the 7th century. In any case the system of compulsory attachment of peasants to their lands remained in force, and the class of *adscripticii* (ἐναπόγραφοι) existed till the latest times. The chief sources for agrarian conditions are, besides the imperial laws, monastic records, among which may be mentioned as specially valuable those of the monastery of Lemboi near Smyrna.

MEANS OF DEFENCE

The general principle of the military defence of the empire in the 4th century consisted in large forces stationary on the frontiers, and reserve forces, stationed in the interior provinces, which could be moved to any point that was in danger. Thus the army was composed of (1) the *limitanei,* frontier-troops (under *duces*), and (2) reserve forces (under *magistri militum*) of two denominations, (*a*) *palatini* and (*b*) *comitatenses.* The *limitanei* were the more numerous; it has been estimated that if they numbered about 350,000, the *comitatenses* and *palatini* together amounted to less than 200,000. It is to be noted that for the old legion of 6,000 men a smaller legion of 1,000 had been substituted, and that the proportion of cavalry to infantry was small. In the 6th century the fundamental principles of the system were the same; but the cavalry had become a much more important branch of the service, and in the wars of Belisarius the *foederati,* barbarian mercenaries of various races, commanded by their own chiefs, played a great rôle. The peasants of Illyria and Thrace, the mountaineers of southern Asia Minor still supply an important part of the army, but the number of barbarians (Heruli, Vandals, Goths, Slavs, Arabs, etc.) is much larger. Solidity and a corresponding want of mobility characterized at this time both cavalry and infantry; their great merit was straight and rapid shooting: Belisarius ascribed his success in Italy to the excellence of the archery. It is remarkable with what small forces (not more than 25,000) the first conquest of Italy was achieved, though Belisarius was far from being a military genius and the discipline in his army was flagrantly defective.

Justinian carried out on the frontiers and in the exposed provinces a carefully devised and expensive system of defensive works. Fortified towns along the *limes* were connected by intervening forts, and at some distance behind was a second line of more important fortresses more strongly garrisoned, which furnished both a second barrier and places of refuge for the inhabitants of the open country. There was an elaborate system of signals by which the garrisons of the front stations could announce not only the imminence of a hostile invasion, but the number and character of the enemy. In North Africa there are abundant remains of the forts of the 6th and 7th centuries, displaying the military architecture of the period and the general frontier system. The typical fortress had three defences: the wall flanked by square towers of three storeys; at a few yards' distance a second wall of stone; and outside a deep foss about 20yd. wide, with vertical sides, filled with water, and along its edge a rampart of earth.

The Army.—We have already seen how the disasters and losses of the 7th century led to a radical change in the military organization, and how the empire was divided into themes. The preponderant influence which Asia Minor won and retained till the 11th century is reflected in the military establishment, which mainly depended on the Asiatic provinces. The *strategos* of a large theme commanded a corps of 10,000 and the scheme of the divisions and subordinate commands has a remarkable resemblance to the organization of some of the armies of modern Europe.

The recorded scheme was probably not uniform in all the themes, and varied at different periods. The *Thĕma* (corps) consisted of 2 *turmai* (brigades) under *turmarchai;* the *turma* of 5 *banda* (regiments), each under a *drungarios* (colonel); the *bandon* of 5 *pentarkhiai* (companies) under a *komētes* (captain). The *pentarkhia,* containing 200 men had 5 subdivisions under *pentekontarkhai* (lieutenants); and there was a smaller unit of ten men under the *dekarkhes* (corporal). The total strength in the 9th century was 120,000; in Justinian's time it was reckoned at 150,000.

Distinct from the military forces (θέματα) of the provinces were the forces (τάγματα) stationed in or near the capital. The most important of these were the *scholae* and the *excubitores.* The scholarian troops were in early times under the master of offices, but subsequently their chief officer, the domestic of the schools, became the highest military commander in the empire next to the *strategos* of the Anatolic theme. In war, when the emperor did not assume the chief command himself, he might entrust it to any commander, and he often entrusted it to the domestic. In the 11th century, after the conquest of Bulgaria, there were two domestics, one for the East and one for the West, and under Alexius Comnenus the domestic of the West received the title great domestic. Under the Palaeologi the great domestic was superior in rank to all other ministers.

Besides the scholarians and the *excubitores* (who had been organized in the 5th century), there were the regiments of the *hikanatoi,* the *arithmos* and the *numeroi.* The *numeroi* were foot-soldiers. The *optimatoi,* also infantry, properly belonged to the same category, though they were constituted as a theme. It is to be observed that the demes or corporations of Constantinople were partly organized as militia, and were available for purposes of defence.

The great difference between this Byzantine army and that of the earlier empire is that its strength (like that of the feudal armies of the West) lay entirely in cavalry, which the successors of Heraclius and the Isaurian emperors developed to great perfection. The few contingents of foot were subsidiary. The army was free from the want of discipline which was so notable in the 6th century; it was maintained in Asia Minor, which was the great recruiting ground, by a system of military holdings of land (an extension of the old Roman system of assigning lands in the frontier districts to federate barbarians and to veterans). The conditions of the marauding expeditions and guerilla warfare, continuously carried on against and by the Saracens in the 8th, 9th and 10th centuries, were carefully studied by generals and tacticians, and we possess the theory of the Byzantine methods in a treatise composed by the emperor Nicephorus Phocas, and edited by one of his pupils. Every detail of an inroad into Saracen territory is regulated.

In the 8th and 9th centuries there was a system of signals by which an approaching Saracen incursion was announced to Constantinople from the Cilician frontier. The news was flashed across Asia Minor by eight beacon fires. The first beacon was at Lulon (which commanded the pass between Tyana and the Cilician Gates), the last on Mt. Auxentius in Bithynia. When this fire appeared, a light was kindled in the pharos of the imperial palace at Constantinople. The system was discontinued in the reign of Michael III., probably after the capture of Lulon by the enemy in 860, and was not renewed, though Lulon was recovered in 877.

The loss of a great part of Asia Minor to the Seljuks, and the disorganization of the provinces which they did not acquire, seriously weakened the army, and the emperors had recourse more and more to foreign mercenaries and barbarian auxiliaries. The employment of Scandinavians had begun in the 10th century, and in 988 was formed the Varangian guard. In the arsenal of Venice are two lions, which were transported from the Peiraeus, inscribed with obscure Runic characters, carved perhaps by Scandinavians in the army of Basil II. Under Michael IV. the famous Norwegian prince Harald Hardrada (described by a Greek writer as "Araltes, son of the king of Varangia") fought for the empire in Sicily and in Bulgaria. But in the latter part of the 11th century foreign mercenaries greatly increased in numbers and importance.

The note of the Byzantine army was efficiency, and nowhere is the immeasurable superiority of the civilization of the Eastern empire to the contemporary States of Europe more apparent. The theory of military science was always studied and taught; constant practice, interpreting and correcting theories, safeguarded it against pedantry; and a class of magnificent staff officers were trained, who in the 10th century were the terror of the enemy. The particular tactics of the various foes whom they had to face were critically studied. We have a series of military text-books, from the time of Anastasius I. to that of Basil II., in which we can learn their principles and methods. In this army there was plenty of courage, and distinct professional pride, but no love of fighting for fighting's sake, nor the spirit which in western Europe developed into chivalry. The Byzantines despised such ideas as characteristic of barbarians who had physical strength and no brains. The object of a good general, as Leo VI. shows in his important treatise on Tactics, was in their opinion not to win a great battle, but to attain success without the risks and losses of a great battle. The same author criticizes the military character of the Franks. Paying a tribute to their fearlessness, he points out their want of discipline, the haphazard nature of their array and order of battle, their eagerness to attack before the word was given, their want of faculty for strategy or tactical combinations, their incapacity for operations on difficult ground, the ease with which they could be deceived by simple artifices, their carelessness in pitching camps, and their lack of a proper intelligence department. These criticisms, borne out by all we know of feudal warfare, illustrate the contrast between a Western host, with its three great "battles," rushing headlong at the foe, and the Byzantine army, with its large number of small units, co-operating in perfect harmony, under a commander who had been trained in military science, had a definite plan in his head, and could rely on all his subordinates for strict and intelligent obedience.

The Navy.—Under the early empire, as Rome had no rival in the Mediterranean, it was natural that the navy and naval theory should be neglected. When Constantine the Great decided to besiege Byzantium by sea, both he and his opponent Licinius had to create fleets for the struggle. Even when the Vandals in Africa made transmarine conquests and became a naval power, the Romans did not seriously address themselves to building an efficient navy. The Vandals harried their coasts; their expeditions against Africa failed. And even when the Vandal power was in its decline and Belisarius set forth on his successful expedition of conquest, his fears for the safety of his squadron in case he should be attacked at sea allow us to suspect that the fleet of the enemy was superior to the Roman. The conquest of Africa secured for Justinian the undisputed command of the Mediterranean, but he did nothing for the naval establishment. It was not till the Saracens, aspiring to conquer all the Mediterranean coastlands, became a naval power that the Roman empire was forced, in a struggle for its being, to organize an efficient fleet. This, as we saw, was the work of Constans II., and we saw what it achieved. In this first period (*c.* 650–720) the naval forces, designated as the *Karabisianoi*, were placed under the command of an admiral, with title of *strategos*. They consisted of two geographical divisions, each under a *drungarios*: the province of the Cibyrrhaeots (probably named from the smaller Cibyra in Pamphylia) which included the southern coast districts of Asia Minor, and the Aegean province, which embraced the islands and part of the west coast of Asia Minor. The former was the more important; the marines of this province were the hardy descendants of the pirates, whose subjugation had taxed the resources of the Roman Government in the last years of the republic. It was a new principle to impose the burden of naval defence on the coast and island districts. Distinct from these fleets, and probably organized on a different principle, was the naval contingent stationed at Constantinople. Leo III. changed the naval administration, abolishing the supreme command, and making the Cibyrrhaeot and Aegean provinces separate independent themes under *strategoi*. The change was due to two motives. There was a danger lest a commander of the whole navy should become over powerful (indicated by the political rôle played by the navy before Leo's accession); but apart from this, the general reform of Leo, which united civil and military powers in the same hands, naturally placed the commanders of the two branches of the navy on a new footing, by making them provincial governors. In this and the following reigns, the tendency was to neglect the fleet; the interest of the Government was concentrated on the army. For a time this policy was prosecuted with impunity, since the Omayyad dynasty was growing weak, and then under the Abbasids, who transferred the capital from Damascus to Baghdad, the sea-power of the caliphate declined. But the neglect of the fleet was avenged in the 9th century, when Crete and Sicily were wrested from the empire, the loss of south Italy was imminent, and Muslim squadrons sailed in the Adriatic—losses and dangers which led to a reorganization of the navy under Basil I. and Leo VI. After this reform we find the navy consisting of two main contingents: the imperial fleet (stationed at Constantinople), and the provincial fleets, three in number, of (*a*) Cibyrrhaeot theme, (*b*) Aegean theme, (*c*) theme of Samos. A small distinct contingent was supplied by the Mardaites who, natives of Mt. Lebanon, had been transplanted (partly to Pamphylia, partly to Epirus, the Ionian islands and Peloponnesus). The imperial fleet seems to have consisted of about 100 warships manned by 23,000 marines (the same men fought and rowed); the provincial fleets of 77 warships manned by 17,000. When the fleets acted together, the admiral in supreme command for the time was called the "drungary of the naval forces." The warships (*δρόμωνες*, "dromonds") were mainly biremes, but there were also uniremes, built for speed, called "galleys" (*γαλαῖαι*). Pyrotechnic was an important department in the naval establishment; the manufacture of the terrible explosive known as *liquid* or *marine fire* (*see* GREEK FIRE) was carefully guarded as a State secret.

The navy, active and efficient in the 10th century, is described by a military and therefore unprejudiced officer of the 11th as the glory of Romania. But towards the end of the 11th century it declined, the main cause being the disorganization of the naval provinces of Asia Minor, which, as we saw, was a result of the Seljuk conquest of the interior. This decline had important indirect consequences; it led to the dependence of the empire on the Venetian navy in the struggle with the Norman power, and for this help Venice exacted commercial privileges which injured Byzantine commerce and opened the door to the preponderant influences of the Venetians in eastern trade. In the period of the Palaeologi the imperial navy, though small, was active; and the importance which it possessed for the State is illustrated by the high rank at court which the admiral (who in the 11th century had received the title of great duke, *μέγας δούξ*) then occupied; the only minister who was superior to him was the great domestic.

Diplomacy.—In protecting the State against the barbarians who surrounded it, diplomacy was a weapon as important in the eyes of the Byzantine Government as soldiers or fortifications. The peace on the frontiers was maintained not only by strong military defences, but by more or less skilful management of the frontier peoples. In the later empire this kind of diplomacy, which we may define as the *science of managing the barbarians*, was practised as a fine art; its full development was due to Justinian. Its methods fall under three general heads. (1) One people was kept in check by means of another. The imperial Government fomented rivalry and hatred among them. Thus Justinian kept the Gepidae in check by the Lombards, the Kuturgurs by the Utigurs, the Huns by the Avars. (2) Subsidies were given to the peoples on the frontiers, in return for which they undertook to defend the frontier adjacent to them, and to supply fighting men when called upon to do so. The chiefs received honours and decorations. Thus the Berber chiefs on the African border received a staff of silver, encrusted with gold, a silver diadem, white cloak, embroidered tunic, etc. More important potentates were invested with a costlier dress. In these investitures precedence was carefully observed. The chiefs thus received a definite position in the empire, and the rich robes, with the ceremony, appealed to their vanity. In some cases they were admitted to posts in the official hierarchy,—being created patricians, masters of soldiers, etc. They were extremely fond of such honours, and considered themselves half-Romans. Another mode of winning influence was to marry barbarian princes

to Roman wives, and rear their sons in the luxury of the palace. Dissatisfied pretenders, defeated candidates for kingship, were welcomed at Constantinople. Thus there were generally some princes, thoroughly under Byzantine influence, who at a favourable opportunity could be imposed on their compatriots. Throughout Justinian's reign there was a constant influx of foreign potentates to Constantinople, and he overwhelmed them with attentions, pompous ceremonies and valuable presents. (3) Both these methods were already familiar to the Roman Government, although Justinian employed them far more extensively and systematically than any of his predecessors. The third method was new and characteristic. The close connection of religion and politics at Constantinople prepares us to find that Christian propaganda should go hand-in-hand with conquest, and that the missionary should co-operate with the soldier. The missionary proved an excellent agent. The typical procedure is as follows. In the land which he undertakes to convert, the missionary endeavours to gain the confidence of the king and influential persons, and makes it a special object to enlist the sympathies of the women. If the king hesitates, it is suggested that he should visit New Rome. The attraction of this idea is irresistible, and when he comes to the capital, the pomp of his reception, the honours shown him by the emperor, and the splendour of the religious ceremonies overcome his last scruples. Thenceforward imperial influence is predominant in his dominion; priests become his advisers; a bishop is consecrated, dependent on the patriarch of Constantinople; and the barbarians are transformed by the penetration of Byzantine ideas. By the application of these various means, Justinian established Roman influence in Nubia, Ethiopia and south Arabia, in the Caucasian regions, and on the coast of the Euxine. The conversion of the Lazi (of Colchis) was specially notable, and that of the Sabiri, who were politically important because they commanded the eastern pass of the Caucasus known as the Caspian Gates. It will be observed that the great prestige of the empire was one of the conditions of the success of this policy.

The policy had, of course, its dangers, and was severely criticized by one of Justinian's contemporaries, the historian Procopius. Concessions encouraged greater demands; the riches of the empire were revealed. It was a system, of course, which could not be permanently successful without military power behind it, and of course it was not infallible; but in principle it was well-founded, and proved of immeasurable value.

In the 10th century we have again the means of observing how the Government conducted its foreign policy on carefully thought out principles. The empire was then exposed to constant danger from Bulgaria, to inroads of the Magyars, and to attacks of the Russians. The key to the diplomatic system, designed to meet these dangers, was the cultivation of friendly relations with the Petchenegs, who did not menace the provinces either by land or sea and could be incited to act against Russians, Bulgarians or Magyars. The system is explained in the treatise (known as *De administrando imperio*) composed by the emperor Constantine Porphyrogennetos (*c.* 950). The series of these northern States was completed by the kingdom of the Khazars (between the Caucasus and the Don), with which the empire had been in relation since the time of Heraclius, who, to win its co-operation against Persia, promised his daughter in marriage to the king. Afterwards the Khazars gave two empresses to New Rome (the wives of Justinian II. and Constantine V.). Their almost civilized State steered skilfully between the contending influences of Islam and Christianity, and its kings adopted the curious means of avoiding suspicion of partiality for either creed by embracing the neutral religion of the Jews. Commercial and political relations with the Khazars were maintained through the important outpost of the empire at Cherson in the Crimea, which had been allowed to retain its republican constitution under a president (*πρωτεύων*) and a municipal board (*ἄρχοντες*), though this freedom was limited by the appointment of a *strategos* in 833, a moment at which the Khazars were seriously threatened by the Petchenegs. The danger to be feared from the Khazars was an attack upon Cherson, and it seems probable that this was a leading consideration with Leo III. when he wedded his son Constantine V. to a Khazar princess. In the 9th century it was an object of the Government to maintain the Khazars (whose army consisted mainly of mercenaries) against the Petchenegs; and hence, if it should become necessary to hold the Khazars in check, the principle was to incite against them not the Petchenegs, but other less powerful neighbours, the Alans of the Caucasus, and the people of "Black Bulgaria" on the middle Volga (a State which survived till the Mongol conquest).

For this systematic diplomacy it was necessary to collect information about the peoples whom it concerned. The ambassadors sent to the homes of barbarous peoples reported everything of interest they could discover. We owe to Priscus a famous graphic account of the embassy which he accompanied to the court of Attila. We possess an account of an embassy sent to the Turks in central Asia in the second half of the 6th century, derived from an official report. Peter the Patrician in Justinian's reign drew up careful reports of his embassies to the Persian court. When foreign envoys came to Constantinople, information was elicited from them as to the history and domestic politics of their own countries. It can be shown that some of the accounts of the history and customs of neighbouring peoples, stored in the treatise of Constantine Porphyrogennetos referred to above (furnishing numerous facts not to be found anywhere else), were derived from barbarian ambassadors who visited Constantinople, and recorded by the imperial secretaries. We may conjecture with some probability that the famous system of the *Relazioni*, which the Venetian Government required from its ambassadors, goes back originally to Byzantine influence.

ROMANES, GEORGE JOHN (1848–1894), British biologist, was born at Kingston, Canada, on May 20, 1848. He was educated at Gonville and Caius college, Cambridge, and early formed an intimate friendship with Charles Darwin, whose theories he did much during his life to popularize and support. When studying under Sir J. Burdon Sanderson at University college, London, in 1874–76, he began a series of researches on the nervous and locomotor systems of the Medusae and Echinodermata. The results were published in *Jelly-fish, Star-fish, and Sea-urchins* (1885). In 1879 Romanes was elected F.R.S. Meantime he had been also devoting his attention to broader problems of biology. In 1881 he published *Animal Intelligence,* and in 1883 *Mental Evolution in Animals,* in which he traced the parallel development of intelligence in the animal world and in man. He followed up this line of argument in 1888 with *Mental Evolution in Man,* in which he maintained the essential similarity of the reasoning processes in the higher animals and in man, applying Darwin's theory of evolution to the development of the mind. From 1886–90 Romanes delivered a course of lectures on "The Philosophy of Natural History" at Edinburgh, and was Fullerian professor of physiology at the Royal Institution from 1888 to 1891. In 1892 he brought out an *Examination of Weismannism,* in which he upheld the theory of the hereditability of acquired characters. In 1890 he settled at Oxford, where he founded a lectureship to be delivered annually on a scientific or literary topic. In 1893 he published the first part of *Darwin and after Darwin,* a work dealing with the development of the theory of organic evolution, and physiological selection, first propounded in a paper contributed to the Linnean Society in 1886, which provoked much controversy; a second part appeared in 1895 after his death, which occurred at Oxford on May 23, 1894; the third part is still unpublished.

His *Life and Letters,* by his widow, appeared in 1896; his essays were edited by C. L. Morgan (1897). He was also the author of a number of poems, a selection from which was published in 1896.

ROMANESQUE ARCHITECTURE: *see* BYZANTINE AND ROMANESQUE ARCHITECTURE.

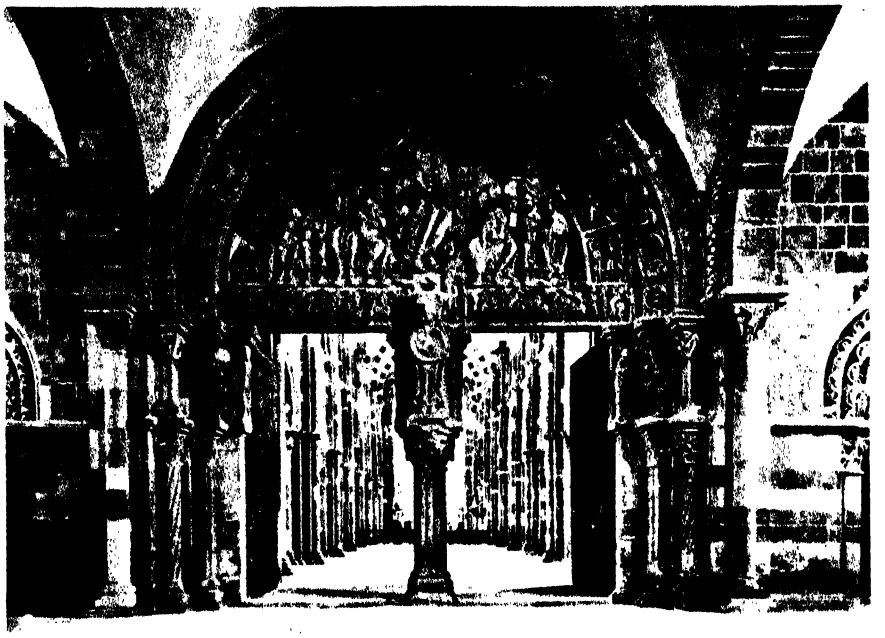
ROMANESQUE ART. The term Romanesque is used in widely varying senses by different authorities. In general, it denotes the art and culture of Europe exclusive of the eastern empire and Russia, from the time of the fall of Rome (476) down to the development of Gothic art which occurred at various dates in different countries, but entirely between 1100 and 1300; in portions of Italy art remained dominantly Romanesque well into the 14th century. The attempt is sometimes made to limit the use of the word to the era following the Carolingian empire (800–987); this, however, causes undue difficulties of chronology and complexities in the identification of much work, so that the broader sense is both more true and more simple.

The dominant element in all Romanesque art is the attempt, increasingly successful with the passage of time, of peoples originally barbaric, brought gradually into touch with the ruins of a magnificent culture, and at the same time under the inclusive and unifying influence of an enthusiastic Christianity, to develop, for themselves, art forms which they could, with their own skill, create and which would satisfy their own emotional demands, so different both from those of the Roman empire and those of the cultivated and Christianized earlier Roman provinces. At first, this attempt was most evidently influenced by Roman art forms and produced caricatures of them; only in such long Christianized provinces as Gaul did some traces of the traditional, technical skill persist through the much troubled pre-Carolingian times. As time went on, however, not only did the fast growing skill of the former barbarians and the conquered peoples under them lead to an increasing freedom from the Roman models, but other influences crept in. Thus, by the beginning of the 12th century, there is evident in all Romanesque work throughout Europe a combination of differing tendencies and traditions whose varying proportions in different localities gave rise to the individual characteristics of different schools of art. These commingled influences may be briefly listed. The first, and still the most important, is Roman art; the fact that Rome was the centre of the Christian church at the time added to its power. The second element was Byzantine, for in Constantinople, throughout the dark ages, the manufacture of all sorts of objects of great beauty continued unabated; with the growing culture of the west, Byzantine and Syrian artists and craftsmen were in great demand and apparently large numbers of them were at work, at least in France. The third element is that which comes directly from the near east, especially Persia and Mesopotamia, through the medium of textiles which were among the most prized church decorations of the time and whose ornamental forms were copied alike in stone carvings and on manuscripts. The last element, which is the most difficult to analyze and evaluate, is the influence of the northern background of Lombard, Goth, Teuton and Celt. The intense vigor of Romanesque art, however crude, is evidence of the power of this influence; to it are also probably due the obvious love of beasts and some of the grotesque element.

This young and vigorous art found expression in many fields. In architecture new forms were developed which eventually gave birth to the Gothic style. (*See* BYZANTINE and ROMANESQUE ARCHITECTURE.) The sculpture of the period is so largely architectural that separate treatment of it can only consider part of its purpose and effect. Up to the 12th century it is crude but tremendously alive. Unable to render the polished graciousness of classic forms, the early sculptor turned first to shallow imitations of Byzantine ornaments, and later naïve interpretations in stone of manuscript decorations and miniatures. Only in Italy, where some remnants of earlier skill seem to have persisted, there developed in the latter part of the 11th century any adequate sculptural technique. In Tuscany this seems to have been largely based on classic tradition, but in Lombardy there appears a mixture of Byzantine elements absorbed from Venetia and more vivid and naturalistic elements, at times strongly impregnated with grotesque feeling, more like the Romanesque across the Alps. Meanwhile, farther north, sculptural technique was rudimentary. Anglo-Saxon sculpture consisted of hardly more than scratchings on stone, and the earliest Norman work, both in France and England, is hardly more advanced. In Scandinavia and countries in which a Scandinavian culture was imposed upon a Celtic background, as in Ireland, the Scottish islands and western England, a much greater skill appears; traditional Scandinavian and Celtic forms, such as the intricate interlaces, frequently based on dragon or snake forms, and much simplified human figures, often themselves worked into geometrical forms, are carved with brilliant decorative effect; the old Norse, pagan shapes merging with the new Christian symbolism, as in the famous stone crosses of England and Ireland.

During the 12th century there was an enormous change throughout Europe, as if, almost suddenly, latent decorative imagination and technical skill had come to maturity. Twelfth century sculpture, alike in France, Italy, Germany, Spain and England was accomplished, and at times, almost sophisticated. A blend of conventionalism and naturalism makes the porches of hundreds of churches beautiful examples of architectural sculpture.

In painting and mural decoration the influences at work were largely Byzantine. (*See* BYZANTINE ART.) Crude attempts to imitate Byzantine mosaic are found in much early Italian Romanesque work, and from manuscript accounts it would appear that similar attempts were once common in Romanesque churches farther west and north. Decorative painting shows also the dominance of Byzantine tradition into the 12th century; here, however, various local schools of illuminated manuscripts (*q.v.*) modified and freed mural decoration. Nevertheless, the chief aim was decorative rather than pictorial. Architectural members were richly patterned and wainscots painted with imitations of stone joints and hanging textiles, with little attempt at realism. Figures were painted flat, with little or no desire for light and shade, and arranged according to a purely decorative pattern; their size was frequently determined by relative importance or decorative necessity rather than any endeavour to achieve realism.



The Romanesque genius found one of its most congenial outlets in the decoration and illustration of books. As early as the 7th century, a vivid school of manuscript design had developed in Ireland and from there spread to the Scotch islands. The works of the school are marked by rich capitals, borders made of geometric interlaces, which often also cover the field of the page, and an occasional use of dragon's heads, birds and grotesque human figures. The complex beauty of these pages exerted a strong influence on later Romanesque work in many parts of Europe and Carolingian manuscripts show a combination of Celtic interlaces with classic motives and drawings inspired by late Roman manuscripts. Later, the intricate Celtic forms passed out of use, the Roman traditions were modified and naturalistic treatment appeared. By the beginning of the 12th century manuscripts in all the countries north of the Alps tended to resemble each other, and the figures show many of the characteristics of 12th century sculpture; the same dignity, decorative design and convincing emotional quality. Borders and ornamental initials had lost the intricate geometric shapes of the earlier period and the stylized leaves and flowers which were later to develop into the glories of Gothic illumination were beginning to appear.

South of the Alps manuscript decoration was following different lines. There, the influence of Byzantine manuscripts, with occasional reminiscences of classic work, remained dominant.

Romanesque metal work followed many of the same lines of development as Romanesque sculpture. In early work that of the Celtic countries was outstanding and magnificent silver-ware and jewellery were produced. Filigree (*q.v.*) was peculiarly congenial to the northern love of interlaces and complexities and was frequently applied, with excellent decorative effect, in small areas, to large, simple cups and chalices. (*See* DRINKING VESSELS.) Meanwhile, Byzantine church silver-ware and goldsmith's work was widely imported into Europe and exerted a strong influence upon the metal work of the later Romanesque times. (*See* SILVERSMITHS' AND GOLDSMITHS' WORK.) Particularly important was the development in France of a famous school of enamel workers, who worked both in cloisonné and *champ levé*. (*See* ENAMELS.) Little of the early wrought iron remains, but the exquisite workmanship and powerful design of many 12th century grilles, door hinges, etc., give evidence of a tradition which must have existed

ARCHITECTURAL DETAILS OF THE ROMANESQUE PERIOD

1. Celtic cross of limestone from Monasterboice, Ireland (900–923?)
2. Church of the Madeleine (restored) at Vézelay, in central France. Built about 1130 by the Benedictine order. Central door of the narthex (enclosed porch) looking into the nave. The circular doorway, richly carved, with columns of varied design and recessed arches, is characteristic of the French Romanesque style
3. Columns and spring of the arches of a doorway in the Abbey of St. Denis, near Paris, begun 1137. The carving of the shafts as well as of the capitals of the columns, and the use of sculptured figures in the recesses of the arches, are features typical of the Romanesque and early Gothic periods
4. A side door of the narthex in the Church of the Madeleine, Vézelay (*see* fig. 2)

APPLIED ARTS OF THE ROMANESQUE PERIOD

1. A portion of the illuminated manuscript of the Alcuin Bible. English, 9th century. 2. An illuminated page from the "Lindesfarne Gospels" or the "Gospel of St. Cuthbert." English, about 700. 3. Reproduction of a Sicilian brocade of the Norman period (12th century). The design is in

cross of silver repoussé work and parcel-gilt on a wood core. Designed by Sanccia Guidisalvi, 12th century. 5. The (reputed) sword of Charlemagne in the Vienna Museum. 6. The chalice of Ardagh, of gold, 7" high; believed to be not later than the 10th century. 7. Reliquary or chasse of Limoges

for some time. In these 12th century examples the chief beauty comes from the expression of structure and the harmony of the decorative forms with their material. (*See* BRONZE AND BRASS.)

The popularity of Byzantine and Persian textiles in Romanesque Europe was a distinct hindrance to the formation of native schools of vital decorative textile design; in most cases products of Romanesque looms were the plainest and simplest materials for practical use. There was, on the other hand, a great deal of rich embroidery produced, of which the Bayeux tapestry (11th century) is the best known example. There are also, in many church sacristies, altar frontals and occasional vestments which reveal a similar skill in the medium and an even greater richness and decorative imagination. (*See* TEXTILES AND EMBROIDERIES; TAPESTRY.) (T. F. H.)

ROMAN LAW. The term "Roman law" is one of somewhat indefinite meaning. It denotes first of all the law of the city of Rome and of the Roman empire. This in itself is an enormously wide subject, for it includes, in the west, the law in force at any period from the foundation of the city (traditional date 753 B.C.) until the fall of the Western empire in the 5th century A.D., and in the east, can be taken to include the law of the Eastern empire, until it too fell with the capture of Constantinople by the Turks in 1453; for the law even of the later Eastern empire remained, in spite of changes, more Roman in character than most other branches of its civilization.

But "Roman law" does not mean merely the law of those political societies to which the name Roman may in some sense be applied, for the legal institutions evolved by the Romans have had, not merely influence on those of other peoples, but in many cases actual application, in times long after the disappearance of the Roman empire as a political entity, and even in countries which were never subject to Roman rule. Thus, to take the most striking example, in a large part of Germany until the adoption of a common code for the whole empire in 1900, the Roman law was in force as "subsidiary law," *i.e.*, it was applied unless excluded by contrary local provisions. This law, however, which was in force in parts of Europe long after the fall of the Roman empire, was not the Roman law in its original form. Its basis was indeed always the *Corpus iuris civilis*, *i.e.*, the codifying legislation of the Emperor Justinian (A.D. 527–565, *see* below), but from the eleventh century onwards (*see* GLOSS; IRNERIUS, ACCURSIUS) this legislation was interpreted, developed and adapted to later conditions by generations of jurists, and necessarily received additions from non-Roman sources. All the forms which it assumed in different countries and at different epochs can also claim to be included under the title "Roman law."[1]

The importance of Roman law is, however, not confined to the actual application of its rules as such either in the Roman empire or elsewhere, for its influence on the development of law in general has been immense. Even to-day, if we look at the legal systems of peoples with a Western civilization, we can say that they fall (with some exceptions, especially the Scandinavian countries) into two groups—an English group, and a group in which the main elements are of Roman origin. To the English group belong England, nearly all the United States of America, and most of the British dominions and colonies; to the Roman group belong the rest. The nations of the Continent are, nearly all of them, living to-day under Codes which, though they contain much that is not Roman, are Roman in their structure, their fundamental categories and their general method of thought. Within the British empire there is Scotland with a system fundamentally Roman, Quebec with its French law, built largely with Roman materials, and South Africa which, like Ceylon, has a system known as "Roman-Dutch," that is to say based on the Roman law as developed by the jurists of the Netherlands. Even English law itself, though owing less to Roman law than any other system, has at different times and in different ways received considerable accessions from Roman sources. (*See* ENGLISH LAW; and *e.g.*, Pollock and Maitland, *History of English Law* I. 88 *seq.*, Holdsworth *History of English Law* II. 145–149, 176–178 IV. 228 *seq.*)

[1]The term "civil law" is frequently used, in England at least, to denote the Roman system in this sense, as opposed to the native "common law."

These developments however lie outside the scope of the article which is confined to the history of private law within the empire up to the death of Justinian.

Periods in the History of the Law.—Considerations of space make it impossible to discuss separately the different stages through which Roman law passed during the 13 centuries which elapsed between the foundation of the city and the death of Justinian, but some idea of the chief periods and their characteristics is essential for the understanding of what follows, and we may perhaps divide as follows:—

(*a*) *The Period of Conjecture.*—This includes the monarchy (753–510 B.C. according to tradition) and the republic up to the passing of the XII. Tables (451–450). For this period we have really no evidence but unreliable tradition and inference from later institutions.

(*b*) *The Mid-Republican Period, from the XII. Tables Until About the Middle of the Second Century B.C.*—Apart from fragments of the Tables and from the historians, who are of course chiefly of use for constitutional law, our evidence is not a great deal better than for the previous period when it comes to detail, and the history of law, like the rest of Roman history, suffers still from the destruction of records when Rome was burnt by the Gauls in or about 387 B.C. However we know of some laws passed, of the existence of certain legal institutions and the names of some famous lawyers, though no professedly legal work has survived, and indeed few were written. The period is pre-eminently one of the *ius civile*, as opposed both to the *ius honorarium* or magisterial law and to the *ius gentium*, in the sense to be explained below.

(*c*) *The Late Republican Period.*—For the last century and a half of the republic the position as regards evidence is already different. A few quotations from legal writers of the time survive in Justinian's digest; we have Cicero, in all of whose works there are numerous references to legal matters, and we have other non-legal literature from which information on law can be deduced. We have too the text of a few laws in inscriptions. The period is that in which magisterial edict comes to be the chief reforming factor in Roman law and it may thus be described as the period of the earlier *ius honorarium*. It was also the period in which the *ius gentium* began to be of importance, and these two facts are not unconnected, for it was probably through the medium of the Edicts that a large part of the *ius gentium* found its way into the law as administered between citizens.

Ius gentium is a difficult phrase to explain, because it has two distinct, though related, meanings, the one practical, the other theoretical. In the practical sense it means that part of the Roman law which was applied by the Romans both to themselves and to foreigners, while *ius civile*, as opposed to it, means that part which the Romans applied only to themselves. This dichotomy can only be explained historically. Roman law like other ancient systems, adopted originally the principle of personality *i.e.* that the law of the state applied only to its citizens. The foreigner was strictly rightless, and unless protected by some treaty between his state and Rome could be seized, like an ownerless piece of property, by any Roman. But from early times there were treaties with foreign states guaranteeing mutual protection and even where there was no treaty, the increasing commercial interests of Rome made it necessary for her to protect, by some form of justice, the foreigners who came within her borders. Now a magistrate charged with the administration of such justice could not simply apply Roman law, because that was the privilege of citizens, and even had there not been this difficulty, the foreigners especially those coming from Greek cities and used to a more developed and freer system, would probably have objected to the cumbrous formalism which characterized the early *ius civile*.

What the magistrate in fact did, was to apply a system composed of the already existing "law merchant" of the Mediterranean peoples and a strong Roman flavouring, the Roman element being, however, purged to a large extent of its formalistic elements. This system was also adopted when Rome began to have

provinces and her governors administered justice to the provincial *peregrini* (foreigners), a word which came to mean, not so much persons living under another government (of which, with the expansion of Roman power, there came to be fewer and fewer) as Roman subjects who were not citizens. The general principle adopted seems to have been to allow disputes between members of the same (subject) state to be settled by their own courts according to their own law, while the governor's courts applied *ius gentium* to disputes between the provincials of different states or between provincials and Romans. The law thus developed in its turn reacted on the law as administered between Romans, especially by way of making it less formal, with the result that to a considerable extent the two systems were identical, and this is true particularly of the law of contract. When therefore a Roman lawyer says that the contract of sale, for instance, is *iuris gentium*, he means that it is formed in the same way and has the same legal results whether the parties to it are citizens or not. This is the practical sense of *ius gentium*, but the idea is closely interwoven with a theoretical sense, that of a law common to all peoples and dictated by Nature which the Romans took from Greek philosophy.

Aristotle had already divided law into that which is natural (*φυσικόν*) and that which is man-made (*νομικόν*) and had asserted that the natural part was in force everywhere. This conception fitted well with the Stoic ideal of a life "according to nature," and became a commonplace which was borrowed by the Roman jurists, who, like other educated Romans, were much under the influence of the Stoic system. In their works this theoretical law of nature, "common to all mankind," then becomes identified with the really practical law which the Romans administered to all free men, irrespective of citizenship, simply on the basis of their freedom.

(*d*) *The Early Empire and the Classical Period.*—The change from republic to empire did not make any immediate difference to private law, except in so far as, bringing peace after a century of turmoil, it was favourable to legal progress. Legal literature, too, increased in volume and a number of quotations from authors of the first century survive in the Digest. This age in fact merges insensibly into the classical period, which is generally taken to include the second century A.D. and the early third century, and is thus considerably later than the classical period of Latin literature. It falls roughly into two divisions, an earlier one covered by the reigns of Hadrian (A.D. 117–138) and the Antonine emperors (death of Commodus A.D. 193) and a later one under the Severi (accession of Septimius Severus A.D. 193—death of Severus Alexander A.D. 235). Not that there is any break in the continuity of development, but the work of the earlier period was of a more creative character, while the later represents the working out of existing principles over the whole field of law. In the Digest there are quotations from all the authors of the classical age, but those taken from three writers of the later period (Papinian, Paul, Ulpian) alone comprise over half the work.

(*e*) *The Post-classical Period.*—With the era of confusion that followed the murder of Severus Alexander, there came a rather sudden falling off in the value of the legal work done, and the restoration of order by Diocletian (A.D. 284–305) did not revive legal literature. The law, of course, did not stand still. New ideas were introduced, especially from Greek sources, through the establishment of the Eastern empire with its capital at Constantinople, and through the growth of Christianity, while the great social and political changes of the sinking empire necessarily had their repercussions on private law. But it was not until the age just preceding Justinian that there was something of an intellectual revival in legal matters, and this revival Justinian was able to use for his great purpose.

SOURCES OF LAW

The Romans themselves divided their law into *ius scriptum* and *ius non scriptum;* by "unwritten law" they meant custom, by "written law," not only that derived from legislation, but, literally, that which was based on any source which was in writing and the list of written sources comprises *leges, plebiscita, senatus consulta, edicta magistratuum, responsa prudentium* and *constitutiones principum.* This list is repeated in Justinian's Institutes though ever since the close of the classical period the only source of new law (apart from custom) had been the emperor's constitutions.

A. **Ius Non Scriptum or Custom.**—Custom (*mos maiorum, consuetudo*) was recognized by the Romans not only as having been the original source of their law, but as a source from which new law could spring. The theory given by the jurists is that the people, by adopting a custom, show tacitly what they wish to be law, just as they might do expressly by voting in the assembly. In the developed law it would seem, however, that custom as an independent source was not very fruitful, and that it exercised its influence rather through the medium of juristic opinion and the practice of the courts.

B. **Ius Scriptum.**—(1) *Leges and Plebiscita.—Lex* is properly an enactment of one of the assemblies of the whole Roman people, the *comitia centuriata, tributa* or *curiata* (*see* COMITIA), but the most ancient of these, the *comitia curiata,* ceased, before the beginning of reliable history, to have any real political functions, though it continued right up to classical times to exist for certain formal purposes. The validity of *plebiscita, i.e.,* resolutions of the purely plebeian assembly, was one of the chief matters of contention between the patricians and plebeians, and the struggle between the orders may be said to come to an end in 287 B.C. when, by the *lex Hortensia, plebiscita* were given the force of *leges.* Thereafter enactments which were strictly *plebiscita* were often loosely referred to as *leges.*

Roman assemblies, like those of the Greek city states, were primary, *i.e.,* the citizen came and voted himself and did not send a delegate, but their power was restricted by the rule that only a magistrate could put a proposal before them and by the absence of any opportunity for amendment or debate. The only function of the people was to answer "yes" or "no" to the magistrate's "asking" (*rogatio*), and constitutional practice further required that the magistrate should consult the senate before putting a proposal to the assembly. In the later republic, at any rate, rejection of a bill was practically unknown and the real power lay with the senate and the magistrates.

Leges Regiae.—The historians have a good deal to say of *leges* passed in the time of the kings, but legislation at so early a date is unlikely. What they took for laws were probably statements of ancient custom from pontifical sources.

The XII. Tables.—Of much greater importance are the XII. Tables, said to have been passed in 451–450 B.C., some 60 years after the expulsion of the kings. The accounts given by the historians of their compilation (*see* ROME, *History*) are inconsistent and mainly mythical, but tradition is no doubt right in representing it as an incident in the struggle of the plebeians for political equality. The moving cause was a desire to obtain a written and public code which patrician magistrates could not wrest at their will against plebeian litigants. What weight should be given to that part of the story which tells of a preliminary embassy sent to Athens to study the laws of Solon, has been much debated. That the embassy itself is legendary can hardly be doubted, but on the other hand, that there was some Greek influence is clear. (See, *e.g.,* Tab. VII. 2-D. 10.1.13.) In the main, however, the materials of the code were taken from native customary sources. The authenticity of the whole compilation has been attacked in recent times, but the most authoritative modern opinion holds, in spite of all scepticism as to details, that the XII. Tables really were an enacted code of law, and that tradition is not far wrong in ascribing them to the middle of the fifth century B.C.

The text of the code has not survived, a remarkable fact, for copies (probably in more or less modernized language) must have been abundant in Cicero's time if, as he says (De Leg. 2, 23, 59) it was still customary in his youth for boys to learn it by heart. All that we have is a number of "fragments" which have had to be collected from allusions and quotations in the works of various authors, *e.g.,* Cicero. (Modern collections are to be found in Bruns' *Fontes iuris Romani antiqui,* 7th ed., 1919, Girard's *Textes de droit Romain,* 5th ed., Paris, 1923, and Riccobono's

Fontes iuris Romani anteiustiniani.)

On the establishment of the empire by Augustus, the assemblies did not immediately cease to function, but their assent to any proposal was a mere formal ratification of the emperor's wishes. The last *lex* known to have been passed was a *lex agraria* under Nerva (A.D. 96–98).

Senatus Consulta.—The senate acquired legislative power in early imperial times though this was never conferred on it by any imperial enactment. The resolution of the senate preceding the placing of a bill before the people had always been practically decisive, and with the decay of the *comitia* their assent evidently came to be regarded as a formality which might be omitted. Actually, the senate nearly always, if not always, legislated at the instigation of the emperor, latterly, indeed, simply embodying his *oratio* or proposal in a resolution, and not long after the classical period, the emperors ceased to use the senate as a vehicle of their legislation.

Edicta Magistratuum.—An edict is a proclamation, originally no doubt oral, later in writing, and any superior magistrate might find it necessary to issue such edicts regarding matters which came within his competence. A peculiarity of Roman law, however, is that the magistrates entrusted with jurisdiction made particular use of this power and that their edicts became one of the most important sources of law. Originally the duty of *iurisdictio*, which means supervising the administration of justice rather than actually deciding cases (*see* p. 454, "Procedure") had presumably lain with the king, from whom it descended to the consuls. With the growth of business it became impossible for the consuls to discharge this duty in addition to their other functions and in 367 B.C. a new magistrate, the *praetor*, was appointed for the purpose. About the year 242 B.C. the increase of foreigners at Rome made it necessary to separate the conduct of suits in which they were concerned from those to which citizens alone were parties, and a second praetor, *praetor peregrinus*, was appointed to deal with cases in which a foreigner was involved. In contradistinction to him, the original praetor, now confined to suits between citizens, came to bear the title *urbanus*[1].

Other judicial officers at Rome whose edicts were of importance were the curule aediles, whose duties included the supervision of the market place. In the provinces supreme judicial power lay with the governors, and quaestors carried out functions analogous to those of the aediles at Rome. The law derived from the edicts of all these magistrates was called *ius honorarium*, as opposed to *ius civile* in the sense of law based on legislation or custom, but owing to the pre-eminent position of the praetors, the phrase is often used simply as equivalent to *ius praetorium*. The nature of this magisterial law is peculiar. The praetor was not a legislator, and he could not therefore make law directly as could the sovereign people, but the Roman system of procedure (especially the formulary system, *see* p. 454) gave him a great power over the provision or refusal of remedies as well as over the form which remedies were to take, and consequently the edict which he issued at the beginning of his term of office setting out what he intended to do was a document of the greatest importance. In it he could say, for instance, "If one man makes such and such an allegation against another, *I will give an action*," even though the circumstances alleged would not give any right at civil law. The edict called *perpetuum* (continuous) because it was intended to announce the principles by which the praetor would be governed throughout his year of office, necessarily ceased to have any validity when that term expired, but it became the practice for each succeeding praetor to take over and reissue as his own much of his predecessor's edict, and by the end of the republic, the part which was thus carried on from year to year (*tralaticium*) must have been considerable, for jurists were just beginning to write commentaries on the edict, a practice which would not have been worth while if the greater part of it had been liable to annual alteration.

[1]This is the usual story, but the historians in an endeavour to reconcile discordant tradition may have read back into early times the institutions of their own day. *See* E. Pais, *Ricerche sulla Storia*, etc. Serie iv. (1921), 265 *seq.*

The change from republic to empire did not immediately make any difference, and the praetors continued to issue their edicts (though we may doubt whether they ever made changes without imperial or senatorial authority), but in the long run their wide powers were evidently felt to be inconsistent with the emperor's supremacy. Hadrian consequently, in or about A.D. 131, instructed the famous jurist Salvius Iulianus to revise and settle the praetorian and aedilician edicts. The changes in substance do not appear to have been of a far-reaching character, but the edict as revised was henceforward made unalterable except by the emperor himself.

The relationship between *ius honorarium* and *ius civile* has often been compared with that existing in England between common law and equity. In both cases we find, as Maine put it (*Ancient Law*, p. 25) a "body of rules existing by the side of the original civil law, founded on distinct principles, and claiming incidentally to supersede the civil law in virtue of a superior sanctity inherent in these principles," and in both cases the resulting duality enormously complicates the law, but, of course, when we come to detail the comparison no longer holds.

Responsa Prudentium.—The force attributed to professional opinions of a certain type was another peculiar feature of the Roman system, and one which contributed in no small measure to its success, for it was the "learned lawyers" (*prudentes*) to whom the moulding of the law into a coherent system was really due.

Originally, according to an entirely credible tradition, law was considered the special province of the *pontifices* (*see* PONTIFEX), who seem to have regarded it as a mystery to be exploited in the interests of their order. Their monopoly was however broken down, according to legend, in 304 B.C., by Gn. Flavius, a clerk of Appius Claudius Caecus, who is said to have stolen from his master and made public, a list of *legis actiones* (*i.e.*, forms of words which had to be followed exactly in the conduct of lawsuits), thereafter known as the *ius Flavianum*. The first known legal treatise, called the "cradle of the law" by Pomponius, is the *Tripertita* of Sextus Aelius Paetus Catus (consul 198 B.C.) which contained the text of the XII. Tables, the *interpretatio* put upon it by the jurists and the *legis actiones*. Probably the last part was identical with the *ius Aelianum* which, according to Pomponius, was a collection of *legis actiones* like the earlier *ius Flavianum*.

It is plain in any case that from about 300 B.C. onwards there came into existence a class of men who made the study of the law their special interest. These *iuris consulti* or *iuris prudentes* were not professional lawyers in the modern sense, but men of rank who sought by giving free legal advice to obtain popularity and advancement in a public career. The *responsa* (answers) which they delivered to those who consulted them were of greater weight than are our modern "opinions of counsel" because the person who actually decided a case under the Roman system of procedure was not, as with us, a trained lawyer, but a lay *iudex*, who did not, like our jurymen, have a judge to direct him on points of law. Augustus empowered certain jurists to give *responsa* with the emperor's authority, and this practice led, perhaps by insensible degrees, to the view that the *iudex* was bound to abide by the *responsum* of a jurist who had received this *ius respondendi*. Gaius at any rate mentions a rescript of Hadrian which laid down that *responsa* were binding if they agreed, and that if they disagreed, the *iudex* could decide for himself which to follow. (*See* Wlassak, *Die klassische Prozessformel*, p. 45.)

The practice of conferring the *ius respondendi* appears to have fallen into disuse about the end of the third century A.D. when the classical period was over, but in the meanwhile, *responsa* had certainly come to be regarded as binding not only for the case for which they were originally given, but also as precedents for future cases, and, further, authority gradually came to be attached to the other writings of those jurists who had the emperor's patent. The "law of citations," an imperial enactment of 426, ultimately laid down that only the works of five jurists, Papinian, Paul, Gaius, Ulpian and Modestinus, might be cited and, subject to some provisos which are obscure, the works of authors quoted

by these five. If the authorities cited disagreed, the majority was to be followed; if numbers were equal, the side on which Papinian stood was to prevail; if he was silent, the *iudex* might please himself.

For the long succession of jurists reference must be made to the individual articles, but mention must be made here of the two "schools," the Sabinians (or Cassians) and the Proculians, into which they were divided in the early empire. Labeo (died between A.D. 10 and A.D. 22), one of the greatest figures in the history of jurisprudence, was the founder of the Proculians (who, however, took their name from a successor, Proculus); Capito, that of the Sabinians (so called from Massurius Sabinus, who was given the *ius respondendi* by Tiberius). What principles, if any, divided these schools, is unknown, though a number of controversies on particular points are preserved, especially in Gaius' Institutes. It is probable, though by no means certain, that there were teaching establishments or societies of some sort in connection with the "schools," for otherwise the list of "heads" given by Pomponius would be difficult to explain. The distinction does not seem to have survived the Antonine age; for Gaius, a Sabinian, is the last jurist of whom we know that he belonged to one or other of the schools.

Constitutiones Principum.—Neither Augustus nor his immediate successors expressly assumed legislative power, and yet Gaius, writing about A.D. 160, can say "there has never been any doubt that what the emperor lays down has the force of law." Ulpian, indeed, refers the validity of constitutions to the so-called *lex regia*, passed at the beginning of each emperor's reign; and there is indeed in the only surviving example of such a *lex* (the *lex de imperio Vespasiani* line 17 *seq.*, *see* Bruns *Fontes* p. 202) a clause conferring such wide powers on the emperor that legislation might be deemed to be included. Nevertheless it is now generally held that this was not the original meaning of the clause and that the emperor's legislative power is a gradual growth. The chief forms of imperial legislation were:—(*a*) *Edicta, i.e.*, proclamations which the emperor, like other magistrates, might issue; but whereas the other magistrates were confined to their own spheres, the sphere of the emperor was in fact unlimited. (*b*) *Mandata, i.e.*, instructions to subordinates, especially provincial governors. (*c*) *Rescripta*, written answers to officials or others who have consulted the emperor, in particular on a point of law. In such cases the rescript lays down the point of law applicable and, since the emperor is supreme, the rule may be a new one. (*d*) *Decreta, i.e.*, decisions of the emperor sitting as a judge. Here too the emperor may lay down a new rule.

The Earlier Collections of Constitutions and the Legislation of Justinian.—The growth of legal literature and especially of imperial constitutions created a need for works of reference which made itself felt long before Justinian, and a beginning was made, almost certainly in Diocletian's day, by a collection of constitutions known as the *codex Gregorianus*, which was followed by the *codex Hermogenianus*, perhaps also dating in its original form from Diocletian. Both collections were unofficial, but their compilers must have had official countenance, for they clearly had access to the imperial archives. The *Gregorianus* contained constitutions from Hadrian to Diocletian, the *Hermogenianus* almost exclusively those of Diocletian's time; later constitutions attributed to it were probably only added in subsequent editions. It was clearly intended to supplement the *Gregorianus*. Unlike these two, the *codex Theodosianus* was an official work compiled by a commission appointed under Theodosius II. and Valentinian III., it was given the force of law as from Jan. 1, 439. Constitutions from the time of Constantine the Great onwards were, with very few exceptions, not to be valid unless contained in it. For the earlier imperial legislation the older *codices* still had to serve. Nearly the whole of the *codex Theodosianus* has been preserved, whereas we only have fragments of the others. Theodosius had also planned a collection which would include juristic literature as well as imperial legislation, but this never came to fruition until it was taken up again by Justinian.

Justinian's Legislation.—(*See* also JUSTINIAN I.) Justinian's main object was, as he himself expresses it, to clear the path of legal authorities of the tangles with which it had become overgrown during the course of centuries, and he set about the task almost immediately on ascending the throne. It must be noted however that he was no mere codifier, but also the author of much new legislation, some of which was of the utmost importance for the later development of law. The emperor was no doubt largely responsible himself for the work undertaken, but it would probably not have been possible to carry it through but for the genius of his chief minister, Tribonian, who was clearly the leading spirit throughout the work. The course of legislation was as follows:—

(1) *The Old Codex.*—In Feb. 528, a commission of ten members including Tribonian (who, however, was not president) was appointed to compile a new collection of imperial constitutions which was to supersede the older ones entirely and, of course, to include legislation subsequent to the Theodosian. The commissioners were to cut out repetitions and contradictions and had large powers of alteration for this purpose. The work was rapidly done and published in April 529, with the force of law as from the 16th. It has not survived as it was later superseded.

(2) *The "Fifty Decisions."*—Justinian, probably partly with a view to facilitating the work of compiling the Digest, issued a number of constitutions settling matters on which the writings of the classical jurists disagreed and abolishing finally some institutions and distinctions which had ceased to be of practical importance. Some 90 constitutions of this character are known to us, but a collection of 50 seems to have been made and published separately. Its exact date cannot be determined.

(3) *The Digest.* (*Digesta or Pandectae*).—Instructions were given on Dec. 15, 530, to Tribonian to form a commission to collect excerpts from the works of the jurists. The collection was to serve practical purposes and consequently everything obsolete or superfluous was to be cut out and, where necessary to bring the matter up to date, alterations were to be made in the text. The excerpts were to be arranged in fifty books and the books into titles according to the subject matter, and the whole was to include all that it was necessary to know of juristic as opposed to imperial law. The compilers were definitely instructed not to adopt the summary methods of the "law of citations" but where the authorities disagreed, to choose what they thought best for themselves. The commission, consisting of 16 members in addition to Tribonian, rapidly completed their task and the Digest was published on Dec. 16, 533, with the force of law as from Dec. 30. Thenceforth no reference might be made to any other text for juristic law. Justinian gives us some idea of the work involved when he says that 2,000 books consisting of 3,000,000 lines were read and that this number was then reduced to 150,000 lines. The Digest is the most important of Justinian's works, for in it are preserved the writings of the classical jurists who were really responsible for the greatness of Roman law, and the "inscription" at the head of each quotation enables us to see from which jurist and from which work it is taken. But of course as evidence for the classical law quotations must be used with care, for the compilers made considerable use of their powers of alteration; much ingenuity, especially within the last 50 years, has gone to the discovery of their "interpolations."

The Institutes.—The revision of the law by Justinian was accompanied by a detailed scheme for the reform of legal education in the universities of Constantinople and Berytus, and one of the requirements of this scheme was a new book to be used for elementary instruction instead of the Institutes of Gaius which had for centuries been the standard work. While the Digest was still unpublished therefore orders were given to Tribonian and two professors to compile a manual for this purpose, and the Institutes were published on Nov. 21, 533, and given the force of law. The work is based on Gaius' Institutes, from which a great part is copied literally, as well as on other elementary works of the classical period; occasional references to imperial legislation are added. It is in fact almost as much a compilation as the Digest, but the references to the authors quoted are omitted and the whole made to read like a lecture delivered by the emperor to his students.

The New Code (*Codex Repetitae Praelectionis*).—The 50 decisions and the many other new constitutions promulgated since 529 necessitated a revision of the old codex and Tribonian, together with four others, was instructed shortly after the publication of the Digest, to prepare a new edition. This was published on Nov. 16, 534, and given the force of law as from Dec. 29.

The Novels.—Although the new code completed Justinian's scheme for providing a collection of authoritative legal texts, he did not cease to introduce new legislation. In all 175 laws published after 534 are known and these are called *Novellae Constitutiones* or Novels. Nearly all are in Greek, which was becoming more and more the official as well as the spoken language of the Byzantine Empire. Justinian never made any official compilation of them, but three private collections have come down to us, and the Novels, together with the Institutes, the Digest and the (new) Code together form what is known as the *Corpus Iuris Civilis.*

THE LAW OF PERSONS

I. **Slavery.**—"The main distinction in the law of persons," says Gaius, "is that all men are either free or slaves." The slave according to Roman law was in principle a human chattel who could be owned and dealt with like any other piece of property. As a piece of property the slave was not only at the mercy of his owner, but rightless, and (apart from criminal law) dutyless. This is the principle, but if the slave was, in law, a thing, he was, in fact, a man, and this fact produced modifications of the principle. In particular, a slave might be manumitted and would then become in most cases not only free but a citizen.

II. **Citizenship.**—This was of importance for the purposes of private law, because certain parts of private law applied only to citizens (*ius civile*). The general rule was that, if the status of the parents differed, the child followed that of the father, if the union was one recognized as marriage by Roman law; otherwise that of its mother, but a *lex Minicia* of republican times enacted that in cases of unrecognized unions between citizens and foreigners the child should always follow the inferior parent. The great extension of the citizenship by Caracalla in A.D. 212 reduced the importance of this part of the law.

III. **Family.**—(a) *Patria potestas.* The chief characteristic of the Roman family is the famous *patria potestas* which the father exercised over his children and over his more remote descendants in the male line, whatever their age might be, as well as over those brought into the family by adoption—a very common practice at Rome. This meant originally not only that he had control over the persons of his children, amounting even to a right to inflict capital punishment, but that he alone had any rights in private laws. Thus any acquisitions made by a child under power became the property of the father. The father might indeed allow a child (as he might a slave) certain property (*peculium*) to treat as his own, but in the eye of the law it continued to belong to the father. In classical times there were already modifications of the system; the father's power of life and death had shrunk to that of slight chastisement, and the son could bind his father by contract with a third party within the same strict limits as applied to slaves and their masters. Sons too could keep as their own what they earned as soldiers (*peculium castrense*) and even make wills of it. In Justinian's day the position as regards property had changed considerably; what the father gave to the son still remained in law the father's property, but the rules of *peculium castrense* had been extended to many sorts of professional earnings (*pec. quasi castrense*) and in all other sorts of acquisitions (*e.g.*, property inherited from the mother) the father's rights were reduced to a life-interest (usufruct). At all times *Patria potestas* ceased normally only with the death of the father, but the father might voluntarily free the child by *emancipation*, and a daughter ceased to be under her father's *potestas* if she was married in such a way as to come under the *manus* of her husband.

(b) *Marriage.*—There were two types of marriage known to the law, one with *manus* and one without, but the former was rare already in the late republic and had disappeared long before Justinian's day. *Manus* was the autocratic power of the husband over the wife, corresponding to *patria potestas* over the sons, and it might result in any of three ways:—

(1) by *confarreatio*, a religious ceremony confined to patricians.

(2) by *coemptio*, a type of *mancipation* (*see* below) which was originally no doubt the Roman form of marriage by purchase; it was purely secular.

(3) *usus*; if a woman lived with a man as his wife for a year, he acquired *manus* over her by a kind of prescription. The XII. Tables had already provided that this might be prevented if the woman absented herself for a space of three nights during the year (*usurpatio trinoctii*). *Usus* was already quite obsolete in classical times.

It may be that at one time marriage with *manus* was the only form of union recognized as marriage at all, but by the time of the XII. Tables this was apparently no longer the case, for it is clear that the *usurpatio trinoctii*, though it prevented *manus*, left the marriage subsisting, so that it was possible to be married without *manus*.

In any case marriage without *manus* was by far the more common in all periods of which we have any real knowledge. It was formed (provided the parties were above the age of puberty and if under *potestas* had their fathers' consent) simply by the beginning of conjugal life with the intention of being married, and this was normally evidenced by the bringing of the bride to the bridegroom's house. It was however legally independent of all ceremonies whether pagan or Christian which might accompany it, and of consummation. The wife remained under her father's *potestas* if he were still alive, if he were dead, she continued (so long as guardianship of women continued) to have the same guardian as before marriage. It was necessary that both spouses should be citizens, or if one was not, that he or she should have *conubium*, the right given to some non-Romans of contracting a Roman marriage. The chief importance of this was that if a Roman contracted a union with a foreign woman, the children would not be in his *potestas* unless she had *conubium*. In marriage without *manus* the property of the spouses remained entirely distinct, and even gifts between husband and wife were invalid. It was usual however for a dowry to be given to the husband on the marriage by the woman or her father; this originally became the indefeasible property of the husband, but in classical times already the wife could recover it if the marriage ended by divorce or by the husband's death, and by Justinian's legislation it had always to be returned to the wife or her heirs.

Divorce was always possible at the instance of the husband in cases of marriage with *manus*, and in marriage without *manus* it was free to either party to put an end to the relationship at will; a letter of *repudium* was usual, but any manifestation of intention to end the relationship made clear to the other party and accompanied by actual parting was all that was legally necessary (*see* E. Levy, *Der Hergang bei der römischen Ehescheidung*). The Christian emperors imposed penalties on those who divorced without good reason, but the power of the parties to end the marriage by their own act was not taken away. *Concubinatus* was recognized in the empire as a sort of morganatic marriage, differing from marriage only by the different intentions of the parties, and excluding marriage, for a man could not have both a wife and a concubine. Constantine first enacted that the children of such unions might be legitimated by the subsequent marriage of their parents, a rule which the mediaeval civil law extended to all illegitimate children.

(c) *Guardianship.*—(1) Of children. Persons under the age of puberty (14 for males, 12 for females) needed *tutores* if they were not under *patria potestas*. Such tutors could be appointed under the will of the *pater familias;* failing such appointment the guardianship went to the nearest agnates (*see* p. 453 "Succession") until Justinian gave it to the next of kin whether agnatic or cognatic; if there were no qualified relation the magistrates made an appointment.

(2) Of women. Originally all women not under *patria potestas* or *manus* needed *tutores*, who were appointed in the same way as those for children. In classical times already this *perpetua tutela mulierum* was little more than a burdensome technicality and it had long disappeared from Justinian's law.

(3) Of lunatics and spendthrifts. Originally such persons were placed under the *cura* of their agnates; later, magistrates appointed curators.

(4) Of minors. Originally children were considered adult when of the age of puberty, but, by a long development, it became usual for those above puberty and under 25 to have *curatores* who were always magisterially appointed.

PROPERTY AND POSSESSION

The most striking thing to an English lawyer accustomed to the complexities of English real property law is the absence of any fundamental distinction between the treatment of land and the treatment of movables. Both can, in the law as we know it, be owned absolutely by individuals, though there may have been a time at Rome as elsewhere when land was subject to communal ownership of some sort. This conception of absolute ownership (*dominium*) is also characteristically Roman, as opposed to the relative idea of ownership as the better right to possession which underlies the Germanic systems, which also, originally, underlay that of Rome. This can be seen by comparing the form of a *vindicatio* (the claim of an owner out of possession) under the *legis actio* system of procedure with that which it later assumed under the formulary system. In the earlier system the plaintiff first makes his assertion of ownership ("I say that this thing is mine") and then the defendant makes a similar assertion. Finally, the things goes to the one whose assertion is based on the better right. Under the later system there is no assertion by the defendant at all; the *iudex* is instructed to condemn the defendant if it appears to him that the thing belongs to the plaintiff, otherwise to absolve the defendant. Hence, unless the plaintiff makes good his title absolutely, the defendant, though he may have no title at all, remains in possession.

A great part of what the jurists have to say on the subject of property comes under the heading "methods of acquiring ownership." These were divided into two classes according as they fell under the *ius civile* or the *ius gentium*.

I. **Methods of the Ius Civile** (a) *Mancipatio.*—This was a ceremonial conveyance needing for its accomplishment the presence of the tranferor and transferee, five witnesses (Roman citizens of full age) a pair of scales, a man to hold them (*libripens*) and an ingot of copper. The transferee grasped the thing and said: "I assert that this thing is mine by Quiritarian law; and be it bought to me with this piece of copper and these copper scales." He then struck the scales with the ingot which he handed to the transferor "by way of price." Clearly this was, as Gaius says, a "symbolical sale," and the relic of a real sale. Originally, when money was unknown, the price in uncoined copper had been really weighed out to the vendor. When this became unnecessary there was still a pretence of weighing, but the price was paid separately, and the form could be used as a conveyance where it was not intended that a price should be paid at all, *e.g.*, because the transferor was making a gift to the transferee.

(b) *In Iure Cessio.*—This was a conveyance in the form of a lawsuit. The transferee claims before the magistrate that the thing is his, and the transferee who is the defendant, admits the claim. The magistrate then adjudges the thing to the transferee.

(c) *Usucapio.*—According to the XII. Tables, two years' continuous possession gave title in the case of land, one year in the case of movables. In the developed law, possession must have begun in good faith, the thing must not be one which has been stolen (even though the possessor himself is quite innocent of the theft) or occupied by violence (this applies especially to land, which could not be stolen) and the possession must have had a justifiable beginning (*iustus titulus*). *Usucapio*, being an institution of the *ius civile* was possible only to citizens, but Justinian fused it with a similar institution (*praescriptio longi temporis*) which had grown up in the provinces. Under his system, three years were required for movables, 10 or 20 for land.

II. **Methods of the Ius Gentium** (a) *Occupatio.*—Ownerless things, provided they are capable of private ownership (not, e.g., *res sacrae*, such as temples) became the property of the first person to take possession of them. This applies *e.g.*, to game, and to articles which have been abandoned or left unattended by their owners.

(b) *Accessio.*—If an accessory thing belonging to A was joined to a principal one belonging to B, the ownership in the whole went to B, *e.g.*, if A's purple be used to dye B's cloth, the dyed cloth belongs wholly to B. By far the most important application of this rule is expressed by the maxim *superficies solo cedit, i.e.*, whatever is built on land becomes part of the land and cannot be separately owned.

(c) *Specificatio.*—If A made a thing out of material belonging to B the Proculians held that ownership went to A, the Sabinians, that it remained in B. Justinian adopted a famous "middle opinion," according to which B retained ownership if reconversion to the original condition was possible (a bronze vase can be melted down), A obtained ownership if it was not (wine cannot be reconverted into grapes).

(d) *Thesauri Inventio.*—The final rule as regards treasure trove was that if it were found by a man on his own land, it went to him; if on that of another, half went to the finder, half to the landowner.

(e) *Traditio, i.e.*, simple delivery of possession with the intention of passing ownership. This was the method of conveyance of the *ius gentium*. It sufficed to pass full Quiritarian ownership of *res nec mancipi*, but not of *res mancipi* (land in Italy, slaves, beasts of draft and burden, and certain rustic servitudes) for which either *mancipatio* or *in iure cessio* was necessary. If therefore A sold and merely delivered a slave to B, A remained at civil law owner of the slave until usucapion had taken place. The praetor however devised methods of protecting B's possession in such a way that A's title became valueless, and B was said to have the thing *in bonis*. From this phrase later writers coined the expression "bonitarian" ownership. Already before Justinian's day *mancipatio* and *in iure cessio* had become obsolete and Justinian took the final step of abolishing the theoretical distinction between Quiritarian and "bonitarian" ownership.

Forms of Property in Land Other Than Ownership.—The ordinary leaseholder according to Roman law had no protection beyond a contractual right against his landlord, and he could not assign his tenancy, but there were two kinds of tenure which, under the praetorian system, obtained protection against third parties as well, and became assignable. These were *superficies* and *emphyteusis;* the former resulting from building leases granted for a long term or in perpetuity, the latter from similar agricultural leases. Both appear to have first originated in grants by the State, or municipalities. Under *emphyteusis* the grantee did not become owner, though he enjoyed a *jus in re aliena* hardly distinguishable from ownership.

Servitudes.—(a) *Praedial servitudes* (*i.e.*, easements or *profits à prendre*) were divided into two categories, rustic and urban, according as they served the need of agricultural land or of buildings. Thus rights of way and of water are usually classed as rustic, while rights to light, to view or to support were urban. Praedial servitudes could only be appurtenant, *i.e.*, they could not exist except as additional advantages attached to the ownership of a piece of land (the "dominant tenement").

(b) *Personal Servitudes.*—The law of Justinian's day brought under the heading of servitudes also the rights of *usufructus* and *usus*. Usufruct was the right to use and take the fruits (*e.g.*, crops) of a thing and corresponded to our life-interest. *Usus* was a more restricted right, also not extending beyond the life of the holder, merely to the use of a thing; thus the usuary of a house could live in it himself but could not let it, as that would be equivalent to taking the fruits.

Possession.—Implied in the absolute conception of ownership is a sharp distinction between ownership and possession. The civil law did not protect possession as such, but one of the most important parts of the praetorian system was constituted by the *interdicta* (special types of remedy) which protected an existing possession irrespective of its rightfulness, *i.e.*, anyone wishing to interfere with it must bring an action and prove his title. If he interfered on his own authority, the praetor would see that the original state of affairs was restored.

OBLIGATIONS

Obligations were classified by the jurists into two main categories, according as they arose from delict (tort) or contract: the remaining obligations the Byzantines placed under the headings of quasi-contract and quasi-delict.

I. **Delict.**—The XII. Tables already show the law in a state of transition from the system of private vengeance to that in which the state insists on the acceptance of compensation instead of vengeance by the person wronged and fixes its amount. Thus in the case of assault (*iniuria*) if one man broke another's limb, talion was still permitted, *i.e.*, the person wronged could inflict the same injury as he had received, but in other cases there were fixed money penalties, *e.g.*, 25 *asses* for a blow. Theft involved a penalty of twice the value of the thing stolen, unless the thief was caught in the act (*furtum manifestum*) in which case he was flogged and "adjudged" to the person wronged.

In classical times, praetorian reforms had substituted a fourfold penalty in the case of *furtum manifestum* and penalties for *iniuria* (which now included defamation and insulting behaviour) were assessed in each case by the court. The law of damage to property was regulated by a statute (*lex Aquilia*) dating from the republic, but later than the XII. Tables, much extended by interpretation and by the praetor, and praetorian actions lay for a number of new delicts of varying importance.

II. **Contract.**—At the time of the XII. Tables a law of contract can hardly be said to have existed, though we know of an institution called *nexum* of which hardly anything can be said with certainty except that it was a kind of loan so oppressive in character that it might result in the debtor's complete subjection to the creditor. It was obsolete long before classical times. The contracts of classical law were divided into four classes, literal, verbal, real and consensual. The literal contract was a type of fictitious loan formed by an entry in the creditor's account book; it was comparatively unimportant, and obsolete in Justinian's day. The verbal contract or *stipulatio* was of great importance, for it provided a form in which any agreement (provided it was lawful and possible) might be made binding by the simple method of reducing it to question and answer, *e.g.*, "do you promise to pay me ten thousand sesterces?"—"I promise." Originally it was absolutely necessary that the words should be spoken, but it may be said (technicalities apart) that by Justinian's day a written memorandum of such a contract would be binding, even though in fact there had been no speaking at all. If an agreement was not clothed in the form of a stipulation, it must, to be valid, fall, according to its content, under one of the types of real, or consensual contracts. A real contract is one which needs for its conclusion (in addition to the consent of the parties) that some thing should be transferred from one party to the other and that the obligation arising should be for the return of the thing transferred. The real contracts are *mutuum* (loan, *e.g.*, of money), *commodatium* (loan, *e.g.*, of a horse), deposit and pledge. Consensual contracts need no element for their formation except agreement—whether expressed in words or otherwise—between the parties, and though there were only four such known to the law, these were the most important in ordinary life—*emptio venditio* (sale), *locatio conductio* (hire of things or services and also giving out jobs to be done), *societas* (partnership) and *mandatum* (agency). In Justinian's day it was further a principle that in any case of reciprocal agreement, *e.g.*, an agreement for exchange (which was not sale), if one party had performed, he could bring an action to enforce performance by the other ("innominate contract").

SUCCESSION AT DEATH

I. **Testamentary Succession.**—That wills existed already at the time of the XII. Tables is certain, and it is highly probable that the form used was still that mentioned by Gaius as the oldest, the will made publicly in the assembly of the *curiae* (*testamentum comitiis calatis*), with the will made before the people drawn up for battle (*testamentum in procinctuas*) as a variant. It may be however that the mancipatory will (*testamentum per aes et libram*) had already been invented. This began as an expedient for effecting the purposes of a will in an emergency, when the other forms were impossible, and consisted in the use of mancipation to convey the estate of the dying man to a kind of trustee (*familiae emptor*) who then distributed it in accordance with the testator's instructions. By the end of the republic, however, the older forms had disappeared, the mancipation had become a mere formality and the instructions of the testator, which were now contained in a written document, constituted a true will, operative only at death and revocable at any time during the testator's lifetime by the making of a new will. In post-classical times the mancipation had ceased to be necessary and the commonest form of will was the *testamentum tripertitum*, needing for its completion the seals of seven witnesses and the signatures of the witnesses and of the testator. In classical times the praetor had already given effect in most cases to a document sealed by seven witnesses.

The first requirement of any Roman will of historical times was the appointment of one or more *heredes*. A *heres* is a universal successor, *i.e.*, he takes over the rights and duties of the deceased (in so far as they are transmissible at all) as a whole. On acceptance, the heir becomes owner where the deceased was owner, creditor where he was creditor and debtor where he was debtor, even though the assets were insufficient to pay the debts. It was thus possible for an inheritance to be *damnosa*, *i.e.*, to involve the heir in loss. Until Justinian's day this consequence could only be avoided by not accepting the inheritance, but Justinian made one of his most famous reforms by introducing the *beneficium inventarii*, *i.e.*, the heir who, within a certain time after the acceptance made an inventory of the deceased's assets, need not pay out more than he had received. In addition to appointing an heir, the testator might also leave legacies, *i.e.*, particular gifts which are a burden on the heir. Freedom of testation was, however, not complete, a man being obliged to leave a certain proportion of his property to his children and, in some cases, to ascendants, and brothers and sisters.

II. **Intestate Succession.**—The history of intestate succession consists broadly in the gradual supersession of a purely agnatic system (*i.e.*, one which takes account of relationship through males exclusively) by a cognatic system (in which relationship is traced indifferently through males or females). The agents in the change were first the praetors and afterwards imperial legislation.

By the XII. Tables those first entitled were the *sui heredes* of the deceased, *i.e.*, those who were in his *potestas* or *manus* when he died and became free from power at his death. Failing these, the nearest agnatic relation (or relations, if there were several of the same degree) succeeded, and, if there were no agnates, the members of the *gens* (clan) of the deceased. Praetorian reforms placed emancipated children on an equality with *sui* and gave to the nearest cognates, or failing such, to the surviving spouse (in marriage without *manus*) rights of succession in the absence of agnates; gentile succession became obsolete probably in the first century A.D. Even under this system it will be seen that a woman would not succeed to a child of hers if any agnate (*e.g.*, a paternal uncle) were alive, nor a child to its mother if there were any agnate of hers. Both these cases were dealt with before the end of the classical period, the former by the *Sc. Tertullianum* (under Hadrian) which gave certain rights of succession to mothers who had the *ius liberorum* (*i.e.*, had borne three children) and the latter by the *Sc. Orphitianum* of A.D. 178, which gave to children the first right to succeed to their mothers. Succeeding emperors made many changes but it was not until Justinian's day that the cognatic system completely triumphed. By Novel 118, completed by Novel 127, a new system was introduced, the principal features of which were the following: Descendants had the first claim, and failing these, a composite class consisting of ascendants, brothers and sisters of the full blood, and children of deceased brothers and sisters. Next came brothers and sisters of the half blood and finally the nearest cognate or cognates if there were several in the same degree.

Husband and wife were not mentioned, but their old (praetorian) rights were kept alive in the absence of any of the above

categories. Justinian also gave to the poor widow a right to one quarter of her husband's estate unless there were more than three children, in which case she shared equally with them. If, however, the heirs were her own children by the deceased, she only received the usufruct (life interest) in what she took.

PROCEDURE

The earliest form of procedure known to have existed is that of the *legis actiones;* this was superseded by the formulary system, which in its turn, gave way to *cognitio extraordinaria.* Characteristic of both the earlier systems is the division into two stages, a preliminary one before the jurisdictional magistrate (*in iure*) and the actual trial before the *iudex.* The object of the first stage is to arrive at an issue, which under the *legis actio* system has to be achieved by the speaking of set forms of words by the parties and sometimes, at least, by the magistrate. Thus in a *vindicatio* (*v. supra*) each party, when making his assertion of ownership grasps the thing in dispute and lays a wand on it, after which the magistrate intervenes and says "Let go both of you." So formal was the procedure that a plaintiff who made the slightest mistake lost his case. For this state of affairs the formulary system provided a remedy. It superseded the older system, so Gaius tells us, as a result of the *lex Aebutia* (date much disputed, perhaps between 149 and 126 B.C.), and two *leges Iuliae* (of Augustus). Between the *lex Aebutia* and the *leges Iuliae* the two systems were both in use.

Under the new procedure the issue was formulated in written instructions (*formula*) to the *iudex,* couched in the form of an alternative, *e.g.,* "If it appear that the defendant owes the plaintiff ten thousand sesterces the *iudex* is to condemn the defendant to pay the Plaintiff ten thousand sesterces; if it does not so appear, he is to absolve him." A draft of the *formula* was probably prepared by the plaintiff before he came into court, but there could be no trial until it was accepted by the defendant; for there was always a contractual element about a lawsuit under both older systems. Pressure could, however, be exercised by the magistrate on a defendant who refused to accept a *formula* of which the magistrate approved, just as a plaintiff could be forced to alter a *formula* of which the magistrate disapproved, by the magistrate's refusal to give his order to the *iudex* to decide the case unless the alteration were made.

The process by which the *cognitio extraordinaria* took its place was gradual, and was accomplished in the provinces earlier than in Rome. Briefly, the new system meant that the magistrate used his administrative powers, always large, for the purpose of settling disputes. He could command, and thus if one man brought a complaint against another before him, he could investigate the matter and give the order he thought fit. As imperially appointed officers who had no *iurisdictio* in the old sense, superseded republican magistrates, so this administrative process became more common. The result is that the old contractual element in procedure disappears, as well as the old division into two stages. Justice is now imposed from above by the state, not, as originally, a kind of voluntary arbitration supervised by the state.

BIBLIOGRAPHY.—Among the chief modern text-books are:—W. W. Buckland, *A Text-book of Roman Law from Augustus to Justinian* (Cambridge, 1921), and (shorter) *A Manual of Roman Law* (Cambridge, 1925); P. F. Girard, *Manuel élémentaire de droit romain* (7th ed., Paris, 1924); R. Sohm, *Institutionen des römischen Rechts* (17th ed., Munich and Leipzig, 1926) (English translation of 9th edition by Ledlie, Oxford, 1901). For Sources and History see *e.g.,* P. Krüger, *Geschichte der Quellen und Literatur des röm. Rechts* (2nd ed., Munich and Leipsic, 1912); T. Kipp, *Geschichte der Quellen des röm. Rechts* (4th ed., Leipsic, 1919); B. Kübler, *Geschichte des röm. Rechts* (Leipsic, 1925); G. Cornil, *Droit romain, aperçu historique sommaire* (Brussels, 1921); E. Costa, *Storia del diritto romano privato* (2nd ed., Turin, 1925); J. Muirhead, Historical Introduction to the Private Law of Rome, 3rd ed., London, 1916. In Holtzendorff's *Enzyklopädie der Rechtswissenschaft,* Vol. 1 (2nd ed. of revised version, Munich and Leipsic, 1915); O. Lenel's article on history and sources (*Geschichte u. Quellen des röm. Rechts*) and E. Rabel's on the private law of classical times (*Grundzüge des röm. Privatrechts*) are both authoritative and contain full references to modern literature. (H. F. J.)

ROMANOFF DYNASTY, the rulers of Russia from 1613 to 1917. The last direct descendant of the earlier dynasty of Rurik, Tsar Theodor, son of Ivan (John) the Terrible, died in 1598. After him the throne was occupied first by his brother-in-law, Boris Godunov, then by an adventurer claiming to be a son of Ivan the Terrible (usually known as the false Demetrius). After his murder, in 1606, Prince Basil Shuiski was proclaimed tsar, but was dethroned four years later. The faction which was in power offered the crown to Vladislas, son of the king of Poland. A Polish army advanced to support his claim. Another faction brought in a Swedish army to fight the Poles. In the meantime two more men sprang up in succession, both pretending to be Demetrius, miraculously saved from death. The country was in confusion and civil war till Minin, a tradesman from Nijni-Novgorod, joined hands with Prince Pojarski, one of the generals who had proved himself an efficient soldier. They formed an army and took Moscow in Oct. 1612; they then sent messengers all over the country urging the people to choose representatives who would assemble in Moscow to elect a new ruler. On Feb. 21, 1613, Michael Romanoff was unanimously proclaimed tsar.

The Romanoffs were not of Rurik's stock, nor were they even of very ancient lineage. They descended from a German nobleman who had emigrated to Moscow early in the 14th century. His fifth son, nicknamed Koshka (the Cat), became head of the family of Koshkins, many of whom were prominent at the court of Moscow in the 14th and 15th centuries. Early in the 16th century one of them, whose first name was Roman, called himself Romanoff. His daughter, Anastasia, was Ivan the Terrible's first wife; it was her son, Theodor, who was the last tsar of the Rurik dynasty. As Ivan the Terrible had no high opinion of his son's mental powers, he appointed a council of noblemen to transact business for his successor, and Anastasia's brother, Nikita, was chairman of this council. He made himself very popular by his constant defence of common people's rights, and one of his sons, Theodor, was celebrated for his learning and refined manners. Boris Godunov, fearing the popularity of the Romanoffs, had obliged Theodor and his wife to divorce and to become monk and nun. It was their son, Michael, who was elected tsar in 1613.

Theodor's monastic name was Philarete. After Boris Godunov's death Philarete became metropolitan of Rostov. At the time of his son's election to the throne, he was a prisoner in Poland. Michael was only 16 years old, and was living with his mother in a convent. His personal reputation played a minor part with those who chose him, as in their eyes he was the lawful heir, being nephew to the last tsar descending from Rurik. His name had been often mentioned in those years of civil war as the only one on which all shades of opinion might meet. A popular rumour asserted that when Tsar Theodor was dying, he appointed his cousin Theodor Romanoff (now the monk Philarete) as his successor, but Godunov stepped in and prevented the tsar's will being fulfilled. As Philarete had taken monastic vows, he could not ascend the throne; besides the *boyars* thought Michael, a mere boy, would be a more manageable sovereign. His election was no doubt due to the general striving after legitimacy, which was satisfied by his close relationship to the extinct dynasty. Three years later his father returned to Moscow and was made patriarch; he then reigned jointly with his son and up to his death in 1633 all State documents bore Philarete's signature on a par with Michael's.

The main work of the Romanoff dynasty was to extend Russia up to her natural geographical limits, and to turn her into a European State from the semi-Asiatic one she had become after being under Tatar rule. Though this policy is usually connected with the name of Peter the Great, it was actually started by his grandfather and unswervingly pursued by his successors down to the 20th century. But though the general trend of Russia's internal and international development progressed along the same lines for three centuries, various undercurrents predominated at certain times and are characteristic of definite epochs. Those epochs, into which the history of the Romanoff dynasty may be divided for purposes of study, correspond fairly exactly with the customary division by centuries. The first epoch, when Moscow

was the only important centre and when the general intercourse with western Europe was nearly as limited as in previous days, corresponds to the 17th century, as it lasted not only till 1689, when Peter the Great became sole ruler, but more exactly till the end of 1698, when, after his first journey abroad, he began transacting State business himself. The second period, down to the death of Paul I., corresponds to the whole of the 18th century, during which Russia, with St. Petersburg as principal centre, gradually became a European country and reached the shores of all the seas bordering on the Russian plain. The third period, from the accession of Alexander I., in 1801, down to the overthrow of the dynasty in 1917, marks the highest point of Russia's activity as a European Power. Whatever territorial enlargements were acquired in this period were in Asia and mostly due to the necessity of reaching a natural and easily defensible frontier on the Asiatic continent, whereas most of the Government's energies were devoted to the work of internal progress, both economic and educational.

I. THE 17TH CENTURY

The state of chaos to which the country had been reduced in the first years of the 17th century, set a hard task to the new dynasty. The pervading poverty, insecurity and disorder required protracted and patient labours before the country could overcome its weakness and disorganization. All the first tsars of the Romanoff house came to the throne at such an early age that no personal guidance could be expected from any one of them for a long time. Michael, and his son Alexis, were both tsars at 16; Alexis's eldest son Theodor, at 14; Peter the Great at 10. Therefore the actual work of government was always in the hands of a council. The first three tsars never took any decision without its having been discussed by this council, but favouritism and intrigue naturally influenced the choice of its members, and all through the century continual popular risings aimed at the exclusion of one *boyar* or another, to whose predominance or to whose cupidity common gossip attributed the calamities of the day. In order to disarm public opinion the Government was constantly convening assemblies of deputies from the whole land—sometimes to discuss a special question, sometimes for submitting all pending business to their decisions. In those assemblies, called *zemski sobor*, the permanent *boyar* council represented the nobles; in addition came deputies from the clergy and from "all the land," both towns and villages. The first nine years of Michael's reign *sobors* sat in Moscow almost uninterruptedly; three more were called together in 1632, 1637 and 1642; in the first eight years of Tsar Alexis's reign there were five *sobors*. Those of later days, between 1653 and 1682 became mere commissions for elaborating points of law and had no positive authority. The Government had become stronger and had built up an efficient staff of agents of its own. On the other hand the *sobor* of 1648–49 had promulgated a code of laws, which was commonly followed and did not require further commissions to enforce universality.

Wars of the New Dynasty.—A great part of the country's strength was wasted in attempts to counteract the encroachments effected by the neighbouring powers on its territory during the period of anarchy. Out of the first 70 years of the new dynasty's rule, 30 were spent in wars against Poland and Sweden. Russia got back Smolensk and Seversk, which had been seized by the Poles, and annexed Kief and part of Little Russia, east of the Dnieper, owing to a rising against Poland of the Cossack hetman, Bogdan Khmelnitski, whom Moscow after long hesitations decided to back. But the effort required for obtaining those advantages did not allow of an equal amount being spent in the direction of the Baltic, where Sweden had put Russia's weakness to profit and had annexed a large area of land. The wars against Sweden led to no result in the 17th century, and Russia had to wait for Peter the Great in order to regain what she had lost in the north-west.

Down south, where since the 15th century a separate State, the khanate of Crimea, had arisen under Turkey's protectorate, the first Romanoffs waged no regular wars; but the danger of Tatar incursions demanded the building up of defences which slowly advanced into the Steppe, for when outposts gradually became prosperous towns, they required in turn a new line of forts to protect them. At the end of the 16th century the Crimean Tatars had twice raided the country up to the very walls of Moscow; 100 years later the fortified line of defence was already 400 m. south of the capital. But the farther Russia spread down in that direction the clearer it became that no peaceful agreement was possible so long as the Black sea was not reached, and that would have meant war with Turkey, a much too formidable opponent at that stage. A cossack hetman, Doroshenko, went to war with the Turks, applied to Moscow for help and was eventually supported; but this adventure merely led to a disastrous peace (1681) by which Western Ukraine had to be surrendered to Turkey. It took 100 years more, and all the energy of Catherine II. and of Potemkin to reverse the situation.

Taxation Reforms.—The finances of the country at the beginning of the new dynasty's rule were perhaps in a still more disastrous condition than any other branch of public service. The main spring of former revenue, taxation of cultivated land, was no more adequate owing to so many fields having been abandoned during the years of anarchy. Besides, those peasants who returned to their devastated villages were often successful in defrauding the State of their taxes. The Government was obliged gradually to work out a new system, that of taxing no more the land, but the landowner, not the "field," but the "house," as owing to the vast expanse of Russia and Siberia, where runaways could always escape with ease from official supervision, taxation of communal land laid too heavy and too iniquitous a burden on the thrifty agriculturists, whereas the lazy ones paid nothing. The same occurred with large landowners; they were responsible for the taxes due from peasants who were settled on their land, besides being obliged to come forward with a fixed number of soldiers in case of war. In order that they should be able to fulfil their obligations the peasants were gradually attached to the soil; and thus a serfdom arose which lasted up to 1861 and practically transformed the peasants into slaves.

Religious Matters.—The administration of the Church was at first entirely in the hands of Philarete, who was elected patriarch in 1616. Till his death, in 1633, he was the actual sovereign, and in ecclesiastical matters his power was absolute. In 1652 the patriarchal see was again occupied by a strong personality, Nikon. Tsar Alexis called him his "particular friend" and gave him a free hand in the reforms he undertook. He revised and corrected the texts of prayer books, the mss. of which had been disfigured by ignorant scribes, and abolished ceremonial practices for which no authority existed. But his activity met with strong opposition, due in most part to Nikon's tactlessness, and led to a schism, *Raskol*. Its followers, *Raskolniki*, are still numerous. Nikon's opposition to secular legislation about monastic property, and his efforts to place his own authority above that of the tsar, eventually made Alexis alter his attitude towards him. He then retired to a convent and refused to perform his duties. For nearly ten years the tsar ruled the Church in his stead, till a council was convened which deposed Nikon and appointed a new patriarch. The danger of having a man next to himself who might succeed in usurping such a measure of power, made Peter the Great abolish the Russian patriarchate.

A curious feature of the first Romanoffs is that notwithstanding their efforts to rule in accordance with the people's wishes, and though each of them in turn manifested a total lack of personal ambition, circumstances so imperiously demanded a strong hand that autocracy was evolved and imposed upon a succession of totally ungrasping autocrats. This general leaning of the country towards a firm rule prepared the way for Peter the Great's activities.

II. THE 18TH CENTURY

The salient figures among the Romanoffs of the 18th century are those of Peter the Great and of Catherine II. With Peter, Russia reached the Baltic sea after 20 years' war against Sweden; with Catherine, her southern frontier, after two wars against Turkey, came down to the Black sea, whereas, on the west, owing

to the partition of Poland, and the annexation of Courland, she came in contact with the Germanic confederation. Two brilliant episodic wars; that of the empress Elizabeth against Frederick the Great, when Russian troops occupied Berlin, and that of Paul I., against the French in Italy and Switzerland, were brought on by political alliances and led to no tangible results. Sweden's two attempts (1741 and 1788) to regain by a sudden attack some of her lost advantages nearly led to Russia spreading further over south-east Finland. Though the conquest of Finland was based neither on historical nor on ethnographical considerations, it became necessary for the security of St. Petersburg, which was founded early in the 18th century and gradually became the seat of government. Two attempts at advance in Central Asia remained fruitless; Peter the Great's conquest of the southern border of the Caspian in 1723 was annulled by the empress Ann in 1732 when the annexed provinces of Mazanderan and Ghilan were handed back to Persia. As for Peter the Great's attempt to seize Khiva and liberate the Russians who were there in bondage, the whole of his army perished in the desert.
